12054. **NOWAK, J., E. PANOW, J. TOKARSKI, WŁ. SZAFER, and J. STACH.** The second woolly rhinoceros (Coelodonta antiquitatis Blum.) from Starunia, Poland. (Geology, mineralogy, flora and fauna.) *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (II)* [*Zool.*] 1930(Suppl.): 1-47. Map, 10 pl., 1 fig. 1930.—This young ♀ is the 2nd woolly rhinoceros carcase found in Galician Pleistocene silts. The anomalous preservation of the skin, tongue, palate, fragments of the intestines, and loose hair, is probably due to saturation with crude oil and salt water. This rhinoceros, as well as the mammoth and fore-parts of the first rhinoceros found, are associated with a tundra flora* which seems to contain secondary inclusions from the present flora of the Carpathian foothills. Starunia is about 120 kilometers south of the terminal moraine and about 40 kilometers from the nearest Pleistocene mountain glacier. The skeleton is mostly preserved, also the skeleton of a 3rd rhinoceros without soft parts. The external appearance suggests the white rhinoceros more than any other living form. The name *Coelodonta antiquitatis* staruniensis* (p. 42), is proposed for this form. All these remains seem to have been carried by a stream in flood into pits containing salt water and crude oil.—*H. E. Wood, II.*

12055. **RODRIGUES DOS SANTOS, J. Jr.** Um caso de macrodontismo num "Oryctolagus cuniculus algirus (Loche)." *Anais Fac. Sci. Porto* 16(2): 80-84. 1 pl., 1 fig. 1930.—Describes a case of abnormal dentition in this sp.*

12056. **ROMER, ALFRED S., and PAUL H. NESBITT.** An extinct cane-rat (Thryonomys logani, sp. n.) from the central Sahara. *Ann. and Mag. Nat. Hist. Ser. 10.* 6(36): 687-690. 1 fig. 1930.—From Pleistocene or post-Pleistocene deposits in the Tanezrouft region. *T. logani** (p. 687), types in Walker Mus., University of Chicago. The presence of this rodent is indicative of a radical change of climate in this now arid region.—*A. S. Romer.*

12057. **SANBORN, COLIN CAMPBELL.** Two new fruit bats collected by the Whitney South Sea expedition. *Amer. Mus. Novitates* 435. 1-3. 1930.—*Pteropus* banksiana (p. 1), Banks Is., between New Hebrides and Santa Cruz Is.; *P.* nitendiensis (p. 2), Santa Cruz Is. Types in Amer. Mus. Nat. Hist.

12058. **[SEREBRENNIKOV, M. K.]** СЕРЕБРЕННИКОВ, М. К. Материалы по систематике и экологии грызунов (Mammalia, Rodentia) Южного Зауралья. [Classification and ecology of the rodents of the southern trans-Ural region.] Ежегодник Зоологического Музея, Академия Наук СССР. (*Ann. Mus. Zool., Acad. Sci. URSS.*) 30(2): 251-284. 3 pl. 1929.—25 spp. and sspp. are listed with notes regarding habits, distribution, ecology, and systematics. *Microtus arvalis* transuralensis (p. 257), Pokrovka, Chelyabinsk Co., So. Trans-Ural region; *Lagurus lagurus* aggressus (p. 267), Ferapontovka, Busuluks Co., Samara prov.; *L. l.* abacanicus (p. 267), Dmitrievka, Munusinsk Co., central Siberia.—*G. Maydell.*

12059. **SNYDER, L. L.** The mammals of the Lake Abitibi region [Ontario]. *Univ. Toronto Studies Biol. Ser. No.* 32. 7-15. 1928.—This paper is based on a collection made in the summer of 1925, and includes notes on local distribution, numbers, habits, economic status, and measurements of 34 spp. The discovery here of *Eutamias minimus borealis* represents an eastward extension of its known range.

12060. **STEAD, DAVID G.** The great whales of Australia and Antarctica. *Australian Mus. Mag.* 4(4): 123-132. 5 fig. 1930.—The author gives a brief account of the whaling industry, particularly in Australian waters. Certain finback spp. visit these waters from June to October, concentrating off Jervis Bay, N. S. Wales, and Point Cloates, Western Australia. *Balaenoptera musculus**, *B. physalus**, *Megaptera nodosa**, and *Physeter macrocephalus* are discussed in detail, with notes on morphology, habits, food, and commercial status. The author suggests that the forward position of snout and blowhole in *Physeter* has evolved as a result of the struggles between this sp. and the giant squids on which it preys. The latter might interfere with the whale's respiration if they could reach its blowhole with their suckers. It is also suggested that the oil in the head-case and the spermaceti in the dorsal humps of *Physeter* facilitate maintenance of equilibrium and freedom of movement.

12061. **SVIHLA, ARTHUR.** Change in color pattern in a captive red squirrel. *Amer. Naturalist* 65(696): 92-95. 1 fig. 1931.—A *Sciurus hudsonicus loquax* at 8 months showed a number of symmetrically disposed spots of light gray, resulting from the presence of unpigmented hairs among normal red ones. After isolation from cage-mates which tormented it, the gray patches began to disappear, owing, apparently, to improvement in the physiological processes of the animal.

12062. **TEILHARD de CHARDIN, P.** Note complémentaire sur la faune de mammifères du Tertiaire inférieur d'Orsmael. *Acad. Roy. Belgique Bull. Cl. Sci.* 14(8/9): 471-474. 2 fig. 1928.—Additional isolated teeth, including: *Adapisoriculus?**, *Adapisorex**, *Plesiadapis**, *Dissacus**, and a *Paramys lemoinei**, lower molar with the paraconid crest.—*H. E. Wood, II.*

12063. **THOMAS, OLDFIELD. Note on Sciurus splendidus, Gray.** *Ann. and Mag. Nat. Hist. Ser. 10.* 2(12): 590. 1928.—*Sciurus splendidus* Gray, 1842, described from an unknown locality, proves to be identical with, and takes precedence over, *S. saltuensis magdalenae* Allen, 1914. *S. variabilis saltuensis* Bangs and *S. saltuensis bondae* Allen become subspp. of *S. splendidus*.

12064. **TROUGHTON, ELLIS Le G. Notes on striped opossums of the genus Dactylopsila.** *Australian Zool.* 6(2): 169-174. 1930.—A synopsis of the literature dealing with the habits and general history of the genus *Dactylopsila*, together with a discussion of the wide variation within different spp. A detailed account of *D. melampus* Thomas and *D. pictata* Thomas is given.—*C. F. Jackson.*

12065. **VOSSELER, J. Zur Fortpflanzung des Känguruhs. Unter Benutzung von Beobachtungen A. Goerlings.** *Zool. Garten* [*Leipzig*] 3(1/3): 1-11. 3 fig. 1930.—The young just after birth work their way through the woolly coat of the mother without assistance by movements of their sturdy anterior appendages. The mother cleans up the trail by licking. This movement is made possible by the much more rapid development of the anterior than of the posterior legs. The mother does not concern herself with the naked embryo; if it falls out of the pouch, it dies, especially since it soon loses the resistance to low temperature which it possessed at birth. Only the posterior pair of teats are used in suckling.—*E. H. Behre.*

12066. **WALKER, M. V. Two "herds" of three-toed horses.** *Trans. Kansas Acad. Sci.* 33: 137-143. 1930.—A descriptive account of prospecting for fossil horses in east central Wyoming and west Nebraska with special reference to the finding of a herd of 8 and one of 6 *Mesohippus bairdi* in the Oligocene northwest of Crawford, Nebraska, in 1929.—*F. C. Gates.*

12070. **BUDAI, E. Attraction universelle et énergie vitale. (Étude astrobiologique théorique.)** *Rev. Path. Comp. et Hyg. Gén.* 30 (398/399): 712-723. 1930.—Many diseases show a cyclic development and a periodic recurrence. This periodicity may sometimes be ascribed to astronomical influences such as "sun spots." The ultra-radio-genetic theory of vital energy which postulates a supply of vital energy from the ultra-penetrating rays of Millikan cannot be accepted for 2 reasons: (1) the method of union between these cosmic radiations and electronic energy of the cell is unknown; and (2) periodicity of pathological phenomena cannot be thus explained. The astro-biologic conception based on the principle of universal attraction is more rational. Lunar periodicity seems related to many biological phenomena (recurrent fever, human ovulation, etc.). The periodicity of biological phenomena in diurnal and semi-diurnal cycles, and the action of certain diastases appear to be influenced by forces from the great cosmic machine. The biological phenomena recurring every 10 yrs. (periodic epidemics) generally associated with sun spots, might be related to Jupiter's position in relation to the sun, and would also depend on the principle of universal gravitation.—*P. Joyet-Lavergne (transl. by A. M. Chickering).*

12071. **CASTIÑEIRAS, JULIO R. Principios fundamentales de la filosofía natural.** *Anales Soc. Cien. Argentina* 107 (2): 97-142. 13 fig. 1929.—The author outlines briefly the history and discovery of the fundamental principles of thermodynamics, their characteristics, and their generalized interpretation; the influence of the 2nd principle on the perfecting of thermal machines, and the application of the calculation of probabilities, with the aim of explaining their essence; and the explanation of most physiological phenomena by this principle. The ideas of Poe, Spencer, Boltzmann, le Bon, etc. on the evolution of the universe are also analysed.—*A. A. Pinkus.*

12072. **CURTIS, FRANCIS D. Second digest of investigations in the teaching of science, including chiefly the research investigations published from 1925 through 1930.** 424p. P. Blakiston's Son & Co. Inc.: Philadelphia, 1931. Pr. $3.00.—The greater part of the book is devoted to current practices in the teaching of the sciences, largely in the high schools and elementary courses in colleges and universities, with special reference to methods and objections.—*C. A. Kofoid.*

12073. **EAST, EDWARD M., (editor). Biology in human affairs.** 399p. Whittlesey House, McGraw-Hill Book Co.: New York, 1931. Pr. $3.50.—This is a collection of authoritative essays (by 13 authors), some of which are more sociological than biological. E. M. East contributes a general chapter on The relation of biology to human problems in the past, present, and future; and also one on Heredity. Other authors and subjects are: M. FISHBEIN, The frontiers of medicine; H. S. CUMMING and A. M. STIMSON, The outlook of public health; E. K. MARSHALL, Physiology of to-day; E. M. PARSHLEY, Zoology and human welfare; D. F. JONES, Efforts to increase the food reso[illegible]; and E. V. McCOLLUM, Diet and nutrition.—*H[illegible]ings.*

12074. **GRUHL, KURT. Tier- und [illegible]ege zoologi[illegible]t des Kreises Grünberg in Schlesien und se[illegible]** New York, 1931. **bung.** 587p. illus. (some col.). W. I[illegible]rg in Schlesien, 1929.—The 1st part co[illegible]aboratory guide [illegible]ion of 21 biotic communities or habitat[illegible]an Co.: New Y[illegible]and detailed notes on the flora and fa[illegible]part, devoted to economic aspects, conta[illegible]s **Tier im Bild.** [illegible]gri-culture, by LEIFELD; on an[illegible]6 pl. Brehm Ver[illegible] by BECKER; on parasites of domestic[illegible]und, M. 15.—T[illegible]RN; on pomology, wine-growing, and h[illegible]ustrated series OTTO HOLZER; on forestry, game, and [illegible]parental rela[illegible]PAUL; on fisheries, by PAUL SCHUMI[illegible]ese relations on bee-keeping, by W. JÄCKEL. The [illegible] reptiles, b[illegible]nsists of systematic, annotated lists of the v[illegible] text, and n[illegible]al groups; a chapter on galls and leaf [illegible]—*C. A. Ko[illegible]y* HUGO SCHMIDT); and an account o[illegible] **Lehrbuch d[illegible]**, including a review of previous botanical w[illegible]av Fischer[illegible]n annotated list of plants. The 4th part treat[illegible] [illegible] protection of animal and plant life. The volume i[illegible] de[illegible]ofusely illustrated and has an index of common n[illegible]Thes.

12075. **JOHNSON, JOHN C. Educational biology. The contributions of biology to education. A textbook for teachers' colleges and university schools and colleges of education.** xx+360p. 123 fig. Macmillan Co.: New York, 1930. Pr. $3.00.—The 27 chapters of this textbook deal with the following subjects: subdivisions of biology; individuation and integration; variation; natural selection; artificial selection; adaptation; isolation and geographical distribution; color in organisms; classification; the primates; man as an animal; instincts in lower animals and in man; degeneration and parasitism; the palaeontological record; the cell, the unit of life; one-celled versus many-celled animals; the embryological record; maturation of the reproductive cells and fertili-

zation; theories concerning inheritance before 1900; Mendel's laws of inheritance; human inheritance; the improvement of the human species; inheritance of acquired characters; civic biology; epochs in the history of biology; and the brain.—*C. A. Kofoid.*

12076. **KELLOGG, CLAUDE R. The opportunities and need for biological research in Fukien.** *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 1: 13-17. 1928.

12077. **KRAFFT, CARL F. Can science explain life?** 94p. Published by author: Washington, D. C. 1931. $1.00.—A revised and enlarged presentation of the author's "Spirazines." [See also B. A. 5: 26527.]

12078. **LAKHOVSKY, GEORGES (préface par d'ARSONVAL). Le secret de la vie. Les ondes cosmiques et la radiation vitale.** 2e éd. revue et augmentée de "L'origine de la vie." 261p. 23 fig., 6 pl. Gauthier-Villars et Cie: Paris, 1929. Price 25 fr.—This enlarged edition expands the author's views on the relations of radiant energy to vital phenomena. Specifically, a graph of sunspots from 1847 to 1907 shows a coincidence of sunspot maxima with yrs. of best Bordeaux wines and of sunspot minima with yrs. of mediocre and poor wines. Plant cancers caused by *Bacterium tumefaciens* are reported as treated successfully by 2 exposures at a 24 hr. interval for 3 hrs. to Lakhovsky's Radio-Cellulo-Oscillateur producing oscillations of a wave length of 2 m. at the rate of 150,000,000 vibrations per sec. Cancer is regarded as a disturbance of the oscillatory equilibrium of the body and curable by its restoration. The geological character of the soil and conductivity of soil water, by their effect on transit and reflection of cosmic rays, are held to have a relation to the relative frequencies of neoplasms. This view is illustrated by data from the incidence of cancer and the geological substrate in Paris and by water supply in other parts of France.—*C. A. Kofoid.*

553p. The ess: New York, [1930]. Pr. $5.

12085. SC **Die Maschinentheorie des Lebens.**
[The mechai ry of life.] [2nd ed.] 194p. Felix
Meiner: Leip 1929. Pr. 7.80 M.

12086. SMA. **WOOD, WILLIAM MARTIN. A textbook of biology.** [6th ed.] 470p. 4 col. pl., 174 engravings. Lea & Febiger: Philadelphia, 1930. Pr. $4.00.—This textbook of biology for students in general, medical, and technical courses is completely revised and largely rewritten. The frog is used as a typical example of a complex animal; its anatomy and physiology are discussed in detail, including the distribution of energy and the nervous system. Part II extends the analysis to the biological unit, the cell, and presents the lives of simple animals and plants. Part III considers some invertebrate metazoans—stinging animals, worms, arthropods, molluscs, and echinoderms. Part IV introduces some theoretical considerations—heredity, variation, adaptation, parasitism, the biology of disease, and evolution. Part V leads to human biology and the connection between biology and human welfare, providing the foundations on which any public health program must ultimately rest.—*W. M. Smallwood.*

12087. **SPRATT, E. R., and A. V. SPRATT. Biology for schools: a textbook suitable for school certificate and similar examinations.** [School examination series.] viii-403p. Univ. Tutorial Press: London, 1931. Pr. 4s. 6d.

12088. **THOMSON, J. ARTHUR, and PATRICK GEDDES. Life: outlines of general biology.** vol. 1 & 2. 1552p. Frontispiece. 202 fig. W. Heffer & Sons: Cambridge; Harper and Brothers: New York, [1931.] Pr. $15.00.—The introduction classifies the domain of biology and the 1st chapter characterizes living creatures and compares them with crystals. The 2nd chapter deals with natural history or ecology, discussing the relations of organisms to types of environment and to modes of life, the interrelations of plants and animals, the balance of nature, and illustrates the intricacies of the interrelations among organisms. The 3rd chapter takes up the basic functions of movement and locomotion, the nervous and sensory functions, hypnosis, sleep, the quest for food, bacteria, vitamins, excretion, circulation in plants and animals, fermentation, metabolism, physiology of the cell, tissue culture, phagocytosis, luminescence, bacteriophage, immunity, poisons, and the question, what is life? The 4th chapter deals with reproduction and sex, discussing adaptation for, modes of, and rates and periodicity of reproduction; hormones, telegony, grafts and chimaeras, consanguinity, fertility, parthogenesis both normal and artificial, dimorphism, sex characters, the Manoilov test, parasitic males, courtship, sex behavior, sex determination, theory of sex, sex reversals, education in animals, parental care, forms of family, position of woman, sex instruction, and eugenics. The 5th chapter discusses animal behavior, from rational conduct to the tropisms of Protista, the subconscious, instinct, linked instincts, intelligence, autonomy of life and mind, mechanism, and vitalism. The 6th chapter treats of form and symmetry, organs, differentiation, integration, homology, analogy, convergence, organogenesis, substitution and change of function, vestigial organs, tissues, cells, cell theory, and the problems of species. In the 2nd volume the opening chapter deals with the development of organisms, germ cells, meiosis, embryonic stages, recapitulation, continuity of germ cells, organisms, regeneration, life cycles, the curve of life, life histories of plants, alternation of generations, the meaning of larval stages, longevity, the biology of death, and the play period and industries of animals. The 8th chapter outlines the steps in organic evolution, characterizes the ascent of life through the geological periods, notes the great structural advances, the divergence of plants and animals, the apartness of the bacteria, the origin of unicellular and multicellular bodies, the beginning of natural death, origin of sex, internal cavities, bilateral symmetry, and the beginnings of brains; discusses the origin of land plants, seeds, insects, birds; analyses the effects of recurrent ice ages; and discusses life beyond our world-limits. The 9th chapter epitomizes the theories of evolution from its adumbrations in Greek philosophy to the latest aspects of Holism. Pre-Darwinian evolutionists are summarized and the evidences for organic evolution, variations, mutations, atavism and reversions, genes, nature and nurture, inheritance of acquired characters, natural and sexual selection, isolation, adaptations, acclimatization, and biotechnics are discussed. The factors in evolution and the different kinds of evolution, including social evolution, are summarized. Chapter 10 discusses the relations of biology and its sub-sciences to the other sciences and to the arts, seeks a harmonization of its specialism in a unity of science, and notes the organismal view in physics. Chapter 11 deals with the biology of man, his pedigree, place of his emergence, beginnings of human society, the significance of hunting and cultivation of plants, and the status of woman in human progress. Chapter 12 relates biology to education, health, medicine,

sociology, population, war, eugenics, education, progress, and relativity; and chapter thirteen leads towards a theory of life. Four appendices deal respectively (1) with the great events in biology, a brief summary of the work of eminent biologists; (2) with naturalists at work, largely an account of British enterprises; (3) of how a biological outlook on life can be developed by education, containing an outline and discussion of educational methods; and (4) with a guide to biological reading, a very full classified list of nearly a thousand titles.—*C. A. Kofoid.*

12089. **VALOIS, CHARLES.** Réserves et parcs nationaux français. [French national parks and reserves.] *Rev. Hist. Nat. Pt. 1. B. Aquicult., Ent., Aquar. et Terrar.* 10(6): 177-193. 1929.

12090. **VLÈS, F.** Travaux pratiques de physique biologique et de chimie physique. [Laboratory guide for biophysics and physical chemistry.] 93p. 55 fig. Vigot Frères: Paris [1929]. Pr. 15 fr.

12091. **VOGEL, J. C.** The cause of the Russell effect observed in oils. *Trans. Roy. Soc. South Africa* 18(4): 295-300. 1930.—The development of photographic plates in the presence of (but not in contact with) wood, vegetable tissues, resins, and oil of various plant and animal origins, is due not to radiation but to volatile substances, here identified as butyric acid, the possibility remaining that similar fatty acids also may be active. Ozone and H_2O_2 are excluded. In 4 samples of olive oils, and in several lubricating oils, no general relationship was found between the Russell (photographic) effect and either the rate of oxidation of the unsaturated part or the I number of the oils.

12092. **WARREN, HOWARD C.** The organic world and the causal principle. *Science* 71(1834): 204-208. 1930.—The evolution of life and mind may be understood in purely mechanistic terms without the introduction of any new type of energy, vital force or entelechy not found in the organic. The laws of cause and effect, which may be summed up under the general principle of the conservation of energy—"the law of unvarying total"—which are effective in the inorganic, are equally effective in the organic. "The changes that occur in connection with the growth of an individual organism and the changes of type which mark the evolution of sp. may all be brought under the principle of the unvarying total." Although every step in organic development is in accord with the causal principle, the process of increasing adaptation, which means the appearance of something novel, leads to the supplementary principle of natural selection. Thus the principle of selective adaptation may be said to be superimposed upon the principle of the unvarying total. At a later stage in the developmental process, the responses of certain organisms to situations come to be determined in part by a 2nd novel and supplementary principle—that of anticipatory adjustment. Thus these 2 supplementary principles, based upon the fundamental causal principle of the unvarying total, form a hierarchy which is needed to account fully for the organic stages of evolutionary progress.—*G. J. Dudycha.*

12093. **WOODGER, J. H.** The "concept of organism" and the relation between embryology and genetics. II. *Quart. Rev. Biol.* 5(4): 438-463. 1930.—This is an analysis of embryological and genetical theory and a discussion of their mutual relations. A symbolic notation is developed, and it is shown how, by means of this analysis, many current disputes and misunderstandings can be avoided.—*J. H. Woodger.*

12094. **YONGE, C. M.** The Great Barrier Reef expedition, 1928-1929. *Rept. Great Barrier Reef Committee* 3: 1-25. 6 pl. 1931.—A general account of the activities, personnel, and equipment of this expedition, with a résumé of work accomplished and recommendations for future work.

12095. **ANONYMOUS.** Adjourned discussion on the introduction of alien species. *Proc. Linnean Soc. London* 142. 17-20 1929/30(1931).—The resolution was unanimously adopted: That this Meeting deprecates all attempts to introduce and naturalise wild animals or plants in countries where they are not native, unless such introduction is urgently needed for economic reasons, and until a thorough study has been made of the local conditions and of the results that are likely to follow.

12096. **ANONYMOUS.** Discovery investigations station list 1927-1929. *Discovery Reports* 3: 1-134. 10 maps. Cambridge Univ. Press: Cambridge, 1930.—Contains the R. R. S. "William Scoresby" stations, South Sandwich Islands stations, and Ross Sea stations.

12097. **ANONYMOUS.** General information regarding the Territory of Alaska. 151p. Illus. U. S. Dept. Interior: Washington, D. C., 1931. Pr. 40 c.—Includes information on agriculture and stock raising, timber resources and national forests, reindeer, fisheries, aquatic mammals, health conditions, game and land fur-bearing animals, fur farming, game and bird refuges, and U. S. A. government publications on Alaska.

12098. **ANONYMOUS.** The Nigeria handbook, containing statistical and general information respecting the Colony and Protectorate. [9th ed.] 350+[9]p. Illus., maps. C. M. S. Bookshop: Lagos, 1929. Pr. 7s. 6d.—Contains data on climate and rainfall, forestry, agriculture and live stock, public health, sanitation, hospitals, health and disease, and poultry keeping.

12099. **ANONYMOUS.** Suggestions for an international marine biological station and laboratory at Hawaii. *Jour. Pan-Pacific Res. Inst.* [*Honolulu*] 6(2): 6-9. 1931.—A round-table discussion.

12104. **HEGNER, ROBERT W.** Laboratory guide for college zoology. 75p., 1 fig. Macmillan Co.: New York, 1931. Pr. $1.

12105. **HEILBRON, ADOLF.** Das Tier im Bild. Aus der Kinderstube der Tiere. 32p. 126 pl. Brehm Verlag: Berlin-Charlottenburg. 1929. Pr. bound, M. 15.—This is the 6th volume in the richly illustrated series "Das Tier im Bild." It deals with the parental relations to offspring. About 5 instances of these relations, mainly among insects, fishes, amphibians, reptiles, birds, and mammals, are discussed in the brief text, and many more illustrated in the numerous plates.—*C. A. Kofoid.*

12106. **HERTWIG, RICHARD.** Lehrbuch der Zoologie. [15th ed.] xii+656p. 588 fig. Gustav Fischer: Jena, 1931. Pr. 22 M.

12107. **KÜHN, ALFRED.** Grundriss der allgemeinen Zoologie. [4th ed.] 264p. 214 fig. Georg Thieme: Leipzig, 1931.—This text is divided into 4 parts: a brief statement of the general characteristics of organisms and the problems of zoology; the structural plan of animals, including a brief outline of the morphology of Protozoa, Porifera, Coelenterata, Vermes, Arthropoda, Mollusca, Echinodermata, and Chordata; activites (nutrition, respiration, excretion, motion and locomotion, irritability); and development and evolution of animals.—*A. M. Chickering.*

12108. **PYCRAFT, W. P.** Random gleanings from nature's fields. 210p. 40 pl. Hale, Cushman & Flint: Boston, 1930. Price $2.50.—This is a selected, revised, and corrected edition of "Essays in Natural History" from the London Illustrated News. Among the topics discussed are the white coloration of mammals, such as

ermines and young grey seals, the feeding habits of jelly-fishes, the coloration of young birds and mammals, the asymmetry of the external ear in owls, the feeding of Sagitta upon fish larvae, the courtship of the Argus pheasant, the origin of the birds' wing, an account of a lesser rorqual whale stranded at Mablethorpe, bats' ears, oyster farms, mermaids and dugongs, the hypertrophy of organs outgrowing their usefulness, the extermination of seals, and the diet of the walrus. —*C. A. Kofoid.*

12109. **ROULE, LOUIS. Description de l'aquarium nouvellement restauré du Muséum National d'Histoire Naturelle.** *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(1): 70-74. 1929.

12110. **STEINMANN, PAUL. Tiere um Haus und Hof. Lebensbilder und Leidensgeschichten.** 251p. 108 fig. H. R. Sauerländer u. Co.: Leipzig, 1931.—This natural history of German wild life deals with the habits and behavior of the badger, fox, marten, otter, bat, mole, hare, hedgehog, roe-buck, stork, raven, gull, swallow, swift, sparrow, finch, blind-worm, tree frog, eel, pike, cricket, dragon fly, water striders, ants and plant lice, bees, spiders, leeches, and the horse-hair worm.—*C. A. Kofoid.*

12111. **STEMPELL, W. Repetitorium der allgemeinen Zoologie (Morphologie, Physiologie, Oekologie, Abstammungslehre).** 269p. 249 fig. Gebrüder Borntraeger: Berlin, 1929. Price 7.60 M.—This is a richly illustrated, much condensed, and very complete compendium of the essential facts in zoology broadly conceived. Fully labelled diagrammatic figures illustrate the essential features of animal morphology, the development of invertebrates and vertebrates, the basic functions, the factors in evolution, cytology, heredity, and the relations of animals to their environment.—*C. A. Kofoid.*

APPARATUS AND TECHNIQUE

12112. **CAYLOR, HAROLD D., and TRUMAN E. CAYLOR. An inexpensive light source for a portable microscope.** *Science* 74(1907): 73-74. 1 fig. 1931.—The light source is composed of a lamp and reflector from a flash light, a hinge-topped metal case, containing 2 standard dry cells, and a rheostat switch which allows 2 different degrees of light.

12113. **DuBOIS, DELAFIELD. A machine for pulling glass micropipettes and needles.** *Science* 73(1891): 344-345. 1 fig. 1931.—With the described machine adjusted to give the type of point desired, it is possible to turn out pipettes or needles at the rate of 4-6 per min.

12114. **GARDNER, I. C., and F. A. CASE. The lateral chromatic aberration of apochromatic microscope systems.** *Rev. Sci. Instruments* 2(7): 416-428. 3 fig. 1931.—Measurements on 20 apochromatic microscope objectives of 4 makes and on 10 compensating eyepieces of 2 makes show that the compensating eyepieces in general do not entirely compensate the chromatic aberration of the objectives and that the complete microscope system is usually undercorrected. The bearing of this on the performance of the system in photomicrographic work by a 3 color process and in the direct visual observation of objects is considered.—*From authors' abstract.*

12115. **GERLACH, JOHN J. Jr. A new dark field microscope illuminator for opaque objects. Producing annular, cross fire, and indirect illumination.** *Rev. Sci. Instruments* 2(7): 412-415. 3 fig. 1931.—The illuminator, measuring $\frac{1}{2} \times 1\frac{1}{4}$ in. in diam. and weighing less than 1 ounce, can be used on any microscope. The annular prism is mounted in a covering of bakelite by means of cement. The light comes up from below on all sides of the object and is reflected at the silvered surface of the annular prism. On emergence from the prism at the inner conical face, which is the fundamental part of the illuminating system, the light is refracted downward and falls obliquely on the mounted object.

12116. **HAITINGER, MAX. Ein lichtstarkes Fluoreszenzmikroskop.** *Mikrochemie* 3(3): 220-222. 1931.

12117. **HARVEY, E. N. A method for comparing growth rates by means of a protractor.** *Science* 74(1906): 46-47. 1931.—The customary growth increment graphs are plotted upon standard coordinate paper and, in any series to be compared, the distances along the abscissa and ordinate allotted to the units of time and growth must remain constant throughout all sheets of graphs. The rate of growth is the slope of the graph between any 2 points or observations. The value of this slope in degrees is easily determined by means of an ordinary transparent protractor.

12118. **HAUSER, F. Two arrangements for illumination with reflected and oblique light.** *Instrument World* 4(40): 67-70. 7 fig. 1931.—On lighting apparatus and technique for taking photomicrographs of opaque objects.

12119. **HERVEY, GEORGE E. R., and JAMES G. HORSFALL. A simple device for humidity regulation.** *Science* 73(1901): 617-618. 1 fig. 1931.—Preliminary description and report on use of an apparatus for humidifying air in incubators, accurate within $\pm 2\%$ relative humidity, and costing about $20.

12120. **HOKE, WILLIAM E. Some aspects of progressive improvement in the screw thread.** *Rev. Sci. Instrum.* 2(9): 554-570. 7 fig. 1931.—Applications are also made to microscopical adjustments.

12121. **HURST, C. T. A device for washing tissues.** *Science* 73(1891): 343-344. 4 fig. 1931.—This apparatus for washing fixed tissues consists essentially of a tank, a rack to hold tubes containing material, and an overhead trough to distribute the water.

12122. **KOHL, E. J., and C. M. JAMES. A method for ripening haematoxylin solutions rapidly.** *Science* 74 (1914): 247. 1931.—Ehrlich's or Delafield's hematoxylin solutions are placed for ripening in a very wide and rather shallow evaporating dish and exposed at a distance of about 2 ft. to any rather powerful quartz Hg vapor lamp. About 2 hrs. are required for Delafield's and 3-4 hrs. for Ehrlich's solution.

12123. **LEIFSON, EINAR. A simple automatic pressure regulator for filtration.** *Science* 73(1904): 707-709. 2 fig. 1931.—Description of an apparatus easily constructed operating on a principle similar to that of an hydraulic press.

12124. **LOUNSBURY, JAMES A. A simple microscope eyepiece pointer.** *Science* 73(1888): 266. 1931.

12125. **McLENNAN, GEO. C. A paraffin embedding apparatus.** *Jour. Roy. Microsc. Soc.* 51(2): 136-138. 2 fig. 1931.—To keep the system at the exact melting point of the paraffin used, heat from the lamp is controlled by a variable electrical resistance.

12126. **RAU, N. S. A note on the use of vacuum-flasks in paraffin imbedding.** *Jour. Indian Bot. Soc.* 8 (2): 131-132. 1929.—Where neither gas nor electricity is available, vacuum flasks can serve as an efficient substitute for a paraffin oven. The flask is filled with water at a temp. a little above the melting point of the paraffin; material is transferred from cedar oil to paraffin in a short test tube; the tube is inserted in the flask through a hole in the stopper; and the cover screwed down. Even cheap flasks maintain heat long enough for satisfactory infiltration.—*W. Dudgeon.*

12127. **SCAGLIETTI, OSCAR. Di un nuovo procedimento tecnico per la decalcificazione dell'ossa. Nota preventiva.** *Monitore Zool. Italiana* 40(3): 94-96. 1929. —Bone fragments that had been fixed for several mo. in Ruffini's solution 3 (Müller's fluid 50 cc., 1% chromic acid 50 cc., glacial acetic 2 cc., corrosive sublimate 1 gm.), and then kept in Kayserling II, had become completely decalcified. This is no doubt due to the Müller's fluid and to the chromic and acetic acids. The Kayserling solution acts as a softening agent, especially on tissues fixed by Cr salts, and this action is manifest after about 30 days. For sections prepared with the usual stains, it is recommended to fix 48-60 hrs. in Ruffini No. 3 thin disks of fresh bone (2 mm. thick or less) taken from the epiphysis, from embryonic bone, or bone which through a pathologic process has partly lost its Ca content.—*O. Scaglietti* (*transl. by P. Hillkowitz*).

12128. **SCHMIDT, W. J. Dichroitische Färbung tierischer und pflanzlicher Gewebe. [Dichroic staining**

of animal and plant tissues.] [In: Handbuch der biologischen Arbeitsmethoden. Abt. V. Methoden zum Studium der Funktionen der einzelnen Organe des tierischen Organismus. Teil 2. Heft 16. Allgemeine und vergleichende Physiologie, Lief. 355.] p. 1835-1924. 1 col. pl., 24 fig. Urban & Schwarzenberg: Berlin, 1931.

12129. SIEDENTOPF, HENRY F. W. On the quality of the image and resolving power in the microscope. *Jour. Roy. Microsc. Soc.* 49(3): 231-236. 1 fig. 1929.—Distinction between quality and resolving power in a microscopic image is stressed. The complicated diffraction which occurs when images are formed of objects as encountered in practical microscopy, makes a theoretical approach to the problems involved seem out of the question. Along purely experimental lines progress is promising, as in the accurate measurement of microscopic images under appropriately varied conditions. This involves a knowledge of the modern theory of contrasts. The very order of magnitude may be questioned for values like 0.025 μ for the thickness of flagellae. Measurements are reported for a mercury globule approximately 17 μ in diam., made with an apochromatic objective 60 n.a. 0.95. Full details are given as to the conditions under which the measurements were made. The only variable was the width of the illumination (central). The diam. of the image decreased as the width of the illuminating pencil increased. It is concluded that the larger diam. with narrow illuminating pencil more nearly approaches the true value.—*W. Marquette.*

12130. VARRELMAN, F. A. Paper apron to prevent curling of microtome sections. *Science* 74(1905): 20. 1931.—Wet paper on a paraffin or celloidin block prevents curling of ribbons.

12131. VEIHMEYER, F. J., C. H. HOFMANN, and C. V. GIVAN. An automatic balance. *Science* 73(1894): 424-426. 1 fig. 1931.—The balance operates on the displacement principle using a pure organic liquid which has low viscosity, vapor pressure, and surface tension. The movement of the beam of the balance is indicated on a scale by an optical lever after being greatly amplified. The image from a single filament lamp is focused on the scale after reflection from a special concave mirror, attached to the beam of the balance, and a plane mirror. Changes in the density of the displacement liquid with temp. which may require adjustment for the scale length are compensated for by means of an adjustment nut which raises or lowers the center of gravity of the beam system. The balance is accurate, flexible, and simple in construction and operation. The fatigue of weighing is reduced and the speed is greatly increased. —*F. J. Veihmeyer.*

12132. WALKER, J. HENRY Jr. Inexpensive aerated aquaria. *Science* 73(1904): 709. 1 fig. 1931.

12133. ANONYMOUS. New micrometer microscope. *Instruments* 4(8): 465-466. 1 fig. 1931.

BIOGRAPHY, HISTORY, AND BIBLIOGRAPHY

HISTORY

12134. BERNARD, ALBERT. La pomme de terre en Bourgogne avant Parmentier. [The potato in Burgundy before Parmentier.] *Ann. Acad. Macon Ser. 3.* 25: 119-122. 1926-1927 (1930).—Historical note regarding the early introduction of the potato into Haute-Bourgogne, France.

12135. BREUIL, H., et R. de SAINT-PERIER. Les poissons, les bactraciens et les reptiles dans l'art quaternaire. *Arch. Inst. Paléont. Humaine [Paris] Mem.* 2: 1-169. 76 fig. 1927.—This is a description and discussion of the drawings, paintings, engravings, and carvings made by Pleistocene man in Europe. Fishes, especially fresh water ones, were favorite subjects of these early artists; amphibians and reptiles were much less frequently reproduced.—*B. F. Howell.*

12136. BROCK, ARTHUR J. Greek medicine. Being extracts illustrative of medical writers from Hippocrates to Galen. 256p. J. M. Dent & Sons; London, E. P. Dutton & Co.; New York, 1929.—The general introduction consists of a very careful summary of the history of Greek medicine, describing briefly the contribution of each school and great teacher, with enough of the general intellectual background to orient the reader. This is followed by excellent translations of large portions of Ancient Medicine, and Airs, Waters & Places and significant shorter selections of the Epidemics, Prognostic, and Surgery. Rufus of Ephesus is represented by "On the interrogation of the patient" and "Anatomical Nomenclature" while about half the book is devoted to extracts from various works ascribed to Galen. Brief extracts are given from Thucydides, Diodorus and Aetius. All the translations are original and scholarly and in most cases are not otherwise available to the non-classical worker.—*C. W. Dodge.*

12137. CAULFIELD, ERNEST. An early case of pyloric stenosis. *Amer. Jour. Dis. Children* 40(5): 1069-1075. 1930.—Patrick Blair gained notable distinction as an anatomist and botanist among the physicians and scientists of the early 18th century. In 1717, he reported an unusual case before the Royal Society, which is probably the earliest description of pyloric stenosis in an infant.—*From author's summary.*

12138. COLÓN, E. D. Datos sobre la historia de la agricultura de Puerto Rico antes de 1898. 302p. Cantero, Fernández & Co., Inc.: San Juan, Porto Rico, 1930.—The book outlines in chronological order the development of the agricultural industry from the discovery of the Island in 1493 to 1898 when the U. S. took possession. It is divided in 3 parts. The 1st deals with the social, political and industrial preparedness of the Spanish people at the time of the discovery of America, which made them a natural ethnological entity prepared for the discovery and colonization. In the 2nd part, the evolution of the agricultural industry, as developed to fit the needs and laws of the mother country and the political and social conditions of the Island, is thoroughly discussed. The introduction of what today are the important crops such as sugar cane, coffee, tobacco and cotton and their bearing in the economic structure of the Island at the time of their expansion is presented. In the last part the experimental work done up to 1898 with various major and minor crops is given. Early in the 15th century the first experiment station in the New World was established in the Island by King Ferdinand; and already in 1890 Quintanilla and López Tuero had performed soil analysis, fertilizer and variety tests with various crops. In conclusion, the writer blames the old system of colonial exploitation for the rather slow development of the agricultural industry during the period reviewed. 143 papers are cited.—*A. Roque.*

12139. CREPIN, PIERRE. La chèvre dans l'antiquité. *Rev. Hist. Nat. Pt. 1. A. Mammifères* 10(11): 361-385. 1929.—After a brief résumé of evidence of the domestication of the goat by the lake dwellers of Switzerland, the Egyptians, and the Chaldaeans, the literature of Greece and Rome is quoted (in translation) in some detail.—*C. W. Dodge.*

12140. DALEY, CHAS. History of Flora Australiensis. *Victorian Nat.* 47(7): 113-115. 1930.—Two letters from Hooker and 1 from Bentham to Mueller are printed.

12141. DANNEMANN, FR. Aus der Geschichte der Ernährungsphysiologie. [History of physiology of nutrition.] *Zeitschr. Ernähr.* 1(4): 113-117; (7): 209-214. 1931.

12142. **DAWSON, BERNARD. The history of medicine, a short synopsis.** 160p. H. K. Lewis & Co.: London, 1931. Pr. 7s. 6d.—The 7 chapters of this book correspond to as many lectures delivered by the author to the junior medical students of Adelaide University, Australia. The intent of the work is to give to these students the historical backgrounds of medical sciences, to demonstrate the stream of medical knowledge flowing from various and varied sources down to our time. This book purposely avoids detailed technicalities and is lightened with many amusing personal anecdotes. The periods covered are: Grecian, Greco-Roman, the Dark Ages and the Hippocratic tradition, the Middle Ages and the universities, the Renaissance, the period of consolidation.—*B. S. Dodge.*

12143. **DENGLER, A. Die Hundertjahrfeier der Forstlichen Hochschule Eberswalde.** [Celebration of the 100th anniversary of the Forest Academy at Eberswalde.] *Zeitschr. Forst.- u. Jagdw.* 62(10): 730-742. 5 pl. 1930.

12144. **FISCHER, EUGEN. Aus der Geschichte der Deutschen Gesellschaft für Rassenhygiene.** *Arch. Rass.- u. Ges.-Biol.* 24: 1-5. 1930.—The first eugenics society in the world was founded in Berlin in 1905, and has been active ever since.—*P. Popenoe.*

12145. **FISCHER, HERMANN. Mittelalterliche Pflanzenkunde.** [Geschichte der Wissenschaften und Botanik. 2 Band.] 326p. 70 fig. München Drucke: München, 1929. Pr. 12.50 M.—The works of the chief writers of the Middle Ages, with reproductions of the illustrations of the time, are presented. Pure botany of the cloisters and schools, and its part in the instruction of the times, are discussed with Salerno, Hildegard, and Albertus Magnus as prominent features. The literature of the applied botany of the period is dealt with in chapters on the uses of plants for decorative purposes, their relation to the symbolism of the times, and the gardens of Christian Europe. The uses of plants in medicine with special attention to medieval editions of Dioscorides receive much attention. A very interesting chapter concerns the changes in the forest areas of Western Europe and follows the introduction and extension of the cultivation of the most important economic plants. A list of synonyms used in medieval plant nomenclature refers the Latin and German terms used by these early writers to the now accepted botanical names. Glossaries of plant names of Roman origin, as well as those coming through the Roman from the Greek and Arabic, and names of German origin are given. Useful indices close the book. —*R. H. True.*

12146. **FREY, CHARLES N. History and development of the modern yeast industry.** *Indust. & Eng. Chem.* 22(11): 1161-1162. 1930.—The history of the yeast industry from the earliest times down to the manufacture of the modern compressed yeast is outlined, with the various theories of fermentation which have arisen during the course of the development of the industry, and a brief survey of the uses of yeast in industry.—*Author (courtesy Indust. & Eng. Chem.).*

12153. **JOHNSON, CHARLES W. An interesting copy of Wiedemann's Diptera exotica.** *Psyche [Boston]* 38 (1): 25-26. 1931.—Data on a copy of this work dated 1820.

12154. **JUEL, H. O. Förteckning över i Uppsala förvarade herbarieexemplar med påskrifter av Linnés hand.** [English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 12-16. 1931.—A list of herbarium specimens kept at Upsala with labels in Linné's handwriting.

12155. **LAUFER, BERTHOLD. The American plant migration.** *Sci. Monthly* 28(3): 239-251. 1929.—In America may be recognized 4 strata of plant cultivation: (1) plants peculiar to America, like maize, pumpkins, and sunflower; (2) those introduced from England in colonial times, like wheat, oats, and apples; (3) plants introduced from the West Indies in the 17th and 18th centuries; (4) plants brought from China and Japan from the 18th century onward. Chinese chronicles prove the introduction from America since 1500 of such plants as maize, sweet potatoes, manihot, tobacco, pineapples, guavas, papaya, custard apples, *Capsicum*, peanut, tomato, and many others. There never was a direct prehistoric interchange of plants between China and Mexico or between Oceania and Peru. The facts indicate that American Indian agriculture must be not centuries but thousands of yrs. old. The potato was introduced into Virginia from Bermuda in 1621-22, and had reached England about 1586. It has never become popular among the civilized nations of Asia, but the sweet potato, introduced from America through the Philippines in 1594, has become one of the important food plants of China. The pineapple, as a result of long cultivation, has become seedless. It was widely dispersed in America before the conquest, and is mentioned by most of the early chroniclers. In ancient Peru it was unknown, but later is was introduced there from Brazil. Its antiquity in Mexico and among the Maya does not seem to be well authenticated. It is reasonable to regard Brazil as the mother country of pineapple cultivation. The fruit first reached England in 1657; it was grown in Guinea before 1602, and was introduced at the Cape of Good Hope about 1660. About 1550 it reached southern India, and at the beginning of the 17th century China.—*P. C. Standley.*

12156. **LEATHES, J. B. The birth of chemical biology.** *Lancet* 219(5591): 889-895. 1930.—Harvey and John Mayor and other early workers on respiration.

12157. **LEE, WM. A. Liverpool and botanical science.** 11p. T. Buncle & Co.: Arbroath, 1928.

12158. **MAJOCCHI, DOMENICO. Concetto biologico sugli alimenti di Jacopo Bartolomeo Beccari "Quid aliud sumus, nisi id ipsum unde alimur?" esposto dal medesimo nel 1728 all'Accademia delle Scienze dell'Istituto di Bologna. Risposta al ch. mo Prof. Pietro Albertoni.** [The biological concept of food of J. B. Beccari ("What then are we, if not that which we ingest?") propounded in 1728 to the Acad. Sci. of Bologna. Answer to the honorable Prof. P. Albertoni.] *Rend. Sess. R. Accad. Sci. Ist. Bologna Cl. Sci. Fis.* 32: 142-148. 1927-1928.—This note commemorates the 200th anniversary of Beccari's discovery of gluten in wheat. In 1728 he announced the identification of gluten in wheat and casein in milk, and thereupon formulated a new concept of qualitative nutrition, viz., that the animal body is made up of substances ingested as foods.—*M. J. Lepore.*

12159. **MARTIN, HENRI. La frise sculptée et l'atelier solutréen du Roc (Charente).** *Arch. Inst. Paléont. Humaine [Paris] Mém.* 5: 1-86. 5 pl., 37 fig. 1928.—Paleolithic implements, engravings, and carvings, and a hu-

man skull from this locality in France, are discussed. The animals figured include the horse, bison, musk-ox, bear, and man.—*B. F. Howell.*

12160. **MELDRUM, ANDREW NORMAN.** The eighteenth century revolution in science—the first phase. 60pp. Longmans, Green & Co.: Calcutta, 1930.—This book is based upon Lavoisier's memoirs and journals (quoted in Berthelot's "La revolution chimique") and upon memoirs of Bayen and Priestley.—*C. W. Dodge.*

12168. **SARTON, GEORGE.** Discovery of the theory of natural selection (with facsimile reproductions of Darwin's and Wallace's earliest publications on the subject [1859]). *Isis: Internat. Rev. Hist. Sci.* 14(1): 133-154. 1930.

12169. **SCHWAPPACH, A.** Eberswalde 1830-1930. *Deutsch. Forstztg.* 45(31): 777-785. 16 fig. 1930.—An historical account of the forest school and experiment station at Eberswalde, Prussia.

12170. **SELGA, MIGUEL.** (transl. from Spanish by L. B. UICHANCO.) Historical notes on the cultivation of wheat in the Philippines. *Philippine Agric.* 20(4): 239-245. 1931.—Available documentary data, some of which are unpublished, show that extensive cultivation of wheat which Luis de Matienzo started in the higher altitudes of the P. I. in 1664, continued actively for at least 70 yrs. to the evident advantage of the people. Wheat growing on a commercial scale was given up in the P. I. not because of unfavorable climate but because competition in foreign trade brought to Manila better wheat at lower prices.—*M. Manresa.*

12171. **SERNANDER, RUTGER.** Linnaeus och Rudbeckarnes hortus botanicus. [With English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 126-157. 5 pl., 7 fig. 1931.—A study of the foundation by Olaus Rudbeck, Sr., of the Botanical Garden at Upsala, in 1657, including a reference to its importance to Linnaeus when he was constructing his classification of plants.

12172. **SPETER, MAX.** Zur hundertjährigen Geschichte des Chloroforms. [The 100 yrs. of chloroform.] *Pharm. Zentralhalle Deutschland* 72(40): 628-630. 1931.

12173. **TRÖGER, J.** Über einige im Altertum zu gewerblichen Zwecken verwendete Pflanzen. [Some plants employed in antiquity for technological purposes.] *Pharm. Zentralhalle Deutschland* 71(38): 593-598; (39): 611-613; (40): 628-631; (41): 642-646. 1930.—A historical review of drug and other economic plants of antiquity.

12174. **WEISS, HARRY B.** More about Doctor Brickell's "Natural History of North Carolina." *Jour. New York Ent. Soc.* 38(3): 313-315. 1930.—This work was pirated from John Lawson's "A new voyage to Carolina, etc.," published in 1700.

12175. **WILSON, E. H.** Gardening's renascence in the 18th and 19th centuries. *House & Garden [New York]* 57(5): 86, 152, 182. 1930.

12176. **ZINSSER, HANS, and ARTHUR F. COCA.** Remarks concerning Landsteiner's discovery of isoagglutination and the blood groups, with special reference to a paper by J. A. Kennedy. *Jour. Immunol.* 20(4): 259-262. 1931.—Contrary to the opinion of Kennedy, credit for discovery of isohemagglutination belongs to Landsteiner and not to Jan Janský.

12177. **ANONYMOUS.** La société Linnéenne de Bordeaux. *Actes Soc. Linnéenne Bordeaux* 80: 11-14. 1928. A review of the society's history since its organization in 1818.

BIOGRAPHY

12178. **ABBOTT, MAUDE E., (edited by).** Appreciations and reminiscences of Sir William Osler. With bibliographies. 2nd ed. *Internat. Assoc. Med. Mus. Bull. 9.* 634p. 51 fig. 59 illus. Privately issued at 836 University St., Montreal, Canada, 1927.—In the present volume the Montreal period (1870-1884) is covered by F. J. SHEPPARD, A. D. BLACKADER, E. J. A. ROGERS, MAUDE E. ABBOTT, BRYSON DELAVAN and MARIAN OSBORN and JEAN CAMERON; the Philadelphia period (1885-1889), by C. K. MILLS, GEORGE DOCK, HOBART AMORY HARE, JOS. LEIDY 2nd, H. R. M. LANDIS, E. B. KRUMBHAAR, J. C. WILSON and W. W. KEEN; the Baltimore period (1889-1905), by LLEWELLYS F. BARKER, HOWARD A. KELLY, HENRY M. HURD, T. R. BROWN, H. A. LAFLEUR, JOHN T. FINNEY, W. S. THAYER and CHARLES P. EMERSON; the Oxford period (1905-1919), by HUMPHREY ROLLESTON, E. SHARPEY SCHÄFER, WILLIAM HALE-WHITE, WILLIAM COLLIER, F. PARKES WEBER, CHARLES SINGER, ARCHIBALD MALLOCK, A. G. GIBSON, WILBURT D. DAVISON, WILDER PENFIELD, R. TAIT McKENZIE, EDWARD CLARK STREETER, WALTER M. BIERRING, HENRY R. VIETS, G. W. NORRIS, EDGAR LOVINGTON GILCREET, C. A. P. HOWARD, J. GEORGE ADAMI and FRANCIS A. WINTER. There are a number of short reminiscent articles by students of the Montreal, Philadelphia and Baltimore periods. The Foreword is by WILLIAM H. WELSH, the Preface by CLIFFORD ALLBUTT, the Editorial Preface by MAUDE E. ABBOTT. There are general articles (Editorials) by A. S. WARTHIN, ARTHUR KEITH, OSCAR KLOTZ, PIERRE MARIE, E. LIBMAN, L. J. RHEA, C. N. B. CAMAC, J. LUDWIG ASCHOFF, JAMES F. COUPAL, ETTORE MARCHIAFAVA, FRANCIS R. PACKARD, KARL SUDHOFF, FIELDING H. GARRISON, GERMAN SIMS WOODHEAD, THOMAS McCRAE, C. F. MARTIN, RUFUS COLE, GEORGE M. KOBER, JOSEPH H. PRATT, J. GEORGE ADAMI, HENRY W. COTTELL, HENRY BARTON JACOBS, LEONARD M. MACKALL, and W. W. CHIPMAN. The early years (1849-1869) are covered by NORMAN B. GWYN and J. L. TODD. The volume also contains a complete bibliography of Osler's writings, the titles covering 133 pages, and a bibliography of writings about him.—*D. J. Healy.*

12179. **A[DIKIN], R. W. H. Miles [1863-1930.]** *Entomologist [London]* 63(810): 264. 1930.—English entomologist whose work was largely done in India, especially on the pests of tea.

12180. **ALFONSUS, ERWIN C.** The life of Anton Jansha. *Amer. Bee Jour.* 71(11): 508-509. Portrait. 1931.—Historical and biographical sketch of this apiculturist and keen student of bees (1734-1773).

12181. **ALVERDES, FRIEDRICH.** Das Lebenswerk Lamarcks. Gedächtnisrede anlässlich der 100. Wiederkehr seines Todestages am 18. Dezember 1929. [Lamarck's life work.] *Sitzungsber. Ges. Beförder. Gesamt. Naturwiss. Marburg* 64(6): 137-141. 1929(1930).

12182. **B. Geheimer, Forstrat Professor i.R. Dr. Phil. Dr. h. c. der Bodenkunde Heinrich Vater.** *Deutsche Forstztg.* 45(9): 218-219. Portrait. 1930.—Vater (1859-

1930) was prof. of soil science at Tharandt Forest Acad. after 1885.—*W. N. Sparhawk.*

12183. **B., W. Baron Shibasaburo Kitasato [1852-1931].** *Nature [London]* 128(3221): 142-143. 1931.—This Japanese bacteriologist in 1889 first demonstrated the bacillus of tetanus; with Emil Behring he produced tetanus antitoxin and laid the basis for serumtherapy. In 1894 he discovered and worked out the chief features of the bacillus of plague. He was director of the Imperial Japanese Inst. for Infectious Diseases, 1899-1914.

12184. **BAKER, E. G. Charles Edgar Salmon (1872-1930).** *Proc. Linnean Soc. London No.* 142. 218-221. 1929/30(1931).—An English botanist, known especially for his work on *Limonium* and *Alchemilla* and for his "Flora of Surrey."

12185. **BANKS, NATHAN. J. H. Emerton [1847-1930].** *Canadian Ent.* 63(1): 23-24. 1931.—Massachusetts artist, arachnidologist, describer of 350 sp. of spiders.

12186. **BARCLAY, A. James Fairlie Gemmill.** *Glasgow Nat.* 9: 58-59. 1919/1930(1931).—Scotch marine biologist, late prof. of zoology in Dundee.

12187. **BENEKE, RUDOLF. Vom Einfluss Hallischer Kliniker auf die Entwicklung der deutschen Balneologie.** *Leopoldina* 5: 110-123. 1929.—Since Paracelsus wrote the first booklet on bathing resorts (Badebuchlein) in the 16th Century, balneology has been built upon chemistry. Friedrich Hoffmann, who, in 1694, founded the medical division of the Univ. of Halle, and who was its director for nearly 50 yrs., was the first great balneologist, using the merely empirical ideas of Sydenham and Boyle. He discovered and made practical application of a number of springs, e.g., Karlsbad. At the same time, he was the founder of German climatology and demonstrated the relation between climate and health. These discoveries have hardly been quoted for 200 yrs., but they represent basic truths even today. 100 yrs. after Hoffmann, Johann Christian Reil, another famous clinician in Halle, introduced the saline and steam baths, which he investigated in a special institution at the salt springs of Halle.—*R. Beneke (transl. by A. Plaut).*

12188. **BILLARD, ARMAND. Courte notice sur les travaux de M. Bedot. [-1927]** *Bull. Soc. Zool. France* 53: 36-37. 1928.—This late director of the Museum d'Hist. Nat. of Geneva wrote important works on Coelenterata.

12189. **BOERI, G. [et al.] Giambattista Morgagni (1682-1771).** *Morgagni* 73(26): 1217-1269. 2 portraits, 3 fig. 1931.—This issue is devoted entirely to articles on Morgagni and the various phases of his work.

12190. **[BORISIAK, A. A.]** БОРИСЯК, А. А. Вильгельм Бранка. 1844-1928. [Wilhelm Branca.] Известия Академии Наук СССР., Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS., Cl. Sci. Phys.-Math.*) 1928(3): 203-204. 1928.—German paleontologist.

12191. **[BORISIAK, A. A.]** БОРИСЯК, А. А. Отто Иекель. 1863-1929. Некролог. [Otto Jaekel, Obituary.] Известия Академии Наук СССР. Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS. Cl. Sci. Phys.-Math.*) 1929(9): 771-775. 1929.—Biography of this distinguished German paleontologist, with a list of his (100) publications.

12192. **BOURDELLE, E. Le professeur E. L. Trouessart (1842-1927).** *Bull. Soc. Zool. France* 53: 67-69. 1928.—Trouessart practised medicine for many yrs., and in 1906 took charge of the mammal and bird departments of the Muséum d'Hist. Nat. in Paris. He was known especially for his Catalogus Mammalium, the 1st edition of which appeared in 1885. He was a former president of the Soc. Zool. de France.

12193. **BOWMAN, A. Thomas Scott, LL.D. (1840-1929).** *Proc. Linnean Soc. London No.* 142. 221-223. 1929/30(1931).—A Scotch biologist and member of the Fishery Board for Scotland, known especially for his extensive publications on Crustacea.

12194. **BRIQUET, JOHN. Auguste Guinet, 1846-1928.** *Candollea* 3: 481-489. 1926/1929.—Appreciation of this Swiss bryologist, in charge of the cryptogamic collections of the Delessert Herbarium 1908-1925, with a list of 45 publications.

12195. **BRÜNE. C. A. Weber [1856-1931].** *Mitteil. Ver. Förd. Moorkult. Deutsch. Reiches* 49(10): 187-190. 1931.—Biography and appreciation of this botanist of the Moor Exp. Sta. in Bremen.

12196. **BULTINGAIRE, L. Les peintres du Muséum à l'époque de Lamarck.** *Arch. Mus. Hist. Nat. [Paris]* 6: 49-58. 1 col. pl. 1930.—An account of such painters of animals and plants as Van Spaendonck, Marechal, Redouté frères, Gérardin, de Wailly, Nicolas Huet, Werner, and Oudinot, and of Lamarck's connection with some of them.

12197. **BURKILL, I. H. Sir George Watt (1851-1930).** *Proc. Linnean Soc. London No.* 142. 226-229. 1929/30(1931).—This Scotch botanist and economist, with a long experience in India, was known especially for his work on the flora and economic products of that country.

12198. **CALVERT, PHILIP P. Dr. Friedrich Ris [1867-1931].** *Ent. News* 42(7): 181-191. Portrait. 1931.—Swiss physician and student of Odonata and Lepidoptera, whose great work was a monograph of the "Libellulinen."

12199. **CÉPÈDE, CASIMIR. La vie et l'oeuvre d'Emile Sauvage [1842-1917].** *Bull. Soc. Acad. l'Arrond. Boulogne-sur-Mer.* 11: 209-295. Portrait. 1922/1928(1929).—Biography and appreciation of this French zoologist, paleontologist, and anthropologist, with an extensive annotated list of his many publications.

12200. **CHAINE, J. Éloge de J.-F. Laterrade [1784-1858].** *Actes Soc. Linnéenne Bordeaux* 80: 77-93. 2 pl. 1928.—Founder of the Soc. Linnéenne de Bordeaux, director of the local Jardin des Plantes, and author of "Flore bordelaise" and other botanical works.

12201. **CHINA, W. E. Dr. Frederick Muir.** *Entomologist [London]* 64(818): 166-168. 1931.—F. Arthur Godfrey Muir [1872-1931] was entomologist of the Hawaiian Sugar Planters' Assoc. and specialist on the Fulgoroidea.

12202. **COOKE, C. MONTAGUE. Joseph Swift Emerson. [1843-1930].** *Nautilus* 44(3): 94-95. 1931.—Hawaiian conchologist.

12203. **CRUM, ETHEL K. Biographical notice of Ida May Blochman [1854-1931].** *Madroño, Jour. California Bot. Soc.* 2(3): 30-31. 1931.—An amateur California botanist.

12204. **COSTANTIN, J. Les derniers jours de Lamarck. Sa mort. Sa philosophie morale. [The last days of Lamarck, his death, his moral philosophy.]** *Arch. Mus. Hist. Nat. [Paris]* 6: 5-10. 1930.

12205. **CURTIS, C. H. Charles Edward Pearson, V.M.H., F.L.S., F.R.H.S. (1856-1929).** *Proc. Linnean Soc. London No.* 142. 214-215. 1929/30(1931).—This English ornithologist and horticulturist was founder and editor of the "Horticultural Trades Journal."

12206. **D., A. A. Obituary. Edward John Haynes Thomas.** *Northwestern Nat. [Scotland]* 5(3): 187-189. 1930.—British physician and amateur field naturalist.

12207. **D., C. D. Dr. Karl Bělař [1895-1931].** *Nature [London]* 128(3219): 59. 1931.—Cytologist of the Kaiser Wilhelm Inst. für Biologie, Berlin.

12208. **DAHL, CARL G. E. H. Wilson: 1877-1930.** *Lustgården* 11; 149-151. 1 fig. 1930.—Obituary notice and brief biographical sketch of this American botanist of the Arnold Arboretum, whose chief work was on the cherries, conifers, and Taxaceae of Japan.

12209. **DALLA VOLTA, AMEDEO. Umberto Parodi—necrologia.** *Boll. Soc. Ital. Biol. Sper.* 3(4): 506-508. 1928.—Parodi (1879-1928) was an anatomical pathologist of Italy and prof. at the Univ. of Catania. He first (1907) demonstrated the transmission of syphilis to the testicle of a rabbit, and was the first in Italy to demonstrate the production of tar carcinoma.—*A. Dalla Volta (transl. by J. G. Edwards).*

12210. **DAWSON. Henry Hill Hickman.** *Proc. Roy. Soc. Med.* 23(8): 1127-1130. 1 fig. 1930.—This address commemorates the centenary of the death, at the age of 29, of a Shropshire practitioner who made practical experiments in anesthesia 18-20 yrs. before its clinical

employment by Long and Wells. Hickman rendered animals unconscious first through partial asphyxiation by the exclusion of air, then by inhalation of CO_2 and N_2O, and performed various surgical operations on the animals during anesthesia. Hoping to extend the benefit of his findings to man, he published in 1824 a pamphlet on this subject, "A letter on suspended animation," which was ignored by both the English and French medical professions.

12211. **DOMIN, KAREL. Václav Vraný [1851-1929].** *Veda Prirodní [Prague]* 11(4): 97-98. Portrait. 1930. —Well-known Czechoslovakian botanist.

12212. **DRUCE, F. Charles C. Coltman-Rogers (1854-1929).** *Proc. Linnean Soc. London No.* 142. 195-196. 1929/30(1931).—Welsh student of forestry, author of "Characteristics of conifers."

12213. **D[UPOND], C. [Laurent Coopman, 1875-1930.]** *Le Gerfaut [Brussels]* 20(2): 81-85. Portrait. 1930.—Belgian ornithologist.

12214. **E., F. W. Fred. V. Theobald [1868-1930].** *Entomologist [London]* 63(803): 95-96. 1930.—British entomologist, author of monographs on the Culicidae of the world and British Aphididae.

12215. **EMILY, J. Le médecin inspecteur général des troupes coloniales, Paul Gouzien [1862-1926?].** *Acad. Sci. Coloniales Compt. Rend. Séanc. Communic.* 8: 565-573. Portrait. 1926-27(1928).—Biography of this French student of tropical medicine, with a list of his published works.

12216. **FAGE, LOUIS. Notice sur Édouard Chevreux [1846-1931].** *Ann. Soc. Ent. France* 100(1/2): 107-120. 1931.—This French zoologist was an authority on Amphipoda. His bibliography contains 114 references.

12217. **FINCH, et al. Professor John Henry Comstock [1849-1931].** *Ent. News* 42(6): 153-157. 1931.—Biographical sketch of this famous teacher of entomology at Cornell Univ.

12218. **FISCHER, ED. Anton de Bary. Zur Erinnerung an seinen hundertsten Geburtstag.** *Naturwiss.* 19(5): 97-102. 1931.—Biography and appreciation of this great German botanist.

12219. **FRANCHINI, F. Vicende postmortali di Marcello Malpighi. [Postmortem vicissitudes of Malpighi.]** *Cultura Stomatol.* 5: 554. 1928.—Dying in Rome in 1694, the Italian anatomist Malpighi left instructions that he be buried in Bologna. Litigation over the site of the tomb prevented permanent sepulture for many yrs. In 1838 his remains were again transferred, in Bologna, to the Chapel of St. Camillo, where they now rest.—*P. Popenoe.*

12220. **FRIEND, HERBERT E. Peter Orlando Hutchinson—antiquarian and botanist.** *Jour. Bot.* 69(821): 137. 1931.—Brief biographical sketch of this Englishman (1810-1897).

12221. **GAGE, A. T. George Henderson (1836-1929).** *Proc. Linnean Soc. London No.* 142. 197-198. 1929/30 (1931).—Member of the Indian Medical Service, interested in natural science and horticulture, and co-author with A. O. Hume of "Lahore to Yarkand" (1873), embodying the scientific results of the Yarkand Mission.

12222. **GAGE, SIMON HENRY. Veranus Alva Moore [1859-1931].—Pierre Augustine Fish [1865-1931].** *Science* 73(1899): 550-553. 1931.—Both were eminent veterinary scientists, great teachers, and administrators. Both served as heads of departments of the New York State Vet. College at Cornell Univ. and later as deans, Fish succeeding Moore.

12223. **GARNETT, HENRY. Richard Buxton. An old-time Manchester botanist [1786-1865].** *Northwestern Naturalist* 6(1): 18-21. Portrait. 1931.—Biographical sketch.

12224. **GEPP, A. Obituary: Frederick Beatson Taylor (1851-1931).** *Jour. Bot.* 69(820): 103-104. 1931.—British botanist who published several papers and a book on diatoms.

12225. **GOLDSTEIN, K. Konstantin von Monakow [1853-1930].** *Deutsche Zeitschr. Nervenheilk.* 120(1/2): 1-7. 1931.—Monakow was particularly known for his work on pathology and function of the brain, the theory of diaschisis, and his biological approach to the problems of neurology and psychiatry.

12226. **GRABAU, AMADEUS W. Memorial of Yatseng T. Chao [1898-1929].** *Bull. Geol. Soc. China* 8(3): 257-261. Portrait. 1929.—This brilliant young paleontologist was on the staff of the Geol. Survey of China. A list of 20 publications is appended.

12227. **GRANT, KERR. T. Brailsford Robertson, D. Sc., Ph. D. [1884-1930].** *Trans. & Proc. Roy. Soc. S. Australia* 54: 192-195. 1930.—This distinguished biochemist and physiologist was born in Edinburgh and educated in So. Australia (Adelaide) and in the Univ. of California. In 1919 he was elected prof. of physiology in the Univ. of Adelaide and in 1927 became chief of the Commonwealth [Australia] dept. of animal nutrition. He was the author of "The principles of biochemistry," "The physical chemistry of the proteins," and many other important works.

12228. **GROCHMALICKI, J. Benedykt de Nałęcz Dybowski (1833-1930).** *Kosmos [Lwów]* 55(1/2): 1-16. 1930.—This distinguished Polish zoölogist, exiled to Siberia 1864-1876, investigated the little-known fauna of that region, and later (1878-1883) continued his work in Kamchatka and the Commander Islands. His collections and publications added greatly to our knowledge of the Siberian fauna (particularly the vertebrates, Crustacea, and mollusks). Lake Baikal was a special object of study. He also carried on medical work among the Siberian natives. From 1883 to 1906 he held the chair of geology at the Univ. of Lwów. A bibliography of 175 titles is appended.

12229. **GROVES, J. Arthur Bennett (1843-1929).** *Proc. Linnean Soc. London No.* 142. 187-189. 1929/30 (1931).—An English amateur botanist, author of nearly 400 papers, owner of a large herbarium, and an authority on *Potamogeton.*

12230. **GRIJNS, G. In memoriam H. Zwaardemaker [1857-1930].** *Arch. Néerland. Phys. Homme et Animaux, Ser. 3C.* 16(1): 1-5. 1931.—Eminent Dutch physiologist, best known for his studies on the physiology of vision, sound production, and audition.

12231. **H[ILL], A. V. Dr. Enrico Sereni [?-1931].** *Nature [London]* 127(3206): 562-563. 1931.—Italian physiologist, in charge of the section of physiology at the Zool. Station of Naples.

12232. **H[ILL], A. W. Dr. Rudolf Marloth [-1931].** *Nature [London]* 127(3216): 945. 1931.—Botanist of So. Africa.

12233. **H[ILL], A. W. Major T. F. Chipp [1886-1931].** *Nature [London]* 128(3221): 141-142. 1931.—Assistant director of Royal Bot. Gardens at Kew, botanical explorer, and writer.

12234. **HAAS, F. Arturo Bofill y Poch.** *Arch. Molluskenk.* 63(2): 83-85. 1931.—Catalonian malacologist (1846-1929).

12236. **HANNA, G. D., and C. C. CHURCH. David Dwight Baldwin, 1831-1912.** *Proc. California Acad. Sci.* 19(13): 431-436. 1931.—Conchologist, noted chiefly for his collections from the Hawaiian Islands.

12237. **HARMER, SIDNEY F. Sir Edwin Ray Lankester [1847-1929].** *Proc. Linnean Soc. London No.* 142. 200-211. 1929/30(1931).—After Huxley's death, Lankester was the leader of British zoologists. He had held professorships at University College, London (1874-1890), and at Oxford (1891-1898), and had been President of the British Assoc. for the Adv. of Sci. While director of the British Museum (1898-1907), he did much to improve its exhibits and broaden its policies. For 52 yrs. he was editor of the "Quarterly Jour. of Microsc. Sci."; he was also editor of the 8 volumes of the "Treatise on Zoology." His numerous publications dealt largely with the morphological phases of zoology. Various volumes of essays rendered conspicuous service in explaining the results of scientific research to the general reader. His initiative resulted in the founding of the Marine Biol. Assoc. of the United Kingdom.

He was at his best as a teacher and inspired many students who became well-known zoologists.

12238. **HARTIG, FRED.** Paul Prestin [1851-1929]. *Societas Entomologica* 44(9): 33. 1929.—This noted pomologist and entomologist and corresponding member of many scientific societies specialized in Lepidoptera (*Parnassius*) and in the study of insects injurious to fruit trees.

12239. **HAŠA, R. H. E. Biolley [1858-1931].** *Věstník Československ. Akad. Zem.* 7(8): 844-847. Portrait. 1931.—Biography and bibliography of this Swiss forest inspector, corresponding member of the Czechoslovak Acad. of Agric.

12240. **HASSELWANDER, A.** Dem Andenken Emil Rosenbergs [1842-1925]. *Anat. Anzeiger* 70(5): 81-107. Portrait. 1930.—This German anatomist was one of the first comparative morphologists to employ ontogeny in the study of evolution.

12241. **HÄSSLER, ARNE.** Adolf Engler. En av den systematiska botanikens förgrundsgestalter. [One of the outstanding figures in systematic botany.] *Bot. Notiser* 1930(6): 513-517. Portrait. 1930.

12242. **HASTINGS, E. G.** William Harmon Wright, 1885-1929. *Phytopath.* 21(3): 243-246. Portrait. 1931.—Biographical sketch.

12243. **HECKENROTH.** Dr. G. Reynaud [-1926]. *Acad. Sci. Coloniales Compt. Rend. Séanc. Communic.* 8: 591-596. Portrait. 1926-27(1928).—A brief biography of this French pathologist, honorary Professor in the École de Médicine, Marseille, with a list of his publications (75), mostly on tropical medicine and parasitology.

12244. **HEINRICH, R.** Jaques L. Reverdin [1842-1929]. *Internat. Ent. Zeitschr.* 23(2): 13-18. Portrait. 1929.—This German scientist, prof. of surgery and famous for his various discoveries in medicine, became infected through an operation, which affected his hearing. In 1910 he retired from the medical profession and devoted himself from then on to natural sciences, particularly the study of Lepidoptera. A list of his 50 publications on entomological subjects concludes the paper.

12245. **HERRMANN, GEORGE.** Aldred Scott Warthin, 1866-1931. An appreciation. *Amer. Jour. Syphilis* 15(3): 289-294. 1 pl. 1931.—The pathology of syphilis and of dinitrophenol and dichlorethylsulphide (mustard gas) poisoning, traumatic lipemia, and the anemias and leukemias were among the subjects to which Warthin made important contributions.

12246. **HESSE, P.** Maximilian Braun. *Arch. Molluskenk.* 63(2): 82. 1931.—Malacological contributions of this German helminthologist.

12247. **HEWITT, J. A.** Prof. W. D. Halliburton, F.R.S. [1861?-1931]. *Nature* [*London*] 127(3216): 932, 945. 1931.—Eminent English physiologist and biochemist, prof. of physiology at King's College 1889-1923.

12248. **HILL, LEONARD.** Group-Capt. Martin Flack, C.B.E. [1882?-1931]. *Nature* [*London*] 128(3227): 402-403. 1931.—Brief biography of this British physiologist, known chiefly for his work on respiration.

12249. **HULT, OLOF.** P. J. Bergius och medicinen i Sverige. [Peter Jonas Bergius (1730-1790) and medicine in Sweden.] [English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 1-11. 1 pl., 2 fig. 1931.—An address on the achievements of this pupil of Linnaeus, who did much for the introduction of vaccination in Sweden. He was also prof. of nat. hist. at Stockholm.

12250. **I., A. D.** Dr. Frederick Muir [1872-1931]. *Nature* [*London*] 127(3215): 900. 1931.—Natural history explorer of the Malay Archipelago, pioneer in biological control of insects, authority on the Fulgoroidea and the genitalia of Coleoptera.

12251. **IBIS.** Obituary. *Ibis* 4(2): 323-333. 1928.—James Edmund Harting, George Muirhead, Gerald William Lascelles, Angus Peter Airlie Hamilton Kinloch, Otto von Zedlitz, Leverett Mills Loomis, Robert John Howard, Robert Miller Christy, Richard Kearton, and Ludovico Söderstrom.—*W. W. Bowen.*

12252. **IBIS.** Obituary. *Ibis* 4(3): 534-542. 1928.—Hans Friedrich Gadow; William Chaster Tait; Linnæus Greening; Robert William Chase; Charles George Danford; Launcelot Harrison; Albert Hess; A. Szielasko; Bradshaw Hall Swales; Harry Balch Bailey.

12253. **IBIS.** Obituary. *Ibis* 6(2): 320-325. 1930.—Emilie Snethlage; Hermann von Ihering; and Hamlet Dalton Wade-Dalton.

12254. **IBIS.** Obituary. *Ibis* 6(4): 679-682. 1930.—Frédéric Courtois and Axel Christiani.

12255. **ISSEL, RAFFAELE.** Luigi Cognetti de Martiis [1878-1931]. *Boll. Zool.* [*Napoli*] 2(2): 79-81. Portrait. 1931.—Italian zoologist, histologist, and histophysiologist.

12256. **JACKSON, A. BRUCE.** Augustine Henry (1857-1930). *Proc. Linnean Soc. London No.* 142. 198-200. 1929/30(1931).—This Irish botanist and forester was a leading authority on the trees of the temperate regions. In early life, while a medical officer in China, he collected many new genera and hundreds of new sp. of plants. He was co-author with Elwes of "The trees of Great Britain and Ireland," and in late yrs. was prof. of forestry in the College of Science at Dublin.

12257. **JEPSON, WILLIS LINN.** The botanical explorers of California.—VII. *Madroño, Jour. California Bot. Soc.* 2(3): 25-29. 3 portraits. 1931.—Brief biographical sketches of 4 early amateur botanists in California: Joseph Cook Nevin (1835-1913), William Hillman Shockley (1855-1925), Charles Austin Stivers, and Lucia A. Summers (1839?-1898), with portraits of the first 3.

12258. **JOHNSON, C. W.** James Henry Emerton [1847-1930]. *Nautilus* 44(3): 97-98. 1931.—Massachusetts conchologist.

12259. **JOHNSON, CHARLES W.** Louis William Swett [1880-1930]. *Psyche* [*Boston*] 37(3): 301. Portrait. 1930.—L. W. Swett was interested in Lepidoptera, mainly Geometridae, of which he has described many new sp.

12260. **JOHNSTONE, R. B.** Daniel Alexander Boyd [1855-1929?]. *Glasgow Nat.* 9: 60-62. 1919/1930(1931).—Scotch naturalist and mycologist, especially known for his work on the fungi of Ayrshire.

12261. **JONES, LEWIS RALPH.** William Allen Orton, 1877-1930. *Phytopath.* 21(1): 1-11. Portrait. 1931.

12262. **JOUBIN, L.** Iconographie de Lamarck. *Arch. Mus. Hist. Nat.* [*Paris*] 6: 1-3. 3 portraits, 6 pl. 1930.—A discussion and reproduction of various portraits of Lamarck.

12263. **K[ENNARD], A. S.** Obituary. Bernard Barham Woodward, 1853-1930. *Proc. Malac. Soc. London* 19(4): 165-166. 1931.—English malacologist.

12264. **KENNEDY, CLARENCE HAMILTON.** Professor James Stewart Hine [1866-1930]. *Ent. News* 42(6): 177-180. 1931.—This well-known entomologist and ornithologist was director of the division of Nat. Hist. of Ohio State Archaeol. and Hist. Mus.

12265. **KINNMAN, GUNNO.** Johan Anders Amilon. *Skogsvårdsför. Tidskr.* 28(4): 453-459. Portrait. 1930.—Account of life and work of this late instructor in silviculture at the Swedish Forest School.—*H. I. Baldwin.*

12266. **KL., ED.** Adolf Fritze [1860-1927]. *Jahresber. Naturhist. Ges. Hannover* 1924/25-1928/29. No. 75. viii. 1930.—German zoologist, former director of the natural history department of the Hanover Museum.

12267. **KLEINE, H. O.** Semmelweis und Virchow. Eine medizinhistorische Studie. *Arch. Gynaekol.* 142(2): 324-328. 1930.—Virchow used his great authority to hinder the acceptance of Semmelweis' theory of the contagiousness of puerperal fever. Not until the yr. preceding Semmelweis' death did he admit the possibility of infection as one cause (he still refused to recognize it as the sole cause) of puerperal fever; and it is doubtful if this tardy and inadequate recantation ever came to the knowledge of Semmelweis.

12268. **KLUYVER, A. J.** In memoriam. Prof. Dr. M. W. Beijerinck. *Nederlandsch. Tijdschr. Hygiëne Microbiol. en Serol.* 5(4): 173-181. Portrait. 1931.

12269. **LAMY, ED.** Un conchyliologiste français du XVIII^e siècle: L'Abbé de Crillon. [An 18th century

French conchologist.] *Jour. Conchyliol.* 74(2): 166-167. 1930.

12270. **KRAUS, F. Ferdinand Blumenthal.** *Zeitschr. Krebsforsch.* 32(1/2): 1-4. 1930.—This article dedicated to the editor on the occasion of his 60th birthday is a brief account of his activities principally as director of the cancer division of the Berlin Charity-Inst.—*H. E. Eggers.*

12271. **KŘIŽENECKÝ, JAROSLAV.** Professor L. J. Cole [1877-1931]. *Věstník Československ. Akad. Zem.* 7(8): 841-844. Portrait. 1931.—Biography and bibliography of this American geneticist, corresponding member of the Czechoslovak Acad. of Agric.

12272. **KÜTTNER, HERMANN.** Gedenkworte an Johannes von Mikulicz anlässlich der 25. Wiederkehr seines Todestages, gesprochen in der Schlesischen Gesellschaft für Vaterländische Cultur. [Address in memory of J. von Mikulicz [1850-1905], delivered on the 25th anniversary of his death.] *Bruns' Beitr. Klin. Chir.* 150(1): 1-6. 1930.—The value of his scientific work in the fields of asepsis, Basedow's and Mikulicz's disease, gastric ulcer, cancer, etc. is emphasized.

12273. **LASSILA, VÄINÖ.** Gustaf Hjalmar Grönroos [1863-1929]. *Anat. Anzeiger* 70(13/17): 345-348. Portrait. 1930.—The most important work of Grönroos dealt with the developmental history of the tritons and the spotted salamander (*Salamandra maculosa*), and with comparative anatomy, e.g., the upper-arm musculature of anthropoid apes and man.

12274. **L[AUBMANN], A.** Robert Ridgway [1850-1929]. *Verhandl. Ornith. Ges. Bayern* 19(1): 211. 1930.—Distinguished American ornithologist.

12275. **L[AUBMANN], A. E. Lehn Schiöler** [?-1929]. *Verhandl. Ornith. Ges. Bayern* 19(1): 211. 1930.—Danish ornithologist.

12276. **LAUBMANN, A.** Dr. Josef Gengler [1863-1931]. *Verhandl. Ornith. Ges. Bayern* 19(2/3): 380-383. 1931.—Well-known Bavarian physician and ornithologist, author of important papers on the birds of Bavaria and the Balkans.

12277. **LECOMTE, H., and J. LEANDRI.** L'oeuvre botanique de Lamarck. *Arch. Mus. Hist. Nat.* [*Paris*] 6: 31-44. 2 pl. 1930.—An account of the "Flore française," the botanical part of the "Encyclopédie methodique," the "Illustration des genres," and Lamarck's herbarium.

12278. **LENZ, FRITZ.** Alfred Ploetz. *Arch. Rass.- u. Ges.-Biol.* 24: vii-xv. 1930.—Life of the German eugenist, introducing a "Festschrift" volume of the Archiv on his 70th birthday.

12279. **LEROUX, DÉSIRÉ. A.-Th. Schloesing (1856-1930), sa vie et son oeuvre.** *Ann. Agron.* [*Paris*] 1(1): 3-10. Portrait. 1931.—Life and work of this European investigator in plant physiology and chemistry, general physiology, agricultural bacteriology, and soil science, with 4-page bibliography.

12280. **LEVI, G. Alexander Maximow.** *Arch. di Sci. Biol.* 13(1/2): 260-261. 1929.—Obituary note.

12281. **LIEB, H. Fritz Pregl (1869-1930).** *Ber. Deutsch. Chem. Ges.* 64(6): 113-118. 1 pl. 1931.—Obituary and brief biography of this German scientist, noted for his work in the field of medical chemistry.

12282. **LINCOLN, FREDERICK C. In memoriam—Edwin Carter.** *Condor* 31(5): 196-200. 2 fig. 1929.

12283. **LINDQUIST, BERTIL. August Stensson [1853-1929].** *Bot. Notiser* 1930(3/4): 314-315. Portrait. 1930.—An amateur botanist of note, especially occupied with the Kullaberg region of southern Sweden.

12284. **LOCATELLI, PIERA. Aldo Perroncito.** *Arch. di Sci. Biol.* 13(3/4): 502-508. 1929.—Obituary.

12285. **L[UCAS], A. H. S. Joseph Henry Maiden, 1859-1925.** *Proc. Linnean Soc. N. S. Wales* 55(4): 355-370. Portrait. 1930.—Director of the Sydney Botanic Gardens, government botanist, and creator of the National Herbarium of N. S. Wales was author of numerous important works on Australian botany, including a monograph of *Eucalyptus* and "Forest flora of New South Wales." A list of about 180 papers is appended.

12286. **LUCAS, A. H. S. Joseph James Fletcher, an idealist secretary [1850-1926].** *Proc. Linnean Soc. N. S. Wales* 55(5): 738-750. 1930.—This biography and appreciation of the distinguished Australian zoologist, written by a close personal friend, deals particularly with his personality and scientific accomplishments and presents numerous anecdotes and excerpts from his writings.

12287. **LUCAS, W. J. G. Trevor Lyle, 1873-1930.** *Entomologist* [*London*] 63(809): 239-240. 1930.—British zoologist and entomologist, specialist on British Braconidae.

12288. **LUTZ, JOHN C. Ernest Baylis [1877-1930].** *Ent. News* 41(9): 285-286. Portrait. 1930.—An amateur coleopterist.

12289. **M., A. H[endrik] A[driaan] Vermeulen.** *Ned.-Indische Blad Diergeneesk.* 43(1): 1-5. Portrait. 1931.—Brief biographical sketch on the occasion of the celebration of the completion of 25 yrs. as prof. of anatomy at the Rijks-Veeartsenijschool, Utrecht.

12290. **M., H. Wilhelm Wehrhahn [1857-1926].** *Jahresber. Naturhist. Ges. Hannover* 1924/25-1928/29 No. 75. v-vii. 1930.—German bryologist.

12291. **MAINS, E. B. Calvin Henry Kauffman [1869-1931].** *Science* 74(1914): 335. 1931.—Brief sketch of the life and work of this American teacher and student of fungi, algae, mosses, ferns, and forest pathology.

12292. **MALMESTRÖM, ELIS. Linnés Självbiografier.** [English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 17-30. 1 pl., 1 fig. 1931.—A special study was made of the autobiographies of Linnaeus with a view to preparing a critical edition. This paper includes a list of the various editions in the Univ. Library at Upsala, the British Museum, and the Linnean Society, with notes and some facsimiles.

12293. **MARKUS, R. Prof. Dr. rer. for. h. c. E. Ostvalds.** [In Latvian.] *Mežsaimniecības rakstu krājums* [*Riga*] 8: 5-13. Portrait. 1930.—An account of the career of the distinguished Latvian forester.

12294. **MARTINOTTI, GIOVANNI. Il Malpighi nello studio di Bologna.** [Malpighi's work in Bologna.] *Rass. Il Comune Bologna* 14: 1-16. 5 illus. 1928.—An account is given of the hostility which the Italian anatomist had to endure from his fellow-townsmen during most of his life.—*P. Popenoe.*

12295. **MEYER, ADOLPH. Constantin von Monakow (1853-1930).** *Arch. Neurol. & Psych.* 25(2): 389-390. 1931.—Von Monakow was neurobiologist rather than neurophysiologist. To the neurologic laboratories of Huguenin, Forel, and Honegger, von Monakow added another personal center of work, devoted extensively to the study of secondary degeneration of human cerebral lesions, with particular attention to the cortex-dependent parts, in vigorous competition with Flechsig's myelinization methods and Hösel's claims. The study of the thalamus, then the study of the red nucleus and the development of the publication of the "Arbeiten" of his laboratory laid the foundations for the "Schweizer Archiv für Neurologie und Psychiatrie."

12296. **MOHR, OTTO L. Christian Wriedt.** *Der Züchter* 1(9): 278-279. 1 fig. 1929.—Obituary.

12297. **MÖLLER, HJ. Sigfrid Olof Medelius [1878-1930].** *Bot. Notiser* 1930(6): 510-512. Portrait. 1930.—A survey of the life and work of this Swedish bryologist.

12298. **N., E. G. William Narramore (1850-1930).** *Proc. Linnean Soc. London* No. 142. 213-214. 1929/30 (1931).—This English biologist was president of several scientific societies in Liverpool.

12299. **N., F. J. Mr. David Davies [1870 ?-1931].** *Nature* [*London*] 128(3227): 403. 1931.—Welsh paleobotanist, known especially for his contributions on the coal-measure fossils of Glamorgan.

12300. **N., M. Sir Ronald Ross.** *Jour. Trop. Med. & Hyg.* 33(23): 365-367. Portrait. 1930.—Brief account of Ross' discovery of malarial parasites in anopheline mosquitoes.

12301. **NEEDHAM, JAMES G. John Henry Comstock.** *Science* 73(1894): 409-410. 1931.—An appreciation of this

distinguished entomologist (1849-1931), long associated with Cornell Univ.

12302. [NEKRASOV, A. D.] НЕКРАСОВ, А. Д. Проф. Н. В. Богоявленский. [Prof. N. V. Bogoĭavlenskiĭ, 1870-1930.] Записки Биологической Станции Общества Любителей Естествознания, Антропологии и Этнографии в Болшеве Московской губернии (*Bull. Sta. Biol. Soc. Amis Sci. Nat., Anthrop. et Ethnogr. à Bolchevo, Gouv. Moscou*) 4: 7-17. Portrait. 1930.—Prof. Bogoĭavlenskiĭ occupied for many yrs. the chair of histology and embryology in the Univ. of Moscow. He was the founder of the Bolshevo Biol. Sta. He was primarily interested in asexual reproduction. His general interests were in protistology, evolution, embryology, and ecology.

12303. NICOL, J. W. Robert Grierson. *Glasgow Nat.* 9: 62-63. 1919/1930 (1931).—An amateur botanist, who died in 1930, known especially for his work on the alien flora of the Clyde area.

12304. NIEZABITOWSKI, LUBIEZ. Prof. Dr. Józef Rostafiński [? -1928]. *Roczniki Nauk i Leśnych* (*Polish Agric. & Forest Ann.*) 20(1): 116-119. Portrait. 1928.—Polish botanist.

12305. OLIVER, F. W. The Hooker Memorial at Halesworth. *Sci. Monthly* 32(5): 470-473. 2 portraits, 2 fig. 1931.—Reference is made to the life and work of Sir William Jackson Hooker (1785-1865) and his son, Sir Joseph Dalton Hooker (1817-1911), distinguished British botanists.

12306. OSBORN, T. G. B. Walter Gill [1852?-1929]. *Proc. Linnean Soc. London* No. 142. 196-197. 1929/30 (1931).—Botanist and former Conservator of Forests in So. Australia.

12307. P., F. B. Prof. W. E. Dixon, O. B. E., F. R. S. [1871-1931]. *Nature* [*London*] 128(3227): 401-402. 1931.—British pharmacologist.

12308. P., G. F. Dr. A. T. MacConkey [1861-1931]. *Nature* [*London*] 127(3217): 980-981. 1931.—This English bacteriologist, originator of the MacConkey bile-salt medium for culturing bacilli, did much work on serums and antitoxins.

12309. PADDOCK, WENDELL. Frederick Grover Charles. *Proc. Amèr. Soc. Hort. Sci.* 27: 575. Portrait. 1930 (1931).—Obituary notice of this American horticulturist (1885-1930).

12310. PANZER, WERNER. Emilie Snethlage [1860?-1929]. *Verhandl. Ornith. Ges. Bayern* 19(1): 212-214. 1930.—Distinguished German ornithologist, former director of the Museu Goeldi at Pará, known especially for her extensive investigations of the birds of Brazil.

12311. PARKER, R. L. Ferdinand F. Crevecoeur [1862-1931]. *Ent. News* 42(7): 212. 1931.—Amateur entomologist and naturalist of Kansas.

12312. PAULSEN, OVE. C. H. Ostenfeld, 1873-1931. *Bot. Tidsskr.* [*Copenhagen*] 41(4): 269-282. Portrait. 1931.—Appreciative account of the life and work of Denmark's leading botanist, author of about 200 papers, of which brief review (in 5 groups) is given.

12313. PATERSON, JOHN. Richard M'Kay [1840?-1920 ?]. *Glasgow Nat.* 9: 53-54. 1919/1930 (1931).—Scotch botanist, author of several lists of plants of the Clyde area.

12314. PAUTRIER, L.-M. L'oeuvre de Raimond Sabouraud. *Česká Dermatol.* 11(1): 5-25. 1930.—Sabouraud, the great French dermatologist, is an authority on tineas. He separated the trichophyta (large-spored fungi) from the microspora, and discovered 19 sp. of the former before 1893.

12315. PEARSON, KARL. The life, letters and labours of Francis Galton. Vol. 3. (In 2 parts.) 673p. 59 pl. Cambridge Univ. Press: Cambridge, 1930. Pr. 69s.

12316. PENSA, A. Luigi Sala [1863-1930]. *Monitore Zool. Italiano* 41(7): 184-194. Portrait. 1930.—Prof. of human anatomy at the Univ. of Pavia, Sala was a follower of Golgi. He wrote important works on the microscopic anatomy of the nervous system, and on embryology and cytology.

12317. PERCIVAL, JOHN. Martin Hubert Foquett Sutton [1875-1929?]. *Proc. Linnean Soc. London* No. 142. 223-224. 1929/30 (1931).—English horticulturist.

12318. PETERSON, O. A. Earl Douglass. *Science* 73 (1897): 486-487. 1931.—Obituary notice and brief life sketch of this paleontologist (1862-1931).

12319. PFEIFER, R. A. Paul Flechsig. Sein Leben und sein Werken [1847-1929]. *Schweizer Arch. Neurol. u. Psych.* 26(2): 258-264. 1930.—Flechsig's greatest contribution to science was his theory of the process of development of the central nervous system.

12320. POLE EVANS, I. B. Alice Marguerite Pegler (1861-1929). *Proc. Linnean Soc. London* No. 142. 215-216. 1929/30 (1931).—South African botanist.

12321. [POULTON], E. B., and N. D. R[ILEY]. Prof. Edwin G. R. Waters [1890-1930]. *Entomologist* [*London*] 63(806): 167-168. 1930.—This prof. of romance languages at Oxford was a student of Microlepidoptera, on which he contributed some 40 papers and notes.

12322. PRIESTLEY, J. H. Harold W. T. Wager (1862-1930). *Proc. Linnean Soc. London* No. 142. 224-226. 1929/30 (1931).—British botanist.

12323. PÜTTER, E. Ferdinand Blumenthal, ärztlicher Leiter der Fürsorgestellen für Krebskranke und -verdächtige in Berlin. [Ferdinand Blumenthal, Medical Director of the Berlin Cancer Dispensary]. *Zeitschr. Krebsforsch.* 32(1/2): 5-9. 1930.

12324. PUTZU, FRANCESCO. Roberto Binaghi (1866-1931). *Arch. Ital. Chir.* 28(6): 661-664. Portrait. 1931.—Binaghi, a brilliant surgeon, published on opsonic index of malignant tumors, the bactericidal action of pus, the protective action of the peritoneum in infections of intestinal origin, etc.

12325. R., J. Mr. J. G. Millais [1865-1931]. *Nature* [*London*] 127(3206): 563. 1931.—A distinguished zoologist and artist, author of standard works on British ducks and mammals.

12327. R., R. Lieut.-Col. Sir Charles Bedford [1866-1931]. *Nature* [*London*] 128(3222): 178-179. 1931.—Scotch physician, for yrs. in the Indian Medical Service, author of works on the composition and physiological effects of alcoholic liquors, and books on poisoning, enteric fever, and elementary hygiene in India.

12328. RAMSBOTTOM, J. David Paul (1845-1929). *Proc. Linnean Soc. London* No. 142. 214. 1929/30 (1931).—Scotch clergyman and mycologist, president of several botanical and mycological societies.

12329. RAYLEIGH, R. J. S. Lord Balfour in relation to science. viii+46p. Illus. Univ. Press: Cambridge, [1931]. Pr. $1.00.

12330. REICHENSPERGER, A. Erich Wasmann S. J.† *Mitteil. Deutsch. Ent. Ges.* 2(4): 50-54. 1931.—A review of his entomological work.

12331. REITH, J. F. Gaspard Adolphe Chatin [1813-1901]. *Pharmaceut. Weekblad* 68(22): 501-513. Portrait. 1931.—Biographical account and bibliography of this French biologist and chemist.

12332. RENDLE, A. B. Richard Hind Cambage, C. B. E. [1859?-1928]. *Proc. Linnean Soc. London* No. 142. 189-190. 1929/30 (1931).—President of the Australian Assoc. Adv. Sci. and a frequent contributor of papers on the flora of New So. Wales.

12333. RENDLE, A. B. Obituary: Richard Vowell Sherring (1847-1931). *Jour. Bot.* 69(820): 104-105. 1931.—Sherring was known for his collections, especially of ferns, in the West Indies and British Guiana.

12334. RENDLE, A. B. Spencer Le Marchant Moore (1851-1931). *Jour. Bot.* 69(821): 134-136. Portrait. 1931.—Well known English systematic botanist.

12335. RENDLE, A. B. Obituary. Dr. Rudolf Marloth. *Jour. Bot.* 69(822): 172-173. 1931.—An appreciation of this well known So. African Botanist.

12336. RENSCH, BERNARD. Johannes Thiele zum 70. Geburtstage. *Arch. Mollusk.* 62(6): 201-209. 1 pl. 1930.—Contains list of malacological papers.

12337. R[ILEY], N. D. Dr. James Waterston [1879-1930]. *Entomologist* [*London*] 63(805): 143-144. 1930.

—Minister, entomologist, authority on British Mallophaga and Chalcidae.

12338. **RITCHIE, JAMES.** Emeritus Professor W. C. M'Intosh, M.D., LL.D., D.Sc., F.R.S., 1839-1931. *Scottish Nat.* 1931 (190) : 97-100. 1931.—This distinguished Scotch zoologist, long at the Univ. of St. Andrews, was known especially for his work on the worms of the "Challenger" and other expeditions and for his investigations of fishery problems.

12339. **ROQUETTE-PINTO, E.** Gloria sem Rumor. [Silent glory.] *Bol. Mus. Nacion.* [*Rio de Janeiro*] 5 (2) : 1-24. Map. 9 pl. 1929.—Johann Friederich Theodor Mueller (Fritz Mueller) whom Darwin called the "Prince of observers," was born in Erfurt, Germany, in 1822, studied biology and mathematics at the Univ. of Berlin, graduated in 1844, and came to Brazil in 1852 with Dr. Blumenau, who founded the first German settlement in southern Brazil. During 1857-1867 he taught mathematics in Desterro; 1876-1891 he was naturalist for the Museu Nacional of Rio de Janeiro; and in 1897 he died. He published 248 monographs and papers on anatomic, physiologic, and ecologic questions, specially invertebrate and floral biology.—*B. Lutz.*

12340. **ROSS, A. John Paterson** [1860-1928?]. *Glasgow Nat.* 9 : 59-60. 1919/1930 (1931).—Scotch naturalist.

12341. **ROSZKOWSKI, WACLAW. Wladyslaw Polinski.** *Arch. Molluskenk.* 63 (2) : 72-80. 1931.—Life and publications of this Polish malacologist (1885-1930).

12342. **S., J. A. Arthur William Mera.** *London Naturalist* 1930 : 37-38. Portrait. 1931.—Brief life sketch of this British lepidopterist, who died in 1930 at the age of 81.

12343. **SCHAUS, WILLIAM, AUGUST BUSCK, and CARL HEINRICH. William Barnes** [1860-1930]. *Proc. Ent. Soc. Washington* 32 (6) : 114. Portrait. 1930.—American surgeon, lepidopterist, and public benefactor.

12344. **SCHLESCH, H. Bernard Barham Woodward.** *Arch. Molluskenk.* 63 (2) : 82-83. 1931.—English malacologist (1853-1930).

12345. **SCHLESCH, HANS. Nécrologie. Hermann von Ihering** (1850-1930). *Jour. Conchyliol.* 74 (1) : 81-88. 1930.—Biography and list of malacological papers.

12346. **SCHLESCH, HANS. Nachruf auf Dr. phil. Anders Cornelius Johansen** [1867-1931]. *Folia Zool. et Hydrobiol.* [*Riga*] 3 (1) : 172-173. 1931.—Danish ichthyologist and malacologist.

12347. **SCHUCHERT, CHARLES. James Perrin Smith.** 1864-1931. *Amer. Jour. Sci.* 22 (127) : 95. 1931.—American paleontologist, prof. of paleontology at Stanford Univ. 1892-1930.

12348. **SCHULTZE, FRIEDRICH. Salomon Eberhard Henschen** [1847-1930]. *Deutsche Zeitschr. Nervenheilk.* 120 (3/4) : 111-116. 1931.—Henschen's principal work was on the symptomatology and pathology of the brain and on the physiology of the senses, particularly the cells of light and color sense.

12349. **SEITZ, A. Eduard Study** [1862-1930]. *Ent. Rundschau* 47 (3) : 9. 1930.—Mathematician, biometrician, and prof. at the Univ. of Bonn.

12350. **S[EIT]S, A. Karl Frings** [1873-1931]. *Ent. Rundschau* 48 (16) : 161. 1931.—German entomologist.

12351. **SHEAR, C. L. Franklin Sumner Earle, 1856-1929.** *Phytopath.* 20 (12) : 923-929. Portrait. 1930.

12352. **S[HELDON], W. G. Selwyn Image.** *Entomologist* [*London*] 63 (809) : 238-239. 1930.—British artist, poet, "littérateur," lepidopterist, and naturalist, who died 1930 in his 82nd year.

12353. **[SHELIUZHKO, L. A.]** ШЕЛЮЖКО, Л. А. Памяти Леонида Константиновича Круликовского. (К десятилетию кончины.) **[In memory of Leonid Konstantin Krulikovskii (1864-1920) on the 10th anniversary of his death.]** Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 24 (3/4) : 236-245. Portrait. 1930.—A review of the life and work of this Russian zoologist, with a list of his 122 publications, chiefly on Lepidoptera.

12354. **SIMPSON, W. J. Waldemar Haffkine, C.I.E.** [1860-1930]. *Brit. Med. Jour.* 2 (3644) : 801-802. Portrait. 1930.—Haffkine produced first a cholera and later a plague prophylactic vaccine which are now effectively used wherever there is an outbreak of these diseases.

12355. **S[ÖDERBERG], E. Arvid Lorentz Segerström,** 1865-1930. *Svensk Bot. Tidskr.* 24 (4) : 573-574. Portrait. 1930.—A brief note of appreciation of this Swedish amateur botanist, with a list of his publications.

12356. **SPRAGUE, T. A. William Richard Carles** (1848-1929). *Proc. Linnean Soc. London No.* 142. 190-191. 1929/30 (1931).—A member of the British consular service, who made important collections of Chinese and Korean plants.

12357. **STANDLEY, PAUL C. Ignatius Urban.** *Science* 73 (1888) : 254-255. 1931.—Obituary notice and brief life sketch of this sytematic botanist [1848-1931] whose special field was the flora of Brazil and the West Indies.

12358. **STANDLEY, PAUL C. Erik L. Ekman.** *Science* 73 (1888) : 255-256. 1931.—Obituary notice and brief life sketch of this student of the Antillean flora, who died Jan. 15, 1931, at the age of 46.

12359. **STAPF, OTTO. Obituary: Ignatz Urban** (1848-1931). *Jour. Bot.* 69 (820) : 105-106. 1931.—This famous German botanist was Unter-Direktor of the Berlin Botanic Garden for many yrs. and the author of "Symbolae Antillanae" amongst other publications.

12360. **STELLWAAG, F. Karl Escherich zum sechzigsten Geburtstag.** *Zeitschr. Angewandte Ent.* 18 (3) : 423-439. Portrait, also *Anzeiger Schädlingsk.* 7 (9) : 97-100. 1931.—Appreciation of life and work of this German entomologist, whose chief work has been on forest insects, with a bibliography of 178 titles—the first article in a 743p. Festschrift.

12361. **STRAND, EMBRIK. Dalla Torre** [1850-1928]. *Internat. Ent. Zeitschr.* 22 (37/38) : 337-340. Portrait. 1929.—An appreciative account of the life and work of this distinguished scientist, well known, not only by entomologists, but also by botanists and general zoologists.

12362. **[STREL'NIKOV, I. D.]** СТРЕЛЬНИКОВ, И. Д. П. П. Сушкин (1868-1928). **[P. P. Sushkin (1868-1928).]** Известия Научного Института имени П. Ф. Лесгафта (*Bull. Inst. Sci. Lesshaft*) 16 (1/2) : 5-9. Portrait. 1930.—This great ornithologist made important contributions in the field of bird morphology, especially osteology, classification, and geographic distribution of palearctic birds, and morphology and ecology of amphibians and reptiles. He was the director of the zoological department of the Lesshaft Sci. Inst. and the secretary of the physico-mathematical division of the Acad. Sci., U. S. S. R.—*S. A. Corson.*

12363. **STURANY, RUDOLF. Dr. Alfred Oberwimmer.** *Arch. Molluskenk.* 63 (2) : 80-81. 1931.—Life and publications of this Austrian malacologist (and physician).

12364. **SUGIURA, KANEMATSU. Katsusaburo Yamagiwa** [1865-1930]. *Jour. Cancer Res.* 14 (4) : 568-569. Portrait. 1930.—Dr. Yamagiwa taught pathology in the Tokyo Imperial Univ. for 40 yrs., writing largely on the etiology of cancer. He was decorated by the Imperial Acad. of Japan for his production of coal-tar cancer in 1915.

12365. **SWEZEY, O. H., and D. T. FULLAWAY. Walter M. Giffard** [1856-1929]. **A biographical sketch.** *Proc. Hawaiian Ent. Soc.* 7 (3) : 347-351. Portrait. 1931.—Entomologist, resident of Hawaii, student of its insect fauna.

12366. **SWEZEY, O. H., and F. X. WILLIAMS. The work of Dr. Frederick A. G. Muir in the biological control of sugar cane insects in Hawaii.** *Jour. Pan-Pacific Res. Inst.* [*Honolulu*] 6 (3) : 2-10. 1931.—Muir was entomologist of the Hawaiian Sugar Planters' Association from 1905 to his death in 1931. His most important work was in the importation of beneficial insects into Hawaii, including the leaf hopper parasites *Elenchus tenuicornis* and *Haplogonatopus vitiensis* from Fiji, and *Pseudogonatopus hospes* from China; a tachinid fly parasite of the cane borer, *Rhabdocnemis obscura*, from Amboina; *Scolia manilae*, an enemy of *Anomala orientalis*, from Luzon; the leafhopper egg parasite *Ootetra-*

stichus formosanus from Formosa; and the predatory bug, *Cytorhinus mundulus*, enemy of leafhopper eggs, from Queensland. A bibliography of his writings is given, listing 143 titles.

12367. S[YKES], E. R. Obituary. James Cosmo Melvill, 1845-1929. *Proc. Malacol. Soc. London* 19(2): 59-61. 1 pl. 1930.

12368. SYLVEN, NILS. Hans Tedin [1860-1930]. *Bot. Notiser* 1930(3/4): 316-318. Portrait. 1930.—Associated with experimental gardens at Svalöf (Sweden) since 1891, he provided much of the background that allowed Johannsen to formulate his theory of "pure lines" in 1903. Shortly after the publication of Mendel's observations, Tedin worked extensively on the genetics of *Pisum*, and was instrumental in developing the well-known Svalöf strains of wheat. He also wrote extensively in a popular manner on practical methods of agriculture.—*H. K. Svenson.*

12369. SYLVEN, NILS. Tycho Vestergren [1875-1930]. *Bot. Notiser* 1930(3/4): 319-321. Portrait. 1930.—Vestergren's earliest published work was on mycology; the fungi of Gotland, Sweden, and exsiccati of micromycetes. He was associated with T. M. Fries, Lagerheim, and Skottsberg. With Skottsberg he published on the flora of Ösel. Later he was occupied with ecology and systematics of the phanerogams upon both of which he published extensively. He was also editor of Botaniska Tidskrift (1908-1917) and a well-known teacher of botany.—*H. K. Svenson.*

12370. SZILY, A. von. Theodor Axenfeld [1867-1930]. *Deutsche Med. Wochenschr.* 56(36): 1543-1544. Portrait. 1930.—Axenfeld's scientific work dealt with almost all provinces of ophthalmology. He was the author of "Bakteriologie in der Augenheilkunde" and the editor of "Lehrbuch und Atlas der Augenheilkunde."

12371. T., G. Thomas Alexander Barns [1881-1930]. *Entomologist* [*London*] 63(804): 119-120. 1930.—English naturalist, geographer, and sportsman, author of 5 books on Africa.

12372. TANNER, VASCO M. Thomas Utting Spalding 1866-1929. *Ent. News* 40(10): 343-344. 1929.—Noted entomological collector, especially of Utah insects.

12373. T[ANSLEY], A. G. Prof. C. E. Moss [1870-1930]. *Nature* [*London*] 127(3194): 98-99. 1931.—English botanist; 1907-1917 lecturer of systematic botany at Cambridge, 1917-1930 prof. of botany at Johannesburg.

12374. THOMSON, G. M. Charles Chilton (1860-1929). *Proc. Linnean Soc. London No.* 142. 191-195. 1929/30(1931).—This New Zealand educator and zoologist, prof. of biology and rector of Canterbury College, made notable contributions to the study of Crustacea (especially Amphipoda and Isopoda).

12375. TICEHURST, N. F. Michael John Nicoll [1880-1925]. *British Birds* 19(9): 206-208. 1926.—A well-known British ornithologist, author of "Three voyages of a naturalist" and important papers on Egyptian birds, and former director of the zoological gardens at Giza, Egypt.

12376. TRACY, HENRY CHESTER. American naturists. viii+282p. E. P. Dutton & Co.: New York, 1930. Pr. $3.90.—Biographical sketches are given of representative naturalists stressing the basic philosophies underlying their writings and their influences on the development of American nature thought. Among those included are Roosevelt, Audubon, Carl Akeley, Roy Chapman Andrews, Burroughs, Muir, Hornaday, Thoreau, Seton, Beebe, John and William Bartram, Edward Howe Forbush, Mary Austin, Olive Thorne Miller, Alexander Wilson, Frank M. Chapman, William Leon Dawson, Walter Prichard Eaton, Liberty Hyde Bailey, and Maurice Thompson.—*M. E. Mathias.*

12377. TRELEASE, SAM F. The work of Dr. Burton Livingston as permanent secretary of the American Association. *Sci. Month.* 32(3): 281-283. Portrait. 1931.

12378. U., H. C. Engelke [1848-1926]. *Jahresber. Naturhist. Ges. Hannover*, 1924/25-1928/29 No. 75. iii-iv. 1930.—German mycologist.

12379. U[GGULA], A. Ett spanskt Linnéporträtt. [With English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 160-161. Portrait. 1931.—A note on a Spanish portrait of Linnaeus.

12380. V. Úmrtí skutečného člena Dr. Fr. Rambouska [1886-1931]. *Věstník Českoslov. Akad. Zem.* 7(8): 1931.—Biography and appreciation of this Czech entomologist, interested especially in chafers and insects which attack sugar beets.

12381. VALENTE, PULIDO. Prof. Annibal Bettencourt, 1868-1930. *Arq. Inst. Bact. Camara Pestana* 6(2): i-x. Portrait. 1930.—Biographical sketch and bibliography of this Portuguese medical bacteriologist and parasitologist.

12382. VAN DUZEE, E. P. American entomology loses a distinguished patron [?-1930]. *Pan-Pacific Ent.* 7(1): 16. 1930.—Obituary note on Dr. William Barnes, lepidopterist, whose private collection is the largest and best studied collection of No. American forms, comprising 500,000 specimens with 1915 holotypes.

12383. VERDOORN, FR. Max Fleischer [1861-1930]. *Ann. Bryologici* 4: 113-122. Portrait, 3 fig. 1931.—German bryologist, known chiefly for his work on the mosses of Java.

12384. VINALL, H. N. Russell A. Oakley [1880-1931]. *Science* 74(1912): 195. 1931.—Brief life sketch of this agronomist of the U. S. Dept. of Agric., whose research activities were concerned chiefly with alfalfa and turf grasses.

12385. VORBRODT, WŁADYSŁAW. Ś. p. Emil Godlewski. *Roczniki Nauk Rolniczych i Leśnych* 24(3): 329-372. 1930.—Biography and bibliography of this Polish botanist.

12386. W., A. S. Dr. Henry M. Ami [1858?-1931]. *Nature* [*London*] 127(3195): 136. 1931.—This well-known Canadian geologist and paleontologist of Swiss origin, made valuable contributions to the knowledge of the Palaeozoic fossils of eastern Canada. He also founded and directed the Canadian School of Prehistory in France.

12387. W., A. S. Dr. Louis Dollo [1857-1931]. *Nature* [*London*] 128(3219): 57. 1931.—A Belgian vertebrate paleontologist, with the Royal Museum of Nat. Hist. at Brussels 1882-1925, whose most important works are on fossil reptiles and fishes.

12388. W., A. S. Sir William Boyd Dawkins—1837-1929. *Proc. Roy. Soc.* [*London*] *B* 107(754): xxiii-xxvi. Portrait. 1931.—This British geologist, palaeontologist, and anthropologist was known chiefly for numerous contributions on early man and associated mammals in western Europe. From 1874 until his retirement in 1909, he was prof. of geology at the Univ. of Manchester.

12389. W., C. M. Sir Andrew Balfour, C.B., K.C.M.G. [1873-1931]. *Nature* [*London*] 127(3199): 279-281. 1931.—Once director of the Wellcome Tropical Res. Lab. in Khartoum, later sanitary adviser to the Sudan Govt., then organizer of the Wellcome Bureau of Sci. Res. in London, and finally organizer of the London School of Hygiene and Trop. Med.

12390. W., F. E. Charles Edward Moss (1870-1930). *North Western Naturalist* 6(1): 34-36. 1931.—British botanist.

12391. W., T. S. "Cooper's fascia." *Amer. Jour. Surg.* 11(3): 563. Portrait. 1931.—Sketch of Sir Astley Paston Cooper [1768-1841], surgeon and anatomist, remembered as the eponym of "Cooper's fascia," "Cooper's glands," "Cooper's hernia," and other structures.

12392. W., T. S. "Roentgen Ray." *Amer. Jour. Surg.* 12(3): 550. Portrait. 1931.—Sketch of the life of Wilhelm Conrad Roentgen [1845-1923], discoverer of x-rays.

12393. WAGER, H. William Norwood Cheesman (1837-1925). *Jour. Bot.* [*London*] 64: 22-23. 1926.—Brief appreciation of the British naturalist, especially interested in Mycetozoa and Fungi, with bibliography of his publications.

12394. WARHURST, ETHEL. Annie Lee. *North Western Naturalist* 6(1): 33-34. 1931.—Brief biographical sketch of this British teacher and botanist who died in 1930.

12395. WEIN, K. F. Ehrhart und J. A. Murray.

Zwei Typen der Botaniker der Aufklärungskeit. [With English summary.] *Svenska Linné-Sällskapets Årsskr.* 14: 73-84. 2 fig. 1931.—Ehrhart was an independent critical observer, while Murray looked upon deviations from the system of Linnaeus "very nearly as a capital crime."

12396. **WEISS, F. E. James Cosmo Melvill (1845-1929).** *No. Western Nat.* [*Scotland*] (3): 150-156. Portrait. 1930.—Biographical sketch of this British botanist, with bibliography.

12397. **WEISS, F. E. James Cosmo Melvill (1845-1929).** *Proc. Linnean Soc. London* 142. 211-213. 1929/30 (1931).—An English botanist and malacologist, known particularly for his publications on Mollusca.

12398. **WEISS, F. E. Wilfrid Robinson (1884-1930).** *Proc. Linnean Soc. London No.* 142. 216-218. 1929/30 (1931).—English botanist and mycologist, prof. of botany in Univ. College, Aberystwyth.

12399. **WEISS, HARRY B. John Southall's "Treatise of Buggs."** *Jour. New York Ent. Soc.* 39(2): 253-259. 2 pl. 1931.—Biographical data on John Southall, with quotations and illustrations of his little pamphlet (1730), which was in fact a clever advertisement.

12400. **WEISS, HARRY B., and GRACE M. ZIEGLER (foreword by L. O. HOWARD). Thomas Say, early American naturalist.** 262p. 27 illus. Chas. C. Thomas: Springfield, Ill., 1930. Pr. $5.—This biography of an early 19th century descriptive naturalist includes accounts of his southern and western trips, his life in Philadelphia and New Harmony, Ind., his work and collections, and many previously unpublished letters and facts.—*H. B. Weiss.*

12401. **WEISSENRIEDER, F. X. Prof. Dr. med. et med. vet. h. c. Theodor Oskar Rubeli, Bern, zu seinem 70. Geburtstage.** *Schweiz. Landw. Monatsh.* 9(5): 107-111. Portrait. 1931.—An appreciation of the director of the Vet.-Anat. Inst. of the Univ. of Bern, on his 70th birthday.

12402. **WHITE, C. T. Obituary. Herbert Bennett Williamson.** *Jour. Bot.* 69(822): 172. 1931.—A brief biographical sketch of this Australian botanist.

12403. **WILLIAMS, ROSWELL C. Frank Haimbach [1859-1930]. CARY, MARGARET M. Mr. Haimbach and his connection with the Germantown Entomological Club, 1926-1930.** *Ent. News* 41(9): 281-284. Portrait. 1930.—Philadelphia lepidopterist, author of several articles, the bibliography of which is given.

12404. **WOLCOTT, GEORGE N. Erik Ekman—an appreciation.** *Science* 73(1897): 487-488. 1931.—Botanist-collector.

12405. **ZIETZSCHMANN, OTTO. Heinrich Bittner [1897-1929]: Ein Nachruf.** *Anat. Anzeiger* 70(6/7): 113-116. Portrait. 1930.—Though only 32 yrs. old, Bittner had already published many works on the anatomy and histology of the lower vertebrates, and had prepared the volume on Trematodes for Schulze's "Biologie der Tiere Deutschlands."

12406. **ZWÖLFER, W. K. Escherich und die Forstentomologie. [Escherich's work in forest entomology.]** *Anzeiger Schädlingsk.* 7(9): 101-103. 1931.

12407. **ANONYMOUS. Abel Chapman [1852?-1929].** *The Bateleur* [*Nairobi*] 1(3): 103. 1929.—British naturalist.

12408. **ANONYMOUS. Robert Dunlop.** *Glasgow Nat.* 9: 54. 1919/1930(1931).—Scotch paleontologist, late curator of the Pittencrieff Glen Museum.

12409. **ANONYMOUS. Obituary. Erik L. Ekman (1883-1930).** *Jour. Bot.* 69(820): 106-107. 1931.—A Swedish botanist who made noteworthy contributions to the flora of the West Indies.

12410. **ANONYMOUS. Valère Haazen [? -1931].** *Bull. Féd. Internat. Pharmaceut.* 12(1): 12. Portrait. 1931.—President of the Internat. Pharmaceutic Federation of Belgium.

12411. **ANONYMOUS. Sidney Langford Hinde [1863-1930].** *The Bateleur* [*Nairobi*] 3(2): 53. 1931.—British ornithologist, who worked on African birds.

12412. **ANONYMOUS. Sir Frederick Jackson, K. C. M. G. [-1929].** *The Bateleur* [*Nairobi*] 1(3): 102-103. 1929.—A noted British colonial administrator and ornithologist; author of "Game Birds of Kenya and Uganda."

12413. **ANONYMOUS. Dr. R. C. Macfie [? -1931].** *Nature* [*London*] 128(3222): 179. 1931.—Scotch doctor and evolutionist.

12414. **ANONYMOUS. Miss Anne L. Massy [? -1931].** *Nature* [*London*] 128(3219): 59. 1931.—Irish zoologist.

12415. **ANONYMOUS. A. W. Mera [1849-1930].** *Entomologist* [*London*] 63(810): 264. 1930.—English entomologist.

12416. **ANONYMOUS. Mr. H. W. Monckton [1857-1931].** *Nature* [*London*] 127(3197): 206. 1931.—A British geologist and botanist, and vice-president of the Linnean Soc.

12417. **ANONYMOUS. Moartea profesorului C. S. Motaş. Comemorarea dela Facultatea de medicină veterinară dela 12 Martie 1931. [Commemoration of the death of C. S. Motaş, by the Faculty of Veterinary Medicine, Bucarest, March 12, 1931.]** *Arch. Vet.* [*Bucureşti*] 22(3/6): 77-95. Portrait. 1930.—Memorial to this Rumanian veterinary pathologist (1869-1931), with tributes in the form of letters from members of the profession.

12418. **ANONYMOUS. Obituary notice.** *Amer. Fern Jour.* 20(4): 158-159. 1930(1931).—Walter Deane, widely known ornithologist and botanist, one of the founders of the New England Bot. Club, member of botanical visiting committees at Harvard Univ., and author of many articles in scientific journals, died July 30, 1930, aged 83. His herbarium of 40,000 sheets was bequeathed to the Gray Herbarium and the New England Bot. Club.—*C. A. Weatherby.*

12419. **ANONYMOUS. Albert Schamelhout.** *Bull. Féd. Internat. Pharmaceut.* 12(1): 13. 1931.—Formerly secretary of the Internat. Pharm. Federation of Belgium and member of the committee on international pharmaceutical nomenclature.

12420. **ANONYMOUS. John Smith [1846?-1930].** *Glasgow Nat.* 9: 100. 1919/30(1931).—Distinguished Scotch geologist and naturalist.

12421. **ANONYMOUS. Mr. Henry James Waddington [1839?-1931].** *Nature* [*London*] 128(3222): 179. 1931.—One of the founders of the Nat. Sci. Soc. of Waddington, England, and a museum preparator of protozoa.

12422. **ANONYMOUS. Alexander Frederick Richmond Wollaston [1875-1930].** *The Bateleur* [*Nairobi*] 2(4): 1930.—British naturalist.

BIBLIOGRAPHY

12423. **ARTSCHWAGER, ERNST. Dictionary of biological equivalents. German-English.** 226p. 6 pl. Williams & Wilkins: Baltimore, 1930.—The book contains the English equivalents for over 15,000 German scientific terms frequently met with in biological papers. To increase the usefulness of the volume, 6 plates illustrating over 600 terms in botany and zoology have been appended. A list of German irregular verbs and common abbreviations, and a conversion table for English and metric units of wt. and measure are also included.—*E. Artschwager.*

EVOLUTION

(See also in B. A. 6(3): Entries 6054, 6056, 6068, 6075, 6117, 6163, 6190, 7960, 8059, 8210, 8235, 8330, 8337, 9041; 6(4): 9068, 9148, 9170, 9174, 9180, 11247, 11264, 11327, 11347, 11352, 11407, 11593, 11873; and in this issue 12075, 12092, 12508, 12557, 12627, 12947, 14236, 14257, 14274, 14303, 14367, 14565)

12431. **ANTHONY, R.** Doit-on regarder l'évolution organique comme étant une marche dans le sens du progrès? *L'Anthropologie* 40(3): 259-265. 1930.—The idea queried in the title implies an indispensable perfection as the starting point of comparisons, and a biological hierarchy based on this idea. Citations from authorities on evolution show that this continuous advance toward perfection is what they mean by progressive evolution. But it is only with regard to predetermined conditions that one organism can be called superior or inferior to another; and it is because we cannot attain a point of view detached from ourselves that we regard the human quality of intellectuality as superior to any other animal qualities with which we compare it, and ourselves, in the absolute point of view, as superior to other animals. Moreover, continuous progress implies a fixed end to evolution and the existence of an inherent will directing it toward that end,—a theological idea. Increase in complexity is confused with progress but has no relation to it. The succession of zoological classes in geologic time is the common argument for progressive evolution but nothing authorizes us to consider any one of these classes as more perfect than another. Special examples are given to show that these classes are not in all ways improved in the order of their appearance. The author's conclusion is that the course of evolution is not a progress in the absolute sense but is a progressive specialization, which in the end leads to extinction. If the idea of biological evolution be incontestably the result of natural causes, one cannot rationally admit it to be an advance in progress.—*W. K. Gregory.*

12432. **BRADLEY, JOHN HODGDON, Jr.** The parade of the living. 308p. (Howard-McCann, Inc.: New York, 1930. Price $3.00.—This is a presentation of the facts and theories of the paleontological origin and evolution of life. The following topics are discussed: spontaneous generation of life; the evidence for fossil bacteria and blue-green algae, the earliest forms of life in the Archean and Algonkian eras; the earliest of fishes; the evolution of algae and sporophytes; the effects of geological changes upon the rate and character of evolution; the dinosaurs; the evolution of the Cephalopoda and of the Reptilia; the flying reptiles and the origin of birds; the origin of mammals and of flowering plants; the evolution of horses, elephants, carnivores, and primates; primitive men; palaeopathology; the evolution of sexuality; and degeneration.—*C. A. Kofoid.*

12433. **CAULLERY, MAURICE.** Génétique et évolution. *Rev. Gén. Sci. Pures et Appl.* 41(20): 567-573. 1930.—The mechanism of evolution seems farther from solution than a generation ago. The work of Weismann and Johannsen has emphasized the very minor rôle of environment in evolution. From accumulated genetical data (*Drosophila, Oenothera,* etc.) mutations appear to be the principal source of evolutionary changes. However, mutation and genetical laws are insufficient to account for evolution because: (1) It is doubtful whether mutations constitute new development in the descent of species as they are modifications of already existing genes. (2) Mutations do not result in physiologically distinct populations, the newly isolated forms being completely inter-fertile. (3) Mutations will not adequately explain adaptation since they occur fortuitously.—*G. F. Sprague.*

12434. **COLTON, HAROLD S.** A Lamarckian experiment. *Amer. Naturalist* 65(699): 343-350. 1 fig. 1931.—An experiment to test the Lamarckian factor in evolution ran 5 yrs. From albino rats a few days after birth, the fore limbs were amputated, while a portion of each litter was kept for control. The rats were bred for 6 generations. When the adult rats were killed, the following measurements were made: Body length, total length, skull length, skull breadth, femur length, tibia length, tibia breadth, and mesial bend of the fibula. Although change of habit changed the proportions of the bones of rats, there was no evidence that the changes are inherited. The mesial bend in the fibula seems to be due to a relative increase in the tibialis anticus and tibialis posticus, as well as to a bend in the tibia, an adaptation to greater stability. As far as the Lamarckian factor in evolution is concerned, the experiments were negative.—*H. S. Colton.*

12435. **DUDYCHA, GEORGE J.** Present tendencies in the philosophy of biological evolution. *Ohio Jour. Sci.* 31(3): 129-142. 1931.—There are 4 contemporary points of view concerning biological evolution each of which presents a different solution of the problem. The 1st view, that of Langdon-Davies, posits mind and memory as the 2 important factors responsible for the progressive development in the history of life; its difficulty is that neither of these terms is adequately defined, nor is the method by which these factors operate made clear. The 2nd view, Clark's Zoogenesis, holds that by some mysterious means all the types of life burst forth simultaneously from the primitive single cell. Since this has not been the case in historic times, we can hardly believe that this is the method of nature. Again we note that the idea of the potentiality of all things in a primitive single cell is not a new view, but one which was enunciated centuries ago by St. Augustine. The view of H. J. Muller concerning the potency of cosmic radiation in effecting variations is suggestive to the extent that it posits a drive which is the go-of-events. This drive has been variously termed by philosophers—vital urge, "elan vital," nisus, etc. "Perhaps we might be so bold as to include cosmic radiation, but this is still somewhat hazardous." Hybridization, the 4th point of view, is directly in accord with one of the outstanding present-day philosophical concepts of development—namely, emergent evolution. This view is not only serviceable in biology, but is also in accord with a more general process which includes many other aspects of the universe than merely life. No theory of biological evolution, no matter how serviceable it may seem with regard to understanding the ramifications of life, is of great value unless it is in accord with the more general aspects of cosmic evolution.—*G. J. Dudycha.*

12436. **FORD, E. B.** Mendelism and evolution. 116p.

Lincoln MacVeagh, The Dial Press: New York, 1931.—A short survey of the evolutionary aspects of modern genetics. Part I treats of the particulate theory of inheritance, including the laws of Mendel and the physical basis of inheritance. The 4 chapters of Part II, Mendelism and Evolution, are as follows: Heredity and the environment (external and internal); Experimental genetics and its bearing on evolution, including "the phenotypic effects of mutation" and "domestication"; The application of the Mendelian theory to evolutionary problems in nature (Mendelism as the basis of organic inheritance, and Mendelism and selection); Special problems of evolution (The origin of species, The evolution of the sex-determination mechanism, The evolution of insect casts, and Abundance and variability). There is a list of references, a glossary, and an index.—*C. S. Gager.*

12437. **GRABAU, A. W. Asia and the evolution of man.** *China Jour.* 12(3): 152-163. 1 fig. 1930.—A review of the geologic and meteorologic history of Central Asia, with reference to the conditions under which man evolved there.

12438. **RICHARZ, STEPHEN. The age of the human race in the light of geology.** *Ann. Rept. Smithsonian Inst.* 1930: 451-464. Map, 3 pl. 1931.—Man was present in Europe some 30,000 yrs. ago.

12439. **SHIPLEY, MAYNARD. The key to evolution.** In four double volumes. Vol. 1, How life began. Vol. 2, How plants arose. Vol. 3, The origin of animals. Vol. 4, The origin of the backboned animals. Vol. 5, From amphibian to man. Vol. 6, Man, cousin to the apes. Vol. 7, Embryology and evolution. Vol. 8, Causes and methods of evolution. 64p. each. Haldeman-Julius Co.: Girard, Kansas. [1931?]. Pr. $2.45 for set.

12440. **TURRILL, W. B. Biological races in seed-bearing plants and their significance in evolution.** *Ann. Appl. Biol.* 18(3): 442-450. 1931.—In seed-bearing plants physiological differences are usually correlated with differences in morphological structure. The minute or non-morphological differences treated are classified under the following heads: differences in susceptibility, resistance, or immunity to parasites; in edaphic limitations; in drought and cold resistance; in phenology; in seed behaviour; in chemical constitution; and competition between plants displaying such differences. Biological characters frequently have a genetic basis. They frequently set limits to geographical distribution and thus have a bearing on isolation and possibilities of hybridization.—*W. B. Turrill.*

(See also in B. A. 6(3): Entries 6103, 6106, 6114, 6117, 6127, 6128, 6129, 6130, 6145, 6148, 6158, 6170, 6173, 6208, 6211, 6420, 6421, 6423, 6424, 6425, 6439, 6440, 6451, 6454, 6493, 6569, 6593, 6603, 6646, 6650, 6665, 6725, 6800, 6901, 7212, 7747, 8051, 8175, 8261, 8295, 8300, 8361, 8440, 8467, 8547; 6(4): 9076, 9149, 9353, 9365, 9367, 9596, 9635, 9956, 10325, 10338, 10364, 10372, 11034, 11071, 11210, 11213, 11279, 11418, 11423, 11426, 11448, 11452; and in this issue 12121, 12125, 12519, 12535, 12536, 12539, 12554, 12566, 12851, 13395, 13815, 14034, 14048, 14061, 14071, 14195, 14205, 14212, 14396, 14470, 14471, 14474, 14476, 14497, 14501, 14503, 14617)

GENERAL

12442. **BHATTACHARYA, D. R. The Golgi apparatus and vacuome theory.** *Allahabad Univ. Stud.* 4: 1-18. 1928.—The author provides a brief survey of the literature on Golgi apparatus and reports his observations on cytoplasmic inclusions in the oogenesis of a number of animals as follows: (1) the Golgi bodies are granular and acquire a juxta-nuclear position in the early stages of development of the egg; (2) the later complex is probably produced by the running together of the Golgi bodies and mitochondria under the influence of strong fixatives; (3) in the later stages of development the Golgi bodies are spherical; (4) the Golgi bodies and vacuome of Parat and Guilliermond are probably homologous structures; (5) the best fixatives for preserving the form of Golgi bodies are Kolatchev-Nassonow and Ludford's modification of the osmic acid method; (6) Parat's neutral red technique is convincing for demonstration of the vacuoles (Golgi bodies); and (7) the homology of the Golgi body with the vacuome can be established only by examining these structures side by side in preparations made with classical fixatives and intra vitam.—*H. I. Corey.*

12443. **FRY, HENRY J. A critique of the cytological method: determining the structure of living cells from fixed ones.** *Anat. Rec.* 46(1): 1-21. 1930.—The most dependable evidence concerning cell components is usually obtained by studying "normal" living cells. Due to opacity or other causes, this is frequently impossible, and fixed cells must be used. In theory it is universally recognized that fixation may cause distortions; in practice the dangers of misinterpreting coagulation artifacts are frequently disregarded. A quantitative method is described for studying cells under the most difficult conditions: when the fixed component cannot be compared with the living one and when different coagulation products show diverse structure. Cells selected for the initial study are in the same stage; they are in a "normal" environment prior to fixation with any appropriate reagent; a common stain is used. A number sufficient to constitute an adequate random sample is chosen, avoiding an unconscious selection of any type. Each cell is measured and analyzed in the greatest detail, using a tabular form. Thereafter follow many similar studies, varying in turn, fixation, stage, environment, stain, and other factors. The relative number of each class of coagulation product under each condition is determined. Average measurements are known. Certain statistical methods can be applied. Current hypotheses developed by the usual method concerning the mitotic mechanism of fertilized echinoderm eggs are seriously questioned by data obtained when using the proposed method. The technique may produce significant results in various cytological, histological, and pathological studies.—*Author (courtesy Wistar Bibl. Serv.).*

12444. **GIROUD, A. Recherches sur la nature chimique du chondriome.** *Protoplasma* 7: 72-98. 1929.—Microchemical tests on the intestinal cells of *Ascaris* reveal the presence and complexity of proteins in the chondriosome. They lead the author to conceive that in part, at least, the sulfhydril group, which is present there, is more or less intimately linked to these substances. —*L. Moyer.*

12445. **HUILLERET, ALBERT. Les protéosomes de Loew et la constitution du protoplasme.** *Compt. Rend. Soc. Biol.* 99(37): 1829-1830. 1928.—Loew has given the name of "proteosomes" to certain granulations which he believes to consist of active albumin and to play an important part in the life of protoplasm, from which they may be dissociated by the action of caffeine and antipyrine. Huilleret, having coagulated protoplasm by formol, observed by the ultramicroscope the formation of "proteosomes" under the influence of caffeine, without any change in the aspect of the protoplasm. He therefore dissents from Loew's theory.

12446. KORNHAUSER, S. I. The history of staining. The development of cytological staining. *Stain Tech.* 5(4): 117-125. 1930.—This is the sixth paper of the series on the history of staining and deals with the advances made in cytological methods, especially the developments since the time of Flemming's first important work in this line (1874).—*Author (courtesy Wistar Bibl. Serv.).*

12447. KÜSTER, E. Frühe Mitteilungen über Plasmaraketen, Plasmatentakeln und Plasmazungen. *Protoplasma* 7: 446-447. 1929.—A comparison of internal and external protoplasmic processes.—*W. Seifriz.*

12448. NEMEC, B. Ueber den Einfluss des Nikotins auf sich teilende Zellen. *Protoplasma* 7: 99-105. 1929.—The achromatic supporting spindle can be separated from the daughter nuclei by the action of nicotine on dividing cells. It can exist for some time as an independent structure and even partly keep its fibrous appearance. It is of about the same specific gravity as the cytoplasm. The nucleolus is higher in specific gravity than the nuclear sap and so is the rest of the nuclear content. —*L. Moyer.*

12449. PARAT, MAURICE. Note rectificative à propos d'une opinion concernant les dictyosomes, qui m'est attribuée par Mlle. O. Tuzet dans un mémoire récent. *Arch. Zool. Exp. et Gén. Notes et Rev.* 70(2): 70-72. 1930.

12450. ROSTAND, JEAN. Les chromosomes, artisans de l'hérédité et du sexe. 280p. Hachette: Paris, 1928. Pr. 12 fr.—This general survey treats the following subjects: independent assortment of hereditary characters and its explanation in chromosome behavior; the hereditary substance; haploid, diploid and polyploid chromosome conditions; Mendelian laws as applied to heredity in man; determination of sex; sex-linked heredity; gynandromorphs, intersexes and supersexes; sex hormones; sex reversal; proportion of sexes; natural and experimental parthenogenesis; merogony; the rôle of the chromosomes in mutation; and, finally, in evolution.—*H. I. Corey.*

12451. SCHILLER, WALTER. Über Pikrofärbungen und ihre Anwendung auf die chromophoben Körperchen von Lipschütz. [Picric staining and its use for the chromophobe bodies of Lipschütz.] *Virchow's Arch. Path. Anat. u. Physiol.* 278(3): 663-689. 12 fig. (4 col., 2 partly col.) 1930.—A discussion of the relation between different cell elements and types of stains.

12452. WERMEL, EUG., und D. SASSUCHIN. Untersuchungen über die Kernsubstanzen und die Methoden ihrer Darstellung. II. Mitteilung: Über die Natur des Volutins und der Mastzellen-Granula. *Zeitschr. Wissenschaftl. Biol. Abt. B. Zeitschr. Zellforsch. u. Mikroskop. Anat.* 6(3): 424-440. 1927.—The author concludes that the metachromatic reaction of methylene is not specific for substances derived from nuclear metabolism, and therefore, the volutin granules in yeast cells are not derived from the nucleus. Protein and carbohydrate tests, as well as Best's carmine stain, indicate that the volutin granules in yeast cells are of a glycoproteid nature, and are therefore storage granules. Similar staining reactions of vertebrate mast cells indicate that their granules are probably of the same nature as are the volutins of yeast. Other tests used were, the iodine reaction, chlor-iodide reaction, and solubility tests of water, ptyalin and diastase.—*S. P. Miller.*

PLANT

12453. HAWKER, LILIAN E. Microsporogenesis in Taxus. *Ann. Botany* 44(175): 535-539. 20 fig. 1930.—The reduction division in the pollen mother cells of *Taxus* was followed. Chromosome tetrads consisting of 4 short thick rods in contact at each end were seen during metaphase of the first division. The pollen mother cells were apparently of two kinds, some having 16 small chromosome tetrads and others having 8 larger ones. Explanations of this phenomenon are put forward. —*L. E. Hawker.*

12454. SHARP, LESTER W. Einführung in die Zytologie. Mit Genehmigung des Verfassers aus dem Englischen überstezt und vollständig neu bearbeitet von ROBERT JARETSKY. 733p. 212 fig. Gebrüder Borntraeger: Berlin, 1931. Price 52.50 M.; bound 55 M.—For the most part this volume is a faithful translation into the German of the 2d edition of Sharp's Introduction to Cytology. The chapter headings are the same as those found in the original, the figures are for the most part the same, even the footnotes are fully retained. However, the translator has introduced a large number of changes into the text, mostly in the form of additions which bring the subject matter more nearly up to date. Such additions are clearly distinguished from the rest of the text by the presence of a [J] in the margin opposite the paragraph or portion of a paragraph which has been introduced. Minor changes which have altered the meaning of the original text are not designated in any way. As a result of the many additions, the body of the text is considerably enlarged. The bibliography at the end of the book has also been considerably enlarged by the incorporation of many papers appearing as late as 1930. It covers 72 pages. There is a full combined subject and author index.—*R. E. Cleland.*

ANIMAL

12455. ALBRO, HELEN T. A cytological study of the changes occurring in the oenocytes of Galerucella nymphaeae Linn. during the larval and pupal periods of development. *Jour. Morph. & Physiol.* 50(2): 527-567. 8 pl. 1930.—Preceding each larval molt, vacuoles, apparently of nuclear origin, are found in the cytoplasm from which they are eliminated at the time of the molt. The accumulation of vacuoles is not so striking at the times of pupation and the emergence of the imago, but occurs nevertheless. Beginning with pupation or just previous to it, the larval oenocytes seemingly undergo a process of deterioration, decreasing in size and presenting a ragged appearance. The fat-cells are closely associated morphologically with the larval oenocytes, and it seems that there is a probable physiological relationship also, since the fat-cells undergo a series of changes at the same time the oenocytes are exhibiting their cyclic behavior. Furthermore, it has been observed that in many instances there is a greater accumulation of vacuoles in that part of the cytoplasm of the oenocytes which is adjacent to the fat-cells than elsewhere.—*Author (courtesy Wistar Bibl. Serv.).*

12456. BEAMS, HAROLD WILLIAM. Studies on the "Golgi apparatus" of insect muscle. *Anat. Rec.* 42(3): 323-333. 1 pl. 1929.—Ludford's modification of the Mann-Kopsch method reveals at the poles of the nuclei definitely impregnated black structures which resemble the Golgi apparatus in tissues where its identity is well known. These structures appear as knotted filaments or masses and are resistant to prolonged treatment with turpentine. It is suggested that they are homologous to the true Golgi apparatus of other tissues. The present status of the Golgi apparatus in muscle tissue is reviewed.—*Author (courtesy Wistar Bibl. Serv.).*

12457. BEAMS, H. W. Golgi apparatus, canalicular apparatus, vacuome, and mitochondria in the islets of Langerhans of the albino rat. *Anat. Rec.* 46(4): 305-327. 2 pl. 1930.—Evidence obtained indicates that the Golgi apparatus, mitochondria, and vacuome are distinct elements of the cytoplasm. The canalicular apparatus (trophospongium) is thought to represent the negative image of the Golgi apparatus. It is assumed that Holmgren must have confused the extensions of the trophospongium to the surface of the cell with some exogenous structures. The clear canals of Bensley are tentatively interpreted as the Golgi apparatus in the living cell. The neutral-red bodies are thought to represent the vacuome of Parat. Tissue which has been stained intravitam with neutral red and subsequently treated according to the modified Mann-Kopsch (Weigl) method retains the neutral-red bodies impregnated a deep black or brown. The Golgi apparatus is likewise

impregnated in the same cell. Accordingly, it is concluded that the Golgi apparatus is not formed by the action of osmic acid or fixatives containing osmic acid upon the neutral-red bodies. Moreover, it is evident that the Golgi apparatus is refractory to neutral red in the islets of Langerhans.—*Author (courtesy Wistar Bibl. Serv.)*.

12458. **BHATTACHARYA, D. R., and KRISHNA BEHARI LAL. The cytoplasmic inclusions in the oogenesis of certain Indian tortoises.** *Allahabad Univ. Stud.* 6: 1-20. 10 fig. 1929.—In young eggs both Golgi bodies and mitochondria form a clearly polarized mass. During development these two inclusions scatter about the cytoplasm and give rise to storage products: the Golgi elements forming "fatty yolk," and the mitochondria "albuminous yolk" both by direct metamorphosis and by indirect influence on developing yolk. Both Golgi elements and mitochondria enter the egg from the follicular epithelium via the zona radiata.—*H. Hibbard.*

12459. **BHATTACHARYA, P. R. Notes on cell organs in the oogenesis of the house gecko.** *Allahabad Univ. Stud.* 6: 21-27. 2 pl. 1929.—A preliminary note. The origin, growth and distribution of Golgi bodies in the egg is similar to that described in other vertebrates. They do not, however, give rise to fatty yolk. Infiltration of Golgi bodies from follicular epithelium has also been observed. Mitochondria have been found only in the peripheral zone of the egg.—*P. H. Dederer.*

12460. **BHATTACHARYA, D. R., and C. B. MATHUR. On the cytoplasmic inclusions in the oogenesis of Pila globosa (Swainson).** *Allahabad Univ. Stud.* 6: 29-40. 2 pl. 1929. Golgi elements as granules and rods appear first in the yolk nucleus of Balbiani along with the first mitochondria. Subsequent redistribution of both inclusions produces a bipolar condition. The Golgi elements very early form "fatty yolk," which soon disintegrates. The Golgi bodies now disappear and mitochondria become very prominent. They form the fuchsinophile yolk (albuminous). Simultaneously yolk is formed de novo in vacuoles on the surfaces of which mitochondria are often found. Nuclear extrusions, though present, take no part in vitellogenesis.—*H. Hibbard.*

12461. **BHATTACHARYA, P. R. The infiltration of Golgi bodies from the follicular epithelium to the egg in fishes.** *Allahabad Univ. Stud.* 6(2): 53-58. 4 fig. 1930. —Such infiltration, via the zona radiata, begins early in development. In advanced oöcytes extrusion of Golgi bodies diminishes until finally it ceases and the zona radiata becomes thin and more opaque. In advanced oöcytes there is no way of distinguishing between ovarian and follicular Golgi bodies.—*P. B. Powers.*

12462. **BLUMENTHAL, REUBEN. Mitotic development of Arbacia eggs in cyanides.** *Physiol. Zool.* 3(4): 539-563. 1 pl. 1930.—Fertilized *Arbacia* eggs were found to continue a limited amount of karyokinetic development at any stage in the presence of concentrated solution of KCN. Such development indicates that mitosis is not directly dependent on oxygen. The inhibition of karyokinesis which finally does occur in KCN might be due to some secondary effect of KCN or of anaerobic metabolism. On the other hand, methyl cyanide stops mitotic activity immediately in all stages. Unlike KCN, methyl cyanide produces a marked effect upon the chromosomes and diaster if the eggs are transferred to it during or after metaphase. Only under the latter conditions is there a delay in cell division upon return to sea-water. Exposure of the eggs to potassium cyanide at any time previous to metaphase will cause a delay in cleavage, while any exposure after metaphase produces no delay in the first cleavage, but rather in the second. Evidence supports the idea that karyokinesis and cytokinesis are partly independent. The processes concerned with mitosis are compared with those of muscular contraction and amoeboid movement.—*Author (courtesy Wistar Bibl. Serv.)*.

12463. **CALKINS, GARY N. Uroleptus halseyi Calkins. III. The kinetic elements and the micronucleus.** *Arch. Protistenk.* 72(1): 49-70. 4 pl. 4 fig. 1930.—The kinetic elements here agree with the more obvious kinetic elements of other ciliates. A motorium in the protoplasm about the gullet and near the mouth gives rise to fibrils which pass to the undulating membrane and to the chain of basal granules underlying the membranelles. The basal bodies of the frontal cirri are also connected by fibrils with this membranelle chain. Other fibrils from the motorium extend down the body. The bulk of the paper is devoted to the history of the micronucleus and the chromosome problem. Four products of the amphinucleus are formed after conjugation. One becomes a new macronucleus and 2, sometimes 3, micronuclei. These do not divide at the first cell division, so uninucleate, sometimes binucleate, individuals arise. They divide precociously for the second cell division. A perfect large mitotic figure with 24 long, rod-like chromosomes is formed. These chromosomes divide transversely. In old individuals the micronucleus lags at division. No chromosomes are formed, the division figures resembling promitosis. Such individuals may conjugate. During conjugation the micronuclei undergo three characteristic ciliate maturation divisions, each with a different type of mitotic figure. The first meiotic spindle is spherical and relatively huge, occupying practically the entire diameter of the organism. Here there are 48-50 small, granule-like, chromosomes in the nuclear plate. With division, these are separated into two groups of 24 each. In the second meiotic division these granular chromosomes are drawn out to form 12 finely granular fibers, 12 halves of these fibers lying on each side of the middle line in the anaphase and passing into the daughter nuclei. At the third meiotic division these fibers condense still more into 12 long, intensely staining, chromosomes which now divide transversely to form the two pronuclei. With fusion of pronuclei, 24 chromosomes are restored. The theory of the gene cannot apply here unless it be assumed that each chromosome contains only one type of gene, in which case it is immaterial whether the chromosome is large or small, or divides longitudinally or transversely. The idea is advanced that chromosomes have evolved into individual entities not by increased chemical complexity, but by association of different genes. If these are arranged linearly in the chromosome, transverse division would result in a qualitative difference in the resulting cells, a condition which is brought about at only one stage in metazoa, viz., the reducing divisions. On this theory it is assumed that only 12 different types of gene with their 12 allelomorphs, are present in *Uroleptus halseyi*.—*G. N. Calkins.*

12464. **CHLOPIN, NIKOLAUS G. Ein Beitrag zur Morphologie und zum Mechanismus der Eisenspeicherung.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 11(2): 316-332. 9 fig. 1930.—Iron saccharide is stored in large amounts in the Kupffer cells of the frog liver. In the Axolotl a marked storage of iron occurs in the convoluted tubules of the kidney. The iron granules acquire a protein-like substratum which will be designated as Krinom. The Krinom of the iron inclusions is differentiated from the neutral red Krinom through its failure to stain with basic dyes in fixed preparations and by its ability to be stained by acid aniline dyes. It, therefore, has the characteristics of a basic protein substance. With successive subjection of frogs to neutral red and iron saccharide, one can get a double storage of Kupffer cells, whereby the neutral red Krinom and the iron granules are contiguous with one another. By successful treatment of the frogs with trypan blue and iron saccharide a strong deposit of iron can be seen within the preformed trypan blue inclusions. —*Author's summary (transl. by S. I. Kornhauser)*.

12465. **CRETSCHMAR, MAX. Das Verhalten der Chromosome bei der Spermatogenese von Orgyia thyellina Btl. and antiqua L., sowie eines ihrer Bastarde.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikr. Anat.* 7(3): 290-399. 6 pl., 8 fig. 1928.—The diploid chromosome number of *Orgyia thyellina* is 22 and in *O. antiqua* 28, but in neither can homologous chromo-

somes be identified. Parasynapsis occurs in synizesis. In the pachytene stage the chromosomes are clearly bivalent, and the double strands are still faintly indicated in the diplotene stage. The first maturation division is reductional. In atypical spermatocytes the diploid chromosome number is present because of failure of synapsis. The expected 25 chromosomes are found in spermatogonia of the hybrids. During the growth phases of the hybrids the longitudinal union of the heterogeneous pairs is lost. In all phases of maturation great irregularity and variability are found and spermatids may contain highly variable complements of chromosomes. Spermiogenesis is completed only in cells with high chromosome numbers. Chromosome number is a criterion of phylogenetic-systematic relation only in cases of single species. It fails in higher systematic groups. Chromosome chains in hybrids are not the multiple chromosomes described by authors, nor are they pathological. Synaptic union is so intimate that separation may be in new planes and hence new affinity relations are established between more than 2 chromosomes. But there is no cytological evidence of an intimate intermingling of genes of the strange species. A survey of cytological results in lepidoptera hybrids shows that fertility is most strongly reduced in forms with a median degree of chromosome disturbance, i.e., in forms with partial or varying conjugation. On account of the anomalies of maturation division of these it is improbable that the sperms contain a complete chromosome complex.—*G. T. Hargitt.*

12466. DAS. A preliminary account of the cytoplasmic inclusions in the oogenesis of Columba intermedia. *Allahabad Univ. Stud.* 4: 1-9. 1928.—The Golgi bodies, shown by both silver nitrate and osmic acid methods, appear in oogonia as dense juxta-nuclear knots. These knots spread around the nucleus in the oocyte stages, and the elements become swollen and give place to "fatty yolk" except in the peripheral zone. These Golgi bodies stain vitally with neutral red. Simultaneously bodies of like nature pass from the theca cells to the follicle cells and, thence, to the periphery of the oocyte. Mitochondria follow a similar cycle from a dense granular aggregate on one side of the nucleus to an even distribution throughout the cytoplasm of the oocytes. True yolk develops from these granules by a process of swelling, first noticeable at the periphery of the cytoplasm.—*H. Hibbard.*

12467. DAWSON, ALDEN B. The "zone of Golgi" in the cartilage cells of Necturus. *Anat. Rec.* 48(2): 379-397. 2 pl. 1931.—In supravital preparations the zone of Golgi appears as a homogeneous area of cytoplasm in which bodies stainable with neutral red and filaments stainable with Janus green B are grouped. Bodies stainable with neutral red also appear in certain osmic impregnations as blackened granules. Since such preparations may be obtained in tissue from animals not previously treated with neutral red, these bodies are undoubtedly preexistent. Filaments which occupy the zone of Golgi are usually discontinuous and do not form a closed network. They react more or less specifically with osmic acid and silver nitrate, but may be demonstrated also by several mitochondrial methods. In mature cells they are indistinguishable morphologically from the filamentous mitochondria of the rest of the cytoplasm. In younger cells they are readily differentiated from the granular and rod-like mitochondria. In this instance the interpretation of osmiophilic filaments as specific Golgi substance or as modified mitochondria would appear to depend on the individual investigator's evaluation of criteria utilized to distinguish such cell components. The zone of Golgi usually occupies a definite area within the cell. In young flattened cells it is found near one pole of the nucleus. In the more rounded deep-lying cells it has a juxtanuclear position and is found on the side away from the surface of the cartilage.—*Author (courtesy Wistar Bibl. Serv.).*

12468. DOGIEL, V. Die sog. "Konkrementenvakuole" der Infusorien als eine Statocyste betrachtet. *Arch. Protistenk.* 68(2): 319-348. 27 fig. 1929.—This is a morphological investigation of the concretion-vacuole in ciliates, especially in Bütschliidae and Paraisotrichidae of which 11 genera and about 25 species were examined. The vacuole is single, spherical or ovoidal, and located in the anterior third of the organism. It has a cuticular cap, a saccular membrane, concretions within its cavity and a complex series of fibrils. During division the vacuole of the hinder daughter is differentiated from the pellicle inward, the concretions arise in the endoplasm and the vacuolar anlage comes to enclose the latter. The vacuole lacks a pore. Three types of concretion-vacuoles, *Blepharoprosthium*, *Didesmis*, and *Paraisotrichia* are recognized. It is concluded that this vacuole functions as a statocyst.—*A. S. Campbell.*

12469. DUTTA, S. K. On the behaviour of the Golgi apparatus in the oogenesis of Calotes versicolor (Boulenger). *Allahabad Univ. Stud.* 4: 19-30. 7 pl. 1928.—In the young oocytes the Golgi bodies appear as a complex juxtanuclear mass, mainly granular. In later stages they scatter in the cytoplasm and become ultramicroscopic in the medullary region. In the cortical layer larger Golgi spherules are arranged in a ring. Subsequently they are broken up and lost to view in the cytoplasm. At one stage of development the follicular epithelium becomes very active and appears to extrude a number of Golgi spherules. They pass through the zona radiata and settle down in the extreme peripheral region of the egg. The Golgi bodies contribute, either directly or indirectly, to the formation of yolk, but it is believed that for the formation of true yolk the mitochondria are responsible.—*H. I. Corey.*

12470. EKBLOM, TORE. Cytological and biochemical researches into the intracellular symbiosis in the intestinal cells of Rhagium inquisitor L. *Skand. Arch. Physiol.* 61(1/3): 35-48. 17 fig. 4 pl. 1931.—Secretion in *Rhagium* larvae is brought about by discharge of plasma globules from the distal ends of intestinal cells. Mitochondria apparently aid in the formation of the secretory drops. The Golgi-net could not be definitely related to secretion. The cells bearing the symbionts are directed toward a central lumen which connects with the main intestinal channel. The yeasts are located in the distal parts and are of variable size and shape. They migrate out singly and independently of globules. Both Gram-positive and negative strains are present. Gemmation is commonly seen but not mycelial formation. —*W. J. Meek.*

12471. FOGG, LLOYD C. A study of chromatin diminution in Ascaris and Ephestia. *Jour. Morph. & Physiol.* 50(2): 413-451. 4 pl. 1930.—The casting off of chromatic material in *Ephestia* and *Ascaris* is comparable in only the broadest and most general sense. In *Ephestia* the diminution substance is not formed in the nucleus, but is due to a later differentiation of the chromosomes. This can be made apparent by the use of differential stains and by other methods. In *Ascaris* diminution does not occur until the 3rd cleavage, and then in all 3 cells that are destined to be somatic. The diminution process in this instance is apparently comparable to the casting out of residual substance which occurs when the nuclear vesicle breaks down in other cells.—*Author (courtesy Wistar Bibl. Serv.).*

12472. FRANKENBERGER, ZDENKO. Studie o spermatogenesi plazů. II. Cytologické poměry spermatogenese Lacerta agilis. [Spermatogenesis in reptiles.] *Rozpravy České Akad. Věd a Umění Tř. 2.* 37(44): 1-16. 2 pl. 1928.—The spermatogonia have 27 chromosomes, one a heterochromosome. The 1st maturation division is a reduction division, the 2nd an equation division. There are many pluripolar mitotic figures in the spermatogonia and spermatocytes.—*J. Florian.*

12473. GATENBY, J. BRONTË. Note on human spermatic cells supravitally stained in neutral red. *Anat. Rec.* 48(1): 121-129. 1 pl. 1931.—In human spermatocytes stained ¼-1 hr. in pink neutral red Ringer, a vacuome appears separate from the Golgi apparatus. In addition,

6-S rods or crystals show up in the neighborhood of the vacuome.—*Author (courtesy Wistar Bibl. Serv.).*

12474. **GATENBY, J. BRONTË. Preliminary report on the effect of phosphorized olive oil on the spermatogenesis of Abraxas grossulariata.** *Jour. Exp. Zool.* 58 (1) : 259-279. 4 pl., 1 fig. 1930.—Olive oil was heated with yellow phosphorus. A minute quantity of this oil was injected into male larvae of *Abraxas*. In 11½ hrs. the dictyosomes of the spermatocytes had produced abortive acroblasts, each containing an acrosome. Generally only one acroblast could be found in 1 spermatocyte. At mitosis the giant acroblast was carried over whole to 1 daughter cell, and eventually into 1 of the 4 spermatids. In many cases the moths, which emerged successfully, were sterile.—*Author (courtesy Wistar Bibl. Serv.).*

12475. **HALL, RICHARD P., and JOHN B. LOEFER. Studies on Euglypha. I. Cytoplasmic inclusions of Euglypha alveolata.** *Arch. Protistenk.* 72 (3) : 365-376. 14 fig. 1930.—Mitochondria and neutral-red globules (vacuome) are described, and their reactions (vital dyes, fixation and staining, osmic and silver impregnation) are noted. Elements of the vacuome—globules scattered principally through the "alveolar zone"—are stained vitally with neutral red and are blackened in osmic and silver impregnation. The origin of reserve shell-plates is traced to small inclusions of the "granular zone." It is pointed out that there is no evidence for the origin of shell-plates from either mitochondria or vacuome.—*R. P. Hall.*

12476. **HANN, HARRY W. Variation in spermiogenesis in the teleost family Cottidae.** *Jour. Morph. & Physiol.* 50 (2) : 393-411. 2 pl. 1930.—In the Cottidae there is a greater variation in the shape of the sperm than among the other teleosts. There is an oval and a slender type of sperm with intergrading forms. Spermatid masses have been found only in some of the oval sperm forms. They have been found in 7 spp. and sspp. of *Cottus* and in 3 other genera, but have not been found outside of the Cottidae. They occur in widely separated places, and in both fresh- and salt-water forms. In *C. bairdii bairdii* they are not found in all localities, their presence apparently being due to some external factor, perhaps temperature.—*Author (courtesy Wistar Bibl. Serv.).*

12477. **HARVEY, L. A. Studies on Echinoderm oogenesis. I. Antedon bifida (Pennant). II. Asterias rubens, Linné.** *Proc. Roy. Soc.* [*London*] *B* 107 (753) : 417-441. 20 fig., 441-454. 14 fig. 1931.—The fully-grown eggs of *Asterias rubens* and *Antedon bifida* are almost identical in constitution, each containing yolk spherules, smaller droplets of fat, mitochondria and Golgi bodies. They agree also in the relation of the Golgi apparatus and mitochondria to yolk formation. In each the mitochondria show the usual changes. The Golgi apparatus of the oogonium and young oocyte consists of 1 or 2 scales at the sides of the nucleus. The scales increase in number and are scattered to the periphery of the egg. Yolk granules arise on the concave sides of the scales. In *Antedon*, cup-like groups of scales are formed, within which yolk granules develop. The function of the Golgi apparatus apparently is that of initiating the isolation of the preformed yolk out of the cytoplasmic solution. A yolk nucleus occasionally appears in the egg of *Antedon* only, and seems to have some secondary relation to formation of fat. It is suggested that the yolk nucleus is the result of accumulation of nucleolar material owing to its excessive extrusion, and that it does not appear in the eggs of *Asterias* owing to the material being used up as fast as formed. There is some evidence of extrusion of nucleolar material in solution in both eggs. Experiments on living eggs of *Antedon* with neutral red and brilliant cresyl blue have demonstrated that the vacuolar system arises under the influence of the Golgi bodies, which can be seen in vivo, in much the same way as yolk droplets arise. There is no relation between yolk and vacuome, however, the latter probably being a reaction of these cells to the dyes.—*L. A. Harvey.*

12478. **HERTWIG, RICHARD. Über die Kernverhältnisse der Acanthometren.** *Arch. Protistenk.* 71 (1) : 33-56. 2 pl. 1930.—In contrast to the oft repeated assertion that the Acanthometra become multi-nucleate even in very early developmental stages, the author shows that *Astrolonche* (*Xiphacantha*) *serrata* and *Haliommatidium mülleri* are uninucleate in fully adult state. The certainty of this fact is strengthened by the evidence presented by finding numerous examples showing how the nucleus, through a peculiar budding, gives rise to a generation of daughter nuclei, although it is not possible to find typical multi-nucleate individuals like most Acanthometra. In a number of many nucleated species (*Acanthochiasma krohni, Phyllostaurus echinoides*), the author was able to find stages of transition from the uni- to the multinucleate condition.—*R. Hertwig (transl. by S. I. Kornhauser).*

12479. **HORNING, E. S., and I. D. MILLER. Chromidial extrusion, and its relationship to atypical nuclear phenomena in tumour cells.** *Australian Jour. Exp. Biol. and Med. Sci.* 7 (4) : 151-160. 4 pl. 1930.—Evidence is given for the assumption that chromidia pass through the nuclear membrane in solution by exosmosis. Chromidiosis has been described in sarcoma cells, and its activity appears to vary directly with the metabolism and growth rate of the neoplasm. It is suggested that chromidia take part in the liberation of growth-promoting substances found in in vitro cultures of malignant tissues. The withdrawal of chromatin from the nucleus upsets the tension forces existing between the cytosome and the nuclearplasm, and leads to invaginations and constrictions in the nuclear membrane. The multinucleated condition common in neoplasms and healthy cells undergoing cytolysis results from repeated nuclear constriction following chromidial emission.—*Authors' summary.*

12480. **HUGHES-SCHRADER, SALLY. The cytology of several species of iceryine coccids, with special reference to parthenogenesis and haploidy.** *Jour. Morph. and Physiol.* 50 (2) : 475-495. 5 fig. 1930.—*Icerya littoralis, I. montserratensis, Echinicerya anomola,* and *Crypticerya rosae* have been studied cytologically in connection with certain breeding experiments. For the first 3 the complete chromosomal history has been established, and the evidence on the 4th is sufficient to indicate that it differs from the others in no essential respect. The ♀♀ are diploid, with a chromosome number of 4, and the ♂♂ are haploid, with a chromosome number of 2. Oogenesis proceeds normally; 2 tetrads are formed and 2 maturation divisions occur in which the chromosomes are reduced to 2 in each ♀ pronucleus. All eggs undergo this reduction; if the eggs are then fertilized, the diploid number is thus restored and development into ♀♀ ensues; if the eggs remain unfertilized, whether in the body of a virgin or of a fertilized ♀, they develop parthenogenetically, with no restoration of diploidy, into haploid ♂♂. The spermatogenesis of the haploid ♂♂ involves a single meiotic division, demonstrably equational in character; the accompanying cytoplasmic division is suppressed, and, from each of the binucleate spermatids thus produced, 2 spermatozoa are formed. These conditions are contrasted with the functional hermaphroditism and haploid parthenogenesis of *I. purchasi.*—*Author (courtesy Wistar Bibl. Serv.).*

formed from all of the derivatives of the zygote.—*A. S. Campbell.*

12482. **KEMP, TAGE. Über die somatischen Mitosen bei Menschen und warmblütigen Tieren unter normalen und pathologischen Verhältnissen.** *Zeitschr. Wiss. Biol. Abt. B. Zeitschr. Zellforsch. u. Mikrosk. Anat.* 11(2): 429-444. 27 fig. 1930.—The number of chromosomes in somatic cells of man and chickens is usually constant but it is still possible that slight variations may occur in normal tissues. Abnormal mitosis is rare. Those occurring in the fetal membranes are obviously of special type. Chromosome counts made in Rous' chicken sarcoma and in tissue cultures of a mouse adeno-carcinoma confirmed the occurrence of mitoses with varying number of chromosomes. The behavior in this respect varies greatly in different tumors. Atypical mitoses were also found in other pathologic tissues, such as benign tumors, regenerative and inflammatory tissues, and malformations, though variations in number of chromosomes have not been observed.—*Author's summary (transl. by R. C. Whitman).*

12483. **KOKOTT, W., (mit Unterstützung aus Mitteln der E. GOLDMANN). Zur Frage des Einflusses erhöhter Temperatur auf die Mitosen in Gewebskulturen.** *Zeitschr. Wiss. Biol. Abt. B. Zeitschr. Zellforsch. u. Mikrosk. Anat.* 11(3/4): 484-490. 1930.—Mitosis is checked at from 42-50° C., processes caught in telophase being especially affected, and the readiness to initiate new processes is paralysed. It is most probable that in both cases the cause is a disturbance of phases set up in the cytoplasmic colloids by the heat.—*Author's summary (transl. by R. C. Whitman).*

12484. **LACKEY, JAMES B. Studies in the life histories of Euglenida. 1. The cytology of Entosiphon sulcatum (Duj.) Stein.** *Arch. Protistenk.* 66(2): 175-200. 24 fig. 1929.—*E. sulcatum,* a euglenoid flagellate, divides in the active state by a primitive form of mitosis. Division is promitotic, the endosome serving as a division center, the nuclear membrane being persistent and the chromosomes being formed of peripheral chromatin. No centrioles are associated with the endosome, which contributes nothing to the cytoplasm. Chromosomes are beaded, and are formed by the growth and alignment of small chromatin bodies of the chromiole type. Such chromosomes, following Dangeard, are termed chromospires. The endosome is encircled by a cordon of chromospires which lie parallel to its long axis. The chromospires break transversely, and there is no sign of a longitudinal split. No mechanism for a qualitatively equal distribution of the chromatin appears. Mitosis is wholly anastral, no spindle being formed. The basal bodies of the flagella may be termed basal granules instead of blepharoplasts, since they do not function as centrioles in division, and are not budded off from the endosome, but themselves divide. The pair of old flagella is handed on to one daughter cell, while their basal granules divide and a pair of new flagella grow out from them. The tube or siphon is absorbed during division, 2 new ones arising de novo in the cytoplasm. No indication of the function or significance of the siphon has been found.—*Author's summary.*

12485. **MAWRODIADI, P. A. Zur Theorie der Chromosomenzentren.** *Anat. Anzeiger* 63(21/24): 342-349. 2 fig. 1927.—The nucleolus of the egg of the nematode *Cystoopsis acipenseri* during the process of maturing is at first round and contains a small, round nucleolulus. This divides into 6 and sometimes more nucleoluli which are localized in pairs in the lobes of the trilobular nucleolus. The nucleoluli then fuse in pairs forming bivalent chromosomes. Two other granules appearing at this stage are considered by the author to be centrioles. The described nucleoluli are essential centers which, by collecting chromatic material, become the chromosomes. —*G. Knaysi.*

12486. **MEHRA, H. R. Cytoplasmic organs in the germ cells and somatic cells of Tubifex.** *Allahabad Univ. Stud.* 3: 1-56. 41 fig. 1927.—The mitochondria of the spermatogonia are perinuclear granules; the Golgi element is small and lies at one side of the nucleus. Free spermatogonia appear later as morulae of spermatocytes whose cytoplasm, in part, flows centrally to form a blastophore. Mitochondria lie on the periphery of this cytoplasmic core. The enlarged Golgi apparatus of the spermatocytes forms a quadrangular investment of the archoplasm. The mitochondria are inconspicuous and do not take part in the formation of the spermatozoa. The Golgi granules form the acrosome atypically. Apyrene spermatozoa formation is described. The oogonia are similar to the spermatogonia. In the oocytes are innumerable small scattered mitochondria, while the Golgi apparatus appears as a dense mass around the nucleus and as scattered rodlets. The mitochondria and Golgi elements fuse and are converted into yolk discs. In somatic cells the Golgi elements are perinuclear, and the mitochondria peripheral, in position.—*C. E. McClung.*

12487. **MEIJERE, J. C. H. de. Über einige europäische Insekten, besonders günstig zum Studium der Reifungsteilungen, nebst einigen Zusätzen zur Azetokarminmethode.** *Zool. Anzeiger* 88(7/8): 209-219. 7 fig. 1930.—The Dutch Coreids *Myrmus miriformis* Fall. and *Chorosoma schillingi* Schumm. have ♂ diploid sets respectively of 12+x and 10+x. *Nabis apterus* F. ♂ with 16+x+y is more common, but the chromosomes are much alike. Among Lepidoptera the Lasiocampid *Macrothylacia rubi* L. has relatively large chromosomes in small number, viz., haploid 14. The author used his own method for making permanent smear-preparations with acetocarmine and Venetian turpentine. The method was applied in the study of meiosis in many plants.

12488. **NAKAMURA, KENJI. Preliminary notes on reptilian chromosomes. III. The chromosomes of some lizards.** *Proc. Imp. Acad. [Tokyo]* 7(1): 26-28. 6 fig. 1931.—The diploid number is: in *Takydromus formosanus* and *T. septentrionalis,* and in *Gekko japonicus,* 38; in *Japarula swinhonis* and in *Hemidactylus bowringii,* 46; in *Eumeces latiscutatus* 26. The ♂♂ of all are homozygous for sex chromosomes (XX). The chromosomes of all the above spp. are shown in metaphase.

12489. **NARAIN, DHARAM. Cytoplasmic inclusions in the oögenesis of Bufo melanosticus, Rana tigrina and Rhacophorus fergusonii.** *Allahabad Univ. Stud.* 6(2): 41-51. 2 pl. 1930.—In young oöcytes Golgi bodies first appear as minute, knot-like bodies close to the nucleus. Later they are dispersed in the peripheral cytoplasm and form fatty yolk. Golgi bodies from the follicular epithelium travel through the zona radiata to form a layer of fine, dust-like, particles in the egg's extreme periphery. Mitochondria are spherical and in early stages form a dense, cap-like cloud over one pole of the nucleus. As many as 5 nucleolar extrusions were observed. These are large in the frog and *Rhacophorus* but fine and granular in the toad. True yolk is formed by metamorphosis of mitochondria.—*P. B. Powers.*

12490. **NOËL, R. Sur le chondriome de la cellule hépatique chez certains poissons.** *Compt. Rend. Soc. Biol.* 98(1): 49-50. 1928.—The author finds the albuminoid plastids which he has described from the liver of the mouse, in the liver of the fish as well. He considers the elaboration of these plastids to be a regular function of the chondriosomes. He also considers the peripheral granules to be of mitochondrial origin.

12491. **NOUVEL, HENRI. Observations préliminaires sur les constituants cytoplasmiques et le micrométabolisme de quelques Dicyémides.** *Bull. Soc. Zool. France* 54: 124-128. 1929.—The vacuome is generally dispersed throughout the cytoplasm. The chondriome is constituted of chondriochonts or granular mitochondria. At certain stages, the verruciform cells contain very considerable masses of lipoids. In the polar cap cells of *Dicyema typus* and at certain times for all Dicyemids there is an abundance of glycogen.—*H. Nouvel.*

12492. **PEACOCK, A. D., and R. A. R. GRESSON. The rôles of the nurse-cells, oocytes and follicle-cells in tenthredinid oogenesis.** *Quart. Jour. Microsc. Sci.* 71(4):

541-561. 3 pl., 1 fig. 1928.—Oogenesis is typical. Studies on *Pristiphora padi, Thrinax mixta, Platycampus luridiventris,* and *Allantus pallipes* indicate that secondary or accessory nuclei have a 3-fold origin, namely, from the nuclei of oocytes, nurse-cells, and follicle-cells. In *Thrinax mixta* and *Platycampus luridiventris* the oocyte nucleoli give rise to buds which become free. In *Allantus (Emphytus) pallipus* the buds pass through the nuclear membrane and form accessory nuclei. Some of the follicle-cells surrounding the last oocyte in *Pristiphora padi,* and the 5th, 6th, and 7th of *Thrinax mixta,* contain dark-staining granules which pass out of the follicle-cell into the egg, and there appear as accessory nuclei. After the chamber oocyte connection has been fully established, some of the cytoplasm of the nurse cells together with accessory nuclei passes through it to the oocyte. Finally the residual cytoplasm and its contained nuclei follow, and are absorbed by the egg.—*R. H. Chipman.*

12493. PENNYPACKER, MIRIAM I. The germ cells in the hermaphroditic gland of Polygyra appressa. *Jour. Morph. and Physiol.* 49(2): 415-453. 2 pl., 4 fig. 1930.—The ♂ and ♀ germ cells of *Polygyra appressa* were found together in the acini from the time the snails were 5 mm. in width onward, and their development traced backward to the gonial stage, in which the aspect of the ♀ cells, present in small numbers in the acinus wall, and the ♂ cells, in greater numbers in the lumen, seems identical. In oocytes, differentiation involves the enormous increase in volume of cell, nucleus, and plasmosome; the appearance of yolk and of a secondary nucleolus attached to the first one, and, in some cells, various other nucleoli, attached to the chromosomes. Meanwhile the chromosomes become diffuse and spread into the interior of the nucleus, finally condensing again on the periphery. Various technical methods produced interesting variations in the aspect of oocyte chromatin and nucleoli. The appearance of the Nebenkern in spermatocytes during the growth period was noted, but no indication of its presence discovered in oocytes until the fairly late growth period. The chromosome forms were noted in spermatogonia, first spermatocytes and oocytes, and their numbers found to be 61-63, 31, and 31, respectively, but no clear dividing oogonia were found, on which similar observations could be made.—*Author (courtesy Wistar Bibl. Serv.).*

12494. POLLISTER, ARTHUR W. Cytoplasmic phenomena in the spermatogenesis of Gerris. *Jour. Morph. and Physiol.* 49(2): 455-507. 6 pl. 1 fig. 1930.—The history of the cytoplasmic components in the spermatogenesis of *Gerris* is, in general, like that which has been described in the Pentatomidae. The observations of fixed material have been checked by extensive studies of freshly teased preparations. During the spermatocyte growth period the chondriosomes undergo considerable increase in mass. During the maturation divisions the chondriosomes are remarkably constant in orientation with respect to the centrioles. The nebenkern arises by fusion of chondriosomes differentiated into chromophilic and chromophobic portions. The Golgi bodies of the earlier spermatocytes are vesicular bodies, the peripheries of which are osmiophilic. These are not visible in fresh preparations, but the masses resulting from their fusion in the late prophase of the first division are visible in the unfixed cells. The non-osmiophilic material inside these masses stains with neutral red in fresh preparations. Only the osmiophilic part of the Golgi masses is involved in the fragmentation to form dictyosomes. There is very suggestive evidence that the process of acrosome synthesis largely takes place inside the sac-like acroblast (Golgi apparatus). In the spermatid, material which stains, in fresh preparations, like the acroblast is never seen, except inside or attached to the acroblast, where it appears in the form of small spheres of "pro-acrosomic" material, which fuse to form the acrosome.—*Author (courtesy Wistar Bibl. Serv.).*

12495. PORT, JAAN. Untersuchungen über die Plasmakoagulation von Paramoecium caudatum. *Acta Inst. Horti Bot. Univ. Tartuensis (Dorpatensis)* 1(4): 1-52. 1 fig. 1928.—The coagulation time was determined with a horizontal ultra-microscope, by noting when the animals fell inactive to the bottom of a small capillary tube. In Spek's medium pH 7.7 was found to be the optimum for growth and coagulation by heat was slower. pH 6.8 and 8.4 were the limits for life in this medium. Between pH 7.7 and 6.8 the coagulation time is shorter from 38°-40° C. and longer from 42°-44° C. Between 7.7 and 8.4 the coagulation time is always shorter. The reaction of the medium influences permeability and hence is a factor in the toxicity of the added salts. These facts also apply to plant cells. The activity of the vacuoles increases at the beginning of coagulation, but soon slows as the animal dies. In an alkaline medium coagulation starts at the surface and proceeds towards the center, and vice versa in acid media. Light increases the coagulating action of neutral salts.—*J. M. Ort.*

12496. SAEZ, FRANCISCO ALBERTO. El estudio de los cromosomas. *Rev. Soc. Argentina Cien. Nat.* 8: 481-502. 4 pl. 1927.—Various methods of microtechnique, especially those of McClung, Painter, Oguma and Kihara, Winiwarter, Allen, Hance, and Belling, were employed in studying the chromosomes of So. American orthoptera, especially Acrididae of the genera *Romalea, Schistocerca,* and *Elaeochlora,* others of the group of Tryxalinae, some locusts and crickets, root tips of onions, and gonads of cats, rabbits, and guinea pigs. These methods are reviewed in some detail and made available in Spanish.—*W. R. Horlacher.*

12497. SAEZ, FRANCISCO ALBERTO. Nota sobre los complejos de cromosomas en cuatro especies de ortópteros ("Acrididae") del Río de la Plata. [Chromosome complexes of four species of Orthoptera ("Acrididae").] *Arch. Soc. Biol. Montevideo* 2(1): 35-43. 1930.—Four genera of South American Acrididae, *Schistocerca paranensis,* Burm., *Elaeochlora viridicata* Serv., *Diedronotus discoideus* Serv., and *Chromacris miles* Drury, were studied and found to have 23 spermatogonial chromosomes each, arranged in graded series.—*I. Corey.*

12498. SAEZ, FRANCISCO ALBERTO. Investigaciones sobre los cromosomas de algunos ortópteros de la América del Sur. I. Número y organización de los complejos en cuatro géneros de Acridios. *Rev. Mus. La Plata* 32: 317-361. 1 pl. 1930.—*Schistocerca paranensis, Elaeochlora viridicata, Diedronotus discoideus,* and *Chromacris miles* each have 23 spermatogonial chromosomes. *S. paranensis* has 3 small pairs, 5 median, 3 large, and the unpaired accessory; *E. viridicata* has 2 small pairs, 4 intermediary, 3 medians and 2 large; *D. discoideus* has 3 pairs of small elements, 5 medians and 3 large. In the 4 spp. mentioned, all the gonial chromosomes are telomitic rods. The chromosomes of *Elaeochlora* are longer than those of *Schistocerca.* The same has been observed in *Chromacris* compared with *Diedronotus.* In the first spermatocyte the 11 tetrads and 1 dyad, typical of the Acrididae, are presented in the 4 species. Variation has been observed in the form of the ring elements, which differ in number in the same individual. The behavior of the elements also varies in the individual. None of the 4 spp. have heteromorphic pairs. It has not been possible to establish the manner of segregation of homologues during maturation. The accessory chromosome always maintains its typical individuality clearly. In the 1st mitosis it always passes, undivided, to 1 pole. In the 2nd spermatocyte it divides equationally. In each sp., the relations of size and form are clearly shown in the 2nd spermatocytes, the constancy observed in the homologues of the spermatogonia being maintained. Each of the genera possesses a special individuality in cellular organization, being parallel with the stable taxonomic position of each genus.—*From author's summary (transl.).*

12499. SAYLES, LEONARD P. Double nucleoli and mitosis in cells of the alimentary tract of Lumbriculus following dilution of the body fluids. *Jour. Exp. Zool.* 58(1): 487-494. 1930.—Distilled water was injected into the coelom of each individual through one spot in the

body wall. The level of injection varied from the 14th to the 15th segment. The only difference in the treatment of control individuals was the substitution of unmodified Ringer fluid for distilled water. All specimens thus far studied were killed between 18 and 48 hours after treatment. In almost every instance several hundred double nucleoli and a correspondingly large number of mitoses were found among the gut cells near the point of injection of water. In similar regions of controls less than 50 double nucleoli and not more than 3 or 4 mitoses were present. These experiments, therefore, offer further evidence in support of the theory that, in *Lumbriculus* at least, dilution of the body fluids is an important factor in arousing cells to regenerative activity.—*Author (courtesy Wistar Bibl. Serv.).*

12500. SHARGA, U. S. Cytoplasmic inclusions in the oogenesis of Pheretima posthuma. *Allahabad Univ. Stud.* 4: 177-190. 3 pl. 1928.—In young oogonia of this earthworm both Golgi bodies and mitochondria appear in juxtanuclear areas. The latter are clearly defined in the early oocyte, where the mitochondrial cap spreads out in a perinuclear position. Later it migrates away from the nuclear membrane and is distributed in the general cytoplasm. The Golgi apparatus spreads out into the cytoplasm in a haphazard manner. No evidence has been found that the Golgi bodies or mitochondria arise "de novo." Neither intra vitam nor the usual fixation methods reveal the presence of neutral fat or yolk. The Golgi elements are less osmiophile than in many other animals. In fully developed eggs they are always spherical. The mitochondria are non-filamentous, but granular. There are no visible nucleolar extrusions into the cytoplasm.—*H. I. Corey.*

12501. SKOWRON, S. Recherches sur la spermatogenèse in vitro. I. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (II) [Zool.]* 1929 (8/10) : 487-499. 10 fig. 1929.—First spermatocytes of *Helix pomatia* have large pseudopodia and are motile. Mitochondria and the Golgi apparatus can be distinguished. Chromosomes refract light strongly. Late prophase chromosomes are clumped laterally near the nuclear membrane, which then completely disappears. At metaphase the spermatocytes have no pseudopodia. Protoplasmic currents often displace mitochondria and shift the position of spindle and chromosomes. There is an increase in size of cell and nucleus in spermatocytes of the 2nd order. The time required for the different stages is given. Increased temp., or ether, diminishes the viscosity and surface tension of protoplasm. Often parts of the cytoplasm break off from the rest of the cell, and cytolytic disintegration of the cells occurs. There is a differential susceptibility to heat at different stages of division; the resting cell is less sensitive than the dividing. At high temp. tripolar or tetrapolar mitoses occur, followed by division. The cells thus arising continue to develop normally. Nuclear division has been observed to occur without corresponding cytoplasmic division.—*K. Jeffers.*

12502. STAEMMLER, M. Über physiologische Regeneration und Gewebsverjüngung. *Beitr. Path. Anat. u. Allgem. Path.* 80 (3) : 512-569. 2 pl. 1928.—Concerns the relation of tissue regeneration to mitotic division. In heart and skeletal muscle of man, double or multiple nuclei occur, and in the liver and kidney binucleate cells are not uncommon. These conditions are not pathological nor related to age, except that they are absent in the fetus and newborn. The binucleate or multinucleate condition apparently arises by amitosis without cytokinesis. It is concluded that in various tissues and organs there is a periodic renewal of the nuclear apparatus by amitosis and a consequent rejuvenation. Literature on occurrence of binucleate and multinucleate cells in vertebrate tissue and on the rôle of amitosis is presented.—*L. H. Hyman.*

12503. WALTER, LADISLAUS. Ciliogenesis in a cystically dilated hydatid of Morgagni. *Anat. Rec.* 42 (2) : 177-187. 2 pl. 1929.—This article contains a description of ciliogenesis in the adult ♀ tube and in the hydatids of Morgagni, according to the type mentioned by Benda and Ikeda. The diplosome sinks from the surface to the inner part of the cell, there divides and forms a granule aggregation. The dumb-bell-shaped matted granules rise to the surface of the cell and sprout cilia.—*Author (courtesy Wistar Bibl. Serv.).*

12504. WILSON, EDMUND B. The question of the central bodies. *Science* 71 (1852) : 661-662. 1930.—Brief discussion of the problem of the central bodies (centrosomes, centrioles) based on a critical re-examination of Mead's original preparations and drawings of maturation, fertilization and cleavage in the *Chaetopterus* egg. The results confirm Mead's account at every point and sustain his conclusions as against the view that the central bodies are either artifacts or random granules.—*E. B. Wilson.*

12505. WU, CHAO-FA. Cytological studies on the spinning glands of the larva of Galleria mellonella: respective rôles played by the nucleus, the Golgi apparatus, and the mitochondria during secretion. *Jour. Morph. and Physiol.* 49 (1) : 509-541. 3 pl. 1930.—Spinning in *Galleria* begins shortly after hatching and continues throughout larval life. The gland cells secrete continuously, irrespective of the act of spinning. The nucleus plays a direct and an important rôle in silk secretion by the migration of nucleoli into the cytoplasm, where they enlarge and synthesize a fatty material in the center; the fatty material is transformed into a non-soluble basophilic substance, which then changes into the secretory product in its final form. The processes of converting the fat into non-soluble substance and of converting the latter into the secretory product progress inwardly from the periphery of each secretory body. The secretory bodies or masses of secretory material break up into smaller and smaller masses and eventually into a fine dispersed state before their entrance into the lumen of the gland. The mitochondria are granular in the cells of the conductive portion and filamentous in those of the reservoir and secretory portions of the gland. In the secretory portion they are oriented with the long axis toward the gland lumen. Their rôle in silk secretion is negligible or at most a minor one. The Golgi apparatus is in the form of discrete ring- and half-ring-shaped bodies and remains so during all stages of secretion. If it plays any rôle in silk secretion, the fact has not been detected by the author.—*Author (courtesy Wistar Bibl. Serv.).*

12506. ZIRKLE, CONWAY. Fixation images with chromates and acetates. *Protoplasma* 5: 511-534. 2 pl., 1929.—Bichromates which exist in solution only on the acid side of a critical range (pH 4.2-5.2) fix with an image differing only in minor details from that of chromic acid. Reversal of the image is as a rule sudden and complete and occurs at different points with different bichromates. With certain bichromates the 2 images overlap. Copper, glucinum, cerium, and zirconium (reduced?) bichromate fix nuclear lymph, nucleoli, dividing chromatin, mitochondria and hyaloplasm. Nickel and zinc bichromate have predominately the basic image but the former gives also swollen chromosomes at metaphase and anaphase and the latter hollow chromosomes at metaphase. Bichromates with the following cations give acid images, Th^{++++}, U^{++++}, Zr^{++++}, Fe^{++}, UO_2^{++}, Hg^{+} and Cr^{+++}. Cobaltous bichromate gives an acid image and in addition fixes some mitochondria in the central cylinder. Zirconium bichromate when reduced with a little alcohol gives an image with both acid and basic element preserved. Nickelous bichromate has a basic image except as noted above.—*Author's summary.*

12513. KARPER, R. E., and A. B. CONNER. Inheritance of chlorophyll in sorghum. *Genetics* 16(4): 291-308. 2 fig. 1931.—Data on the occurrence and inheritance of the various chlorophyll characters so far studied in sorghum are presented. White seedlings seem to be the most frequent type of chlorophyll mutation in sorghums, and those found were simple Mendelian recessives. Two types of virescent seedlings, v_1 (virescent white) and v_2 (virescent yellow), are both simple recessives. Two types of yellow seedlings, one found in Sudan grass and one in kafir, of different phenotypic expression, are assigned different genetic factors, y_1 and y_2. Both are of simple inheritance and lethal. White seedlings in Sudan grass gave ratios indicating as many as 3 pairs of multiple factors involved, but if present, they could not be determined and separated because of weakness of the stock. An albino factor, acting as a zygotic and gametic lethal, is probably a better explanation of the peculiar ratios obtained. A virescent yellow Sudan grass, in which the homozygous recessive survives to maturity, is apparently due to a single gene. A chlorophyll deficiency in sorghum not transmitted through the pollen but strictly maternal in inheritance produces normal, yellow, and striped green and yellow seedlings, depending upon the nature of somatic tissue upon which the seed are borne. The factors *R* (red stem) and *w* (albino) were found to be linked with a crossing-over of 41.34%. Linkage has not previously been reported in sorghum. The frequency and diversity of chlorophyll recessives recently found in sorghum suggest a parallelism with the many types found in maize. Sorghum is largely self-fertilized, and while chlorophyll-deficient types are not so numerous as those found when maize is selfed, they are quite common and, apparently, the result of frequent mutation. These characters in sorghum are apparently not already present in the heterozygous condition, since lines or strains inbred and under observation for a number of generations without showing any chlorophyll-deficient types seem suddenly to mutate to the recessive form, and in some instances, while stock was being studied for one type of recessive, a gene mutation giving rise to another type has occurred.—*R. E. Karper.*

12516. MONSCRIEFF, R. SCOTT. The chemical effect of a Mendelian factor for flower colour. *Nature [London]* 127(3217): 974-975. 1931.—In *Pelargonium zonale,* scarlet-flowered varieties have the pigment pelargonin; a violet-red variety contains cyanin, differing from pelargonin only by the possession of 1 more OH group. A rose-pink variety, "Constance," containing cyanin+flavone, selfed, gave 17 rose-pink and salmon-pink offspring, the pigment of the latter being pelargonin+a trace of flavone. Evidently the latter flower color is recessive, and the effect of the factor concerned is to substitute OH for H on the anthocyanidin nucleus.

12517. NIEWIAROWICZ, LEON. Doświadczenie nad chowem krewniaczanym żyta. [Experiments on the ancestry of rye.] *Roczniki Nauk i Leśynch (Polish Agric. & Forest. Ann.)* 15(3): 554-585. 1 pl. 1926.

12518. PATWARDHAN, G. B. A preliminary note on inheritance in castors. *Jour. Indian Bot. Soc.* 10(2): 100-109. 1 pl. 1931.—This is a report of incidental results obtained in breeding *Ricinus communis* at Poona to secure high yield and high oil content. In the cross spiny × spineless, F_1 plants all showed intermediate dominance of spininess, i.e., sparse distribution on the capsule. In bloom × bloomless, single bloom is dominant to no bloom, and treble bloom is dominant to double bloom Single bloom is defined as bloom on the stem, petiole, and peduncle; double bloom is bloom on the lower leaf surface also; treble bloom is bloom on both leaf surfaces. Green fruit × bright pink fruit gave pink capsules in the F_1, and 3 green to 1 pink in F_2. Red or purple stem × green stem gave in the F_2 3 "all grades of red up to dark purple-red" to 1 green. —*W. Dudgeon.*

12523. **WOLTERECK, R.** Bemerkungen über die Begriffe "Reaktions-Norm" und "Klon." *Biol. Zentralbl.* 48(3): 167-172. 1928.—Exception is taken to the meanings attached to these terms by certain investigators. "Reaction Norm," introduced by the author in 1909 as the physiological expression for Johannsen's "Genotype," the kernel of the expression lying in the idea of immutability, is wrongly used by E. Stein when she refers to certain irreversible changes in *Antirrhinum*, brought about by radium treatment, which were carried over to the asexually produced offspring, as changes in the Reaction Norm. The changes were due rather to a complex of internal and external conditions which varied for each object exposed and they disappeared with the next sexual generation unless it was likewise subjected to the same treatment. Shull and Webber call the asexual offspring of a single plant a "Clone." The confusion of unisexual (parthenogenesis) with asexual reproduction has led to giving the name "Clone" likewise to a succession of generations arising from a single female gamete. True clones are ruled out in the study of mutations and the same is done with these so-called "Clones." This is unwarranted, because bisexuality is not a sine qua non for mutation, e.g., bacteria. It is misleading, however, to call parthenogenetic lines clones, i.e., organisms without successions of generations and without the essentials of true inheritance, viz., alternation between concentration of the whole germ in one matrix and development of the soma from this one-cell matrix.—*P. H. Yancey.*

ANIMAL (EXCEPT MAN)

12527. **[AGOL, I. I.]** АГОЛ, И. И. Ступенчатый аллеломорфизм у Drosophila melanogaster. [Step allelomorphism in Drosophila melanogaster.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5(2): 86-101. 2 pl. 1929.—In the F_1 from the cross x-rayed yellow ♂ × double yellow (*yy*) ♀, 1 ♂ with reduced bristles was obtained which, as well as his offspring, in general resembled sc^1, sc^2, sc^3, flies but differed from them by the high reduction of head, sides, scutellum and post-alar bristles. This new gene (sc^4) in compounds with other scutes gave reduced bristles on parts of the body where reduction was common to both, and reversion to the wild type for characteristics not common to both genes. Thus sc^4 is partially allelomorphic to other scutes and belongs to the series of "step allelomorphs" previously described by Serobrovsky and Dubinin, according to whose hypothesis the genes of this series are located not in identical but in somewhat displaced loci of homologous chromosomes. The author concludes that the gene is not homogeneous but is composed of separate parts, each having independent action on definite parts of the organism.—*G. A. Lebedeff.*

12528. **AGOL, I. J.** A case demonstrating the absence of somatic induction in Drosophila. *Amer. Naturalist* 65(696): 88-92. 1931.—An x-rayed apricot ♂ crossed to 4 double-yellow attached-X ♀♀ produced yellow ♀ offspring and 304 phenotypically white ♂♂. Analysis showed the white to be due to the interaction of apricot and a mutation identical or allelomorphic to ruby. This had occurred in the early development of the apricot male in that part of the chromatin destined to enter the germ cells and after the separation from it of the chromatids which were to form the optic anlage. The somatic tissue of the fly was apricot, the germinal tissue apricot-ruby (phenotypically white).—*W. P. Spencer.*

12529. **[BELYAEV, M. M.]** БЕЛЯЕВ, М. М. О наследовании бесхвостости у домашней кошки. [Inheritance of taillessness in the domestic cat.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(1): 25-28. 1930.—The conclusion of Castle and Bateson that short tail in cats is inherited as a single dominant factor is confirmed. A normal ♀, with a tail 52% the length of her body, crossed with a ♂, with a tail 5% the length of his body, gave 4 kittens with tails 2, 18, 50, and 53% of body length at the age of 6 weeks, i.e., 2 normal and 2 short-tailed. Evidently the female was heterozygous (*Aa*). A cross between 2 short-tailed cats gave 4 kittens with tails of 0, 11, 28, and 47% of body length, thus showing ideal 3:1 segregation, short to normal. A cross between a homozygous tailless ♀ with a normal ♂ gave 4 embryos, and later 3 kittens, all with short tails.—*G. A. Lebedeff.*

12530. **BONTEMPO, ETALIANO.** Un caso di mutazione morfologica nella razza suina pugliese. *Riv. Zootecnia* [*Firenze*] 8(7): 273-277. 2 fig. 1931.—The Puglia hog has an arched back, generally black bristles, but not rarely it is a dirty white with black on the rump. A mutation with concave back was bred to a normal sow. The offspring were: 4 with a strongly concave back, 2 with moderately concave back and 1 with the back slightly concave. The mutant type of back is considered dominant.

12531. **[BORISEN'KO, E. YA.]** БОРИСЕНЬКО, Е. Я. Исследование аутосомной геновариации Radius incompletus у Drosophila melanogaster. [English summary.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(2): 115-138. 1930.—Autosomal recessive mutation, "Radius incompletus," arose in a wild Caucasus line of *D. melanogaster*, and is characterized by incomplete development of the second longitudinal vein of the wing; gene "*ri*" is located in the 3rd chromosome (locus 45.66). Variation in the degree of vein incompleteness was found to be merely phenotypical.—*G. A. Lebedeff.*

12532. **DANFORTH, C. H.** The manifestation of a sex-linked trait following skin transplantation. *Jour. Heredity* 20(7): 319-322. 2 fig. 1929.—Feathers produced after skin transfer from a ♂ to a ♀ chick developed a sex-linked trait of the donor, a sex-limited trait of the host. The importance of such traits as criteria of sex reversal is emphasized.—*C. H. Danforth.*

12533. **DANFORTH, C. H.** Bantam genetics; distribution of traits on a Sebright-Mille Fleur cross. *Jour. Heredity* 20(12): 572-581. 4 fig. 1929.—Descriptions are given of the F_1's of various bantam crosses among the descendants of a Sebright × Mille Fleur cross, involving size, color, comb form, hen-feathering in the male, leg-feathering, brachydactyly, and vulture hock. In some cases F_2 data are given and the results of skin grafting and castration experiments on feather form and coloring are presented. In addition to white spangling, which occurred in connection with all other patterns, 6 other types of coloration were found in the ♀ plumage. Cocky phases were determined for all but one of the corresponding ♀ types.—*L. M. Dickerson.*

12534. **DELACOUR, J.** Notes sur quelques hybrides. *Rev. Hist. Nat. Appl. Pt. 2. Ornithol. Avicult. l'Oiseau* 8(9): 276-284. 1927.—The following hybrids, made by

the author over a period of more than 20 yrs., are described: *Pavo muticus* × *P. cristatus; Lophophorus impeyanus* × *Gallus gallus; G. varius* × *G. gallus; G. sonnerati* × *G. gallus; Diardigallus diardi* × *Gallus gallus; Syrmaticus soemmeringi scintillans* × *S. reevesi; S. mikado* × *S. ellioti; Chrysolophus pictus* × *Phasianus c. colchicus; Hierophasis edwardsi* × *H. swinhoei; Gennoeus leucomelanus* × *G. horsfieldi; Tragopan temminckii* × *T. satyra; Columba speciosa* × *C. maculosa; Chloephaga rubidiceps* × *C. magellanica; C. magellanica* × *Alopochen aegyptiacus; Asarcornis scutulata* × *Anas platyrhynchos; Dendrocygna viduata* × *Metopiana peposaca; Anas poecilorhyncha* × *A. undulata; A. falcata* × *A. penelope; A. falcata* × *A. strepera; A. americana* × *A. penelope; A. sibilatrix* × *A. sponsa; A. spinicauda* × *A. sibilatrix; A. bahamensis* × *A. spinicauda; A. bahamensis* × *A. brasiliensis; A. flavirostris* × *A. crecca; A. flavirostris* × *A. castanea; A. flavirostris* × *A. spinicauda; Metopiana peposaca* × *Netta rufina; Nyroca americana* × *Metopiana peposaca; Nyroca fuligula* × *N. americana; N. marila* × *N. americana; N. marila* × *N. affinis.*

12535. **DEMEREC, M., and J. G. FARROW. Non-disjunction of the X-chromosome in Drosophila virilis.** *Proc. Nation. Acad. Sci.* 16(11): 707-710. 1930.—The frequency of primary non-disjunctions was 1 in about 1500 individuals; ♀: ♂ ratio for primary non-disjunctions was 1: 19; primary ♂♂ were sterile; frequency of secondary non-disjunctions was 1 in 1120 individuals; ♀: ♂ ratio approximately 1: 1.—*C. V. Beers.*

12536. **DEMEREC, M., and J. G. FARROW. Relation between the x-ray dosage and the frequency of primary non-disjunctions of X-chromosomes in Drosophila virilis.** *Proc. Nation. Acad. Sci.* 16(11): 711-714. 1930.—At low dosages the increase in the percentage of primary non-disjunctions was almost proportional to the x-ray dosage applied. Between 1200 and 2000 r-units the increase in non-disjunctions is smaller and the fertility of treated flies declines. Suggests that flies which would have shown non-disjunctions are killed off in larger proportion than regular offspring.—*C. V. Beers.*

12537. **[DUBININ, N. P.]** ДУБИНИН, Н. П. **Исследование явления ступенчатого аллеломорфизма у Drosophila melanogaster. [Phenomenon of step-allelomorphism in Drosophila melanogaster.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5(2): 53-85. 7 fig. 1929.—In the F_1 from the cross x-rayed beadex ♂ × $\frac{ju}{sc\ t\ vsl\ Bcl}$ ♀, one ♀ scute (sc^2) was found which differed from the normal scute in that it had reduced bristles in places where the normal scute had not, and normal head bristles which are usually reduced in normal scute. From the cross $\frac{sc^2\ Bx}{sc^1 w}$ × yellow ♂♂, the following results were obtained: ♂♂ 36 $sc^1 w$, 23 $sc^2 Bx$, 3 sc^3 and 35 $sc^1 wBx$; ♀♀ 64 *Bx* and 79 wild. 3 sc^2 ♂♂ had banded wings and were sterile. Males which had non-crossover x-rayed chromosome were fertile, while males with only the left-hand part of x-rayed chromosome (with new sc^2 gene) were sterile. In the F_1 of the cross x-rayed vermillion ♂ × $\frac{sc^1 w}{sc^1\ t\ vsl\ Bcl}$ ♀♀, one of the $\frac{sc^1 w}{v}$ ♀♀ had reduced bristles on the head and abdomen, but on the scutellum the number of bristles was normal. In general the effect of this new gene, sc^3, is more pronounced than other scute allelomorphs. Further studies showed that sc^3 is localized in the left end of the X-chromosome and manifested only in combinations with other scutes. sc^3 has semi-lethal effects on ♂♂. Biometrical studies showed that these 3 genes have different quantitative and qualitative effects on bristles in various parts of the body. The nature of these genes was found in studying them in combinations. Instead of obtaining the expected intermediate type, as is usual in crosses when two genes of the same series of allelomorphs are involved, partial reversion to the wild type was obtained from flies with different scutes, e.g., in sc^3 flies the 1st notopleural bristle is almost completely reduced; in sc^2 flies it is normal; while in the combination $\frac{sc^3}{sc^2}$ this bristle is normal, as in sc^3. The dominance of a character is found in all cases where the difference is in quality, while in all cases of quantitative differences between scutes the degree of reversion to the wild type is somewhat different; e.g., in sc^1 flies ocellar bristles are reduced on the average in 98%, and in sc^3 flies in 44%, while in combinations in 35%. Thus in combinations reversion to the wild type is only partial. Every gene of the scute series in combinations is manifested doubly: that part of a characteristic of a given scute which coincides with a characteristic of the other allelomorph is expressed in the combination; the other part which is normal in other scute allelomorph reverts to the wild type. Thus one part of a scute gene, e.g., $\frac{sc^1}{sc^2}$, is in a heterozygous condition, and the other part, which is manifested in a combination, is in a homozygous condition. Such a homo-heterozygous condition of the parts of the gene is due to their having non-corresponding loci in the chromosome. This is noticeable in $\frac{sc^2}{sc^3}$ combinations, which are almost normal with the exception of reduced bristles on the abdomen. The yellow gene which reduces dorso-central bristles also belongs to this series of step-allelomorphs.—*G. A. Lebedeff.*

12538. **[GAISINOVICH, A.]** ГАЙСИНОВИЧ, А. **Ступенчатый аллеломорфизм у Drosophila melanogaster. [Step-allelomorphism in Drosophila melanogaster.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(1): 15-24. 1930.—In the F_1 from the cross x-rayed yellow ♂ × double yellow (yy) ♀, a scute ♂ was obtained which established a line which in general resembled sc^1, sc^2, sc^3, and sc^4, but differed from them by the number of reduced bristles in different parts of the body. This new gene (sc^5) in combinations with other scutes (e.g., $\frac{sc^5}{sc^4}$) gave reversion to the wild type only for characteristics not common to both genes. Thus sc^5 was found to belong to the series of "step allelomorphs" (Serebrovsky, Dubinin, Agol) and located not in an identical but somewhat displaced locus in regard to other scute genes.—*G. A. Lebedeff.*

12539. **GOWEN, JOHN W. Genetic non-disjunctional forms in Drosophila.** *Amer. Naturalist* 65(698): 193-213. 10 fig. 1931.—Abnormal individuals with anatomical changes consisting largely of overgrowth or undergrowth of wings, bristles, eye grid, and reproductive organs appear sporadically and in ratios to the normal varying from 1 in 25 to 1 in 100 in a special stock of *D. melanogaster.* Fertility is reduced and life shortened in affected individuals. These variations are associated with a change of chromosome numbers, there usually being 12 instead of the usual 8. A 3rd chromosome recessive gene brings about these chromosome changes at maturation division.—*I. M. Burgess.*

12540. **HANSON, FRANK BLAIR, and ELVENE WINKLEMAN. Visible mutations following radium irradiation in Drosophila melanogaster.** *Jour. Heredity* 20(6): 277-286. 6 fig. 1929.—A total of 49 germinal mutations arising from males treated with radium and mated to double-X yellow females or from the C 1 B stock of an experiment on lethal mutations are reported. They have been separated into sex-linked and autosomal groups.—*Author's summary.*

12541. **HARRIS, B. B. The effects of x-rayed males upon mutation frequency in Drosophila.** *Jour. Heredity* 20(6): 299-302. 1 fig. 1929.—In tests on the effect of "aging" x-ray treated germ cells on frequency of sex-linked lethals, no correlation was found between the production of mutations in spermatozoa and their viability or the duration of their functional capacity. The testes of the adult ♂ contain both mature spermatozoa and immature germ cells, some of which undergo repeated divisions in the adult testis before maturity.

X-rays are more effective in producing transmissible gene mutations and chromosome abnormalities in the mature spermatozoa than in immature cells. The distribution of mutations in different regions of the X-chromosome are in accord with similar results reported by Muller.—*L. M. Dickerson.*

12542. **HERIBERT-NILSSON, NILS. Sind die induzierten Mutanten nur selektive Erscheinungen?** *Hereditas* 15(3): 320-328. 1931.—Concerning the experimental production of mutants in recent years by various agencies, the author holds that the appearance of new types may not be due to increased mutability, but may be a selective phenomenon, the agency applied killing off a large portion of the non-mutated types and thereby increasing the percentage of rare segregates. The basis for this supposition is the result of experiments in which high temperature, 36-36.5°C., was applied to cultures of *Drosophila melanogaster*. The types used were wild-type, +, and yellow body, white eye, yw. After 24 hours' treatment twice as many yw flies hatched as +; after 48 hours' treatment no + flies hatched, only yw. The larvae of the yw are more resistant to temperatures than the + type. During the first three days only yw flies hatch, which shows that this type is more resistant to heat in the period most effective for inducing mutants. The temperature treatment thus increases the number of mutant types in relation to the normal. This effect is compared with that of keeping for several years seed of *Oenothera*. Germination is reduced, but the number of mutants thrown is increased. These phenomena are similar, selective, not mutative. —*H. Wexelsen.*

12543. **HERSH, A. H. Facet number and genetic growth constants in bar-eyed stocks of Drosophila.** *Jour. Exp. Zool.* 60(2): 213-248. 1931.—Analysis of data on facet number in the dorsal (x) and ventral (y) lobes of the eye of fifteen bar stocks, differing in the Xple genes (scute, echinus, crossveinless, cut, vermillion, garnet), discloses a power function, $y=bx^k$, in which b and k (genetic growth constants) take different values in the different stocks; they differ also in males and females. b is a decreasing exponential function of k, showing about 36 per cent and about 43 per cent decrease per 0.1 unit increase in k, in females and males, respectively. Mean facet number for the entire eye plotted against k gives a periodic curve with decreasing amplitude which oscillates quite regularly (in females, at least) about the average for forked bar, the base of reference. For females the amplitude is about thirty facets; logarithmic decrement about 0.062; one full cycle covers about $0.20k$. Similar values for the males follow: amplitude about 50 facets; logarithmic decrement about 0.056; one full cycle covers about $0.25k$. An interpretation of the power, exponential, and periodic functions is given in terms of the distribution of growth.—*Author (courtesy Wistar Bibl. Serv.).*

V.)]** [German summary.] Труды Лаборатории Экспериментальной Биологии Московского Зоопарка (*Trans. Lab. Exp. Biol. Zoopark, Moscow*) 5: 217-234, 21 fig. 1929.—Experiments were conducted on 2 Siamese cats (♂ and ♀). Low temperature environment (−3° to +16° C.) resulted in 2½ mos. in darker pigmentation, especially of extremities. Local application of high temp. resulted in light pigmentation or complete depigmentation of hair on the heated spot. Observation of the offspring (5) showed the following order of pigmentation development: muzzle, ears, tail, paws, back, sides, abdomen, axillae. The authors conclude that the pigmentation of Siamese cats is truly acromelanistic, and is determined by external temp. and physiological thermo-regulating factors. Cutting of the neck sympathetic nerve caused growth of depigmentized hair instead of black. The difference in pigmentation of various body regions is due to variety in thresholds of tissue irritability. In the young, change in coloration with age is determined by the access of temperature stimulus; thus, newborn Siamese cats are wholly white, due to the high intra-uterine temp., but in the post-uterine life their hair becomes pigmented according to the sensitivity of various parts of the body to the lowered temperature.

12548. **LARSEN, L. HANSEN.** Danish progeny performance tests and their bearing on the practice of dairy cattle breeding. *Internat. Dairy Congr. Eng. Ed.* 1931 (Sect. 1): 117-127. 1931.—In Denmark every year, progeny performance tests (P.P.T.) are worked out for 3-400 bulls, mainly of Red Danish Milk Breed. P.P.T. indicates that certain bull-lines and cow-families are highly homogeneous, others highly heterogeneous for one or more desirable characters; thus, the P.P.T. directs attention to bulls and bull-lines possessing the valuable factors and simplifies the estimation of the value of an animal's pedigree. When estimating a bull's transmitting ability for dairy characters, use of records of dam, grand-dam and sire's dam alone permits only 40% correct prediction; this increases to 60% if the sire's P.P.T. is taken into account.—*Author's summary.*

12549. **LUCE, WILBUR M. The temperature-effective period in infrabar and its heterozygotes.** *Jour. Exp. Zool.* 59(3): 467-498. 1931.—In the bar-eyed races of *Drosophila melanogaster* the ommatidial number in the adult flies is dependent upon the temperature to which the larvae are subjected during development. By allowing the larvae to start their development at one temperature and then transferring them at intervals to another to complete their development, the period during which temperature affects ommatidial number was determined at 17°, 22°, and 27°C. for homozygous infrabar and for infrabar-by-bar heterozygotes. In the cross between infrabar and bar, the bar factor is nearly completely dominant. In both homozygous infrabar and heterozygotes between infrabar and bar the effective period for temperature is proportionately longer at lower temperatures. In infrabar the relative position of the termination of the effective period remains constant while that of the initiation varies inversely with temperature. In the heterozygotes the relative position of both the termination and initiation varies with temperature. In the heterozygotes the major effect of temperature appears to be upon the processes that initiate and terminate the effective period, and the effect upon the facet-forming process itself is slight; while in infrabar the major effect seems to be an acceleration of the facet-forming process, and the differential effect upon the length of the effective period is slight.—*Author (courtesy Wistar Bibl. Serv).*

12550. **MARCHLEWSKI, T. Genetic studies on the domestic dog.** *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (II)* [*Zool.*] 1930(1/2): 117-145 1 pl. 1930.—Observations are reported on the inheritance of skull type and body build

among dogs, chiefly English Pointers. The conclusion is reached that a light and narrow type of head such as is found in various breeds of sheep dogs is dominant over the more broad and dished type found in hounds and other hunting dogs, and that the difference is a genetically simple one since clear segregation occurs. The same conclusion is reached concerning body build, a lighter type characteristic of English Pointers being dominant over the heavier, broader chested German type. Compact cat-like foot is imperfectly dominant over the outspread hare-like foot of the German type. A cross involving large pendulous ear (hunting dog type) in relation to short erect ear, produces animals with small but hanging ears. Hence small is dominant over large and pendulous over erect, but no measurements are given in support of these conclusions. The author confirms the findings of other investigators that there is a dominant, as well as a recessive, yellow coat color in relation to black, and dominant as well as recessive black in relation to gray. Both dominant (harlequin) and recessive types of white spotting are recognized. Roaning and ticking (scattered groups of colored hairs on white areas) are found to be dominant. —*W. E. Castle.*

12552. **[NAZARENKO, I. I.]** НАЗАРЕНКО, И. И. Исследование новой сцепленной с полом доминантной геновариации **"Abrupt X" у Drosophila melanogaster. [New sex-linked dominant genovariation "Abrupt X" in Drosophila melanogaster.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(2): 85-113. 2 fig. 1930.—"Abrupt X," dominant sex-linked mutation (locus 3.7), was found among *y v sn* stock in 1928. Homozygous "*Ax*" flies have short veins in both wings which are often bent; posterior cross vein is often interrupted, bristles on the head, thorax and breast are missing, thorax often broad with a dent in the middle and rising at the sides. In the heterozygous *Ax,* 2nd, 3rd, and often 4th veins are normal; bristles are also normal with the exception of supraalar, orbital and dorsocentral. The dominance of the *Ax* gene is not complete, and only about 30% of the heterozygotes are distinctly *Ax*. Through selections for + and − modifiers, lines in which *Ax* was completely dominant or recessive were obtained, which the author regards as new evidence of the relativity of dominance and recessiveness. Certain results lead the author to conclude that *Ax* is due to translocation of a piece of the sex chromosome in the Notch region and its attachment to the homologous chromosome at the locus 3.7.—*G. A. Lebedeff.*

12553. **NORDBY, J. E. Quadruplet lambs.** *Jour. Heredity* 20(8): 388. 1 fig. 1929.—A Hampshire ewe gave birth to quadruplets which averaged 81 lbs. in weight 90 days later. One of the quadruplets retained for breeding produced twins and another a set of twins at one birth, triplets at another.—*L. M. Dickerson*

12554. **PATTERSON, J. T. X-rays and somatic mutations.** *Jour. Heredity* 20(6): 260-267. 1 fig. 1929.—It is demonstrated that the production of breaks in the chromosomes is one of the main biological effects of irradiation. Somatic modifications similar in every way to those produced by gene mutations are also produced by breaks in the chromosomes of heterozygous individuals. Both kinds of "somatic mutations" occur normally but at only a fraction of the rate at which they can be induced by x-rays.—*L. M. Dickerson.*

12555. **PATTERSON, J. T. The production of gynandromorphs in Drosophila melanogaster by x-rays.** *Jour. Exp. Zool.* 60(2): 173-203. 2 pl. 1931.—A study on the effect of x-raying the germ cells in the production of mosaics, including sex mosaics or gynandromorphs. It was found that treating the germ cells of one of the parents increased the frequency of the appearance of gynandromorphs about three times over that found in the untreated or control material. X-raying the X-bearing sperm cells results almost exclusively in the elimination of the treated X-chromosome from the male parts of the gynandromorphs, whereas treating the egg cells results in the elimination of the treated and untreated X-chromosomes with about the same frequency. Gynandromorphs can be produced by breaking the X-chromosome by irradiation. Such mosaics have in the male parts an extra fragment of an X-chromosome, in addition to one entire X-chromosome. Advantage may be taken of the effects of breaks to study the question of a possible sex factor in the X-chromosome An analysis of gynandromorphs and aberrant males and females produced by breakage indicates that, if there is a gene for sex, it must lie at some point on the chromosome between the loci for singed and forked or their normal allelomorphs.—*Author (courtesy Wistar Bibl. Serv.).*

12558. **[PROMPTOV, A. N.]** ПРОМПТОВ, А. Н. Плейотропная геновариация **"Polymorpha" у Drosophila funebris Fabr. [Pleiotropic genovariation Polymorpha in Drosophila funebris Fabr.]** [German summary.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5 (3/4): 149-181. 1 pl. 1929.—In the F_2 of wild *D. funebris* found in the province of Moscow, 2 mutant flies were found. One crossed with a normal gave, beginning with F_2, a line of polymorphic (pm) flies in which the wings, eyes, and legs were modified. The modification of wings varied from short veins to notches of different degrees. Often the wings were short or even rudimentary. The modifications in the eyes also varied from "rough" through reduction in the number of facets to almost eyeless. The modifications in the legs were in the tarsus; 4-2 tarsi were found. The recombination of these modifications varied, although strong modification in wings was correlated with variations in eyes and legs, and vice versa; slight modification in wings was correlated with normal eyes and legs. One basic non-sex-linked gene and several modifiers were found to be responsible for all 3 changes. Selection for one particular modification did not affect other changes. Crosses of "pm" with wild gave in F_1 normal flies; in F_2 in many cases 3:1, normal segregation. Deviation from this ratio to a great extent depended upon environment. In pm stock at 12-15°C. the % of "pm" decreased to 0%, i.e., all phenotypically were normal; at 25-26°C. the % of "pm" increased to 100%. The effect of temperature on wing modifications extends throughout the pupal stage, while its effect in modifying the eyes is limited to the first 3-4 days of larval life. Decreased nutritive value of culture media decreased the % of polymorphic flies. Cross between "pm" and 2 lines (B and D) of wild flies showed that these lines weakened the gene for "pm" in various degrees. From the cross "pm" × B in the F_2 and succeeding generations polymorphism is more pronounced than from the cross "pm" × D. Thus it is concluded that the appearance of the polymorphic fly is due to two basic factors: genotype (gene + modifiers), which determines the degree of polymorphism; and environment, effecting the conditions for the development of these changes in a certain number of individuals, i.e., determining the % of "pm" among phenotypically normal flies.—*G. A. Lebedeff.*

12559. **ROBERTS, ELMER. A zebra-horse cross.** *Jour. Heredity* 20(12): 544-548. 4 fig. 1929.—The history of several zebroids obtained in crosses between mares and a Grevy zebra (*Equus grevii*) is given. The zebroids were chocolate with black stripes, regardless of the color of the mare. They withstood the effects of hot weather better than other farm animals.—*L. M. Dickerson.*

12560. [ROKITSKIĬ, P. F.] РОКИЦКИЙ, П. Ф. Поле действия гена. [Field of activity of the gene.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5 (3/4): 182-214. 20 fig. 1929.—26 regions on the body of *Drosophila melanogaster* of which 24 were symmetrically placed on each side of the body and 2 on the axis were considered as the fields of activity of the genes Polychaeta, Notch$_8$, and Hairy-wing, increasing the number of bristles; Dichaete and scute decreasing the number of bristles; and split-bristle gene (*Shd*) simultaneously reducing bristles in one place and splitting and increasing them in another. In each *Drosophila* line studied (Leningrad, Bukhar, Caucasus, and others) reduction or increase in the number of bristles is confined to certain portions of the body—"fields of gene activity"—which are highly specific for all of the genes studied. As the number of the bristles in a given region may vary, the deviation from the mean shows the percentage of "manifestation" of a given gene. In other words, a gene may not be fully expressed. The field of activity of the gene often depends upon sex, since in the males the degree of bristle reduction is higher than in the females. Consequently the field of reduction in the male may include dots which in the female are normal. The degree of manifestation of the gene depends also upon its dominance. Environment and genotype may change the field of activity of a given gene, since environment may determine the degree of its expression. Genotype may have a general effect on the field when the whole field is changed, and a specific effect when certain elements (dots) of the field are displaced, thus changing the structure of the field. In its turn the structure of the field not only depends upon the genotype but also on the tissue, which may have a different degree of "susceptibility" in a given case to the reduction process. As a result of such mutual effect of the gene and tissue one or another pattern, whether it involves the distribution of bristles or pigment as in piebald, is developed. —*G. A. Lebedeff.*

12561. **ROKIZKY, P. TH. Über das Hervorrufen erblicher Veränderungen bei Drosophila durch Temperatureinwirkung.** *Biol. Zentralbl.* 50(9): 554-566. 1930.—A discussion of Goldschmidt's experiments in which mutations were induced in *D. melanogaster* by exposure to high temperatures, followed by the author's substantiation of Goldschmidt's experimental procedure. Exposure of larvae 1-8 days old to 37-38° C. for 24 hours yielded mutation types in F_1, F_2, and (or) F_3, which were designated as rough eye, dark body and darker trident pattern, notch type, crinkled wings, reduced bristle size, lethal (questionable), rudimentary wings (sex-linked), deformed wings with raised tips, III cross vein, and indentation of the inner edge of the wings. Suggests that the higher temperature exposures effect changes in individual genes, though types similar to hereditary changes effected by x-ray or radium treatment were not obtained.—*E. F. Grossman.*

12562. [ROMASHOV, D. D., and E. I. BALKASHINA.] РОМАШОВ, Д. Д., и Е. И. БАЛКАШИНА. Материалы по генетике Drosophila funebris F. [Genetics of Drosophila funebris F.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5(2): 102-146. 13 fig. 1929.—A series of apparent mutations was arbitrarily classified into: (1) mutations which segregated in F_2 into 3:1 and 1:1 ratios; (2) mutations which segregated very irregularly; (3) non-segregating and evidently non-heritable changes. The greatest number were found in the last two classes, which is explained by the unstable equilibrium between heritable and environmental factors, temp. and humidity being especially emphasized.—*G. A. Lebedeff.*

12564. [SEREBROVSKII, A. S.] СЕРЕБРОВСКИЙ, А. С. Исследование ступенчатого аллеломорфизма. [Step allelomorphism.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(2): 61-72. 1930.—In *Drosophila melanogaster* in the F_2 from the cross, x-rayed eosin (w^e) ♂ × double yellow (*yy*) female, one scute ♂ was obtained which, as well as his offspring, resembled other scutes (sc^1, sc^2, sc^6, sc^4, sc^5) but differed by the absence of ocellar, notopleural, and coxal bristles; and by the presence of scutellar and sternal bristles. The flies having the new scute gene (sc^6) in combinations with other scutes (with the exception of sc^5) partially resemble the parents in characters common to both and are like wild flies in bristles not common to both; i.e., scute^6 is one of the series of scute step-allelomorphs. But in the combination $\frac{sc^6}{sc^5}$ there is complete reversion to the wild type, thus showing that sc^6 and sc^5 are not allelomorphs although they both belong to the same series of allelomorphs.—*G. A. Lebedeff.*

12565. **SEREBROVSKY, A. S., and L. G. PETROFF. Downless chickens.** *Jour. Heredity* 20(7): 331-332. 2 fig. 1929.—The occurrence of 3 downless chicks in the progeny of closely related families is attributed to the action of specific semi-lethal genes.—*L. M. Dickerson.*

12566. **STURTEVANT, A. H. The claret mutant type of Drosophila simulans: a study of chromosome elimination and of cell-lineage.** *Zeitschr. Wissenschaft. Zool.* 135(3/4): 323-356. 4 fig. 1929.—Claret *D. simulans* is a "pink" eye-color, found by Plunkett in 1924, recessive, 3rd-chromosome, locus 130, "corresponds" to claret in *D. melanogaster*. Eggs of claret ♀♀ mostly perish, remainder gave highly unusual results. (1) 3% were gynandromorphs. (2) 6% of ♀♀ were XXY exceptions through primary non-disjunction, some being "equationals." (3) 50% of ♂♂ were XO sterile exceptions, some through primary non-disjunction, but most from elimination at 1st cleavage division. (4) 40% of both sexes were sterile haplo-IV's, from primary non-disjunction and from elimination at 1st cleavage. (5) 4% were haplo-IV in part only of body, from elimination at slightly later stage. (6) There was a high correlation in non-disjunction of X and IV and in elimination of X and IV. (7) Crossing-over was reduced for right end of X, as seen in regular sons. (8) There was presumably high elimination of chromosomes II and III, partly accounting for high egg mortality. (9) One mosaic was probably haploid through elimination. (10) Probably triploid intersexes occurred occasionally. The above effects (except 7) were correlated by assumption of slowed division rate of chromosomes produced in claret ♀, the retardation being most marked at reduction and at very early cleavage. Cytologically, the X of *D. simulans* is like X of *D. melanogaster*, except that it has stronger constriction; Y shorter simple rod, not longer and J-shaped as in *D. melanogaster*. Intensive study of above gynandromorphs and mosaics showed: (1) Elimination was predominantly or exclusively of maternal X. (2) Elimination was nearly exclusively at 1st, 2nd or early cleavage division, instead of in late imaginal discs as in Minute-n piebalds. (3) One side of the head includes descendants of a larger sample of blastoderm nuclei than do other parts studied, since each side of head probably comes from 3 separate imaginal discs. (4) The closeness of relationship (derivation from similar blastodermic nuclei of limited region) was highest for abdominal parts, lowest for thoracic parts of the gynandromorph. (5) The degree of relationship between various regions was roughly inversely proportional to distance upon surface in any direction except across midline. (6) Differentiation of structural parts was independent of origin of component nuclei but was determined by position of nuclei after completion of growth of competing discs. (7) Distribution of cleavage nuclei to blastoderm was indeterminate and different from embryo to embryo. (8) Mutant characters were generally self-differentiating and dependent only on constitution of nuclei in each locality.—*C. B. Bridges.*

12567. **SUMNER, FRANCIS B. Genetic and distributional studies of three sub-species of Peromyscus.** *Jour. Genetics* 23(2): 275-376. 4 pl. (1 col.), 27 fig. 1930.—The geographic races considered differ strikingly in pigmentation of hair and skin; less conspicuously in length of certain parts (tail, foot, femur, etc.) These char-

acters were dealt with quantitatively. The pigmental characters bear definite relations to certain environmental gradients; the linear measurements show no such definite relations. Mean racial differences in all these characters are entirely genetic, as shown by failure to converge in a common environment. Individual differences are partly genetic, partly non-genetic. A few of these racial (sub-specific) differences are absolute, in the sense that one race may possess in full measure a characteristic which another entirely lacks. For the most part, however, the differences are of degree. Hybrid generations, F_1 and F_2, show an intermediate condition in respect to most characters. But partial dominance is shown in certain pigmental characters, notably dorsal stripe of the tail, lack of tail-stripe being incompletely dominant over its presence, illustrated in two inter-racial crosses and one inter-specific cross. This dominance is "fluctuating" with an enormous range of variability in F_1. For the two characters which exhibit such dominance most clearly, there is a shifting of the mean in the recessive direction in F_2, as compared with F_1. In no case does a racial difference depend upon a single pair of Mendelian allelomorphs. There is, however, evidence of genetic segregation for pigmental characters, though not for body parts. As regards the former, there is great increase of variability in F_2, as shown by a uniform increase in the magnitude of the standard deviations, and by the occurrence of individuals approaching the parent types. Attention has been devoted to methods of estimating the considerable number of factor differences, with divergent results. One's first impression that the numbers involved are small, based on finding segregants closely resembling one of the parent types, is erroneous. Individuals which measure up to the average condition of one or another of the pure races, in respect to the ensemble of pigmental characters (i.e., such a standard as would include half of a population of the pure race in question) are lacking altogether in F_2 of each of the principal crosses, despite the fact that these pigmental characters are all correlated. Intra-racial correlations among these characters are of the same signs as inter-racial ones, e.g., darker individuals, as well as races, have more extensive colored areas than do paler ones. These correlations are commonly lowest for the pure races and F_1 hybrids, higher for F_2, highest for an F_3 derived from selected F_2 parents. The coefficients for the back-crosses are variable, though much more often higher than those for F_1. These relations are such as might be expected on the supposition that the characters are genetically connected and tend to segregate. These correlations are due to diverse effects of the same genetic factors, rather than to linkage. This common genetic basis for all the pigmental characters is not absolute. There is considerable independent variability among them, a large fraction of which is genetic. Thus two pigmental characters may have certain factors in common and others peculiar to themselves. Correlations exist between some of the measurable parts of the body (e.g., tail and foot), but they show no such relative magnitudes in the hybrid generations as in the case of pigmental characters. Correlations between linear measurements and pigmental characters are lacking, except in certain cases where their meaning is uncertain despite high statistical probability. Two typographical errors occur on page 307. On line 10, the exponent of the fraction $\frac{1}{4}$ should be 3, not 1. On line 19, the exponent of $\frac{1}{8}$ should be 4, not 2.—*F. B. Sumner.*

12568. SZUMAN, JERZY G. Wypadek obojnactwa u kura. [A case of gynandromorphism in poultry.] [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 17(1/2): 169-174. 1 fig. 1927.—A golden Leghorn chicken had a ♂ comb but ♀ plumage (except about 50 feathers on the body and breast). The feathers which grew in after plucking were ♀.

12569. [TIMOFEEVA-RESOVSKAIA, E. A.] ТИМОФЕЕВА-РЕСОВСКАЯ, Е. А. Влияние рентгеновских лучей на возникновение геновариаций у Drosophila funebris. **[Effect of Roentgen rays on the origin of geno-variations in Drosophila funebris.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(1): 9-14. 18 fig. 1930.—Males of *D. funebris* stock inbred for 30 generations were x-rayed (about T4 Muller's dose) and crossed with normal ♀♀. Out of 689 crosses, 77 were sterile; and the 612 fertile crosses gave in F_2 24,722 flies (12,660 ♀♀ and 12,056 ♂♂). In F_2 and F_3 the following mutations were observed: sex linked,—miniature, crossveinless, plexus; autosomal,—reduced 2, reduced 3, missing, abnormal abdomen, and 3 recessives, spread, reduced vein, and short cross-veins. Not a single mutation of genes for eye color or body color was observed. 24 mutations were lethal, which is very low in comparison with the number of lethals in *D. melanogaster*, due, according to the author, to the absence of "markers" which make it impossible to detect all lethals. In general it was found that x-raying very significantly stimulated gene mutations.—*G. A. Lebedeff.*

12570. [TIMOFEEV-RESOVSKII, N. V.] ТИМОФЕЕВ-РЕСОВСКИЙ, Н. В. Обратные и соматические геновариации определенного гена в противоположных направлениях под действием рентгеновских лучей. **[Reverse somatic genovariations of a definite gene in opposite directions under the influence of Roentgen rays.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 5(1): 25-31. 1929.—Eggs and pupae of homozygous white and *sc* w^e *ec* and also F_1 pupae of cross *w/W* female × *w* male of *D. melanogaster* were x-rayed; 50kV, 5mA, distance from the culture to anticathode 17-18 cm., exposure 100 and 120 min. Out of 1407 *sc* w^e *ec* flies one ♀ with about 50 colorless facets on the left eye, one ♂ with 5 colorless facets on the right eye and one ♂ with 3 darker facets were obtained, i.e., 2 cases of somatic genovariation from w^e to *w* and somatic reverse genovariation from w^e to *W*. No reverse somatic *ec* genovariations were observed. Out of 1449 homozygous white flies one ♂ had one colored facet in the right eye, the color being slightly paler than normal red; evidently *w* mutated reversely to one of the light-red allelomorphs of the *w* series. From the x-rayed F_1 eggs and pupae of *w/W* ♀♀ × *w* ♂♂, 16 flies with white facets out of 786 *Ww* ♀♀ were obtained. From cultures of x-rayed eggs the number of white facets was 16, 28, 33, 112 in 4 flies, while from x-rayed pupae the number of facets was 1-9. Out of 775 red-eyed ♂♂, 6 ♂♂ with 1-26 white facets were obtained. 802 white eyed ♀♀ gave no genovariations. Out of 735 white eyed ♂♂ one had 3 normal red facets in the right eye. The mortality of x-rayed eggs and pupae was extremely high. Sterility among females hatched from x-rayed eggs and pupae was lower than among x-rayed adults.—*G. A. Lebedeff.*

12571. [TIMOFEEV-RESOVSKII, N. V.] ТИМОФЕЕВ-РЕСОВСКИЙ, Н. В. Обратные геновариации и изменчивость гена в разных направлениях. **[Reverse genovariations and variability of the gene in opposite directions.]** [German summary.] Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(1): 3-8. 1930.—White, $y c_v v f$, $s_e w^e e_c$, $s_c e_c c_i^e v g^2 f$, males were x-rayed and crossed to virgin females of the same cultures. In the F_1 the following mutations to the wild type were observed: $s_c \rightarrow S_c$ 3 times among 11,005 flies, $w^e \rightarrow W$ once among 4,267 flies, $c_v \rightarrow C_v$ once in 5,172 flies, and $f \rightarrow F$ twice among 12,991 flies. Similarly $r_u h s_t p^p s_{s^e}$ and $r_u h t_h s t c_u s_r e^5 c_3$ ♂♂ were x-rayed and crossed with virgin ♀♀ of the same cultures. In the F_1 of these crosses $h \rightarrow H$ mutation was observed once in 960 flies, and $p^p \rightarrow P$ twice in 6,723 flies. Thus both sex-linked and autosomal reverse mutation were obtained by x-raying, which shows that recessive mutations are not due simply to absence of formerly present genes, and that the effect of x-raying is not destructive, as already shown by Muller.—*G. A. Lebedeff.*

12572. [TIMOFEEV-RESOVSKII, N. V.] ТИМОФЕЕВ-РЕСОВСКИЙ, Н. В. Существует ли "последействие" рентгенизации на геновариационный процесс. **[Is there an "after-effect" of x-rays on genovariation?]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(2): 79-83. 1930.—X-rayed *y cv v f*

♂♂ of *Drosophila melanogaster* were mated with bar females. (50kV, 5mA, aluminum filter 1mm. in thickness, focal distance about 15 cm., exposure 45 min.) 672 daughters mated with their brothers gave 49 lethal and 4 visible mutations (white, miniature, cut and reverse mutation of forked to its normal allelomorph) all in the x-rayed chromosome. Males with the x-rayed chromosome (from the preceding mating) were mated with homozygous bar ♀♀ and their daughters were tested for delayed mutations. At the same time, some of the above x-rayed ♂♂ were mated with double yellow ♀♀. F_1 ♂♂ were mated with bar ♀♀ and the daughters tested for delayed mutation. Altogether 756 ♀♀ tested for "after effect" of x-rays yielded only 2 (or 3) mutations (lethal). One lethal appeared in 793 control cultures. The author concludes that there is no after-effect of x-rays on frequency of mutation.—*G. A. Lebedeff.*

12573. **WHITING, P. W. X-rays and parasitic wasps.** *Jour. Heredity* 20(6): 268-276. 3 fig. 1929.—X-ray treatments of adult *Habrobracon juglandis* have little if any effect on duration of life or general vitality. Treated ♀♀ are likely to become sterile after producing a few offspring, but if they have been fed with honey instead of with caterpillars they produce no offspring after strong dosages. Treatment of mated ♀♀ decreases the ♀ ratio, probably by injury to sperm in seminal receptacles. Fertility of treated ♂♂, measured by ♀ ratio among their progeny from untreated mates, is decreased by weak dosages and sterility is induced by strong dosages. There is evidence for temporary recovery of fertility of treated ♂♂. Only one mutation, "cream" eye color, has appeared among ♂ progeny of treated ♀♀. Of 141 tested daughters of treated wasps, two gave visible mutations, "small-head" and "miniature," while at least 28 showed conditions indicating lethals.—*Author's abstract.*

12574. **WHITNEY, LEON F. The heredity of trail barking propensity in hounds.** *Jour. Heredity* 20(12): 561-562. 1 fig. 1929.—Dogs of certain breeds follow the trail of animals which they are pursuing, mutely. Representatives of the hound family, and certain other breeds, bay on the trail. The F_1 generations between barkers and mute trailers were always trail barkers, indicating the dominant character of trail-barking. The typical drawl in the hound's bay was missing, giving way to the staccato bark characteristic of the house dog. —*L. F. Whitney.*

12575. **WIESCH, ADOLF. Vererbung der Scheckzeichnung und korrelative Beziehung der Färbung bei Rindern.** *Kühn-Archiv* 22: 347-396. 1929.—In progressive loss of pigment in cattle, the shoulder pigment disappears (on both right and left sides) more rapidly than that on the sides and back. Then follow the sides and head. Head pigment is always present in the dark spotted cattle of the lowlands (Niederungsrindern). The fore legs are more pigmented than the rear; and the right fore-leg is more frequently pigmented than the left. In general ♂♂ are less pigmented than ♀♀. There is a positive correlation between spots on the head, white throat, and pigmented legs. The mean values of the spotting of the descendants are displaced with the mean values of the parents from one extreme to the other. The descendants of the different crosses of the 3 classes set up show characters of the adjacent classes with 2 exceptions. The results of the crosses can be explained by the different combination possibilities of the homomeric factor pairs suggested by Funkquist to explain inheritance of head spots. As a result of the great breadth of modification of the spotting, in every class are individuals of a different genotype. The mean value of the head spots of the progeny parallels the mean value of those of the parents. A special character (white base of tail) in some families behaves as a dominant character.—*From author's summary (transl.).*

12578. **BIEMOND, A. Neurotische Muskelatrophie und Friedreichsche Tabes in derselben Familie.** *Deutsche Zeitschr. Nervenheilk.* 104(3/4): 113-145. 8 fig. 1928.—Neurotic muscular atrophy and related diseases are distinguished from Friedreich's ataxia by (1) marked changes in electrical conductivity of muscles and nerves, and (2) the complete absence of pyramidal tract-falling symptoms in neurotic muscular atrophy. Neurotic muscular atrophy is a pronounced hereditary familial disease, affecting a higher percentage of males than females. It often skips a generation, as shown in certain family trees. A description of the pathology is given and a review of six cases, in view of which this author believes two factors to be necessary for the development of neurotic muscular atrophy, a dominant factor, and a sex-linked recessive. When both factors are expressed, typical Tooth-Marie-Charcot-Hoffman's disease develops. If an individual with this complex marries a normal, only the dominant factor can be expressed in their offspring, which then exhibit the intermediate forms between muscular atrophy and Friedreich's ataxia which is due to the recessive sex-linked factor. Tuberculosis and syphilis may be the inciting factors in some cases.—*E. E. Jones.*

12579. **DAYTON, NEIL A. Intelligence and size of family.** *Jour. Heredity* 20(8): 365-371. 1929.—The material for this study is taken from the first 10,455 examinations of retarded children in Massachusetts public schools. The nativity of the mother and size of family were tabulated and discussed. From this study the foreign born mothers (43% of the population in the towns surveyed) are over-represented in our group. They are 68% of the mothers of retarded children and 75% of the mothers of mentally defective children. In the cases used, completed families with a child in the lower levels of intelligence are approximately twice as large as completed families with a child in the upper levels.—*N. A. Dayton.*

12580. **FARR, CLIFFORD B., L. A. SCHWARTZ, and LAUREN H. SMITH. The relative importance of hereditary factors in constitutional and organic psychoses. Analysis of two hundred cases.** *Jour. Nervous & Mental Dis.* 71(1): 36-43. 1930.—The inadequacy of data for analysis of the hereditary of nervous disorders is discussed, and a statistical treatment of cases of organic psychosis (paresis) and of so-called functional psychosis (manic-depressive) is presented with reference to heredity. From the standpoint of direct heredity, there is little difference between the two types, although functional and environmental factors are important in initiating the illness in both. Histories obtained for cases studied indicate the presence of nervous disorders in the family group in 30-40% of the cases.—*K. Jeffers.*

12581. **HEFNER, R. A. Inheritance of crooked little fingers. (Streblomicrodactyly.)** *Jour. Heredity* 20(8): 395-398. 3 fig. 1929.—This characteristic is caused by a shortness of the branch of the flexor digitorum ligament leading to the middle phalanx of the little finger, which results in inability to extend the finger parallel to the other digits. It is inherited as a Mendelian dominant.—*L. M. Dickerson.*

12582. **KEHRER, FERDINAND. Über das erbliche Zittern und die Bedeutung von Langlebigkeit, Kinderreichtum und Zwillingsgeburten in Sippen mit heredodegenerativen Nervenleiden. [Hereditary tremor and significance of longevity, child-prolificacy and twin-**

births in the kinships of heredo-degenerative nervous troubles.] *Deutsche Zeitschr. Nervenheilk.* 114(4/6): 165-208. 1930.—Hereditary tremor has many varieties and associations, "a complex hereditary Anlage," which the author reviews with the aid of old and new geneal-logic charts. Largely a critique of O. Minor's conclusions (1921-1927) and of his typhus macrobioticus multiparus. Facts are cited to show that long life is not more common in this stock than in that of other senile neuroses such as dementia and paralysis agitans. Minor did not make due comparison with controls. Prolific families have no relation to the originating basis of heredo-degenerative nervous troubles. Neither does Minor's combination of longevity and child prolificness, nor crossed or sex-limited heredity, have any relation thereto. Twin births in the kin of hereditary neuroses (e.g., Huntington's chorea, pseudosclerosis, Parkinson, Thomsen's disease, &c.) are briefly considered, but the author doubts any general over-frequency.—*W. Browning.*

12583. **KELLY, ARTHUR. Hereditary absence of the clavicle.** *Jour. Heredity* 20(8): 353-355. 2 fig. 1929.—Inheritance through three generations as a dominant non-sexlinked character is reported. A photograph and x-ray picture of the subject are figured. In medical literature the defect had previously been reported as occurring in some degree in 8 families (31 cases) and as hereditary, and has been named cranio-cleido-dysostosis —*W. E. Castle.*

12584. **LABBÉ, MARCEL. Le facteur héréditaire dans le diabète.** *Bull. Acad. Méd.* [*Paris*] 105(23): 956-970. 1931.—Labbé presents tables of 3 diabetic families through 3 and 4 generations, and concludes that although a large number of cases are attributable to faulty nurture, diabetes (especially in the severe form) is hereditary.

12585. **MANOILOFF, E. O. A rare case of hereditary hexadactylism.** *Amer. Jour. Phys. Anthrop.* 15(3): 503-508. 2 fig. 1931.—The author describes a case of hexadactylism on the hands and feet. The unique feature is that the anomaly can be traced in the family for more than 700 years. The roentgenological picture makes it plain that the thumbs must be considered as the supplementary fingers. The carpus bones in both rows are disposed regularly, but the os multanulum majus is connected not with one, but with two metacarpal bones. There are the same deviations from the normal also on the feet; the carpus bones are normal, but with the cuneiform are connected not one, but two metatarsal bones.—*Author (courtesy Wistar Bibl. Serv.).*

12587. **MISERA, J. Die Inzucht und ihre Beziehungen zur Haarstärke und Konstitution. [Inbreeding and its relation to hair strength and constitution.]** Dissertation, Breslau Universität. 56p. 1928.

12588. **POWDERMAKER, H. Vital statistics of New Ireland (Bismarck Archipelago) as revealed in genealogies.** *Human Biol.* 3(3): 351-375. 4 fig. 1931.—Through the genealogical method, vital statistics were collected among a group of Melanesians in New Ireland. 455 women formed the basis of the study and were divided into age groups according to their generation. It was found that there has been an increase in deaths occurring before marriage during the last three generations and that this increase takes place during infancy. The birth rate is small and not increasing and it is obvious, therefore, that the population is declining. Sex ratios are presented showing more males at birth and at the time of marriage for all three generations. There has been no change during these three generations in feeding and care of the infant, in the manner of living of pregnant woman and nursing mother. Neither have the fundamental aspects of native culture been broken up by white contact. The people appear busy, happy, living their normal life. The increase in infant mortality, therefore, can not be due to native customs (since they are the same as in the past), nor to psychological factors. Introduced diseases such as tuberculosis, gonorrhea and syphilis are suggested as a possible cause for the decline in population.—*H. Powdermaker.*

12589. **SNYDER, L. H. Inherited taste deficiency.** *Science* 74(1910): 151-152. 1931.—Preliminary report of experiments confirming Arthur L. Fox's conclusion that taste deficiencies exist. Study of 100 families shows that the taste deficiency for para-ethoxy-phenyl-thiourea is inherited as simple recessive.

12590. **WIENER, ALEXANDER S., and MAURICE VAISBERG. Heredity of the agglutinogens M and N of Landsteiner and Levine.** *Jour. Immunol.* 20(5): 371-388. 1931.—Specimens of blood of 131 families with 642 children were examined for agglutinogens A, B, M and N. Concerning the heredity of the agglutinogens M and N, 2 exceptions to the theory of Landsteiner and Levine, were found, but in neither case could the possibility of illegitimacy be excluded. Concerning the heredity of the agglutinogens A and B, one exception to the Bernstein theory was found, but here again the possibility of illegitimacy could not be excluded. Considering the size of the series examined (642 children) a certain percentage of illegitimacies is rather to be expected, and the authors therefore believe that their results speak well for the theories of heredity discussed. —*A. S. Wiener.*

12591. **WILLOUGHBY, R. R. The families of freshmen.** *Human Biol.* 3(3): 342-350. 1931.—Pedigree charts of the grandparents and their children and grandchildren were collected from 71 Clark University freshmen and analyzed. Most of the stocks were found to be much more than maintaining themselves; assortive mating of about .2 was found in fertility as measured by the number of siblings of parents; as a result of the selective factors inherent in the experiment the ♂♂ considered were found to be from preponderantly ♂ families, and conversely; the correlation between fertility and intelligence is approximately zero.—*R. R. Willoughby.*

squares, cubes, square roots, cube roots, and reciprocals of all integer numbers up to 10,000. 3rd ed. 208p. E. and F. N. Spon, Ltd.: London, [1931?] Price 7s. 6d.

12595. **DODD, EDWARD L.** Classification of sizes or measures by frequency functions. *Amer. Statistical Jour., Suppl.* 227-234. (March) 1931.—A synopsis is given of the methods of Pearson, Edgeworth, Charlier, and others in developing functions to describe frequency. Then are treated frequency functions formed with the use of $|x|$, $x|x|$, $x^2|x|$, etc., which are equal respectively to x, x^2, x^3, except that when x is negative they have the opposite sign. With the aid of "conjugate" moments which involve such expressions, 6 parameters may be introduced into a frequency function or "curve" without going higher than 2nd moments.—*E. L. Dodd.*

12598. **FRÉCHET, M., et H. ROULLET.** Nomographie. 208p. 79 fig. Armand Colin: Paris, 1928. Pr. 10.50 fr.—The authors discuss the various forms of nomographs which may be used for graphical calculations. The book is divided into 3 main sections: (1) relations between 2 variables, (2) relations between 3 variables, (3) relations between more than 3 variables. Under each topic there is a theoretical discussion of the construction of the special type of nomograph which is followed by a description of the method of its construction. Both Cartesian nomographs, where the results are read from a series of curves, and those where the results are read from points on scale lines, are considered. Many of the figures show nomographs for the graphical solution of particular problems. There are 54 illustrative exercises included in the text, showing the application of nomographs to the solution of problems in various branches of pure and applied science, together with suggestions for the construction. There is a short list of numerical tables and a bibliography.—*H. M. Lufkin.*

12599. **GAUSE, G. F., und W. W. ALPATOV.** Die logistische Kurve von Verhulst-Pearl und ihre Anwendung im Gebiet der quantitativen Biologie. *Biol. Zentralbl.* 51(1/2): 1-14. 6 fig. 1931.—The authors discuss the properties of the logistic curve and describe its practical application in the domain of Biology. Analysis, with the aid of this curve, of the material published by Driver on the influence of temp. on the eye facet number in *Drosophila,* indicates that the process which determines the eye facet number is different in ♂♂ and ♀♀ and it may be described with the aid of the logistic curve. The logistic curve seems to be important in the physiology of development, where it may describe the accumulation in time of different determining substances.—*G. F. Gause.*

12600. **GOULDEN, C. H.** Modern methods of field experimentation. *Scientific Agric.* 11(10): 681-701. 1931.—The analysis of variance as developed by Fisher and his staff forms the basis for the Rothamsted methods of designing field experiments and for the statistical reduction of the results. Algebraic formulae and methods of calculation are given in detail.—*C. H. Goulden.*

12601. **GUILFORD, J. P.** Some empirical tests of the method of paired comparisons. *Jour. Gen. Psychol.* 5(1): 64-77. 1931.—A comparison of Thurstone's method with the author's method of deriving scale-values from data obtained by the method of paired comparisons was made by using data obtained from lifted weights. In most respects the *G*-method proved to be the more convenient and valid, but it has one weakness in that the unit is a variable factor.—*Author's summary.*

12602. **IRWIN, J. O.** Mathematical theorems involved in the analysis of variance. *Jour. Roy. Statistical Soc.* 94(2): 284-300. 1931.—It is shown why it is correct to divide the "sums of squares" by the "degrees of freedom" and how the additive property holds.—*J. R. Miner.*

12603. **KRONACHER, C. (with the collaboration of C. F. von PATOW).** Biometrik. Eine Einführung. 2nd ed., rev. 71p. Paul Parey: Berlin, 1930. Pr. 6.50 M.

12604. **KUTSUNAI, Y.** Notes on interpreting experimental results. *Hawaiian Planters' Record* 35(3): 279-294. 6 fig. 1931.—The scatter diagram of degree Brix against polarization of sugar cane juices from many localities and varieties forms approximately a straight line, and the analyses deviating much from this line are considered suspicious. The weights of sugar cane from the test plots are compared with Chauvent's criterion for eliminating disturbing weights. Methods for interpreting the results of field trials containing 1 to several unknown constants and 1-3 unknown variables are suggested.—*Y. Kutsunai.*

12605. **MacLEAN, JOHN.** Graphs and statistics. A suggestion for a finishing course in mathematics. 200p. Tutorial Press: Bombay, 1926. Price 4rs.

12606. **NEYMAN, J., and E. S. PEARSON.** Further notes on the χ^2 distribution. *Biometrika* 22(3/4): 298-305. 1931.—The error in combining frequency groups for the χ^2 test is probably small if the groups contain only a small part of the total frequency. For small samples the test is also reasonably satisfactory. The difference between minimum χ^2 and the χ^2 of maximum likelihood is small.—*J. R. Miner.*

12607. **PÜTTER, A.** Die Auswertung zahlenmässiger Beobachtungen in der Biologie. Eine praktische Anleitung in Beispielen. 56p. 6 fig. Walter de Gruyter & Co.: Berlin and Leipzig, 1929. Pr. 5 M.—A brief treatment of the following statistical constants: Arithmetic mean; average deviation; standard deviation; average deviation of the mean value of a series of observations; the reliability of sums and products; the significant difference; correlation between 2 quantities; partial correlation coefficients; 3 and 4 quantity correlation problems. —*A. M. Chickering.*

12608. **RHODES, E. C.** On the fitting of parabolic curves to statistical data. *Jour. Roy. Statistical Soc.* 93(4): 569-572. 1930.—A summary of Jordan's method, in which not the simple power series, but a series of orthogonal functions, is fitted. The virtue of the method is that each successive approximation merely adds a new term to those already calculated.—*J. R. Miner.*

12609. **SCARBOROUGH, JAMES B.** Numerical mathematical analysis. 416p. Johns Hopkins Press: Baltimore, Humphrey Milford, Oxford Univ. Press: London, 1930. Pr. $5.50.—This book is designed for the student who desires to analyze mathematically the problems of his work and present them numerically. With this in view the material is so arranged as to set forth systematically the most important principles, methods and processes used in obtaining numerical results and estimating their significance. The book is concerned only with fundamental principles and processes and is not a treatise on forms of computation. Each major subject is introduced with a brief statement of purpose and utility. The underlying theory is then developed, and from this base the formulas and processes are derived as simply as possible, confusing methods or higher calculus being avoided. Methods for checking the accuracy of the results attained are worked out. The limitations of the formulas and the pitfalls connected with the processes are carefully pointed out. The subject is then illustrated by suitable pertinent examples. Chapters dealing with such important matters as the accuracy of approximate calculations, interpolation, numerical differentiation and integration, quadrature, solution of numerical equations, normal law of error and precision of measurement, etc., are clearly and best of all interestingly presented.—*J. W. Gowen.*

12610. **STEFFENSEN, J. F.** Some recent researches in the theory of statistics and actuarial science. 48p. Macmillan Co.: New York, 1930. Pr. $2.00.—The 3 lectures contained in this book are devoted to a discussion of the place of mathematics in statistical and actuarial theory. The 1st lecture shows that mathematical relations utilized in statistical or actuarial theory should be in such a form that the theoretical assumptions contain no

contradictions. This viewpoint leads to the conclusion that the use of the uncorrected σ_r, m_r, μ_r, etc., are the best available approximations to $\overline{\sigma_r}$, $\overline{m_r}$, $\overline{\mu_r}$, etc., and at least insures no such contradictions. The 2nd lecture takes up the methods of summarical approximation and their justification. It is shown that such problems are essentially mathematical and that statistical success is no necessary criterion for their acceptance. The 3rd lecture deals with statistical reduction formulas as means of describing facts of observation. It is pointed out that while the formulas used for this purpose are often entirely empirical, for most cases good theoretical reasons can often be given for believing that one formula will fit the facts better than another and that the choosing of this formula at the outset results in a sounder foundation and a more intelligent interpretation of the resulting conclusions.—*J. W. Gowen.*

12611. **STEVENSON, PAUL H. Conversion of non-metric data to form suitable for statistical comparison.** *Amer. Jour. Phys. Anthrop.* 16(1): 91-96. 1 fig. 1931.—The general problem of adequate statistical treatment and final analysis of non-metric data is stated and the difficulties involved are briefly reviewed. As an example, certain data on beard growth among different racial groups inhabiting central Asia are given and a method described whereby these data are converted from the ordinary category percentage distribution form to a statistical index form suitable both for quantitative appraisal and ready comparison with similar data from other sources. The formula elaborated is equally applicable to all non-metric data based on quantitative observations calling for such initial notations as absent, slight or trace, medium and marked occurrences of physical characters not subject to direct measurement. —*Author (courtesy Wistar Bibl. Serv.).*

12612. **UICHANCO, LEOPOLDO B. Methods of computing the number of days covered by an event in periods of two months or over.** *Philippine Agric.* 20(1): 49-51. 1931.—The method herein reported lends itself to work in biological investigations. With the use of a table the number of days covered by varying number of calendar months can be readily and accurately determined.—*M. Manresa.*

Mat. e Nat.* 12(9): 351-352. 1930.

12615. **WAHLUND, S. Gelbrostbestimmungen an Wintergerste. Eine statistischmethodologische Untersuchung.** *Hereditas* 15(2): 194-212. 1931.—The material consisted of determinations of *Puccinia glumarum* on 4 varieties of winter barley at Svaløf by 6 investigators working in pairs, each pair examining 1 of the 3 plots of each variety. The plants were grouped in 5 groups with limits 0-1, 1-2, 2-3, 3-4, and 4-5. The ordinary method now is to give each class arbitrary values, i.e., 0.5, 1.5, etc., and determine the average susceptibility through the formula $M=\sum\frac{n_i}{n}.(i+0.5)$, where n_i is the number of determinations between i and $i+1$, and n the total number. This method of estimating class values is not satisfactory and a new method is developed based on a standard series for which is determined the class values taking the mean of the series as zero and the standard deviation as unit. The formulas used for this determination are given and likewise an example of the application. The class values obtained in this way are substituted for the arbitrarily chosen 0.5, 1.5, etc. A discussion is given of the variation of the series due to environment and variation in the technique of measuring, taking the plots as units and using the formula developed by "Student" and others for cases with a small number of variates.—*H. Wexelsen.*

GENERAL

12619. BENNETT, E. W. Natural transport of stones and marine animals. *Nature [London]* 126(3182): 646-647. 1930.—Instances of the transportation of various forms of animal life on drifting kelp.

12620. GARDINER, J. STANLEY. Commensal algae and reef corals. *Nature [London]* 126(3184): 724. 1930.—Algae have been found in *Millepora* and *Heliopora* down to 50 fathoms and in *Gardineria* from more than 222 fathoms. Reef-building corals are often covered with a white slime, which ultimately kills them. This seems to be a precipitation of amorphous $CaCO_3$ from the supersaturated sea-water, owing to the chemical operations of the chlorophyll of the commensal algae in utilizing CO_2.

12621. HANCOCK, G. L. R., and W. W. SOUNDY. Notes on the fauna and flora of Northern Bugishu and Masaba (Elgon). *Jour. East Africa & Uganda Nat. Hist. Soc.* 36. 165-183. 6 pl. 1929(1931).—A brief account is given of the country north west of Mount Elgon (formerly Masaba) and the slopes to Jackson's summit on the west (lat. 1° 1′ N; long. 34° 5′ E). The country rises from the plains (4,000 ft.) to the lower hills (6,000-7,000 ft.), of which district the aquatic insect fauna is discussed. Records include mosquitoes *Culex vansomereni* Edw., *Culex andersoni,* Edw., and *Anopheles garnhami* Edw. *A. kingi,* Christ. was found breeding. In the streams at about 6,000-7,000 ft. *Anisops* was not represented nor were Veliidae; only a single individual of the family Gerridae was found; all these occurred at lower levels. *Metrocoris* was represented both at lower and higher altitudes. *Enithares v-flavum* was found in the streams at the higher levels. Temp. of streams at 4,000 ft. was about 17°C., at 7,000 ft. 13°-14°C. In the bamboo forest at 9,000 ft. larvae of *Culex hancocki,* Edw. were found in bamboos bored by *Conicofrontia* sp. and were found also in collections of water in bamboos which had been broken or cut off. In this region the butterfly *Argynnis hanningtoni* occurred, and a number of plants were noted including *Kniphofia snowdenii, Oenostachys dichroma, Begonia, Epilobium,* and small Cruciferae. In the Alpine zone a number of plants are specially mentioned, others being referred to in an appendix which contains also Lepidoptera, Coleoptera, and Diptera records. *Seneciobius loveni* was found feeding on *Senecio elgonensis* and a *Xestorhinus* and *Parasystates* were found at the bases of the leaves of this plant. *X. lobeliae* occurred at the bases of leaves of *Lobelia elgonensis* and chironomid larvae were found among pieces of ice in the water (temp. 2°C.) in these plants. The temp. of a small lake, in which were Crustacea but no insects, was as high as 10°-11° C.; a white frost was experienced at Mudange camp (12,000 ft.).—*Authors' summary.*

12622. KENDREW, W. G. Climate. A treatise on the principles of weather and climate. 320p. 53 maps, 12 pl. Oxford Univ. Press: New York, 1930. Pr. $5.—Written for the general reader and for specialists in other fields who desire a knowledge of climatology, this book devotes only a few pages to climatic types. It does, however, treat climatology mostly from its geographic side, and the principles of climate from the distribution standpoint. The parts of the book are: Insolation and temp.; Pressure and winds; Humidity, rainfall, and clouds; Sunshine, fog; Mountain and plateau climate; Weather, especially of the British Isles; Local winds; Some climatic types. There is no bibliography and almost no mention of authorities or sources of information. Frequent brief mention is made of effects of weather and climate on mankind.—*S. S. Visher.*

12623. PAPENHUSEN, FRIEDRICH. Das Vardargebiet. Ein Beitrag zur Landeskunde Mazedoniens. *Mitteil. Ver. Erdkunde, Dresden* 1930: 1-182. 10 fig. 1931.—Included in this paper are brief descriptions of the vegetation, fauna, agriculture and forestry of the region.

12624. SHELFORD, V. E. Phenology and one of its modern descendants. *Quart. Rev. Biol.* 5(2): 207-216. 1930.—The history of the idea of summing temp. is traced from its beginning by Reáumur in 1735. The failure of the method and the necessity for using hourly temp. are demonstrated, with reasons therefor.—*V. E. Shelford.*

Map, 2 pl. 1930.—This introduction includes a brief account of topography, arboreal vegetation, and previous biological work. The area lies within the "transition" zone.

12626. YONGE, C. M. The Great Barrier Reef of Australia. *Nature [London]* 126(3171): 206-210. Map, 3 fig. 1930.—Over 100 sp. of corals are concerned in the formation of these reefs. They are assisted by the coralline algae, Lithothamnium, Foraminifera, and the shells of the giant clam, *Tridacna gigas.* The reefs are rich in the pearl shells, *Pinctada margaratifera* and *P. maxima,* and a sp. of *Trochus* from which pearl buttons are made.

ANIMAL

12627. BEQUAERT, JOSEPH C. Are ants better protected against the attacks of their predaceous enemies than other arthropods? *Zool. Anzeiger* 88(7/8): 163-176.

1930.—The paper is a discussion of Poulton's views as to the efficacy of so-called ant-mimicry as a protective device against the enemies of arthropods. Supplementary information is presented concerning certain arachnids, beetles, dragonflies, ant-lions, predaceous Hemiptera and Diptera, fishes, reptiles, birds, and mammals that prey on true ants. An attempt is made to estimate the relative importance of the several groups of predators as enemies of the Formicidae. While few arthropods are true ant-hunters, some vertebrates are decidedly ant-specialists; the most important are many frogs and toads, a fairly large group of ant-eating birds, and the so-called "ant-eaters" (Echidnidae, Myrmecobiinae, Myrmecophagidae, and Manidae) of the tropics. The crux of the problem is not whether ants have many or no enemies, but whether or not ants are better protected than other arthropods against whatever enemies they have. No special protection against predators needs be invoked in order to explain the undeniable preponderance of the Formicidae in nature. A bibliography of 37 supplementary titles is appended.—*J. Bequaert.*

12628. **BOLDT, RUDOLF. Sandwüste am Main. (Col., Lep.)** *Ent. Zeitschr. [Frankfurt a/M]* 44(17): 249-254. 1930.—Ecological notes on the Coleoptera and Lepidoptera on the sandy wastes.

[Madrid]* 4(2): 91-94. 2 fig. 1929.—A simplification of Berlesse's apparatus, in which the action of heat is replaced by that of humidity.

12630. **BUXTON, P. A. Description of the environment.** In: **Insects of Samoa.** Part 9: Summary and index. Fasc. 1. p. 1-32. 6 pl., 2 fig. Brit. Mus. (Nat. Hist.): London, 1930.—The islands of Samoa are volcanic, principally olivine basalts. The highest altitude is about 6,000 ft. on Savaii. The interior portions of the larger islands are practically unknown. Tutuila is separated from the western Samoa islands by a depth of 6,000 ft. From Oct. to March, when the potential radiant heat would normally be greatest, there is increased cloudiness. Black-bulbed maximum thermometers showed that the least intense heat radiation occurred May-July, and greatest about Dec. The highest mean record for sunshine at Apia is 200 hrs. in Aug., and the lowest 133 hrs. in Feb. Mean monthly temp. ranges from 25.01° to 26.28° C. The mean annual temp. is 25.78° C. and the extreme temp. range in 30 yrs. was from 16.4° to 34.6° C. The seasonal differences in temp. are of little biological significance. The mean daily range in temp. at sea level is 6.4° C., and at 2,000 ft. but 9.6° C. The mean annual rainfall varies with location and altitude from 107.8 in. at Apia to 196.1 in. at Pago Pago, and to probably over 280 in. in the mountains. At Apia the wettest mo. is Jan. (16.5 in.) and the driest July (2.8 in.); while at Pago Pago the wettest month is Feb. (24.2 in.) and the driest Aug. (7.9 in.). While there is a clear seasonal distribution there is no dry season. The mean annual humidity is over 80%. In this warm damp climate comfort depends upon the winds, which are highest during the period of southeast trade winds from May to Oct. Hurricanes occur 2-3 times a yr. The steady all-year upper stratum anti-trade winds may be important insect carriers. Only 4 native mammals and 34 land birds are known; the Samoan birds are derived from the West. Four sea snakes, 1 land snake, and 10 or 11 lizards are known. There are no fresh water fish. Three genera of prawns are found in the mountain streams. The fauna is typically oceanic, with no sp. of high antiquity or of great morphological interest. The flora most nearly resembles that of Fiji and Tonga and is oceanic, with more than 30% of the flowering plants endemic. The people have apparently come from the west bringing their own parasites, and their domestic animals with their parasites.

12631. **CHAPMAN, ROYAL N. Biotic potential, environmental resistance and insect abundance.** *Congres Internation. Xe Zool. à Budapest. 1927.* 2: 1209-1218. 1929.—Quantitative data show that populations of the confused flour beetle, *Tribolium confusum,* in environments of given size and under controlled conditions, come to a point of saturation at which they remain. Thousands of eggs may be present but the numbers of larvae, pupae, and adults do not increase due to the fact that the potential rate of increase is balanced by the resistance of the environment.—*R. N. Chapman.*

12632. **CRAWFORD, STANTON C. Nocturnal adaptations.** *Proc. Pennsylvania Acad. Sci.* 5: 1-8. 1931.—This study of adaptations to nocturnal life exhibited by representatives of various animal groups is based on field studies made in the rain forest of British Guiana. Possible advantages of the noctural habit are discussed, the adaptations found are described, and the functions of the several senses which may play a definite rôle in night life are analyzed.—*S. C. Crawford.*

12633. **CREASER, E. P. Some cohabitants of burrowing crayfish.** *Ecology* 12(1): 243-244. 1931.—The occurrence of an ostracod, a copepod, and an amphipod in a burrow of *Cambarus diogenes* is recorded.—*E. P. Creaser.*

12634. **DAVIDSON, VERA G., and MARTHA W. SHACKLEFORD. Diurnal variations in the vernal invertebrate population of a central Oklahoma prairie.** *Bull. Univ. Oklahoma (Proc. Oklahoma Acad. Sci.)* 9 (456): 54-59. 1929.—The population April 13–May 2, 1928, was in its vernal society since it was steadily increasing toward the vernal maximum, and the groups of invertebrates comprising it were approximately constant in their % relationship to the whole community. The vernal society was characterized by ants and minute white earthworms on the ground, and Diptera, leafhoppers, and aphids in the herbs. The total herb population during this period, when sampled by sweeping at 3-hr. intervals, reached its daily maximum between midnight and 3 a.m. and had a 2nd lesser peak between noon and 3 p.m. Diptera, Cicadellidae, spiders, and Hemiptera showed this same curve with 2 peaks. In the Diptera, the maximum came at night; in the other groups, the maximum came at the time of the daylight peak. The most abundant sp. of Diptera, spiders, and Hemiptera showed similarly a 2-peaked curve. Since periods when quantitative collections are large represent times when invertebrates are relatively inactive, the data seemed to indicate a diurnal rhythm of activity in vernal, prairie insect life, the periods of greatest inactivity corresponding to the coldest and hottest parts of the 24-hr. cycle. The data presented no evidence of extensive migration between sod and herbs by any group or sp. of vernal invertebrates.—*Authors' summary.*

12635. **DAVIS, WILLIAM MORRIS. The Lesser Antilles.** 207p. 16 pl., 66 fig., Maps. American Geogr. Soc. of New York: New York, 1926.—The book includes brief discussion of the possibility of a land bridge between the Greater Antilles and So. America; of the origin of the birds, mammals, and *Agave* sp. of the Lesser Antilles; and of Atlantic and Pacific coral reefs.

12636. **DAWSON, RALPH W. The problem of voltinism and dormancy in the polyphemus moth (Telea polyphemus Cramer).** *Jour. Exp. Zool.* 59(1): 87-132 1931.—Experimental rearings of the polyphemus moth in Minnesota indicated the great importance of relative temp. levels and progressions in the regulation of dormancy or voltinism. Any constant temp. high enough to sustain life and permit growth also sufficed for continued brood development. Thus, rearings at constant temp. so low as to prolong larval life from 30 or 40 to 107 days, and to produce such marked physiological effects as the reduction of the average wt. to less than ½ the normal, and to render the ♀ practically sterile by the limitation of their egg quotas, were not followed by dormancy. In striking contrast to these results, a progressively declining temp. scale, comparable to autumnal cooling, was highly or completely effective in inducing dormancy, even though the lowest temp. attained was still relatively high. Thus it appears that the phenomenon of dormancy (and therefore of brood

development per year) bears a definite relation to temp. progressions, more or less irrespective of their actual levels. It is important to note in this connection that environmental influences operating days or even weeks in advance of the time of pupation may determine the type of voltinism to be displayed by the pupae. Some rather definite data not in harmony with the evidence for acceleration of development due to alternating temp. were secured.—*Author (courtesy Wistar Bibl. Serv.)*.

12637. **[FORMOZOV, A. N.]** ФОРМОЗОВ, А. Н. О пустынном элементе в фауне южной части Восточной Европы. [The desert element in the fauna of the southern part of eastern Europe.] Доклады Академии Наук СССР., Cep. A. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1928(20/21): 449-453. 1928.—On the basis of literature on the distribution of the Aral-Caspian fauna, it is concluded that many forms of this fauna were found not only in the lower Ural and Volga regions, and in the semidesert steppes of N. E. Caucasus, but also in the W. and NW. beyond the Kalmuck steppes. This shows that it is ancient in origin, probably post-glacial.

12638. **FRIEDERICHS, K.** Welche Faktoren regeln die Individuenzahl einer Insektenart in der Natur? [Factors affecting the number of individuals of an insect species in nature.] *Anz. Schädlingsk.* 5(10): 119-123. 1929.—A review.

12639. **PANTIN, C. F. A.** The adaptation of Gunda ulvae to salinity. I. The environment. II. The water exchange. III. The electrolyte exchange. *Jour. Exp. Biol.* 8(1): 63-94. 1931.—I. This triclad lives on the seashore in the estuaries of very small streams. The components of the external medium are (1) stream water which is rich in Ca and CO_3 and (2) Atlantic sea water. These are mixed in different proportions in different parts of the estuary. Salinity determinations made on samples taken from the actual places where *Gunda* occurred show that *Gunda* has to withstand changes from completely fresh to undiluted sea water. It may normally be exposed to either extreme for several hrs.—II. In Plymouth tap water which contains little dissolved substance the worms swell rapidly during the 1st hr. to about double their volume in sea water, and the majority die within 48 hrs. In dilute sea water the worms swell to a greater extent the greater the dilution, but at great dilutions the swelling is much less than would be expected if the worm behaved as though it were covered with a perfectly semi-permeable membrane. In natural water and in solutions containing Ca the swelling is much less than in Plymouth tap water or in distilled water; hence Ca may act primarily by lowering the permeability of the worms to water.—III. The rate of loss of salts on transference from sea water to various dilute solutions was studied by measurement of the electric conductivity of the solutions. Salts are lost by the worms from the moment of immersion in dilute solutions. They lose only 25% of their salts during the time that they imbibe a volume of water from the dilute solution equal to their initial volume. The limiting internal salt concentration of worms surviving in water containing Ca is about 6-10% of the normal concentration in sea water. No such limiting value can be found for distilled water, since salts are lost continuously till cytolysis occurs. Ca reduces the rate of loss of salts. Other factors do not seem to influence this rate.—*J. M. Robson.*

12640. **SHACKLEFORD, MARTHA W., and MARY J. BROWN.** A comparison of the autumnal society of prairie invertebrates and of coincident weather conditions in 1927 and 1928. *Bull. Univ. Oklahoma (Proc. Oklahoma Acad. Sci.)* 9(456): 20-23. 1929.—The population may vary quantitatively from yr. to yr.; there were about ½ as many insects captured by similar methods in the same field in 1928 as in 1927. The duration of the autumnal society and the abruptness with which it disappears with the approach of winter differs with different yrs. In 1927, no marked decline in numbers was noted until the 1st week in Nov., while in 1928 the decline was apparent by the middle of Oct. Quantitative differences in population between yrs. were due in the instance observed to a diminution in numbers of many groups and sp., not to a few only. The autumnal population may vary qualitatively from yr. to yr. Pentatomidae and Fulgoridae (*Scalops* spp.) were present in much greater numbers in 1928 than in 1927 in the herbs, while earthworms and ants were much less abundant in the current as compared with the previous yr. The smaller total population both in herbs and ground, the rapid decline in the autumnal society, and the qualitative peculiarities observed in 1928 as compared with 1927 were coincident with a drier spring and summer, a more rapid by declining mean autumnal temp., a greater autumnal relative humidity and greater variability during the collections. Moisture was somewhat less than average, previous to collections, and somewhat greater than average during the latter part of the autumn, and temp. conditions in air and soil were rigorous as compared with similar factors in 1927.—*Authors' summary.*

12641. **STEVENS, BELLE A.** Ecological observations on Callianassidae of Puget Sound. *Ecology* 10(4): 399-404. 3 fig. 1929.—*Upogebia pugettensis* (Dana) and *Callianassa gigas* (Dana) destroy oysters in Puget Sound. They throw mud over young oysters and drain beds by constructing Y-shaped burrows. Their foods and methods of burrowing are described.—*A. S. Pearse.*

PLANT

12642. **[ABOLIN, R. I.]** АБОЛИН, Р. И. Южная часть Алма-Атинского округа Казакской АССР в естественно-историческом отношении. [Natural conditions in the southern part of Alma-Ata district of Kazak ASSR.] [English summary.] Труды Института Почвоведения и Геоботаники Средне-Азиатского Государственного Университета (*Trans. Soil & Geobot. Inst. Middle Asiatic State Univ. Kazakstan*) 1: 5-63. 33 fig. 1929.—Middle Asia is divided into 8 zones on the basis of temp.: very hot, hot, very warm, warm, moderately warm, moderately cold, cold, and very cold. In these zones the following life zones are described: desert steppe, dry steppe, meadow or wood steppe, subalpine, alpine, and snowy or super-alpine zone. The soil, climate, and vegetation are described for each zone in detail.—*L. J. Pessin.*

12643. **ANDERSEN, SVEND.** Om vegetationen paa danske kaempehöje. [Vegetation on the Danish burial mounds.] *Bot. Tidsskr. [Copenhagen]* 41(4): 283-303. 1931.—A study of the vegetation on 8 burial mounds, in various parts of Denmark, with a list of the sp. occurring on each. The vegetation on these mounds is surprisingly varied; 180 sp. are listed as occurring on the 8 mounds studied; 86 of these occur on only 1 of the mounds, and only 1 sp., *Succisa pratensis*, occurs on all 8 mounds.

12644. **AUER, V.** Some future problems of peat bog investigation in Canada. *Suomen Metsätieteellinen Seura. Comment. Forest. [Helsingfors]* 1: 3-31. 1928.—The problems suggested are: distribution; the living plants constituting the surface at present, considered from the standpoint of plant-sociology; the layers of peat under the surface, considered as a record of the development of vegetation in post-glacial times; formation and development; form (degree of convexity); formation of soils; and practical investigations (litter, afforestation, fuel).—*G. B. Rigg.*

12645. **BEHMANN, G.** Zur Morphologie und Vegetation nw-deutscher Binnendünen. *Mitt. Florist.-Soziol. Arbeitsgemeinschaft Niedersachsen* 2: 167-188. 5 fig. 1930. —Studies in the dunes of the nature preserve Neumühlen near Verden am Aller confirm the opinion of Tüxen that the colonization of the quicksand of northwest German inland dunes is caused primarily by *Weingartneria canescens* and *Carex arenaria* which start the development toward the Weingaertnerietum. On quiet or slightly moving sand, *Polytrichum piliferum* has also been observed as first colonizer. The moss and lichen carpets prefer clearly a northwestern exposure. Their develop-

ment is mainly traced back to very open pine woods of artificial origin. Plants forming much humus (*Pinus sylvestris, Calluna vulgaris, Nardus stricta*) increase considerably in the area of the northwest German oceanic climate the acidity of the soil, as shown by the following measurements: naked quicksand at a depth of 0-5 cm., pH 4.5, humus=0.25%; *Weingaertneria* community 50-60% covered with vegetation, at a depth of 10-20 cm. (root layer) pH 4.55, humus=0.40%; under *Calluna vulgaris* at a depth of 0-6 cm., pH 3.5, humus=5.65%; in decomposed pine needles the pH is 3.1 as against 4.3 in the upper undecomposed layer. The continuous predominance of such humus producers or pure stands of them (owing to man's influence) will finally make impossible in this area not only their own existence but also the growth of higher plants in general. —*G. Behmann (transl. by A. Rehder)*.

12660. **[ILLICHEVS'KII, S.]** ІЛЛІЧЕВСЬКИЙ, С. Рослинність околиць м. Полтави. [Vegetation in the vicinity of Poltava.] [English summary.] Записки Полтавського Сіл.-Господарського Політехнікуму (*Mém. Agr. Polytechnicum, Poltava*) 2(4): 1-27. 1928.—The author distinguishes and lists the plant spp. for the 3 communities. (1) On argillaceous soil of a river valley towards the upland there are forest belts, forest margins on hills and slopes, dry hills and steep hillsides, dry upland meadows, wet meadows, upland marshes, brooks and ditches, and weedy grass communities. (2) Within the limits of spring floods in the river valley, there are forests, alder groves, saline meadows, sandy meadows, river bank communities, and river aquatics. (3) On a sandy terrace there are dry groves, wet forest, arid sandy areas, depressions among the dunes ("plates" or "pannes"), cold marshes (bogs) with *Sphagnum*, salines, and areas of weedy sand. It is concluded that in the series of associations, the same plants are characteristic of the same degree of soil moisture. A plant changes its usual station according to variations of latitude and climate; therefore a plant is less plastic than is usually believed, for its sensitiveness to environment is compensated by changing its stations. The same locality affords examples of associations characteristic of

various climates and latitudes, each association with its proper vegetation, aspect, microclimate, and landscape.—*From author's summary.*

12661. **IVANOV, L. A. Die Sonnenstrahlung als Faktor der Pflanzengeographie und Ökologie.** [Sun irradiation as a factor in plant geography and ecology.] *Biol. Zentralbl.* 49(8): 493-508. 3 fig. 1929.

12662. **JENNY, H. Hochgebirgsböden.** In: Handbuch der Bodenlehre. 3: 96-118. Julius Springer: Berlin, 1930. —Climatic conditions in high mountains and their action in the development of alpine soil types are discussed. Data from regions where investigations have been carried on at these high altitudes are summarized showing the close relation which exists between soil and vegetation.—*C. F. Cox.*

12664. **KELLER, BORIS. Die Methoden zur Erforschung der Ökologie der Steppen- und Wüstenpflanzen.** [In: Handbuch der biologischen Arbeitsmethoden. Abt. XI. Chemische, physikalische und physikalisch-chemische Methoden zur Untersuchung des Bodens und der Pflanze, Teil 6, Heft 1, Lief. 335.] p. 1-128. 22 fig. Urban und Schwarzenberg: Berlin, 1930.—The climatic and soil factors of steppe, semi-arid, and desert regions are analysed, with emphasis on the wide daily and yearly temp. ranges, the scanty and irregular water supply, and the effect of winds. Details of these factors are given for various areas including much data from southern Russia. Soils are described as to color, humus content, texture, and profile character ranging from the dark tschernosems of the grass steppes to the gray and yellow soils of the desert. Saline and solonetz soils are included. Growth forms and spp. of the various plant communities are exemplified, principally from Russian areas. Not only are the community relations discussed but also the root and stem systems, the leaf structure, and the osmotic concentration of the cell contents of steppe and desert plants are examined. Finally a scheme is presented for the classification of the plant communities under consideration. There is a summary of recent work in this field which includes contributions from many Russian investigators. Many of the data are tabulated.—*G. D. Fuller.*

12665. **MAXIMOV, N. A. The physiological significance of the xeromorphic structure of plants.** *Jour. Ecol.* 19(2): 273-282. 1931.—Very different types of plants with almost no common characters are included under the name of xerophytes. When plants are grown under desiccating conditions there are always a decrease in the dimensions of all cells, increase in number of stomata per unit area, a more compact network of veins in the leaf, denser hair covering, thicker cuticle and wax covering, and very often an increased development of palisade tissue and a decreased development of spongy tissue. These changes create conditions favorable to increased photosynthesis and in many instances to increased transpiration. Experimental evidence shows that many xerophytes have very high rates of transpiration. It is not, however, the rate of transpiration when an abundant water supply is present, but the capacity to restrict water loss to a minimum in time of drought, that characterizes the water utilization of xerophytes. When wilting occurs water loss is much less in xerophytes than in mesophytes because the former have a much lower rate of cuticular transpiration. The essential quality of the xerophyte is drought resistance, and hence xerophytes are defined as plants of dry habitats which are able to decrease the transpiration rate to a minimum under conditions of water deficiency.—*G. D. Fuller.*

12666. **LOREY, E. Vegetationsstudien im Hochgebirge.** *Ber. Senckenberg. Naturforsch. Ges.* [*Natur u. Mus.*] 60(7): 316-322. 1 fig.; (8): 372-377. 3 fig.; (9): 425-433. 3 fig.; (10): 474-481. 4 fig. 1930.—The characteristic plant formations of Rhätikon (the northern calcareous Alps) north of Davos are described. In the Brandner Valley are conifer forests of *Pinus silvestris* and *P. montana* var. *arborea*, with steppe-like undergrowth, relics of the last interglacial epoch, edaphically conditioned, not climatic as in the great central alpine valleys. The scrub forest zone is dominant on regions of poor soil and on avalanche areas on limestone slopes. The gravel field here shows successive stages. Quadrat studies show the dominant herbs to be nitrate-loving plants, *Ranunculus aconitifolius, Cirsium spinosissimum,* and *Poa alpina* var. *vivipara.* The dwarf mesophilous and hydrophilous communities of alpine snow meadows were investigated (minimum area $1m^2$). On the primitive rock, $pH < 6$, *Salix herbacea* was frequent. On limestone, $pH > 6.2$, area only half covered, an Aribidetum coeruleae was common. The mesophilous and hydrophilous sp., whose abundance and constancy were determined, are pictured. A discussion of adaptation and the application of organization characteristics is given. The wind ridge flora consists only of succulents and true xerophytes, of which not only the structure but the physiological characters (great suction power) are discussed. The most frequent of these are the Loiseleurietum (*L. cetrariosum*) and the Elynetum (*E. myosuroides*). Maps show the distribution of the communities.—*E. Lorey (transl. by H. H. M. Bowman).*

12667. **MONTGOMERY, CHARLES E. Ecology of the mosses of the Grand de Tour region of Illinois, with special reference to pH relations.** *Bot. Gaz.* 91(3): 225-251. 1931.—The Grand de Tour mosses were found on sandy, limestone, and morainic soils, and on stumps, old logs, and tree bases. They represent 62 sp. from 14 families. The pH of the 2-3 cm. of the soils in which the mosses grew made up the main body of tests, but many tests of soil 1 in. below the surface were also recorded. More than 1100 tests were made April-Nov. under as many different conditions as possible. The limestone soils were all alkaline. The sandy soils had pH values of 3.8-8.2, and the morainic soils of 5.0-8.2. The pH variations between top soils and the soil 1 in. deep were 0.0-2.8. Mosses that prefer acid soil are *Polytrichum commune, P. piliferum, Catharinea angustata, Pohlia nutans, Dicranum scoparium, Dicranella heteromalla, Calliergon schreberi, Hypnum haldanianum, Georgia pellucida,* and *Bryum caespiticium.* Mosses found on soils close to or above the neutral point were *Mnium cuspidatum, Bartramia pomiformis, Aulacomnium heterostichum, Brachythecium* spp., *Anomodon* spp., *Amblystegium* spp., *Thuidium recognitum,* and *Climacium americanum.* Mosses seem to have an optimum pH. Most sandy soil mosses are acid although some are alkaline. As in the case of many of the higher plants, some mosses are fairly good soil indicators.—*C. E. Montgomery.*

12668. **NĚMEJC, F. The floras in the Czechoslovakian travertines. A report on the investigations during the years 1925 and 1926.** *Acta Bot. Bohemica* 8: 86-103. 1929.—The Czechoslovakian travertines originated either from ordinary cold waters containing great quantities of dissolved limestone or from hot springs. If arising from mossy tufts or liverwort beds, the contained structure is somewhat visible, as are contorted leaves, water plants, grasses, or twigs fallen into the brook. Travertines from hot springs lacking plant configuration. The abundance of leaf and fruit impressions of a number of trees are discussed both in relation to the geologic age of occurrence and the exact location of their collection for study.—*V. O. Graham.*

12669. **PACIORKOWSKI, Z. Przyczynek do znajomości składu botanicznego pastwisk włościańskich powiatu tarnowskiego.** [Plant communities of cow pastures in Tarnow.] [With German summary.] *Roczniki Nauk i Leśnych* (*Polish Agric. & Forest Ann.*) 25(1): 67-94. 1931.—The following 5 vegetation types are distinguished: (1) *Trifolium repens* on alluvial, sandy loam soils, moderately productive and rich in $CaCO_3$; (2) *Nardus stricta* on poor, acid, wet, sandy soils; (3) mixed type with *Lolium perenne* dominant, on fertile alluvial soils rich in $CaCO_3$; (4) mixed type with *T. repens*

prominent on poor alluvial sandy-loam, on wet humus soils, and on sandy-loam soils of diluvial origin; and (5) mixed type with broad leaved weeds, on alluvial sandy-loam or sterile soils.—*From author's summary (transl.)*.

12675. **[SAMBUK, F. V.]** САМБУК, Ф. В. Растительные ассоциации на желто-подзолистых почвах Коношской дачи. Вологодской губернии. [Plant associations on the yellow podsol soils in the Province of Vologda.] [German summary.] Журнал Русского Ботанического Общества при Академии Наук СССР. (*Jour. Soc. Bot. Russie, Acad. Sci. URSS.*) 12(1/2): 33-58. 8 fig. 1927.—A peculiar yellow podsol soil has developed on a series of hills underlain by calcareous sandy loam. The summits are occupied by a Piceetum hylocomiosum, upper slopes by a Piceetum vacciniosum, lower slopes by a P. herbosum, and the lowest levels by a Piceetum sphagnosum. Meadows occur rarely where the forest has been cleared. One sedge, *Carex wiluica*, is here recorded for the first time in European U. S. S. R. In the eastern part of the Tinowoe Moor there is a *Hypnum* bog, occupied by *Drepanocladus vernicosus*. This has the aspect of a filled pond, but closer examination shows it to represent a spring-bog. It carries certain sp. which elsewhere in Vologda are constants of such bogs, and the conifers have crooked tops as in spring-bogs. From the utilization standpoint this forest-district is divisible into: (1) obligate forest land, (2) forest-field land, (3) obligate meadow land, and (4) a reserve improvable area.—*E. T. Wherry.*

12676. **SOLACOLU, TH.** Analyse pollinique de la tourbe de "Poiana-Stampei." [Pollen analysis of the Poiana-Stampei (Rumania) peat.] *Intâiul Congr. Nat. Naturalişt. România* 1: 407-410. 1928 (1930).

12677. **SOÓ, R. de.** A Magyar vizek virágos vegetâciójának rendszertani és szociológiai âttekintése. [Systematics and sociology of the phanerogamous vegetation of the Hungarian inland waters.] *Magyar Biol. Kutató Intézet Munkái* 2(1): 45-79. 1928.—After a general characterization of the hydatophilous associations the author gives the composition of some communities of water plants; he then discusses the sp. and forms found in Hungary and the Balkan Peninsula and particularly the ecological modifications (status) of *Callitriche, Ceratophyllum, Myriophyllum, Hippuris*, and *Utricularia*.—*D. Fehér (transl. by A. Rehder)*.

12678. **SOÓ, REZSÖ.** Kisérleti ökológiai Tanulmányok a Balaton Vidékén. 1. Párolgásmérések különböző növényszövetkezetekben. (Elözetes közlemény). [Experimental-ecological studies at Balaton. Transpiration measurements in various plant associations.] [German summary.] *Mat. és Természettud. Értesitö (Math. u. Naturwiss. Anzeiger Ungarischen Akad. Wiss.) Budapest* 46: 602-614. 1929.

12679. **SUOMALAINEN, PAAVO.** Über die Samenkeimlinge auf einer Meeresstrandwiese in Südfinnland. *Ann. Soc. Zool.-Bot. Fennicae Vanamo* 11: 173-187. 1930.—A series of orientation experiments was carried out during the summers of 1927 and 1928 on the island of Längerholm in Finland. The meadow studied was low-lying and on the west side of the island. The plant sp. were zoned and their growth densities determined according to Norrlin's gradation table. Typical experimental plots, 1 m. sq., were then chosen in each zone for the study of seed germination. The zones were: (1) the *Scirpus-Juncus* consisting principally of *Triglochin maritima, S. uniglumis, J. gerardi*, and *Glaux maritima;* (2) the *Scirpus-Calamagrostis* with *Eriophorum polystachyum, S. uniglumis, C. neglecta, J. gerardi*, and *Galium palustre;* (3) the *Carex* of *E. polystachyum, C. goodenowii*, and *G. palustre;* and (4) the *Deschampsia* zone, of chiefly *D. caespitosa* and *Filipendula ulmaria*. As would be expected, a number of plants also grew between the zones. The seed of all plants which were typical to the zones germinated and produced seedlings with the exception of *Glaux maritima*. While the number of seed germinating in the same zone was fairly constant at a definite time during the summer, the total number per sq. m. was peculiar to each zone and appeared to fluctuate during the summer. The ratio of the seed count made during the summer of 1927 to the seedling count made during the summer of 1928 was particularly great in the case of *Juncus gerardi*, being 1218 to 1 in the *Juncus* zone and 8458 to 1 in the *Deschampsia* zone. The ratio was also great in the case of *Carex goodenowii*. The lowest ratio noted was that of *Deschampsia* (27 to 1).—*E. T. Bodenberg.*

12681. **THODAY, D.** The significance of reduction in the size of leaves. *Jour. Ecol.* 19(2): 297-303. 1931.—It is difficult to tell whether a plant with large leaves exposes more surface than one with small leaves. Structural modifications tending to reduce resistance within the leaf to the flow of water may be as important for xerophytes as features leading to a reduction of transpiration. In the case of dissected leaves with narrow segments and of pinoid, ericoid, and cupressoid leaves, no part of the mesophyll is more than a short distance from the channels of supply. Storage of water in leaves is of secondary importance in many cases. The extent of the internal surface of the leaf is of considerable importance, since the greater part of the resistance to diffusion is located there.—*G. D. Fuller.*

12689. WOOD, J. G. An analysis of the vegetation of Kangaroo Island and the adjacent peninsulas. *Trans. & Proc. Roy. Soc. S. Australia* 54: 105-139. 3 maps. 1930.—An analysis is made of the flora and vegetation of Kangaroo Island, and the peninsulas of Fleurieu, Eyre, and Yorke. The flora of this gulf region is composed almost equally of migrant species from the western and eastern centers of distribution in Australia, together with 82 endemic spp., out of a total of 657 spp. The migration from the west was earlier than the migration from the east; and the Southland, represented at present by Kangaroo Island and the sunklands of the gulfs, formed the chief means of passage through which the spp. of westerly origin passed. The migration of spp. from the eastern center occurred chiefly after the separation of Eyre Peninsula, and the gulfs have proved a barrier to westerly migration of these spp. As the result of continued separation, sp. production occurred at the points of greatest isolation, viz., in the west end of Kangaroo Island and the southern portion of Eyre Peninsula. In these 2 regions 69% of the total endemic spp. are found, the greater number of which are confined to 4 families. In the 2nd part of the paper the ecology of the Gulf Region is dealt with. Excluding the savannah forests of *Eucalyptus odorata* and *E. leucoxylon,* all the forest and scrub types developed within the 20-in. annual isohyet are of the sclerophyll type and are variants of the "stringybark formation" of the Mount Lofty Ranges, with *E. obliqua* as the climatic climax forest tree. A new edaphic sub-climax is present in the west end of Kangaroo Island, in the Port Lincoln district, and in the southern extremity of Yorke Peninsula. Other subclimaxes and associations are recognised, and their relations to succession in the sclerophyll forests of Southern Australia are discussed.—*Author's summary.*

12690. ZENARI, SILVIA. Le stazioni rupestri d'alta montagna nella zona delle Dolomiti. [High mountain cliff stations in the zone of the Dolomites.] *Atti Accad. Sci. Veneto-Trentino-Istriana* 21: 3-35. 1930.—Three types of associations are noted, one characteristic of the dolomitic rock in situ, another of the gravelly debris derived from it, and the 3rd of the marl-clay terrain of the Raibliano. The manner of populating and the biological characteristics of such associations are described. —*Author's summary (transl.).*

PLANKTON

12691. BAJKOV, ALEXANDER. Reports of the Jasper Park lakes investigations, 1925-1926. VII. A study of the plankton. *Contr. Canadian Biol. & Fish.* 4(21/24): 345-396. 1929.—More than 500 night and day quantitative samples of plankton were obtained from 18 lakes situated at 3,339-5,550 ft. above sea level. Special galvanized iron plankton cylinders which cut out a vertical column of water at any point from surface to bottom with a minimum amount of disturbance were used. Total amount of plankton and the amounts of the various sp. were estimated and results expressed in diagrammatic form. Light and temp. have considerable influence on the vertical migrations of plankton. All planktonic organisms were divided into 3 groups: positively and negatively heliotropic and indifferent. To the 1st group belong nearly all green and blue-green algae, the next group comprises nearly all sp. of *Cladocera;* and the last group includes most sp. of diatoms.—*A. Bajkov.*

12692. BAJKOV, ALEXANDER. Biological conditions of Manitoban lakes. *Contr. Canadian Biol. & Fish.* 5 (10/12): 383-422. 1 map, 1 fig. 1930.—Physiography and biology of certain of the Prairie Lakes, including Lakes Winnipeg, Manitoba, and Winnipegosis, and the cycle of exchange of organic matter, are discussed. Total amount of plankton in Lake Winnipeg was estimated as 5,512,500 cu. m., containing approximately 1,147,500,000 kgm. of rough wt., 114,750,000 kgm. dry wt., 76,500,000 kgm. organic matter, 38,250,000 kgm. mineral salts, and 30% ash in dry wt. Similar estimates were also made for bottom fauna.—*A. Bajkov.*

12693. BORNER, L. Die Bodenfauna des Ritomsees und seines Deltagebiets vor der Absenkung (1916). (Schluss.) [The bottom fauna of Lake Ritom (Switzerland) and its delta before the subsidence of 1916.] *Zeitschr. Hydrol.* 4(3/4): 1-30. 1928.—See also Rev. d'Hydrol. (Hydrogr. Hydrobiol. Piscicult.) 4(1/2): 121-162. 1927.

12694. BUJOR, P. Noui contribuţiuni la studiul biologiei lacului Tekirghiol. [Biology of the salt lake of Tekirghiol.] [With French transl.] *Intâiul Congr. Nat. Naturalişt. România* 1: 139-151. 1928(1930).

12695. CANDEIAS, ALBERTO. Estudos de plancton na baía de Sesimbra. *Bull. Soc. Portug. Sci. Nat.* 11(3): 11-72. Map, 6 pl. 1930.—An annotated list of the spp. found in the Bay of Sesimbra, Portugal, includes in Ciliata, 10 sp. of Tintinnidae; in Dinoflagellata, 9 Dinophysidae, 38 Peridinidae; in Diatomaceae 21 spp.; in zooplankton 32 spp. The physical conditions of distribution are treated, and an extensive bibliography follows. Illustrations are presented of 87 forms. No new forms are described.

12696. FORTI, ACHILLE. Osservazioni biologiche sopra alcuni laghi dell'Albania orientale. [Biological observations on some lakes of eastern Albania.] *Atti Accad. Sci. Veneto-Trentino-Istriana* 21: 121-132. 1930.—An analysis is given of 20 collections from about 5 stations, with lists of spp. for each. A table of 84 spp. (chiefly plankton) shows their local distribution. The life in the various lakes was remarkably distinct, even in those very near each other, and this seems to preclude wind transportation.

12697. JUDAY, C., and E. A. BIRGE. A second report on the phosphorus content of Wisconsin lake waters. *Trans. Wisconsin Acad. Sci., Arts & Lett.* 26: 353-382. 11 fig. 1931.—The P content of 479 lakes of northeastern Wisconsin was determined The mean quantity of soluble P in the surface water of the various lakes is 0.003 mgm. per liter; the range is from none in 9 lakes to a maximum of 0.015 mgm. in 1. In 54 pairs of spring and summer observations on the surface water of 32 lakes, 26 pairs showed a smaller amount of soluble P in summer than in spring, 12 pairs were the same, and 16 pairs yielded a larger amount in summer than in spring. In

the 2nd and 3rd groups, the soluble P was maintained at the spring level, or even increased somewhat during the summer in spite of the fact that some of these lakes supported large crops of phytoplankton at that time. Most of the thermally stratified lakes showed a more or less marked increase in quantity of soluble P in the lower strata in summer. The mean quantity of organic P in the surface water of these lakes is 0.020 mgm. per liter (range 0.005-0.103 mgm.). On the basis of the vertical distribution of the organic P, the various series of samples may be divided into 3 groups: those with the same quantity of organic P at surface and bottom; those with a larger amount at the bottom; and those with a smaller amount at the bottom.—*Authors' summary.*

12698. **KIKUCHI, KENZO. Diurnal migration of plankton Crustacea.** *Quart. Rev. Biol.* 5(2): 189-206. 4 fig. 1930.—The intensity of the sunlight and the turbidity of the water seem to be the predominant factors determining the vertical distribution of plankton. In a few cases, the change in temp. of the water in the metalimnion determines the upper or the lower limit of the vertical distribution. The physiological state of the animal must also be taken into consideration. Diurnal change of these factors, especially of intensity of sunlight, causes the periodical vertical migration. On the basis of the responses of animals to light intensity or temp. of water and on the basis of locomotor activity, various types of diurnal migration are recognized.—*K. Kikuchi.*

12699. **KOLKWITZ, R. Eine Planktonprobe aus dem Kapuas-Strom.** [In: "Beiträge zur Kenntnis der Flora von Borneo," paper 10.] *Mitteil. Inst. Allg. Bot. Hamburg* 7(3): 179-181. 1931.—A list of diatoms and other plankton from this river in Borneo.

12700. **POPOV, A. M. Hydrobiological explorations in the Nordenskiold Sea (Sea of the Brothers Laptev).** *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(5/6): 462-467. 1931.—Near the delta of the Lena, where the water is less salty than elsewhere in this Sea, and where most of the spp. are those of brackish water (some freshwater spp. occur close to the river's mouth) 73 sp. were taken. Nordenskiold Sea has a distinctly arctic fauna. Some 350 benthonic forms occur. The animal life is scanty. Four groups occur: circumpolar; eastern spp., with range from the Nordenskiold Sea to the Pacific; western spp., with range extending from this Sea to the Atlantic part of the Arctic Basin; and a group of endemics in Siberian seas, or spread along the Arctic coast of Siberia. The 1st and 3rd groups predominate in the northern and western part of the Sea, those of the 4th group in the southeastern part. Littoral life is almost absent; only *Gammarus locusta* L. was found.

12701. **[SUZDAL'SKIĬ, V. I.] СУЗДАЛЬСКИЙ, В. И. Опыт санитарно-биологического исследования барабинских озер: "Узункуль," "Большой Яркуль" и "Амбакуль." [Sanitary-biological investigation of Barabin lakes: "Uzunkul'," "Bol'shoi Iarkul'," and "Ambakul'."]** Известия Томского Государственного Университета (*Trans. Tomsk State Univ.*) 82: 345-364. 1928.—An annotated list of 82 spp. of plankton and benthon.

12702. **TITUS, LESLIE, and VILLIERS W. MELOCHE. Note on the determination of total phosphorus in lake water residues.** *Trans. Wisconsin Acad. Sci., Arts & Lett.* 26: 441-444. 1931.

12703. **TRESSLER, WILLIS L., and BERNARD P. DOMOGALLA. Limnological studies of Lake Wingra.** *Trans. Wisconsin Acad. Sci., Arts & Lett.* 26: 331-351. Map, 10 fig. 1931.—Lake Wingra is a small, shallow body of water at the outskirts of Madison, Wisconsin. It shows very little stratification, even in winter under the ice. The difference in temp. between surface and bottom rarely exceeds 5°. A maximum of 26° C. was observed at the surface in summer. A fairly strong wind will mix the water from surface to bottom when the lake is open. The transparency is 0.5-2.5 m. as shown by the Secchi disc. The conductivity is 290-390 units (reciprocal of megohm resistance); average is 330. The color is about 18 on the platinum-cobalt scale. O is present at all depths and at all seasons in sufficient quantities to support animal life. Free CO_2 is found at the surface only in winter; at all other times there is a deficiency. The water contains a large amount of fixed CO_2, which may attain 110 p.p.m. The pH is 7.8-8.7. Chlorides were found in minute traces only. Organic P is high in summer, low in winter. Soluble P is low in summer and high in winter. The dissolved silica is abundant and shows some correlation with the number of diatoms. The nitrates are high at all times, but highest in winter. Free ammonia is highest in winter with a secondary rise in spring. Ammonia and nitrates are low in summer. Organic N is low in winter and high in spring and summer; it parallels the plankton curve fairly closely. The average amount of organic C is 9.0 p.p.m. The organic matter in the centrifuge plankton follows roughly the number of plankton organisms. The diatoms are most abundant of all the plankton organisms, being found in large numbers in the spring and in somewhat smaller numbers in the fall. In summer the blue greens are quite abundant. Of the crustaceans, *Cyclops* is the most abundant.—*Authors' summary.*

12704. **WIEBE, A. H. Investigations on plankton production in fish ponds.** [*U. S.*] *Bull. Bur. Fisheries (Document 1082)* 46: 137-176. 1 fig. 1930.—In ponds at Fairport, Iowa, determinations were made of N as NO_3, NH_3, NO_2, and organic N; dissolved and total P chlorides; dissolved O; free CO_2; and pH. Plankton samples were taken at regular intervals and were studied qualitatively as well as quantitatively. The organic matter in the water was also determined. Results show that the soluble P becomes completely exhausted at times and hence may be a limiting factor. The growth of plankton may be increased through the addition of fertilizer (superphosphate, soybean meal, sheep manure, and shrimp bran).—*A. H. Wiebe.*

12705. **WIEBE, A. H. Dissolved phosphorus and inorganic nitrogen in the water of the Mississippi river.** *Science* 73(1902): 652. 1 fig. 1931.—On the basis of an analysis of 44 samples of water it is concluded that inorganic N is apparently not a limiting factor for phytoplankton in the waters of the Mississippi River at Fairport, Iowa, but soluble P may be at times.

12706. **[ZAKHVATKIN, A. A.] ЗАХВАТКИН, А. А. О вертикальном распределении и суточных миграциях зоопланктона в Байкале. [Vertical distribution and daily migration of Lake Baikal zooplankton.]** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(6): 133-138. 1930.—The size of the nets prevented the capture of the adult forms of Cottomephoridae and Comephoridae. Young forms of *Cottocomephorus grewingkii* and of *Comephorus* were absent in the daytime in the upper layers. In the case of *Macrochetopus branickii,* young forms abounded at 100 m. depth; old ones were deeper. Absent from the upper 50 m. during the day, this sp. swarmed there at night. The most abundant and omnipresent sp. was *Epischura baicalensis;* it was absent in the upper 2-3 m., reaching a maximum at 8-10 m., decreasing sharply at 20-40 m., and reaching a 2nd maximum at 60-100 m., where sexually mature individuals were slightly more frequent. *Triarthra longiseta, Anuraea aculeata,* and *Notholca longispina* were more or less similar in their distribution and migrations.

DISEASES CAUSED BY FUNGI

12707. **BENNETT, F. T. Gibberella saubinetii (Mont.) Sacc. on British cereals. II. Physiological and pathological studies.** *Ann. Appl. Biol.* 18(2): 158-177. 3 pl. 1931.—Under storage conditions, *G. saubinetii* retains its vitality for at least 2 yr. in its vegetative stage, and for at least 1 yr. (probably much longer) in its perithecial stage. Heating to 100° C. for 5 min. under dry conditions kills the fungus on or in diseased grains, but this treatment of seed grain is not a practicable way of controlling the disease. *G. saubinetii* causes "seedling blight" and "foot rot" of cereals, but is much less virulent than *Fusarium culmorum* and *F. avenaceum* in this respect. All 3 fungi attack the ears similarly, with equal virulence and with similar results. *G. s.* occurs throughout England and in Ireland, but full details of its frequency of occurrence in the British Isles have not yet been obtained. This fungus, the conidial stage of which is known as *Fusarium graminearum* Schwabe, produces mature perithecia on natural and artificial substrata, given ample moisture and a uniform temp. of 21-22° C. British summer shade temp. does not suffice for this. The minimum temp. for germination of conidia and ascospores is about 5° C. Between 5 and 10° both kinds of spores develop mycelia, and the fungus can infect cereal seedlings. The optimum temp. for vegetative growth and the production of mature perithecia is about 24°; the maximum temp. for growth is about 37°. In its vegetative and perithecial stages this fungus can withstand prolonged exposure to −1° to −20° C. and in its vegetative stage it persists through the winter in Great Britain.—*Author's summary.*

12708. **BEYMA THOE KINGMA, F. H. van, und W. F. van HELL. Ueber die Botrytiskrankheiten der Lilien.** *Phytopath. Zeitschr.* 3(6): 619-632. 6 fig. 1931.—In 1928 the authors isolated and described *B. elliptica* (Berk.) Cooke, which forms no sclerotia. Van Hell in 1930 found a race which forms sclerotia. When lilies are infected with the 2 strains the latter kills the plants while the former causes only slight damage. *B. hyacintha* van Beyma, isolated from lily bulbs, was also parasitic in some cases and likewise caused the plants to die. 2 strains of *B. cinerea* Pers. isolated from lilies, of which one forms sclerotia and the other not, could in favorable circumstances (for the fungus) also cause leaf spots like *B. elliptica*. Of these fungi only the sclerotia-forming strain of *B. elliptica can* be regarded as actually parasitic. Since a difference in the formation of sclerotia is not of specific rank, it is the authors' opinion that the 2 should be retained under one name.—*Authors' summary (transl.).*

12709. **BONGINI, V. Le macchie fogliari del Ciclamino (Phyllosticta cyclaminis Brun.) [Leaf spot of cyclamen.]** *Boll. Lab. Sper. Fitopatol.* 7(3): 4-9. 3 fig. 1930.—A fungus was isolated from infected leaves which produced pycnidia on various media and reproduced the disease when inoculated into healthy leaves of *Cyclamen persicum* and *C. europaeum*. The ascospore form, *Didymella* **cyclaminis*** (p. 8), was found in the spring on leaves previously infected with *Phyllosticta* during the winter —*V. Bongini (transl. by C. Zeimet).*

12710. **EZEKIEL, WALTER N., D. C. NEAL, PAUL R. DAWSON, and E. B. REYNOLDS. Report of the fourth annual cotton-root-rot conference.** *Phytopath.* 21(10): 957-964. 1931.—A summary of the conference held at College Station, Texas, on January 19, 20, 1931, including the following topics (most of the research material being previously published): Physiologic specialization of *Phymatotrichum omnivorum,* sclerotia and mycelial strands, spore stages, nutritional requirements of the organism in artificial culture, host plants, effect of the disease on hosts, overwintering on live infected roots and periodicity of root rot, relation of occurrence to soil conditions, subsoiling experiments, fertilizers, soil disinfectants, rotation and cultivation, barriers to root rot spread, flooding experiments, and resistant strains and varieties.—*W. A. Whitney.*

12711. **GADD, C. H. The Armillaria root disease of tea.** *Tea Quart. [Ceylon]* 3(4): 109-113. 2 pl. 1930.—A root disease in Ceylon caused by *Armillaria mellea* is described. A constant feature of infection is the development of black rhizomorphs on the cortex, a feature which is rare under Nyasaland conditions. The radial fissures characteristic of this disease in Java were not observed in the field though they develop in the laboratory. Fructifications are rare. The destruction of diseased bushes and adjacent jungle stumps and roots has afforded adequate control and there has been no serious spread of the disease since its detection in 1927. *Albizzia lopantha, Acacia decurrens* and *Grevillea robusta* are also liable to attack in Ceylon.—*C. H. Gadd.*

12712. **HARTER, L. L., and W. J. ZAUMEYER. Pythium butleri—the cause of a bean wilt.** *Phytopath.* 21(10): 991-994. 1931.—This bean wilt, appearing coincidently in Greeley, Colorado, and Rosslyn, Virginia, is characterized in the early stages by a wilting of the foliage in the warmer part of the day followed by a nocturnal resumption of turgidity. Later appreciable drooping of the branches is seen and, under favorable conditions, the mycelium may grow profusely over the dead cortex, often from the soil line to the branches. High temp. is required for the development of maximum symptoms, humidity being a factor largely restricted to the period of infection. *P. butleri* (=*P. aphanidermatum*) probably affects all snap-bean varieties.—*W. A. Whitney.*

12713. **HOPKINS, M. C. Southern Rhodesia: Alternaria leaf spot of tobacco.** *Internat. Bull. Plant Protect. [Rome]* 5(9): 165. 1931.—3rd report for S. Rhodesia.

12714. **IACOBESCU, N. Contribuţiuni la studiul fenomenului de putrezire al lemnului, in picioare şi doborât. [Rotting of standing and felled timber.]** [With German summary.] *Intâiul Congr. Nat. Naturalişt. România* 1: 198-204. 1 fig. 1928 (1930).—In a railroad tie "Rotkern" was noted in various degrees of color. The so-called wound gum, which represents a natural penetration of "Rotkern," is not an amorphous secretion of the wood as formerly thought, but is an organism. The coloration occurs in living, standing, or felled wood. Rotting of telephone and telegraph poles occurs only in places where the ground is saturated with water. Rotting of house timbers by *Merulius lacrymans* and other fungi is discussed in its botanical, technical, and legal aspects.—*Author's summary (transl.).*

12715. **JOCHEMS, S. C. J. Spikkel in Deli-tabak. [Cercospora disease on Sumatra tobacco.]** [With English summary.] *Mededeel. Deli Proefsta. Medan-Sumatra 2nd Ser.* 72. 1-35. 3 pl. 1931.—From the beginning of tobacco culture until 1900 frog-eye was one of the commonest leaf spots in Sumatra. From 1910 to 1929 it was of no consequence. In 1930 it reappeared in rather serious form, especially in the so called "zwarte stofgrond" country, which consists of a black andesitic-dacite soil. In 1931 the whole tobacco district was affected, but again the "zwarte stofgrond" district most severely. On some estates incipient infection continued to develop in the curing sheds after the leaves had been picked, producing large dark green and black spots with

little or no zonation. As the external appearance of the Sumatra wrapper leaf is one of its principal qualities, this form of *Cercospora* disease caused much damage. In limited experiments the trouble was somewhat overcome by ample ventilation, while a large % of the black spots disappeared after fermentation.—*Author's summary.*

12716. **KENDRICK, JAMES B. Seed transmission of cowpea Fusarium wilt.** *Phytopath.* 21(10): 979-983. 1 fig. 1931.—Preliminary trials failed to show that *Fusarium tracheiphilum* penetrates the seed. Evidence is presented that the fungus is transmitted on the seed where machine methods are used for harvesting. Hand-picked seed from diseased plants showed a low percentage of wilt in 2 out of 5 trials. A rather high percentage of wilt resulted from using 1-yr. old seed.—*Author's summary.*

12717. **KONOPACKA, W. Mączniak rzekomy na różach. [Downy mildew of roses.]** [With English summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 18(2): 169-172. 1927.—*Peronospora sparsa* is reported as a new disease in Poland. It was observed in Lublin on seedlings of *Rosa canina* and *R. rubiginosa.* Spraying with bordeaux mixture gave favorable results.

12718. **LOHWAG, HEINRICH. Zur Rinnigkeit der Buchenstämme.** *Zeitschr. Pflanzenkrank.* 41(8): 371-385. 5 fig. 1931.—The prominent, soft, swollen, longitudinal grooves of beech trunk result from radial longitudinal fissures in the heart wood along which rot fungi (*Fomes fomentarius* and others) quickly spread. When the crack (and the mycelium) reaches the cambium, its activity ceases but the adjacent parts increase their activity so that the grooves are mostly bordered by swellings. This appearance can be designated as the "spongy channeling" of beech. Since moisture hinders the production of the fruiting bodies, it is possible to explain both the strong resistance of the portions rich in water and the weak resistance of the portions containing air by the same cause, viz., the moisture relations. In parts poor in water, such as the heart wood, it is not the presence of air but the absence of water which causes the stronger mycelial growth.—*Author's summary (transl.).*

12719. **PEROTTI, R., e G. BONAVENTURA. Attacchi di Botrytis cinerea, Pers. su infruttescenze di ricino. [Attacks of B. cinerea on the inflorescence of the castor bean.]** *Boll. R. Ist. Sup. Agrar. Pisa* 3: 101-110. 1927.—Control recommendations are: treat the seed with 1% H_2SO_4; after harvest, burn all the plants; avoid cultivating *Ricinus* in the same soil again for 2 yr.

12720. **PETRI, L. Un'estesa infezione di "Pythium" su piante di grano. [Infection of wheat by Pythium.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 11(12): 1066-1068. 1930.—In May, 1930, all the wheat in the province of Padua showed more or less injury. A late variety usually showed the injury on the 1st internode and also on the rhizome, while an early variety showed it on the 2nd internode. The lesions resulted from an attack of *Pythium* which occurred at a point of the culm which had been injured by the late cold weather and aided by the continued spring rains. (See also *Ibid. Boll. R. Staz. Pat. Veg.* 10(3): 285-301. 10 fig. 1930.)—*L. Petri (transl. by B. F. Lutman).*

12721. **REICHERT, I., and F. LITTAUER. The causal agent of gummosis disease in Palestine.** *Hadar* 4(6/7): 145-150. 4 fig. 1931.—Many isolations from citrus trees affected by foot and trunk rot, and fruits attacked by brown rot yielded spp. of *Phytophthora.* On potato dextrose agar 2 groups of *Phytophthora* were differentiated, one showing a radial type of growth resembling that of *P. citrophthora,* the other showing a woolly type of growth resembling that of *P. parasitica* as obtained by Leonian on malt extract agar. Temp. relations confirmed the above determination: *P. citrophthora* did not grow at 32° C., whereas *P. parasitica* did. Comparison with well determined strains from Egypt and Spain confirmed the identifications. Inoculations with the strains determined as *P. citrophthora* alone, and also with *P. citrophthora* from Egypt, on orange fruits produced typical brown rot. Since it has been shown that both foot and trunk gummosis may be caused by either *P. citrophthora* or *P. parasitica,* it is proposed to accept the old name brown rot gummosis for the two terms Pythiacystis gummosis and mal di gomma previously used. As both species causing gummosis develop well in wet soil, removal of the soil from the base of the tree, or the use of rings around the base of the trunk has been recommended. Gummosis may be considerably reduced by effective control of brown rot.—*Author's summary.*

12722. **SPRAGUE, RODERICK. Cercosporella herpotrichoides Fron, the cause of the Columbia Basin footrot of winter wheat.** *Science* 74(1906): 51-53. 1931.—Inoculation studies showed that *C. herpotrichoides* (emended description given) is the primary cause of a footrot of winter wheat and barley occurring in the Columbia River (U. S. A.) basin. The fungus was identified by means of spores produced on corn meal cultures.—*R. Sprague.*

12723. **STANER, P. Une maladie étrange des racines du caféier.** *Bull. Agric. Congo Belge* 21(3): 919-923. 1 fig. 1930.—A root disease of coffee present in Belgian Congo, Netherlands Indies, Kenya, Uganda, the Philippines and Brazil, described by Mayné (1915), is discussed. Infection spreads throughout the root system. Young leaves hang down, old leaves turn yellow and fall. Buds secrete a brownish substance which solidifies on them. The disease is due to the association of *Pseudococcus citri* and *Polyporus coffeae.* The fungus incrusts the roots, and the insect encysts within the incrustation. The fungus fruits after the death of the tree. The insects, attended by red ants, lay their eggs at the base of the trunk; larvae live on the roots; the adults form on the roots dense colonies in which the hyphae of the *Polyporus* grow on the honey dew secreted by the insects. The fungus apparently does not harm the insect, but seems to protect it from too much or too little water. The fungus ultimately attacks the cortex of the roots which have been weakened by insect attack, causing progressive and rapid necrosis. *Sclerotium (Rhizoctonia bataticola),* reported elsewhere in association with the *Polyporus,* has not been found in this study. Means of control suggested by various workers are compiled.

12724. **TANAKA, SHÔICHI, and SHIGERU ENDO. Studies on a new canker disease of Japanese pear trees caused by Phomopsis fukushii n. sp.** *Tottori Nogaku-Kwaiho (Trans. Tottori Soc. Agric. Sci.)* 2(1): 123-134. 2 pl. 1930.—A new canker disease [*P. fukushii** (p. 132)] of Japanese pear trees (*Pirus serotina*) is described. The disease is prevalent in Tottori, Kanagawa and Saitama Prefectures. The fungus invades the cut ends of branches and the wounds of trunks and limbs, causing dark brown cankers. It affects old trees most readily. Pear varieties such as Okusankichi, Nijisseiki and Taihei are more or less resistant, while Imamura-aki, Imamura-natsu, Chojuro and Meigetsu are readily attacked. When artificially inoculated, the fungus attacks not only Japanese pear trees but also a European variety (*P. communis*) although the latter is not affected in the orchards. Apple trees are completely immune. The min. temp. for mycelial growth is about 8°C. and the max. about 33°. —*Authors' summary.*

12725. **[TOGASHI, K., and E. TSUKAMOTO.] [On the 3 species of Fusarium which cause the wilt-disease of pea. (Preliminary report II.)]** [In Japanese.] *Jour. Soc. Agric. and Forestry Sapporo, Japan* 19(87): 409-419. 1928.

12726. **UPPAL, B. N. India: Rhizoctonia bataticola on sorghum in the Bombay Presidency.** *Internat. Bull. Plant Protect. [Rome]* 5(9): 163. 1931.

12727. **VERONA, O. Marciume dei frutti di pomodoro dovuto a "Rhizopus nigricans" Ehr. [Tomato rot due to R. nigricans.]** *Boll. R. Ist. Sup. Agrar. Pisa* 6: 647-653. 1 col. pl. 1930.—Cultivated in a medium containing carbohydrates and acids, growth of the fungus was promoted by addition of sugars and hindered by acids.

12728. **WARE, W. M. A blossom wilt of lavender**

caused by Botrytis cinerea. *Jour. So.-Eastern Agric. Coll. Wye, Kent* 28. 206-210. 2 fig. 1931.—*B. cinerea* is able to cause infection of *Lavandula* spp. only through wounds and then it is restricted to the portion of the flowering stem between the blossom bud and first pair of leaves. Self-inflicted wounds probably account for the natural infection, since there was no evidence of insect injury. The characters of the organism are briefly described.—*W. A. Whitney.*

12729. YAMAUCHI, TAMETOSHI. [Diaporthe associated with mulberry blight "Kangare."] [In Japanese, with English summary.] *Bull. Imp. Sericult. Exp. Sta.* 8(1): 1-34. 9 pl. (1 col.). 1930.—On typical blight specimens *Diaporthe* was almost always present. The fungus, supposed to be the real pathogen, has been considered as *D. orientalis* and more recently *D. niphonia.* The fungus has a pycnidial, or *Phomopsis,* stage, which is the usual form on the lesion, with α and β spores. The filiform body in the pycnidium is considered a kind of spore, because it has its own sporophore; it is a transition form between the elliptical and the filiform spores. Germination of the β spore was not achieved. The genetic relation between the perithecial and the pycnidial stages has been shown by cultural and serological (agglutination reaction) methods. The opt. temp. for development is about 25°C. The fungus often occurs on trees dying from natural or artificial causes. Inoculation experiments proved that the fungus cannot attack healthy plants in warm regions. Only when the tree was inoculated with a piece of naturally infected bark did the margin of the inoculated parts turn slightly brown or reproduce pycnidial papillae. Though the fungus seems to have an intimate relation to the disease, it is not considered the sole cause. The fungus is widespread but the disease is restricted to snowy localities. The temp. adaptation of the fungus is not low, and the disease may occur in a season of rather high temp., but no indication of spread was recognized. The fungus appears readily on injured trees.—*From author's summary.*

12730. ZELLER, S. M., and J. W. DEREMIAH. An anthracnose of Ledum caused by a species of Elsinoë. *Phytopath.* 21(10): 965-972. 3 fig. 1931.—An anthracnose of the evergreen shrub, *L. glandulosum,* is described. It occurs along the Pacific coast of Oregon and Washington, and one specimen from Michigan on *L. groenlandicum* has been examined. The disease seems to be distributed throughout the range of the genus *Ledum* in the U. S. A. Leaf and stem spots are the chief symptoms of the disease. *E. ledi* Zeller (*Aulographum l.* Peck) (p. 970) is constantly associated with the disease. The fungus was first described on *L. groenlandicum* from St. Lawrence County, New York. An emended description of the fungus and disease is included. *Cryptostictis* arbuti Zeller (*Disaeta a.* Bonar) (p. 972) frequently occurs in Oregon on *L. glandulosum* in close proximity to *E. ledi.*—*Authors' summary.*

DISEASES CAUSED BY BACTERIA

12731. JOHNSON, E. M., and W. D. VALLEAU. Blackleg of tobacco seedlings. *Phytopath.* 21(10): 973-978. 5 fig. 1931.—A stem rot of tobacco seedlings at the transplanting stage is described from 2 plant beds in Kentucky. Affected plants showed actively motile bacteria. The name, blackleg, is suggested for the disease because of its resemblance to blackleg of potato. Bacteria isolated from affected plants caused a stem rot of Turkish tobacco in the greenhouse, and a stem and pith rot of Burley tobacco in the field. Soft rot of potatoes and carrots was produced by cultures of the stem-rot pathogen. Comparative studies indicate that the stem-rot organism is similar to, if not identical with, *Bacillus aroideae* in that it produces acid but not gas on beef broth containing lactose, dextrose, and sucrose.—*Authors' summary.*

12732. KROHN, V. Die ersten Funde von Phytomonas maculicola McCulloch in Suomi. [P. maculicola on cabbage in Finland.] *Phytopath. Zeitschr.* 3(5): 531-532. 1931.

12733. LIRO, J. IVAR. Finland: Bacterium maculicolum. *Internat. Bull. Plant Protect.* 5(8): 141. 1931.—First occurrence of this cabbage disease in Finland.

12734. PEROTTI, R., e O. VERONA. La rogna del cotogno (Pirus cydonia, L.). [Quince rot.] *Boll. R. Ist. Sup. Agrar. Pisa* 3: 51-59. 1 pl. 1927.—From the lesions were isolated small, short bacteria 1-1.5 × 2.5-3 μ, very active. They, stained with Ziehl's carbol fuchsin and gentian violet, are gram negative, and non-acid fast. They are asporulant, and do not liquefy gelatin or coagulate milk.

DISEASES CAUSED BY PHANEROGAMS

12735. BONAVENTURA, G. Contributo alla conoscenza del parassitismo della "Cuscuta pentagona" Engel. [The parasitism of C. pentagona.] *Boll. R. Ist. Sup. Agrar. Pisa* 6: 427-439. 3 fig. 1930.—List of plants serving as host.

12736. HARRISON, R. M. Observations of many hosts of dodder (Cuscuta epithymum Murray) in Kent, and a record of a variety new to Britain. *Jour. So.-Eastern Agric. Coll. Wye, Kent* 28. 300-303. 8 fig. 1931.—After listing 46 plants attacked by *Cuscuta,* mention is made of *C. epithymum* var. *angustata* subvar. *alba* Engelm. found for the first time in Britain. The pathological histology of dodder of eyebright (*Euphrasia officinalis*), itself a semi-parasite on grasses, on wild rose, on *Brachypodium pinnatum* and *Lotus corniculatus* is briefly described.—*W. A. Whitney.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

12737. ARNDT, C. H., and G. STEINER. Aphelenchus parietinus as the cause of seedling losses in cotton. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(8): 82-83. 1931. [Mimeographed.]

12738. GOFFART, H. Rassenstudien an Heterodera schachti Schm. *Arb. Biol. Reichsanst. Land- u. Forstwirtsch.* 18(1): 83-100. 7 fig. 1930.—The paper consists of 2 parts: Morphological differentiation of races of *H. schachti;* and host relationships of the various races. Measurements are given of the eggs of the strains from sugar beet, oats, and potato. The oat strain has distinctly larger ova. Measurements of the ova of the sugar beet and oat strains overlap. The youngest larvae of the sugar beet strain are also distinctly longer but of nearly the same diam. (α 23-28); the sugar beet and oat strains are 20-23 and 18-23 resp. Measurements of the cysts show that α reaches its largest values in the sugar beet strain and its lowest in the potato strain. Cysts of nematodes from sugar beet and oats, sugar beet and potato, sugar beet and turnip-rooted cabbage, potato and turnip-rooted cabbage, potato and white cabbage, white cabbage and oats, all differ appreciably in the α value. Cysts from sugar beet and turnip-rooted cabbage, sugar beet and white cabbage, and white cabbage and turnip-rooted cabbage, differ only slightly in this value. The sugar beet strain infected mangold, spinach, sugar beet, turnip-rooted cabbage, white cabbage, cauliflower, mustard, black radish, and radish. Corn, oats, wheat, rye, barley, potato, tomato, clover, pea, and sunflower were not susceptible. The turnip-rooted cabbage and white cabbage strains did not infect other hosts. The potato strain infected only the tomato though other members of the Solanaceae were used (*Nicotiana* and *Petunia*). Members of the Gramineae, Chenopodiaceae, and Cruciferae were not infected. A nematode population (*H. schachti*) conforms to one of the following possibilities: (1) it belongs to a fixed biological race and has a limited circle of host plants; (2) it belongs to 2 or more fixed races, each with a limited circle of host plants; (3) it consists of a group of individuals, which have no fixed host plants and are therefore genetically heterozygous. It is uncertain whether the author presents the above statements as a

possibility or a necessary conclusion from his findings. —*B. G. Chitwood.*

12739. **KOESLAG, J. D. Een onderzoek over de resistentie van verschillende roggerassen tegen het stengelaaltje.** [Resistance of rye varieties to the stem nematode (Tylenchus dipsaci). *Tijdschr. Plantenziek.* 37 (5): 96-104. 3 fig. 1931.—Of 35 varieties of rye grown on a plot heavily infested with *T. dipsaci*, only 2 poor inland varieties proved somewhat resistant. Infestation within a field is often localized but may spread to neighboring fields. Cases are also known of fields formerly badly diseased, which now yield healthy crops. Infection at an early stage causes most serious injury.—*H. L. G. de Bruyn.*

12740. **VERRIER, M. L. Contribution à l'étude de la cécidie de Livia juncorum Latr. sur Juncus conglomeratus L.** *Bull. Soc. Ent. France* 1929 (4): 77-80. 1929.—The conical gall produced by this psyllid at the point of inflorescence in *Juncus* first arrests the development of the floral parts and then stimulates the development of structures morphologically identical with a leaf or cauliform bract.*—*S. B. Fracker.*

INFECTIOUS CHLOROSES (MOSAIC, YELLOWS, CURL, ROSETTE, ETC.)

12741. **BOLAS, B. D. Physiological investigations of mosaic disease in the garden tomato.** *Exp. & Res. Sta. Nursery & Market Gard. Indust. Devel. Soc. Turner's Hill, Cheshunt, Herts.* 16: 62-67. 1930 (1931).—The effect of mosaic disease on the efficiency of the plant is most strongly felt in the presence of blue-green light. The effect in white light is similar to that in red light at low intensities, the harmful effect of the virus increasing with the intensity. When tomato sap was filtered through paper and portions of the residue used for inoculum, stripe was not produced in infections from the center, while both stripe and fern-leaf symptoms were of fairly common occurrence in infections from the edge. The temp. at which inoculation is carried out influences the period of incubation. Aucuba mosaic leaves maintained at 40°C. for 15 min. before, during, and after inoculation were not affected, while inoculations made at 32° and 13° showed mottle in 6 days, at 11° in 8 days, and at 5° in 13 days. Under influence of a 0.5 microamp. electric current, the portion of the virus producing intense symptoms accumulated at the + pole while that producing milder symptoms went to the − pole. No evidence of change in pH or of oxidase content was found within the range of migration of the virus. Plants receiving a full day's light showed normal mottling while those receiving that equal to a December day showed typical winter symptoms of blistering and slight deformation on some of the leaves. A short clearing process is outlined. Fern-leaf produced by Aucuba mosaic has been converted into typical mottle by exposing plants having the former symptoms to 90°F. for a few days and an artificial 12-hr. day at a light intensity of 750 foot-candles. Regeneration of a green color when the yellow area of a leaf is treated with a Cu salt indicates that the etiolation may be correlated with a pathological acid production in the tissues.—*W. A. Whitney.*

12742. **KIRKPATRICK, T. W. Further studies on leaf-curl of cotton in the Sudan.** *Bull. Ent. Res.* [*London*] 22 (3): 323-363. 2 pl. 1931.—The virus disease of cotton in the Gezira area known as "leaf-crinkle"* is identical with that called "leaf-curl" at Shambat near Khartoum. It shows different symptoms in different varieties, including "net-vein enations" and "mosaic."* The disease is transmitted by white flies, *Bemisia gossypiperda* [Aleurodidae], as proved by numerous experiments. Attempts to transmit by means of *Aphis gossypii* and *Empoasca facialis* were unsuccessful. Evidence is presented to show that the virus of leaf curl is not transmissible through seed or soil. There is considerable variation in the incubation period of the disease, the minimum being 8 days. Shading and low soil temp. seem to retard its development. The disease appears to be latent in some plants, not appearing until they are mutilated. White flies which have taken up the virus as larvae may transmit it as adults. The white fly is capable of transmitting the virus for as long as 27 days after feeding on an infected plant. The virus does not pass through the egg stage. The disease was transmitted by white fly from Sakel cotton to *Hibiscus esculentus*, but not the reverse; from cotton to *H. cannabinus* and vice versa; from *H. esculentus* to *H. c.* and vice versa; from Sakel and *H. c.* to Watts long staple cotton; from Watts to Sakel. *Althaea rosea* and *H. sabdariffa* were found affected with leaf curl, with white fly present. Some cotton varieties show only crinkle, others only mosaic. Similar crinkle diseases are noted on tomatoes. It is believed the virus is carried over from one season to the next in ratoon plants, which should be eradicated.

12743. **LE PELLEY, RICHARD H. Introductory note on virus diseases of plants in Kenya.** *Jour. East Africa and Uganda Nat. Hist. Soc.* 1930 (37): 198-200. 1931.—Some of the more important are: sugar cane mosaic; tobacco mosaic; maize streak; rosette of ground nuts; curly-leaf of cassava; possibly several virus diseases of potatoes.

12744. **MUMFORD, EDWARD PHILPOTT. On the curly top disease of the sugar beet: a biochemical and histological study.** *Ann. Appl. Biol.* 17 (1): 28-34. 2 pl. 1930.—A number of physico-chemical measurements were made of the saps from 2 strains of sugar beets, one resistant, the other susceptible to curly top. An increase of refractive index, specific resistance and of freezing point depression was noted in diseased as compared with healthy leaves in both strains, indicative of an increase in total solids and non-electrolytes in diseased tissues. This increase was much greater in the susceptible than in the resistant strain. In general sap from resistant beets was less concentrated in total solids and non-electrolytes, and more concentrated in electrolytes than sap from susceptible beets. Observed differences in pH were small, but there was a general tendency toward greater acidity in young leaves of the resistant strain. Nitrogen content was greater in sap of young leaves and roots of susceptible beets than in corresponding portions of either healthy or diseased plants of the resistant strain; the N content was increased in diseased tissues. In the susceptible strain the quantity of sugar is increased in the leaves, but decreased in the roots, in the presence of the disease; in the resistant strain the quantity of sugar is decreased in diseased leaves as well as roots. The possible relation of sugar accumulation in the leaves of susceptible beets to the feeding of the leafhoppers is pointed out. Phloem necrosis occurs in diseased plants of both the resistant and susceptible strains. A tendency toward greater thickness of epidermis and cuticle was noted in the resistant strain.—*F. Weiss.*

12745. **UPPAL, B. N. India: a new virus of Dolichos biflorus.** *Internat. Bull. Plant Protect.* [*Rome*] 5 (9): 163. 1931.—Resembling mosaic of beans and observed on *D. biflorus* and *D. lablab.*

NON-PARASITIC DISEASES AND TERATOLOGY (INCLUDING DISEASES OF UNKNOWN CAUSE)

12746. **BAKER, CLARENCE E. A study of the skin structure of the Grimes apple as affected by different types of injury.** *Proc. Amer. Soc. Hort. Sci.* 27: 75-81. 4 pl. 1930 (1931).—Russet appears in its earliest form as thin layers of cork cells, produced by a phellogen to bridge the ruptured cuticle and epidermis. Larger russeted areas such as frost bands are of similar structure. The cork cambium together with the cork cells produced toward the surface of the apple is usually clearly visible. Flakes formed of groups of cork cells that have sloughed from the ruptured surface of large injuries as the fruit increases in size are also seen. Russeted fruit loses more moisture in storage than normal fruit, leading to early shriveling. Storage scald appears in its earliest stages as a darkening of the exterior 1-2 layers of collenchyma, immediately beneath the epidermis, the cuticle being normal. In more advanced scald the subepidermal cells become disintegrated and compressed, the cuticle losing

its definite structure. Ammonia injury appears first as a browning of the cells immediately around the lenticels just beneath the epidermis. Sulphur burning from spray materials may develop in the first 5-6 layers of collenchyma cells without apparent injury to the cuticle. In other types of spray burning the cuticle may be ruptured or raised by the formation of a mass of cork cells beneath it and exterior to the normal subepidermal tissue.—*C. E. Baker.*

12747. **BÈNES, G. Contribution à l'étude sur le court-noué.** *Progrès Agric. et Vitic.* 96(41): 348-349. 1931.—Plants grown near grapes suffering from "short-node" showed "root-burn," which may be due, in the case of beets, to puddling of the soil by rains resulting in lack of aeration. Soils favoring root burn are generally high in Fe and low in Ca. Both "short-node" in vines and "root-burn" in beets seem due to malnutrition, owing to a soil defect which can be remedied by lime.

12748. **CARNE, W. M. Grey speck disease of wheat and oats (known as white wilt in Western Australia).** *Western Australia Dept. Agric. Leafl.* 227. 1-5. 1 pl. [1931].—White wilt of wheat and oats in Western Australia is identical with the gray speck disease of oats in Europe and the roadside take-all in South Australia. In this state it is associated with brown mallet or wandoo in mallet country. The disease appears as yellow or whitish patches on hillsides, first noticeable in June or July. By the end of August or early September the affected areas either recover and produce nearly normal crops or fail. Failure depends on unsuitable climatic conditions for growth in August and September. The disease has been experimentally controlled by certain chemical treatments; possibly some such treatment may be found which will be economically justified. The evidence available indicates that cropping not more than once in 4 yr. definitely reduces the disease.—*Author's summary.*

12749. **JUSTESEN, S. H. Invloed van de bemesting op de kurkvorming van de aardappelknol. [Influence of manuring upon the formation of woundcork in the potato tuber.]** [English summary.] *Tijdschr. Plantenziek.* 37 (1): 1-16. 2 pl., 5 fig. 1931.—Greatest wound-cork formation occurred with potatoes manured only with nitrate, the smallest amount with those fertilized only with potash, and intermediate with complete manuring or none at all. The wound-cork reaction at the stem end was visibly greater than at the bud end, but the number of suberized cell layers in the two positions was about equal. In the center of the tuber the wound reaction was less, presumably because of lack of O.—*H. L. G. de Bruyn.*

12750. **MITTER, J. H., and R. N. TANDON. A disease of Solanum melongena in Allahabad.** *Jour. Indian Bot. Soc.* 9(4): 242. 1 pl. 1930.—In 1930 brinjal plants showed a stunted tufted growth, the shriveled, green to dull violet stems became denuded, and the fruit, when present, was greatly reduced. The cause in unknown.—*W. A. Whitney.*

12751. **MOORE, H. C. Notes on sprout tuber or no-top potatoes.** *Amer. Potato Jour.* 8(8): 189-192. 1 fig. 1931.—Sprout tuber or no-top potato injury in Michigan in 1931 was most severe in the central and southern districts where drought was severe in September 1930. Field observations in affected areas showed that sprout tuber or no-top was most severe in potatoes grown on very light, humus-deficient soils. Early plowing and preparation of the seed bed; green-sprouting the seed 2 weeks previous to planting; and storage of seed at 36-40° F. were factors that lessened sprout tuber injury.—*H. C. Moore.*

12752. **PEROTTI, R. Patologia da concimazioni "ad alta dose" particolarmente di nitrato. [Diseases from too much fertiliser, especially NO_3.]** *Boll. R. Ist. Sup. Agrar. Pisa* 3: 129-150. 1 fig. 1927.—The optimum concentration of KNO_3 solutions for cereals is 0.2%. For growing drug plants the optimum is 0.05%. Plants receiving abundant nitrates are more susceptible to attacks of parasites than controls.—*From author's conclusions (transl.).*

12753. **REICHERT, I., and J. PERBERGER. Little leaf disease of citrus trees and its causes.** *Hadar* 4(9): 193-194. 2 fig. 1931.—Report of studies on a new disease causing heavy losses in Palestine. No organism with etiological relations was found. Chemical analyses and climatic studies showed the disease to be due to drought combined with K deficiency; the outstanding symptom lies in a change from mesophytic to xerophytic growth habit.

12754. **SCHOLLENBERGER, C. J. Effect of leaking natural gas upon the soil.** *Soil Sci.* 29(4): 261-266. 1930.—Where natural gas leaks the soil blackens and develops a peculiar stagnant mud odor, as well as the acrid odor due to constituents absorbed from the gas. The most pronounced chemical effect upon the soil is shown by a great increase in exchangeable Mn content, and by an appreciable increase in exchangeable NH_3. This increase in active base content causes a lowering of the pH. The source of the exchangeable Mn is in the higher oxides, which are abundant in many soils. The effects of the gas are due to displacement of air from the soil, resulting in a biological reduction under anaerobic conditions so established, and are quite transient. The exchangeable Mn quickly reverts to the non-exchangeable form under exposure to conditions favoring oxidation, and plants grow well in the soil. Recovery of very acid soils damaged by gas would no doubt be hastened by an application of lime in addition to thorough aeration.—*Author's summary.*

DISEASE RESISTANCE AND PARASITISM

12755. **ANDERSON, BERNARD A. The toxicity of water-soluble extractives of western yellow pine to Lenzites sepiaria.** *Phytopath.* 21(10): 927-940. 2 fig. 1931.—The hot-water extracts of *Pinus ponderosa* are more toxic to *L. sepiaria* than corresponding cold-water extracts. In general, the water-soluble-heartwood extracts seem slightly more toxic than the corresponding sapwood extracts, but no pronounced difference in the relative toxicity of the 2 types of extracts was noticed. Water-soluble extracts obtained from air-seasoned material were more toxic than corresponding water-soluble extracts from kiln-dried material. This would indicate a loss of certain volatile materials toxic to *L. sepiaria* brought about by the temp. used in kiln drying.—*Author's summary.*

12756. **CELICHOWSKI, KAZIMIERZ, i ANTONI KURYŁŁO. Przyczynek do badań raka ziemniaczanego. Z doświadczeń wazonowych nad odpornością ziemniaków przeciwko rakowi ziemniaczanemu. [Potato wart.]** [With German summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 18(2): 173-180. 3 fig. 1927.—Various potato vars. were tested for resistance to potato wart. Of these only Pepo, Parnassia, and Hindenburg were resistant. Rains increased susceptibility. *Author's summary (transl.).*

12757. **GARBOWSKI, L. Wrażliwość uprawianych w Polsce odmian żyta na rdze źdźbłową Puccinia graminis Pers. f. sp. secalis Er. et Henn. [Resistance of Polish rye varieties to rust.]** [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 19(2): 195-240. 21 fig. 1928.—4 vars. were found highly resistant to rust but none was immune. Barley could easily be inoculated with this form of *P. graminis* but not oats or wheat.—*Author's summary (transl.).*

12758. **GASSNER, G., und K. HASSEBRAUK. Untersuchungen über die Beziehungen zwischen Mineralsalzernährung und Verhalten der Getreidepflanzen gegen Rost.** *Phytopath. Zeitschr.* 3(6): 535-617. 10 fig. 1931.—For practical decision of the fertilizer question, yields must be studied exclusively. Strong N applications clearly lengthened the fruiting period of the rust, while K and P fertilizers had no effect. K fertilizers somewhat increased resistance to rust when the other nutrients remained constant. If N and P were also changed the effect of K varied in proportion as it exceeded N

and P, i.e., the action of K depends on the N:P ratio. KCl and K_2SO_4 were about equally efficient in increasing resistance. N decreases resistance to rust, its action increasing as N is in excess of P and K. In neutral soils ammonium salts weakened resistance most, followed by $Ca(NO_3)_2$, $NaNO_3$, and KNO_3. Overfertilizing with $NaNO_3$ and KNO_3 can change resistant to susceptible plants. The action of phosphoric acid always depended on the soil content of N and K and the K:N ratio. According to the P:K:N ratio, phosphoric acid increased the resistance or the susceptibility. The difficultly soluble salts are weaker in their action than the soluble ones. The actions of these salts is attributable to their effects on leaf activity and the protein content of the plants.—*From authors' summary (transl.)*.

12759. **HANNA, W. F. Studies on the nature of rust resistance in wheat. V. Physiology of the host.** *Canadian Jour. Res.* 4(2): 134-147. 1931.—Determinations were made of catalase, diastase and oxidase activity; rate of respiration; and content of chlorophyll, xanthophyll and carotin in the seedling leaves of varieties Little Club, Marquis, Kanred, Kota, Mindum, Kubanka, Emmer and Khapli. Catalase activity increased and diastase activity decreased as the leaves became older. Rust reaction was not correlated with enzyme activity. No significant differences were found in the oxidase activity or respiratory rate of the 8 varieties. Little Club and the varieties of the *vulgare* group were relatively rich in chlorophyll and the carotinoids. It is suggested that photosynthetic processes may take place more rapidly in the cells of the varieties having a high content of these pigments, and thus furnish conditions suitable for the growth of the rust mycelium.—*W. F. Hanna.*

12760. **REINKING, O. A., and C. J. HUMPHREY. Laboratory tests on the durability of Philippine woods against fungi.** *Philippine Jour. Sci.* 45(1): 77-91. 2 pl. 1931.—The paper presents data on the resistance to decay of 15 common Philippine woods and a species of southern yellow pine from the U. S. A. These were tested against *Daedalea flavida, Polyporus sanguineus, Tramctes versatilis, T. meyenii, Xerotus nigrita,* and 9 unnamed spp. of common and destructive Philippine fungi. Small blocks of wood were inserted in 2-liter Erlenmeyer flasks, inoculated, and allowed to decay up to 28 mo., but for the most part 16-17 mo. The severity of decay was gauged by loss in weight and by the physical condition. The relative scale of durability derived accords well with the published records of the resistance of the same woods to fungus attack under natural or service conditions. Molave (*Vitex parviflora*), yakal (*Hopea plagata, Isoptera borneensis, Shorea balangeran*), and tindalo (*Pahudia rhomboidea*) lead in durability. The softer woods, such as the lauans (*Shorea, Parashorea, Pentacme*), guijo (*Shorea guiso*), katmon (*Dillenia philippinensis* and *D. luzonensis*), dapdap (*Erythrina variegata*), and malaanonang (*Shorea polita*), are quite perishable under conditions favorable to decay. Narra (*Pterocarpus indicus* and *P. vidalianus*) and apitong (*Dipterocarpus grandiflorus* and *D. vernicifluus*) proved moderately durable.—*Author's summary.*

12761. **TUBEUF, [K.] v. Ist Pinus peuce gegen den Blasenrostpilz immun oder für ihn nur wenig disponiert?** *Zeitschr. Pflanzenkrank.* 41(8): 369-370. 1931.—*P. peuce* is not, as previously accepted, completely immune to white pine blister rust, but is less susceptible than *P. strobus* and *P. monticola.*—*Author's conclusions (transl.)*.

12762. **VILKAITIS, V. Ar kūlėtī kvīečiaī estī labīau nurūdījе? [Is smutty wheat less resistant to yellow rust?]** [With German summary.] *Žemės Ūkio Akademijos Metraštis [Lithuania]* 1929/1930: 110-118. 2 fig. 1931.—Smutted plants from contaminated seed were more susceptible to rust.

DISEASE CONTROL (SEED TREATMENT, SOIL DISINFECTION, FUNGICIDES, AND SPRAYING)

12763. **BAGENAL, N. B., W. GOODWIN, E. S. SALMON, and W. M. WARE. The control of apple scab. I. Bramley's seedling.** *Jour. So.-Eastern Agric. Coll. Wye, Kent* 28. 188-205. 3 fig. 1931.—The 2 control plots taken together yielded 28.6%, in 1924, and 28.3%, in 1925, scab-free apples. The plot sprayed 3 times with bordeaux gave 69.6% scab-free apples in 1924 and 68.5% in 1925, an increase of 41.0% and 40.2% over the control plots, and of 20.7% and 10.7% over the plots sprayed 3 times with lime-sulphur. The plot sprayed 3 times with bordeaux, compared with that sprayed twice, showed an increase of 20.8% in 1924 and of 15.2% in 1925. The plot sprayed 3 times with lime-sulphur, compared with that sprayed twice, showed an increase of 23.8% in 1925. No increase in fungicidal power was obtained in either year when lead arsenate was added to lime-sulphur. No scorching (russetting or leaf-fall) of any commercial importance occurred with any of the sprays used.—*Authors' summary.*

12764. **BIRMINGHAM, W. A. Black spot or scab of apple. Experiments for its control in New South Wales. 1. Distribution, life-history, etc. 2. The Batlow experiments.** *Agric. Gazette N. S. Wales* 42(8): 635-640; (9): 721-729. 5 fig. 1931.—7 spray programs were tried during 1925-30. Bordeaux throughout gave best control of black spot, but in certain seasons involves the risk of severe russetting. Bordeaux (6-4-40) at "spur burst" stage, followed by lime-sulphur (1-14) at the "pink" stage and lime-sulphur (1-35) at the "calyx" stage and subsequently as required, gave best control without risk of russetting. The average % of infection for the 5-yr. period was 1.4, as compared with 55.2 and 63.5%, respectively, for the control plots. In 1927-28, when conditions for black spot were very favorable, the % of infection for the control plots were 94.8 and 87.4, respectively, while in plot 2 (Bordeaux followed by lime-sulphur) it was 4.5. The department recommendation is: Bordeaux mixture (6-4-40) at "spur-burst" stage; lime-sulphur (1-14) 26° Beaumé at "pink" stage; lime-sulphur (1-35) at "calyx" stage and subsequently as required.

12765. **BURNETT, L. C., and CHAS. S. REDDY. Seed-treatment and date-of-sowing experiments with six varieties of flax.** *Phytopath.* 21(10): 985-989. 1931.—Due to the exceptionally dry season, satisfactory yields of flax were obtained only from the 1st sowing, May 1; little more than ½ as much (53.4%) from the 2nd sowing, May 14; and practically no yield from the 3rd sowing, May 31. When Bison flax of high vitality was grown under a wide range of conditions, the percentage of seed which produced plants varied from 14.9 to 53.4. In the same experiments, seed of the same lot treated with Ceresan gave percentage stands of 42.6-63.6. Seed treatment with Ceresan increased yields of Bison flax 26.5% in 26 replications and the yields of 5 other varieties (2 replications each) by 12.6-44.5%.—*Authors' summary.*

12766. **CLAYTON, E. E. Vegetable seed treatment with special reference to the use of hot water and organic mercurials.** *New York [Geneva] Agric. Exp. Sta. Bull.* 183. 1-43. 6 fig. 1931.—From extensive experiments over a period of 9 yr. the following conclusions are drawn. Stimulation of growth is caused but rarely by either chemical or heat treatments of seeds. Retardation of growth may also result from seed treatment. Thus, in certain seeds, e.g., lima beans, treatment with mercury decreases the yield of tops and pods by about 25%. Treatment with organic mercurials does not increase the percentage of seed germinating, but prevents decay of seed and developing seedling, and hence increases the percentage stand. The greatest increases in stand were secured in early spring when the germination period is longest and the likelihood of decay greatest. Comparison of many copper and mercury compounds used as dusts showed that organic mercurials were distinctly superior to other preparations in protecting the seed and increasing stands. Damping-off was partly controlled by organic mercurials, when seed was sown in the greenhouse. Liquid organic mercurial treatments in comparison with mercuric chloride, iodide, or cyanide were much safer to use. Seed stored after treatment with

liquid organic mercurials may, however, develop injury. In tomato, there was temporary inhibition of germination. Treated seed germinated well when planted at once, or after 3 yr., but when sown 6 months after treatment it germinated very poorly. In carrots germination decreased rapidly after treatment. Dust treatments did not affect germination either immediately or after storage for 4 yr., and the dust apparently lost but little of its effectiveness during storage. Hot water treatments of brussels sprouts, cabbage, or cauliflower seed at 50° C. and up to 30 min. exposure had no immediate effect on germination, provided the seed was of good vitality. Later effects were directly proportional to the length of treatment. Hot water treatments should be no longer than necessary to destroy parasitic organisms and should not be used much in advance of the probable date of sowing. Many combined chemical and hot water treatments were tested, most of which reduced germination more rapidly than either form of treatment separately. The only substances used in seed treatments which had a beneficial effect on germination were aluminum and zinc sulphates.—*E. E. Clayton.*

12767. **DURUZ, W. P. Further notes regarding peach rust control.** *Proc. Amer. Soc. Hort. Sci.* 25: 333-337. 1928.—All the lime-sulphur and bordeaux sprays applied in the early fall gave good control of *Tranzschelia punctata*. The late fall applications alone were not effective. One application in late fall and another in the spring were more effective than a single spraying, due to the killing of successive crops of spores in the bark pustules. Liquid lime-sulphur, full dormant strength, gave the most uniform and best control. There was little difference between the effectiveness of the other S sprays in any one block. Bordeaux applied early in the fall was practically as effective as the S sprays, but in the late fall or spring, it was less effective than the full strength liquid lime-sulphur.—*From author's discussion.*

12768. **HURT, R. H., and F. J. SCHNEIDERHAN. Calcium sulphide for the control of apple and peach diseases.** *Virginia Agric. Exp. Sta. Tech. Bull.* 36. 15p. 2 fig. 1929.—Experimental work with calcium sulphide as a fungicide for apples and peaches was begun by the senior author in 1926. Field experiments in 1926, 1927, and 1928 showed clearly that this material had great merit as a summer fungicide for both apples and peaches. 2 grades of material were used in these experimental tests, namely, U. S. P. Crude Calcium Sulphide containing approximately 60 % CaS, and a commercial preparation made especially for spraying work containing approximately 65% CaS together with a spreading agent. The material designated in this paper as calcium sulphide is a mixture of calcium sulphide (CaS), anhydrous calcium sulphate and small amounts of the reducing agent. This aggregate of materials is a result of the process of reducing the calcium sulphate which is used for making the calcium sulphide. In these experiments the 2 grades of material were used at the rate of 10 lb. to 50 gal. of water on apples, and 8 lb. to 50 gal. on peaches. In comparative tests to determine caustic reaction to leaves and fruit of both apple and peach, calcium sulphide was less caustic than any of the fungicides now in common use.—*R. H. Hurt.*

12769. **MEER, J. H. H. van der. Maatregelen ter voorkoming eener ernstige aantasting der tomaten door de schimmel Cladosporium fulvum Cke. ("Meeldauw"). [Means of preventing tomato leaf-mold.]** [English summary.] *Tijdschr. Plantenziek.* 37 (4): 69-90. 3 fig. 1931.—Greenhouses were disinfected with formaldehyde gas liberated by the permanganate method or by heating formaldehyde pastils. The min. quantity necessary for killing the spores was 1 cc. solution and 0.5 gm. $KMnO_4$ or 0.77 pastil per m^3, and tight closing of the house for 24 hr. A quantity of formaldehyde insufficient to kill the spores delays their germination, in proportion to the concentration or length of exposure. The min. quantity of SO_2 necessary to kill the spores was obtained by burning 2.5 gm. S per m^3, and closing the house for 20 min. A subminimal quantity did not delay germination. In large houses which cannot be kept tight, larger quantities are required. In a house of 600 m^3 killing of the spores was obtained by burning 6 kg. S divided into 3 lots. Sulphur is preferred because of its cheapness. *H. L. G. de Bruyn.*

12770. **MURRAY, R. K. S. Further sulphur dusting experiments against Oidium.** *Rubber Res. Scheme (Ceylon)* 8(2/3): 17-24. 2 pl. 1931.—The experiments described confirm previous conclusions, and the better control secured here is attributed mainly to the earlier start of operations. It is valueless, however, to commence dusting while the fungus is still passive. Disregarding yield figures, the treatment could confidently be recommended for the improvement in foliage alone. Experiments on S dusting have reached a stage at which treatment can be definitely recommended on the most severely diseased areas. Whether the work should be undertaken on more mildly affected estates is left open. —*From author's conclusions.*

12771. **PADEREWSKI, JÓZEF. Praktyczne zabiegi przeciw grzybowi "Cerospora beticola."** [Control of C. beticola.] [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 20(1): 100-115. 8 fig. 1928.—Experiments showed that the only way to control *C. beticola* is by producing plants with a crown containing at least 3.4% of N. Spraying is of no avail and is even dangerous if the tops are to be used for feed. Use of nitrate fertilizers is not sufficient; in addition the external crown leaves must be removed. In passing from the outer to the inner leaves the % of N increases rapidly while the % of other constituents decreases. It is thus possible to secure leaves having at least 3.4%, and in many cases 4.5-5.0%, of N. The yield from such plants is also 2-3 times as great as from plants not thus defoliated. The sugar content was also greater.—*Author's summary (transl.).*

12772. **PASINETTI, L. Contributo allo studio delle sostanze anticrittogamiche (esperienze col Fideol N. 1). [Contribution to the study of fungicides. Experiments with Fideol No. 1.]** *Riv. Patol. Veg.* 19(9/10): 193-213. 1 pl. 1929.—A new disinfecting mixture known as "Fideol" of the F. I. D. E. society is said to be composed of a mixture of formalin, mercuric chloride, alcohol and other ingredients. Tests were made to determine its effect on seed of wheat, maize, barley, oats, beets and kidney beans and its fungicidal power against *Ustilago tritici, U. maydis* and *Tilletia tritici*. Treating the seed with ½%, 1% and 2% solutions for 7 or 15 min. did not affect the germination percentage and in many cases the growth was more rapid. Treatment with 2% solution for 15 min. prevented growth of the fungi.—*F. M. Blodgett.*

12773. **PEROTTI, R., e S. ADLER. Sull'impiego del carbone e di alcuni suoi preparati negli speciali riguardi fitopatologici. [Use of charcoal and some of its preparations in plant pathology.]** *Boll. R. Ist. Sup. Agrar. Pisa* 3: 267-315. 5 fig. 1927.—Vegetable charcoal, "vegetina," and "vigorina" are compared as to bactericidal properties and their effects on development and growth of the higher plants.

12774. **SCHLÖSSER, JACOB. Schnitt der Schattenmorellen als Mittel zur Bekämpfung der Monilia.** *Obst- und Gemüsebau* 77(5): 77-78. 1931.—The author notes a considerable loss in the shade cherry crop from *Monilia*, and agrees with Sorenson that heavy and regular pruning may lessen the attack. Control by pruning is effective only when all infected twigs and branches are removed. Based on his observations during 15 yr. in Freiland, he concludes that twig or branch infection takes place at picking time from the numerous fruit mummies, the copious spores from which infect wounds and breaks in the bark of twigs. Early fruit infections arise from bark infections of the previous year, from which the mycelium penetrates to the young fruit via the pedicel. As a spray he recommends thorough application of 0.5% carbolic acid just before picking. A

cheaper grade of this material makes the cost reasonable. —*W. A. McCubbin.*

12775. **STANER, P. La désinfection des graines de coton.** *Bull. Agric. Congo Belge* 21(3): 830-832. 1930.—Methods and apparatus are discussed, particularly those in use in, or suitable for, Belgian Congo. The Simons hot air sterilizer gives good results if the seed is dry, but since such accessories as automatic temp. control can usually not be used in Africa, and since moist seed is killed at 65° C., its use with moist seed is not recommended. The Mallet sterilizer is preferable, as more complete temp. control is possible. Disinfection with H_2SO_4 is dangerous to the operator and is expensive. Use of Clayton gas (a mixture of sulphurous anhydride with sulphuric anhydride) is still in the experimental stage in Belgian Congo. Use of other poison gases, chloropicrin, CS_2, HCN, et al., is not recommended because of the complicated technic of producing and using them. Dusting the seed is impracticable on the required scale in Belgian Congo.

12776. **THIES, W. H. Why spray materials spread.** *Proc. Amer. Soc. Hort. Sci.* 24: 172-175. 1927.—Spreading of any given spray material depends on its composition, which determines the extent to which the substance is adsorbed by the surface. Without adsorption neither wetting nor spreading can occur. The velocity at an appreciable distance from the nozzle depends on the size of the drops more than on the initial velocity imparted by the spray outfit, unless the actual carrying of the material is accomplished by a draft of air. The ideal outfit, then, is one which delivers a mist-like spray, always releasing it near the surface to be covered.—*From author's discussion.*

12777. **TILEMANS, EM. Les influences de la désinfection des graines de coton sur le développement des maladies.** *Bull. Agric. Congo Belge* 21(3): 833-837. 1930. —Experimental results indicating improvement of stand as a result of seed disinfection are mentioned.

12778. **WOODMAN, R. M. An examination of some commercial suspensions used in the spraying of plants.** *Chem. & Indust.* 50(42): 391T-397T. 6 fig. 1931.—From photomicrographic and sedimentation experiments it was demonstrated that a manufactured suspension (Brouisol) is much finer-particled than ordinary bordeaux; that a manufactured S suspension (Sulsol) and a S paste (Ialine) yield dilute suspensions in which the S particles are much finer than those obtained by dusting S dusts; that Sulsol is a finer-particled and more stable suspension that one made from Ialine S; and that addition of soap to an Ialine suspension causes coagulation of the S particles, more rapid sedimentation, a tendency to uneven distribution, and adsorption of the S in the droplet edges. Use of gelatin as a protective colloid for Ialine S suspensions is barred because of precipitation of S. Gum arabic also is of little use, and the suggestion is tentatively made that the particles of S are too small to benefit greatly from inclusion of protective colloids.—*Author's summary.*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

12779. **BYL, P. A. van der. Plantsiektes: Hul Oorsaak en Bestryding. [Plant diseases: their cause and control.]** 404p. 115 fig. Nasionale Pers Beperk: Capetown, 1928.—The book is intended primarily as a text for college students, but it is adaptable to the needs of teachers and students in agricultural schools and to progressive farmers, and also as a reference work for local use in South Africa. The spelling employed differs enough from that in use in the Netherlands and its colonies to render it somewhat difficult to read with the ordinary dictionary. A very complete host index occurs at the end, with which is supplied the Latin names of the hosts. Approximately one-sixth of the text is devoted to a general discussion of fungi, and one-fifth to the etiology and control of plant diseases, including a chapter of 16 pages on parasitic flowering plants. Most of the remainder of the book is devoted to chapters on the diseases of particular hosts, one-fourth of the total space in the book being given to fruit diseases, principally apple, peach, grape and citrus, with short sections on mango, quince, mulberry, walnut, papaya, pear and strawberry. One-sixth of the book is devoted to truck crops. Special brief sections are given to carnations, asters and chrysanthemums, roses and violets. In the general portion of the book the diseases of a considerable number of less important hosts are mentioned, including numerous local species of trees, with footnote references to the author's English publications on South African diseases.—*C. Hartley.*

12780. **GHESQUIÈRE, J. Principales maladies du coton au Kasai et au Sankuru.** *Bull. Agric. Congo Belge* 19(4): 552-561. 3 pl., 1 fig. 1928.—An account of the symptomatology and control of the principal diseases: sore shin (dark rust, damping off, seedling rot) due to *Rhizoctonia;* root knot, caused by *Heterodera radicicola;* bacteriosis; and "Maladie du pivot," with symptoms resembling *Fusarium* collar rot, but due to an undetermined basidiomycete.

12781. **HASKELL, R. J., J. E. McMURTREY, Jr., G. W. FANT, and STATE COLLABORATORS. Results of the tobacco disease survey, 1930.** *U. S. Dept. Agric., Bur. Plant Indust., Plant Dis. Reptr. Suppl.* 80. 5-29. 1931 [Mimeographed].—Seed is mostly home-grown, although about 40% is purchased from local growers. About 62.5% of the growers clean their seed, the method varying from wind blowing and sieving to machine cleaning. Approximately 40% of those treating seed used formaldehyde, 33% $AgNO_3$, 15% semesan, and 12% $HgCl_2$. Seed treatment is practiced most extensively in the southeastern states, where bacterial leaf spots first made their appearance. The general practice in treating seed was (1) treat for 10 min., (2) wash thoroughly in water, and (3) dry before planting. Plant beds are, for the most part (58%), located on the edge of woods or in wooded areas, the balance were in fields. About 70% of the growers make new beds each year; of the beds used for more than 1 yr., a large number were sterilized with steam or by burning before being sown. Even new beds are sterilized in the same manner, primarily for weed control. Where beds are burned, 2 hr. or less was more effective than a longer period. Where seed-bed diseases and flea beetles are prevalent the application of bordeaux or a copper-lime dust is general. Injuries in seed beds from drouth, excess water, and chlorine (in fertilizers) are reported. Damping off, bed rot (*Rhizoctonia* or *Sclerotinia*), bacterial soft rot (*Bacillus ?aroideae*), wildfire (*Bacterium tabacum*), angular leaf spot (*Bact. angulatum*), mosaic, and root knot (*Caconema radicicola*), together with minor afflictions, compose the register of seed-bed maladies. In the field, crop rotation is practiced on about 60% of the plantations. In 1930 early plantings showed less injury from black root rot (*Thielavia basicola*) than did the later settings; subsequently bacterial leaf spots and frenching were less prevalent. Mosaic was the most common and severe of all field diseases during 1930, infections of 90-100% being observed. Ring spot was of wide, and seemingly increasing, occurrence. Vein banding (virus) in Kentucky spread rapidly in early-set tobacco near potato fields. Black shank (*Phytophthora nicotianae*) and bacterial wilt (*Bact. solanacearum*) were severe in North Carolina. Sore shin (*Rhizoctonia solani* and *Sclerotium rolfsii*) was more prevalent than usual in N. C. and was not held in check by the dry weather. Brown root rot (undetermined) was serious in Wisconsin. Drouth spot was reported from Virginia, Ohio, South Carolina, and Georgia.—*W. A. Whitney.*

12782. **JOHNSTON, JOHN R. Enfermedades y plagas de la piña en la América tropical. [Diseases and pests of pineapple in Tropical America.]** *Bol. Unión Panamer.* 65(1/2): 88-103. 6 fig. 1931.—A popular description of the more common diseases and pests with mention of the conditions of development, varieties of pineapples affected, and methods of control where necessary. Included in the list are the black rot due to *Ceratostomella*

(*Thielaviopsis*) *paradoxa*, base rot of suckers and slips, black rot of the fruitlets, crown rot, sunburning, russeting, leaf spot, chlorosis, various deformities, nematode injury; borer injury due to *Metamasius ritchii* and *Cholus wattsi*, *M. sericeus* and *M. dimiadepennis* also being reported as accompanying injured fruit; the moth borer *Tmolus echion* with reference to *Hypolycaena philippus* and *Castnia icarus*, and the mealy bug *Pseudococcus bromeliae*.—*J. R. Johnston.*

12783. [KARAKULIN, B. P.] КАРАКУЛИН, Б. П. Об опытах по изучению вредоносности болезней растений путем применения искусственных заражений. [Study of harmfulness of plant diseases by means of artificial infection.] [German summary.] Болезни Растений [*Bolezni Rastenii*] 19(1/2): 1-8. 1930.—Studies are reported which show the possibility of infecting whole groups of plants, under canvas, by blowing rust spores on them with a dust gun. The effect of rust on wheat, when it first appears as late as the blooming period and develops to only a slight degree, was not expressed on the weight of individual plants or their vegetative parts, but was expressed in grain development; in general there is a sharp distinction between the weight of kernels of infected and control plants. Statistical treatment of these results shows that the difference may be regarded as almost a certainty (odds of 2.9).—*Author's summary (transl.).*

12784. **MANDELSON, L. F.** Tobacco diseases. *Queensland Agric. Jour.* 36(2): 213-233. 6 pl. 1931.—Blue mold, mosaic disease, black root rot, black shank, damping off, stem rot, bacterial leaf spots, *Fusarium* wilt, frog-eye, bacterial wilt, *Phyllosticta* leaf spot, ring spot, frenching, brown root rot, and K and Boron deficiencies are discussed.

12785. **RAMÓN y ACOSTA, DOMINGO.** Investigaciones fito-patológicas. *Rev. Facult. Agron.* [*Montevideo*] 4. 74-90. 1931.—A list of parasitic fungi with notes on hosts, origin, and characteristic injuries caused by each.

12786. **RIVERA, V., e E. CORNELI.** Rassegna dei casi fitopatologici osservati nel 1929 (danni da freddo e da crittogame). [Plant disease survey in 1929 (injuries by cold and cryptogams).] *Riv. Patol. Veg.* 21(3/4): 65-100. 2 pl., 1 fig. 1931.—The injuries by low temp. in 1929 to olives, grapes, and peaches in 5 localities of Umbria and Marche are described in relation to proximity to lakes, topography of land, conditions of soil and air moisture, and varieties affected. In general either ambient or cultural conditions which cause active growth resulted in greater injury, in respect to entire trees, or parts of trees. Injury was favored by moist soil or atmosphere, pruning, and irrigation, and was hindered by aridity, transplantation of adult trees, and lack of pruning. Anatomical studies indicated the maximum damage was in the youngest succulent tissue, especially the cambium, and was due to dehydration. It was characterized by the formation of open spaces which occurred where the resistance to laceration was least. The cold weather also served to repress various plant diseases, e.g., those caused by *Septoria graminum* and *Accidium ranunculacearum*, and the crown gall of olives. *Erysiphe graminis* was earlier and more abundant. Notes are also given on the occurrence of *Sclerospora macrospora*, tracheomycosis of melons, *Sclerotinia libertiana* on beans, *Accidium magelhaenicum*, *Clasterosporium carpophilum* on cherries, *Ustilago hordei*, *Orobanche crenata*, *Exoascus deformans*, *Puccinia triticina*, *plasmopara viticola*, *Phragmidium subcorticium*, *Sclerotinia fuckeliana*, *S. fructigena*, *Urocystis occulta*, *Rhizoctonia violacea*, *Nectria ditissima*, fusariose of potatoes, and pathogenic alterations of sweet cherries and plane trees.—*F. M. Blodgett.*

12787. **STANER, P.** Maladies du Citrus au Congo Belge. *Bull. Agric. Congo Belge* 20(3): 364-373. 7 fig. 1929.—The principal diseases are: gummosis; scab (*Sporotrichum citri*, *Sphaceloma fawcetii*); anthracnose (*Colletotrichum gloeosporioides* and *Gloeosporium limeticolum*); fruit rot (*Penicillium italicum*, *P. digitatum*, and *Pythiacystis citrophthora*); sooty mold (*Capnodium citri*); algae disease (*Cephaleuros virescens*); chlorosis; parasitism by *Loranthus*; and the depredations of *Lepidosaphes beckii*, a coccid on oranges, frequently parasitized by the fungus *Aschersonia*.

12788. **SU, U. THET.** India: Plant diseases in Burma. *Internat. Bull. Plant Protect.* 5(8): 141-142. 1931.—Mosaic disease of chillies (*Capsicum annuum*) and sterility of pigeon pea (*Cajanus indicus*) are mentioned.

PLANT PHYSIOLOGY, BIOCHEMISTRY, AND BIOPHYSICS

GENERAL

12789. **BARTON-WRIGHT, E C.** Recent advances in plant physiology. 352p. 51 fig. P. Blakiston's Son & Co.: Philadelphia, 1930.

12790. **ONSLOW, MURIEL WHELDALE.** The principles of plant biochemistry. Part I. 326p. 11 fig. Cambridge Univ. Press; Macmillan Co.: New York. 1931. Pr. $4.75.—The emphasis in this book is laid upon the carbohydrates, proteins, and respiration. The 1st chapter considers the types of sugars which occur in plants, analyses of the sugars in plant tissues, and the mutual interrelations of the carbohydrate family of compounds. The 2nd chapter deals with the cell wall, its constituents and modifications. The 3rd chapter considers oxidation-reduction systems, such as the oxygenase-peroxidase system, tyrosinase, laccase, peroxidase, oxido-reductases, and other systems. The relation of these to respiration is discussed, along with the historical sequence of investigations. Chapters IV and V deal with the plant proteins and N metabolism. Albumins, globulins, prolamins, and glutelins are described; and the metabolism of seed and seedlings, starved leaves and shoots, synthesis and decomposition of proteins, purine metabolism, proteolysis, and amino acids receive consideration. The final chapter deals with respiration of both yeast and the higher plants. The substrate for respiration, relation of phosphate to the process, dismutation of methyl-glyoxal, acetaldehyde as an intermediate product and its fate, action of coenzymes and of molecular O, and oxidative anabolism are the principal topics. Eleven sectional bibliographic lists are provided, with about 975 references to pertinent literature.—*C. A. Shull.*

12791. **VORBRODT, LADISLAS.** Pisma Emila Godlewskiego Starszego. [Publications of Emile Godlewski 1870-1890.] 598p. Portrait. Polska Akademja Umiejetnosci: Krakow, 1930.—This is the 1st of 3 volumes intended as a complete publication of the work of Godlewski, in commemoration of his 80th anniversary. Vol. 1 contains articles in the field of physiology. Ten articles of 275p. are in Polish; 4 articles of 66p. in French; and 13 articles of 257p. in German. The 2nd volume is to begin with 1891 and extend through 1910. The 3rd will contain recent publications together with popular articles in the field of agriculture. In general, the scientific articles appear in the language in which they were originally published but for articles which have appeared

in Polish, translations or résumés occur in French or German.—*B. M. Duggar.*

OSMOSIS, PERMEABILITY, PHYSICO-CHEMICAL PHENOMENA

12792. COLLA, SILVIA, e ZIPORA DANIN. Variazioni di pressione osmotica in alcuni basidiomiceti. [Variations of osmotic pressure in some Basidiomycetes.] *Boll. Soc. Ital. Biol. Sperim.* 5(6): 885-887. 1930.—In *Boletus edulis, Amanita caesarea, Cantharellus cibrarius,* and *Russula virescens* the osmotic pressure values were specifically different. They showed diminution during maturation and senescence, and were different in the different portions of the same individual.—*M. Comel.*

12793. NIETHAMMER, A. Beitrag zur Kenntnis des lebenden Zellinhaltes der Rinde heimischer Waldbäume. *Forstwiss. Centralbl.* 53(2): 74-77. 1931.—Bark parenchyma cells of oak, beech, linden, ash, and chestnut were stained in a neutral red solution and then put in various plasmolyzing solutions, including KNO_3, $ZnSO_4$, $CuSO_4$, $NiSO_4$, $CoSO_4$, $Tl_2(SO_4)_3$, $Al_2(SO_4)_3$, $HgSO_4$, potassium-nickel cyanide, mercuric acetate, mercuric sulphocyanate, and caffein. With several of these, the cell contents contracted into reddish or dark-colored spheres. The reaction was less marked during the winter rest period. During the intensive growth period the bark cells become filled with Ca-oxalate crystals, which are resorbed later.—*W. N. Sparhawk.*

WATER RELATIONS, SAP MOVEMENT

12794. FURR, J. R., and J. R. MAGNESS. Preliminary report on relation of soil moisture to stomatal activity and fruit growth of apples. *Proc. Amer. Soc. Hort. Sci.* 27: 212-218. 2 fig. 1930(1931).—The investigations reported indicate that orchard trees can function at nearly the maximum rate so long as the moisture content of the whole root zone is appreciably above the wilting %. As the zones of greatest root concentration reach the wilting %, the tree apparently adjusts itself to reduced water supply through earlier closing of the stomata each day. Earlier stomatal closing, resulting in a reduction in CO_2 entrance to the leaf and a reduction in photosynthesis, is reflected in a reduced growth rate in the fruit. The more restricted the root zone and the greater the root concentration in certain soil areas, the more pronounced the reaction of the tree is likely to be during periods of reduced moisture supply.

12795. GAWRILOW, N. J., und B. B. EWSLINA. Untersuchungen auf dem Gebiet der Tabakchemie. I. Das Wasser im Tabak. *Biochem. Zeitschr.* 208(1/3): 79-90. 1 fig. 1929.—Analyses of different varieties of tobacco for water showed that the Markusson method of distillation with toluol or better the less inflammable ethylene chloride gives a more correct value than the ordinary 3-hr. period of drying at 95° C. in an oven. The latter method gives a value 3-7% high for the water content. Of the other methods tried none was successful in the extraction of all of the hygroscopic water with the possible exception of the method which uses a stream of dry air, in which case lower temp. may be applied than with the distillation methods.—*A. D. Moinat.*

12796. JONES, W. N. A sensitive recording (transpiration) balance with a new form of electrically operated recorder. *Jour. Exp. Biol.* 8(1): 9-16. 1931.—A new form of self recording balance is described, sensitive to losses (or gains) of about 0.015 gm. A new design of 3-pen electrical recorder is also described. This possesses a very wide range and gives a continuous record for some days without attention.—*J. M. Robson.*

12797. MONTEMARTINI, LUIGI. L'assorbimento dell'acqua nei bottoni fiorali delle rose Druschki. Saggio di esame di bilancio idrico di un organo vegetale. [Absorption of water by rose buds. An example of water balance.] *Rend. R. Ist. Lombardo Sci. e Lett.* 63(11/15): 1-9. 1930.—Determinations were made every 6 hrs. of the loss in wt. of a rose bud placed with its stem in water. The quantity of water absorbed during petal unfolding was determined at the same time. The absorption was independent of the transpiration, and reached a maximum in the morning.—*L. Montemartini* (*transl. by H. S. Wolfe*).

12798. RETTIG, H. Über den Einfluss der Luftfeuchtigkeit auf die Entwicklung und die Gewebedifferenzierung der Pflanzen. *Bot. Arch.* [*Leipzig*] 25(1/2): 128-172. 4 pl., 14 fig. 1929.—*Sinapsis alba* and *Tropaeolum majus* are affected similarly by humidity and soil moisture, although the latter is more effective. Stem structure is little affected by either factor. Leaves grown in relatively dry air are smaller and more closely veined; contain more stomata; have smaller epidermal, guard, and palisade cells; and the cells have a higher osmotic value. These results are more pronounced on soils of low moisture. In some plants of *S. alba* moist air caused structural changes similar to those of relatively dry air. These results are compared with those of other workers and theories are presented to explain them.—*Author's summary* (*transl. by N. A. Pettinger*).

MINERAL NUTRIENTS, SALT RELATIONS

12799. BERTRAND, GABRIEL, et L. SILBERSTEIN. Sur le dosage du soufre et du phosphore dans les plantes. *Ann. Sci. Agron. Franç. et Étrangère* 47(3): 319-323. 1930.—The % of S and P found in fresh material, dried material, and ash, and that lost in calcination, are tabulated for *Brassica napus, Solanum tuberosum, Trifolium pratense, Valerianella olitoria, Medicago sativa, Taraxacum officinale, Allium cepa,* and *Triticum sativum.* Determinations of S in fresh and in dried material gave consistent results in all cases except *Allium.* However, ash determinations show 43.8% (*Brassica*) to 76.1% (*Allium*) less than fresh samples. P content as determined from fresh and dried samples is consistent, loss during calcination (at low temp.) running from 0.2% in *S. tuberosum* to 7.1% in *Medicago.* Fresh material should be used for analysis in families in which S exists in a volatile form, e.g., Cruciferae, Liliaceae, etc.—*G. S. Avery, Jr.*

12800. ECHEVIN, R. Variation de la matière minérale des feuilles au cours du jaunissement automnal. *Rev. Gen. Bot.* 39(463): 405-419. 1927.—The generalization made by Sachs that there is a migration of the mineral element of the leaf down the stem during leaf yellowing is questioned, and the errors in previous methods of investigating this question are pointed out. To assure oneself of migration, all parts of the tree or plant must be chemically analyzed for each element over a period of time, including an examination of the green leaf as it ages, turns yellow, and finally falls. In addition it must be determined that, as the element diminishes in leaf, it increases proportionately in the stem and later in the root. Some investigators have reported an increase of ash and Ca in the yellowing leaf while others have not.—*R. P. Hibbard.*

12801. ECKERSON, SOPHIA H. Influence of phosphorus deficiency on metabolism of the tomato (Lycopersicum esculentum Mill.). *Contr. Boyce Thompson Inst.* 3(2): 197-218. 2 pl., 5 fig. 1931.—Vigorous 4-5 in. tomato plants were transplanted to sand and watered with a nutrient solution lacking phosphate. There is a rapid decrease in reductase (nitrate-reducing) activity which results in N starvation. Although there is an abundance of nitrate present the plant can no longer use it. After the soluble P compounds have been used up, the complex phosphatides begin to break down. This results in the disintegration of the protoplasm and therefore the disorganization of the cell. If phosphate is supplied to the plant before the phosphatides are affected, reductase is regained and the plant recovers.—*S. H. Eckerson.*

12802. HARTT, CONSTANCE ENDICOTT. Potassium deficiency in sugar cane. *Bot. Gaz.* 88(3): 229-261. 14 fig. 1929.—Cuttings of Louisiana Purple sugar cane were grown in quartz sand in glazed earthenware crocks. Nutrient solutions were based on Shive's best solution and contained the following p. p. m. K: 703.8, 0.0, 3.9, and

39.0. In 4 mo. a gradation in growth was obtained as well as die-back and discoloration symptoms of K starvation; 3.9 p. p. m. K was insufficient for the best growth. The K-deficient plants had greatest diastase activity in all organs except roots, in which activity was equal. The blades of the controls had greater invertase activity than the K-deficient plants. All organs of the controls had greatest peptase activity. Ereptase was the same in all plants. The catalase activity was greater in plants supplied with K, with the exception of the roots. Equalizing the K content of blades did not equalize the invertase activity and therefore it seems likely that K may play a rôle in the formation of invertase. K-deficient plants had greater % of total sugars, reducing sugars, and sucrose. Greater lignification occurred in K-deficient plants, while greater cutinization was found in plants supplied with K. Abnormal distribution of vessels in pith of roots, small size of vessels and parenchyma cells of stems, large cavities in cortex of roots, and underdevelopment of root hairs occurred in K-deficient plants. Suggestions are made regarding the causes of symptoms of K starvation, as well as the greater resistance toward low temp. and diseases found among plants supplied with K; and an attempt is made to link together in a chain of cause and effect the derangements in morphology and physiology.—*C. E. Hartt.*

12803. McCOOL, M. M., and W. J. YOUDEN. The pH and the phosphorus content of the expressed liquids from soils and plant tissues. *Contr. Boyce Thompson Inst.* 3(2): 267-276. 1 fig. 1931.—The pH readings of liquid removed from soils and from the stems of coleus, tomato, and apple twigs by the application of different pressures, becomes decidedly less as the pressure is increased. In this respect marked changes were noted even when the hand pressed samples were subjected to 1000 lbs. per sq. in. Further reductions took place as the pressure was increased. The P content of the moisture removed from soils became less as the pressure was increased. There was considerably less P in that obtained by the application of 4000 lbs. per sq. in. than there was in the hand pressed liquid. The solutions obtained by high pressures in several instances contained less P than 1 part per million.—*M. M. McCool.*

12804. NIGHTINGALE, G. T., L. G. SCHERMERHORN, and W. R. ROBBINS. Some effects of potassium deficiency on the histological structure and nitrogenous and carbohydrate constituents of plants. *New Jersey Agric. Exp. Sta. Bull.* 499. 36p. 4 fig. 1930.—Working largely with Bonny Best tomato plants grown in plus- and minus-K nutrient cultures, it was observed that externally the lack of K affected the plants in much the same way as the lack of N. The 1st conspicuous symptoms were the development of a stiff woody stem and of yellowish green leaves with purple veins and the early setting of fruit. Internally there was a marked accumulation of carbohydrates and the formation of thick cell walls in the xylen, phloem, and mechanical tissue. There was no difference between the plus- and minus-K tomato plants as to concentration of nitrates. However, when the external nitrate supply was withheld, the plus-K plants quickly assimilated all the nitrates in their tissue, while the minus-K plants maintained a high concentration of nitrates until death, suggesting that K is essential for the synthesis of organic N from nitrates. The comparative abundance of nitrites following the application of K to minus-K plants indicates that K is specifically necessary for initiating nitrate assimilation. Finding the protein fraction to be about the same in the plus- and minus-K plants, it is concluded that K is not directly essential for the later stages in synthesis of storage proteins, since the % of total protein may be comparatively high in K-deficient plants which invariably have a low proportion of meristematic tissue. Most of the K in the plant is water soluble and, when present in limited amount, is translocated freely from mature tissue to regions of active cell division, no meristematic tissue being found which did not contain an abundance of K. Minus-K plants increased considerably in length but little in diam., the activity of the cambium being apparently inhibited. Lack of K also limited the development of cork cambium or the initial embryonic layer of the abscission zone. During the last stages of minus-K treatment, many of the leaves and fruits failed to abscise. K-deficient plants died prematurely if bearing fruit, the limited K supply being translocated to the fruit at the expense of the growing tip. Death of the tip was followed shortly by the death of the entire plant.—*Courtesy Exp. Sta. Rec.*

PHOTOSYNTHESIS, CHLOROPHYLL

12805. CONANT, J. B., and W. W. MOYER. Studies in the chlorophyll series. III. Products of the phase test. *Jour. Amer. Chem. Soc.* 52(7): 3013-3023. 1930.—Pure chlorophyll compounds give a characteristic color reaction or phase test on treatment in ether solution with strong methyl alcoholic KOH. In the "*a*" series the color is yellowish brown which soon changes to intensive green. In the "*b*" series the phase is reddish brown. This method of saponifying the phaeophorbides is used as a test of the purity of the material, but the products of the reaction have been relatively little studied. The authors studied these products from pure members in the "*a*" series, saponifying methyl phaeophorbide *a*, phaeophorbide *a*, and the trimethyl ester of chlorin *e*. Under phase test conditions at room temp. unstable chlorins are formed in large amounts; from these chlorins a new type of compound, designated as the phaeopurpurins, results by a spontaneous change. By the use of ethyl alcohol in place of methyl, or by lowering the temp., the unstable chlorins become the sole products. Quick saponification at an elevated temp. produces chlorin *e* and no unstable chlorins. Probable empirical formulas for the compounds described, together with representative analytical data, are given, although it is too soon to attempt to write satisfactory structural formulas for the compounds involved in the phase test.—*M. C. Merrill.*

12806. CONANT, J. B., J. F. HYDE, W. W. MOYER, and E. M. DIETZ. Studies in the chlorophyll series. IV. The degradation of chlorophyll and allomerized chlorophyll to simple chlorins. *Jour. Amer. Chem. Soc.* 53(1): 359-373. 1931.—It has been shown that the saponification of allomerized chlorophyll *a* yields phaeopurpurin 7, a characteristic product of the phase test; allomerization and the phase test appear to be equivalent processes. Phaeopurpurin 7 (a monomethyl ester) on pyrolysis loses CO_2 and CO, forming the monomethyl ester of a simple chlorin which appears to be a hydrogenated rhodoporphyrin. The corresponding dibasic acid is formed by the action of hot alcoholic KOH on phaeopurpurin 7, oxalic acid being split off. These facts show that phaeopurpurin 7 is an *a*-keto acid. Pyrochlorin *e* is a simple chlorin of the unallomerized series; it still contains the C atom which is eliminated as CO in the allomerized compound. It appears to be isomeric with phylloporphyrin. All these facts point to an oxidation-reduction process as being involved in the phase test and allomerization.—*Authors' summary.*

12807. CRIST, J. W., and MARIE DYE. Spectral light, chlorophyll and vitamin A. *Proc. Amer. Soc. Hort. Sci.* 27: 220. 1930 (1931).—Abstract of studies on asparagus.

12808. FODOR, A., und R. SCHOENFELD. Darstellung und Eigenschaften wässeriger Carotinlösungen. [Preparation and properties of aqueous solutions of carotin.] *Biochem. Zeitschr.* 233(1/3): 243-244. 1931.—Preliminary report.

12809. HONERT, T. H. van den. Beperkende Factoren bij de Koolzuurassimilatie. [CO_2 assimilation and limiting factors.] *Handelingen 5th Nederlandsch-Indisch Natuurwetensch. Congres Soerabaja* 1928: 410-415. 1 fig. 1928.—According to Blackman's "principle of limiting factors" the velocity of CO_2 assimilation is determined by several factors (CO_2, light, temp.), but only by one at a time. This is graphically represented by an ascending line, which suddenly becomes horizontal with a sharp

break, as soon as the factor represented on the abscissa is no longer the limiting one. Several authors deny the existence of this sharp break and maintain that there is a gradual transition from the limitation by one factor into the limitation by another factor. However, nearly all experiments have been made with leaves or even entire plants, in which the individual plastids are in very different conditions of light and, perhaps, of CO_2. Even if Blackman's curve held good for each individual plastid, it might hardly be expected to do so for the entire leaf or plant. Therefore assimilation experiments were made with a filamentous terrestrial alga (*Hormidium flaccidum*), which forms tiny pellicles on fluid culture media, consisting of only 1 layer of cells, each cell containing 1 plastid. Several mgm. of this alga were used in the experiments. All chloroplasts could be kept in exactly the same conditions. A complicated method was elaborated, by which the influence of light, temp., and CO_2 was studied. CO_2 was determined by means of a slightly modified Krogh gas analysis apparatus (accuracy .001%). The assimilation curves of the single chloroplasts were nearly "ideal Blackman curves." It is argued that assimilation is a chain process, consisting of at least 3 consecutive (diffusion, photochemical and dark chemical) processes. As in other chain reactions, the slowest process of the chain practically determines the velocity of the total process. One by one the above processes were made the "slowest" by making respectively CO_2, light, and temp. the limiting factor. The properties of the individual processes (temp. coeff., etc.) could thus be studied, all of which were found to be in full agreement with the above conception. When CO_2 is limiting, the assimilation rate is always governed by a diffusion process, even in small, unicellular organisms, into which CO_2 penetrates very easily. With temp. as the limiting factor the Q_{10} (temp. coeff.) was 1.87 12°-20° C. The plastid contains an assimilating agent (probably the chlorophyll), which has an extremely high affinity for CO_2, so that at a CO_2 pressure of only 1/100,000 atmospheres it is almost entirely saturated with it. The chlorophyll content of the algae was determined spectrophotometrically. Willstätter's "assimilation number": (gm. CO_2 per hr./gm. chlorophyll) was 6.75 at 20° C. (temp. limiting factor). The assimilation quotient: O_2/CO_2 was probably higher than 1, possibly because in *Hormidium* the first visible assimilation product is an oil.—*T. H. van den Honert.*

BIOCHEMISTRY, METABOLISM (GENERAL)

12810. BEUTLER, RUTH. Über den Zuckergehalt des Nektars einiger einheimischen Blütenpflanzen. *Sitzungsber. Ges. Morph. u. Physiol. München* 38: 24-31. 1927/1928.—Nectar was studied from a variety of native plants to find out the concentration and kinds of sugars present although it has been previously thought that bees tolerate a solution of cane sugar of about 4.25% and reject one that is appreciably stronger, the nectar was found to contain sugar in greater concentration. Small quantities of nectar on analysis showed the presence of cane sugar, dextrose, and levulose, and in some cases maltose, but no mannose or pentose.—*O. F. Black.*

12811. CONRAD, C. M. The decarboxylation of d-galacturonic acid with special reference to the hypothetical formation of l-arabinose. *Jour. Amer. Chem. Soc.* 53(6): 2282-2287. 1931.—A test was made of the theory that *l*-arabinose arises in acid decomposition of *d*-galacturonic acid as an intermediate product in the formation of furfural. Galacturonic acid in the form of its Ba salt was decarboxylated with 4% H_2SO_4 but no arabinose could be recovered. Ehrlich's tetra acid *"a,"* a polymer of *d*-galacturonic acid, was also studied but in no case could arabinose be recovered from the decarboxylation products. Carefully conducted controls showed that added arabinose could always be recovered. *l*-Arabinose was found in the hydrolytic products of both apple and lemon pectins. In the case of apple pectin over twice the amount of arabinose that could have been due to decarboxylation was found. The arabinose recovered from the hydrolytic products of plant substances comes from arabinose units in the substances and not from decarboxylation of galacturonic acid.—*Author's summary.*

12817. IWANOFF, NICOLAI N., R. S. ALEXANDROWA, und M. A. KUDRJAWZEWA. Über die Umwandlung der Zuckerarten beim Reifen der Früchte von Wassermelonen. *Biochem. Zeitschr.* 212(4/6): 267-279. 1 fig. 1929.—Glucose, fructose, and sucrose were determined in watermelons at various stages of growth from fruit setting to harvest and after a period in storage. The sugar fractions were also determined in melons grown under different climatic conditions and in wild and cultivated forms. The first sugar present in very young melons was glucose. This was gradually converted to fructose until the fructose: glucose ratio was above 1 when condensation to form sucrose occurred. In ripe melons a constant fructose: glucose ratio after inversion of 1.3: 1.4 existed. Climatic conditions had little effect on the total sugars but greatly influenced the relative amount of sucrose and free reducing sugars. Cultivated sp. of watermelons were higher in all forms of sugar and in the fructose-glucose ratio than wild sp. Following harvest, sucrose increased with a corresponding decrease in fructose and glucose for several weeks, after which there was a gradual decrease in sucrose and total sugars.—*M. H. Haller.*

12818. KAFUKU, KINZO, TETSUO NOZOE, and CHUTA HATA. Studies on the constituents of the volatile oil from the leaf of Chamaecyparis obtusa, Sieb. et Zucc., f. formosana, Hayata, or Arisan-Hinoki. I. *Bull. Chem. Soc. Japan* 6(2): 40-53. 1931.—An unsaturated fatty acid was found with properties close to those of chamaenic acid ($C_{16}H_{16}O_2$), constituting the larger part of the acid portion. Of the acid-free oil, terpenes occupied about 34%, of which about 50% consisted of *d*-sabinene, and 20-30% of a new monocyclic terpene "chamene." The constitutional formula for chamene was partly deduced, but not yet fully established. The chief constituents of the leaf oil, *d*-sabinene, *d*-chamene, and *d*-terpinenol-4, have never been found in the oils from root or wood; while *d*-α-pinene, dipentene, and α-terpineol, which form the main part of the latter oils, are found in the former oil either in very small quantities or not at all. Almost all the constituents found in this oil are to some extent related to sabinene.

12819. KAFUKU, KINZO, and NOBUTOSHI ICHIKAWA. Studies on the volatile constituents of the leaf of Chamaecyparis formosensis, Matsum. *Bull. Chem. Soc. Japan* 6(4): 94-102. 1 fig. 1931.—Chemical composition and properties of various constituents are reported.

12820. KAFUKU, KINZÔ, and TETSUO NOZOE. Studies on the constituents of the volatile oil from the leaf of Chamaecyparis obtusa, Sieb. et Zucc., F. formosana, Hayata, or Arisan-Hinoki. 2. *Bull. Chem. Soc. Japan* 6(5): 111-118. 1931.—Chemical studies are reported.

12821. KRAYBILL, H. R., J. T. SULLIVAN, and L. P. MILLER. Seasonal changes in the composition of Stayman apple tree. I. Carbohydrates. *Proc. Amer. Soc. Hort. Sci.* 27: 206. 1930(1931).—Abstract.

12822. LINK, KARL PAUL, and ALLAN D. DICKSON. The preparation of d-galacturonic acid from lemon pectic acid. *Jour. Biol. Chem.* 86(2): 491-497. 1930.—A convenient source material for the preparation of crystalline *d*-galacturonic acid is lemon pectic acid, obtainable commercially. The pectic acid is hydrolyzed in 2.5% H_2SO_4 and the galacturonic acid first obtained as its Ba salt. The Ba-galacturonate is converted into the free galacturonic acid by decomposition with 0.1*N* H_2SO_4.

12823. MANSKE, RICHARD H. F. The occurrence of d-mannose in seaweed and the separation of l-fucose and d-mannose. *Jour. Biol. Chem.* 86(2): 571-573. 1930.—Mannose was identified as a constituent of the hydrolytic product from *Fucus vesiculosus*. The greater portion of the fucose was removed by crystallization, and in a less pure although crystalline product the presence of *d*-mannose was shown by the isolation of a mannoheptoic acid and lactone from the HCN addition product. Mannose had concentrated in the final mother liquor, and the isolation of its phenylhydrazone was made possible by the remarkable insolubility of the latter in pyridine.—*Author's summary.*

12824. PREISING, FRIEDRICH-AUGUST. Untersuchungen über den Kohlenhydratstoffwechsel des immergrünen Laubblattes im Laufe eines Jahres. *Bot. Arch.* 30(3/4): 241-306. 1930.—The 2 spp. studied were *Ilex aquifolium* and *Hedera helix*. Assimilation takes place throughout the yr., but during the winter months is very low and of what types is not definitely known. In March carbohydrates and glucosides appear in appreciable amounts. April-Aug. starch is the chief carbohydrate, although in May and July saccharose appears in abundance and then disappears entirely, to appear again in Sept. for a short time in great quantity. Much glucose is never present so it is thought to be utilized directly by the cell. Osmotic pressure is the highest in leaves during Nov.-March. It is not due to the presence of sugar or glucosides because that is the time when carbohydrates are low; furthermore, in summer and spring when sugar is abundant, osmotic pressure is the lowest. The starch produced during the summer shows a daily increase and a decrease in the night. When leaves are injured by wounding or by an adverse environmental condition, quantities of saccharose are present. —*R. P. Hibbard.*

12825. SCHMIDT, ERICH, KARL MEINEL, und WILHELM JANDEBEUR. Das Mindest-Äquivalentgewicht von Cellulosen. *Naturwiss.* 19(18): 376. 1931.—Progress note on studies on the chemistry of cellulose of *Picea excelsa* and *Phytelephas macrocarpa*.

BIOCHEMISTRY, METABOLISM (NITROGEN RELATIONS)

12828. GAWRILOW, N. J., und M. M. BOTWINIK. Über einen Anhydridkomplex aus Edestin, der die Hexonbasen enthält. *Biochem. Zeitschr.* 214(1/3): 119-133. 1929.—When edestin was hydrolyzed according to the method of Zelinsky, the phosphotungstic acid precipitate contained both hexone bases and monoamino acid possessing anhydride properties. The ninhydrin reaction was negative while the picric acid gave a positive test. After complete hydrolysis histidine and arginine were present. From the ethyl acetate extract of the monoamino acid fraction histidine could be identified after hydrolysis. Similarly in the diamino acid fraction arginine was detected. The work of Haurowitz was confirmed, indicating that histidine forms complexes with monoamino acids which do not precipitate with phosphotungstic acid.—*G. W. Pucher.*

12829. MACHT, DAVID I. A pharmacological study of leucines and cystines. *Jour. Pharmacol. & Exp. Therapeut.* 36(2): 243-250. 1929.—The pharmacodynamic effects of leucine and cystine on the growth of living seedlings of *Lupinus albus* in nutrient plant-physiological solutions were studied. Both the leucines and cystines definitely influenced growth of the plants. In each case the levo-rotatory variety was pharmacologically more active than the dextro. Combinations of the various stereoisomers gave evidence of a definite synergistic pharmacological effect.

12830. SJOLLEMA, B. Über die Zusammensetzung des Weidegrases, seinen Gehalt an Nitrat, Rohprotein und Reinprotein sowie das Eiweissverhältnis in einigen Grasproben. *Tierernährung* 2(6): 505-519. 1931.—Pasture grass often contains nitrate in early spring as well as later, even in autumn. Differences in soils and methods of manuring are important factors. The highest amount of KNO_3 was about 2%. Grass with low % of proteins seldom shows even 0.5-1.0% KNO_3. The content of crude-proteins was sometimes more than ¼ of the dry matter, sometimes about 1/10; that of true-proteins was about 1/4-1/12 of the dry matter. Nearly half of the spring samples contained 20-24.9% crude-proteins and about 18.5% of true proteins. The nutritive ratio was often too narrow, in other cases too wide for a good physiological and economical effect of the pasture. The extreme values were 1:2.4 and 1:9.5. The % of proteins decreased in several cases considerably, in some weeks even to ½ the original content. Sometimes pastures with a low % of proteins contain a relatively large amount of non-protein N.—*From author's summary.*

BIOCHEMISTRY, METABOLISM (ENZYMES, FERMENTATION)

12832. BOAS, I. Über eine neue enzymatische Oxydationswirkung (Metaoxydase). *Biochem. Zeitschr.* 227(1/3): 135-139. 1930.—In common vegetables were found characteristic color changes in connection with definite oxidisable substances. Since it was not possible to determine whether it was a question of a new enzyme or of phenolase, it was decided to name the active material metaoxidase. Whether metaoxidase is to be included among the true metabolic ferments is doubtful. Since it is never found in animal substances and only rarely in vegetable substances, and since it is soon destroyed in normal gastric juice, it is probably not taken up into the body juices of animals.—*Author's summary (transl. by I. I. Lemann).*

12833. CALDWELL, M. L., and M. G. TYLER. A quantitative study of the influence of acetate and of phosphate upon the activity of the amylase of Aspergillus oryzae. *Jour. Amer. Chem. Soc.* 53(6): 2316-2320. 1931.—The highest amylase activity of this enzyme in the presence of either of these buffers occurs in systems of slightly higher pH value as the concentration of either is increased from 0.01 to 0.10 *M* (measurements at 40° for 30 min. in presence of 2% starch). Increasing the concentration of acetate from 0.01 to 0.10 *M* slightly decreases the activity of the amylase. The decrease in the presence of 0.01 *M* acetate is negligible and is more than offset by the increase in reproducibility of results over those obtained in unbuffered systems. Changes of phosphate from 0.01 to 0.10

M do not influence the activity of the enzyme, which is also the same in the presence of 0.01 *M* acetate or 0.01 *M* phosphate, if the pH values of the systems are suitably adjusted. In measurements of the activity, acetate is preferable to phosphate because of its more efficient buffer effect in the region of optimal pH for the action of this amylase. In measurements of 30 min. at 40° with 2% starch containing 0.01 *M* acetate, the amylase is most active saccharogenically at pH 5.3-5.5. —*From authors' summary.*

12834. **DENNY, F. E. The effect of thiocyanates upon amylase activity. I. Potato amylase.** *Contr. Boyce Thompson Inst.* 3(2): 277-286. 1931.—Since previous experiments had shown the effectiveness of solutions of thiocyanates in hastening the germination of freshly-harvested potato tubers, and since the successful treatments also caused a reduction in the starch content of the tubers, experiments were undertaken to determine whether this result could be accounted for by a direct effect of the thiocyanate in hastening amylase activity. The capacity of the expressed juice to form reducing sugar from soluble starch was decreased by both NaSCN and KSCN when the amounts added were in excess of about 10 mgm. per 100 cc. of reaction-mixture. Smaller amounts had no effect. The rate at which starch was broken down to the stage at which no blue color was given with I was less influenced by the thiocyanates, since it required about 100 mgm. per 100 cc. to cause retardation of amylase action. Neither the sprouting response nor the observed breakdown of starch of potatoes treated with thiocyanates is caused by any direct effect which the chemical itself exerts upon the amylase of the potato.—*F. E. Denny.*

12835. **DENNY, F. E. The effect of potassium cyanide upon the amylase activity of potato juice.** *Contr. Boyce Thompson Inst.* 3(2): 297-308. 1931.—The addition of small amounts of KCN to the juice of potato tubers increased the amylase activity; 30 mgm. of KCN per 100 cc. of reaction-mixture caused an increase of 50-100%. But when the KCN was added to juice which had been dialyzed in collodion bags no increases were observed. In order that the activating effect of KCN may become evident not only must the amylase be present but also a portion of the juice which will pass through collodion in dialysis. When the juice was dialyzed for various periods up to 24 hrs. before the addition of KCN, the gains in amylase activity due to the KCN became progressively smaller.—*F. E. Denny.*

12836. **GUTHRIE, JOHN D. The inhibiting effect of oxidase on the reduction of sulphur by potato and gladiolus juice.** *Contr. Boyce Thompson Inst.* 3(1): 125-130. 1931.—Treatment of dormant potato tubers or gladiolus corms with ethylene chlorhydrin results in an increase in the power of the juice to reduce S to H_2S. This action is increased by boiling the juice or carrying out the reaction in an atmosphere of N. Addition of unboiled juice to boiled juice results in a decrease in H_2S production. Fresh juice catalyzes the oxidation of H_2S. These results are explained by the presence of oxidase in the unboiled juice.—*J. D. Guthrie.*

12837. **IWANOFF, NICOLAI N., und F. A. KRUPKINA. Über die Stickstoffausscheidung der Hefe während der Gärung.** *Biochem. Zeitschr.* 212(4/6): 255-266. 1929. —On the basis of experiments which ran only 1-2 days, it is reported that pure cultures of *Saccharomyces cerevisiae, S. apiculatus, S. pastorianus,* and *S. ludwigii* caused an increase in the N of the fermented sugar solution as the result of a decomposition of the proteins of the yeast cells. The N content does not change in this way unless a fermentible sugar is supplied, and the phenomenon is definitely related to fermentation rather than to autolysis.—*C. J. Lyon.*

12838. **IWANOFF, NICOLAI N., und A. N. AWETISSOWA. Über die fermentative Umwandlung des Guanidins in Harnstoff.** *Biochem. Zeitschr.* 231(1/3): 67-78. 1931.—Guanidin is a good source of N for *Aspergillus niger* if a solution of glucose and guanidin salt is given the fungus grown on peptone. The living fungus decomposes guanidin into urea and NH_3 only in the presence of carbohydrate. Under these conditions formation of the corresponding ferment, designated "guanidinase," occurs in the mycelium. The dead, dried mycelium of *A. niger* which contains guanidinase and no urease splits guanidin into urea and ammonia quantitatively. Boiling of such mycelium destroys the guanidinase.—*Author's summary (transl.).*

12839. **LISCHKEWITSCH, MARIA L. Das Abschätzen der Samenqualität nach dem Fermentgehalt.** *Fermentforsch.* 12(2): 244-261. 1930.—Classification of seed according to their content of catalase, amylase, lipase, and proteases is not particularly hopeful, as it is influenced greatly by conditions under which the seed are grown and ripened, and also by inherent properties of the seed, particularly that of quick or slow ripening.—*E. McCoy.*

12840. **MYRBÄCK, KARL, und HANS von EULER. Co-Zymase und die Aktivierung der Gärung frischer Hefe durch Hefenextrakt.** *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 176(6): 258-268. 1928.—A substance designated as "factor Z" present in yeast extract and other extracts—not yet isolated—is capable of very materially increasing the speed of fermentation of fresh yeast without a corresponding increase in the number of cells. It is essentially different from cozymase. It is readily soluble in 94% alcohol, is not precipitated by $Ba(OH)_2$ or lead acetate but is precipitated by lead acetate plus NaOH. It is not affected by autolysis, and it dialyses through celloidin. While boiled yeast extracts containing 2 units of cozymase accelerate the fermentation of fresh yeast by more than 100%, a purified solution of cozymase of 30 units is inactive. Conversely, fresh yeast is activated by solutions containing no cozymase. This fact is contrary to Kostychev's assumption that cozymase activates fresh yeast. His views, therefore, have no bearing on the question of whether the fermentation by dried yeast can be ascribed to the presence of living cells. The activation of fresh yeast can neither be traced to the presence of amino acids nor to that of hexose-phosphates.—*F. A. Rotondaro.*

12841. **NEUBERG, CARL, und MARIA KOBEL. Weiteres über die Vorgänge bei der desmolytischen Bildung von Methylglyoxal durch Hefe.** *Biochem. Zeitschr.* 210 (4/6): 466-488. 1929.—Methyl glyoxal was formed by the decomposition of Mg-hexose-diphosphate under the action of substances contained in a variety of yeast preparations. These included the liquid from plasmolyzed top yeast, the residual mass of cells, washed bottom yeast in dry form, and untreated dry yeast. The methyl glyoxal was captured by the use of dinitro-phenylhydrazine which gives with it an insoluble compound.—*C. J. Lyon.*

12842. **NEUBERG, CARL. Über das Verhalten des glukose-schwefligsauren Natriums zu Hefe und damit zusammenhängende Fragen.** *Biochem. Zeitschr.* 212 (4/6): 477-489. 1929.—The Na salt formed by the union of Na_2SO_3 and glucose during the process known as "sulphite fermentation" is not fermented by either top or bottom yeasts. It actually hinders the fermentation of fermentable hexoses. When used along with other compounds involved or thought to be involved in the reactions of fermentation, the results are usually those to be expected from the use of the products of dissociation of the sugar-sulphite compound except that acetaldehyde appears under unusual conditions. The possible relationships to the hypothetical reactions of fermentation are considered in detail.—*C. J. Lyon.*

12843. **SEN, PARIMAL BIKAS. A method of locating urease within tissue by microchemical method.** *Indian Jour. Med. Res.* 18(1): 79-82. 1 pl. 1930.—Urease of tissue acts on a solution of urea applied to the tissue, in alcohol or acetone solution up to 80-85%. The $(NH_4)_2CO_3$ formed, being insoluble in so strong a solution of alcohol or acetone, is crystallized out at the site of urease action, and may be rendered visible by treatment with a metal (Ca, Cu, Pb, Ni, Co) which gives an insoluble carbonate in place of the $(NH_4)_2CO_3$. Cobalt gives good results, and has no effect on protein.

The cobalt carbonate crystals are blackened by exposure of the section to H_2S.

12844. SZENT-GYÖRGYI, A., und K. VIETORISZ. Bemerkungen über die Funktion und Bedeutung der Polyphenoloxydase der Kartoffeln. *Biochem. Zeitschr.* 233(1/3): 236-239. 1931.—Crushing potatoes increased the activity of the phenoloxidase at least 15 times. Either inhibiting factors were destroyed, activators freed, or it must be assumed that the ferment and its substratum were spatially separated in the tissue. The presence of such a system, far exceeding respiratory needs, in potatoes (and presumably in other phenoloxidase plants) which was inactive in the uninjured plant and immediately freed upon injury, may indicate that it is not related to respiration but to natural immunity. Quinones (formed in the brown discoloration on injured potatoes) have a high bactericidal value; on the other hand, they may affect only the proteins, thereby giving bacteria an unsuitable medium; it was not possible to find bactericidal action in the quinones of injured potatoes.

BIOCHEMISTRY, METABOLISM (RESPIRATION, OXIDATION)

12845. CROZIER, W. J., and A. E. NAVEZ. Temperature characteristics for the production of CO_2 by Phaseolus seedlings. *Jour. Gen. Physiol.* 14(5): 617-630. 1931.—Rate of CO_2 production by seedlings of *P. aureus* 5-7 days after sprouting was studied as a function of temp. The CO_2 production was determined by the usual $Ba(OH)_2$ titration method. From about 12-20°C. the log of the rate of CO_2 production is a straight line function of the reciprocal of absolute temp., the slope or temp. characteristic (μ) of which is 16,500. A critical temp. appears at 20-21°C., above which this relation no longer holds.—*P. S. Tang.*

12846. ERMAKOFF, A. I., und NICOLAI N. IWANOFF. Über die Atmung der Samen von Ölpflanzen. *Biochem. Zeitschr.* 231(1/3): 79-91. 1 fig. 1931.—Respiration of flax, castor bean, and almond seed is the same in the initial stages as that of carbohydrate seed. The respiratory quotient of oleaginous seed beginning to sprout approximates 1. Flaxseed showed no increase in dry wt. on germinating; the quantity and quality of the oil was unchanged during the first hrs. Mono- and disaccharides increased at the beginning of germination through enzymatic splitting of polysaccharides. The I value of linseed oil remains unchanged both on the 1st day of germination when the amount is the same as in the seed, and on the 2nd-3rd day when it has distinctly decreased, showing that the oil is not oxidized directly by the O_2 of the air. The germinating seed in the oil plants tested used carbohydrate, primarily, as respiratory material.

12847. HARRIS, G. H. The influence of top on root as determined by root respiration of young fruit trees. *Proc. Amer. Soc. Hort. Sci.* 26: 329-334. 2 fig. 1929(1930).—An apparatus is described for the continuous measurement of tree-root respiration. It was found by using this apparatus that any injury to the root, even very slight, resulted in a temporary increase in its respiratory activity. The bursting of buds markedly depressed root respiration although it had previously increased. Vegetative buds had a more pronounced effect than blossom buds. In the early stages of shoot growth, root respiration remained at a low level. At a certain stage in growth when the leaf area was increasing relatively fast, root respiration increased rapidly until around the time shoot elongation ceased. Diam. growth of top depressed root respiration while that of roots increased it. New root growth in length continued to take place when all other apparent activities had ceased but was usually accompanied by a relatively low respiratory activity.—*G. H. Harris.*

12848. TANG, PEI-SUNG. Temperature characteristics for the oxygen consumption of germinating seeds of Lupinus albus and Zea mays. *Jour. Gen. Physiol.* 14(5): 631-641. 1931.—The Warburg manometer technique was used, with slight modifications, over the range 7-26° C. Above and below a critical temp. at 19.5°C. the temp. characteristic for O consumption by *L. albus* was $\mu = 11{,}700 \pm$ and 16,600 respectively. The same critical temp. was encountered in *Z. mays*, with temp. characteristics $\mu = 13{,}100 \pm$ above and $\mu = 21{,}050$ below that temp.—*P. S. Tang.*

ORGANISM AS A WHOLE

12849. HOLT, MARY. Giant yeast cells. *Trans. Roy. Soc. Canada, Sect.* 3. 22(2): 269-270. 1928.—Attempts to identify, among the products of casein hydrolysis, the substance responsible for the formation of giant yeast cells when yeast is allowed to bud in media containing sugars, salts, and the products of casein hydrolysis, are reported; of 12 amino acids tried, 2 (aspartic and glutamic) caused giant cells. With aspartic acid, cells 70μ long were obtained.

12850. QUEDNOW, KLAUS GEORG. Beiträge zur Frage der Aufnahme gelöster Kohlenstoffverbindungen durch Orchideen und andere Pflanzen. *Bot. Arch.* 30(1/2): 51-108. 2 fig. 1930.—When *Brassica*, as a representative of higher autotrophic plants, was compared with various spp. of orchids under conditions of darkness, it was found to absorb through the roots the same C compound in practically the same amounts. The magnitude of absorption depends on the kind of C compounds used. Glucose is the best source of C, followed by levulose, saccharose, and maltose. Up to certain limits an increase in concentration of C compounds results in an increase in dry wt. of tissue. The pH of the medium controls the quantity absorbed (optimum about 4.7). In *Brassica*, germination and early growth under normal condition is provided for through the presence of reserve material in the seed. This is not the case with orchids. In nature the pH value and the proper C compounds are determined by the activity of the fungi. Under controlled experimental conditions the necessity for fungi is obviated by adjusting the pH value and providing in the medium of growth the suitable C compound.—*R. P. Hibbard.*

GROWTH, DEVELOPMENT, REPRODUCTION

12851. CHIARUGI, ALBERTO. L'inversione sessuale apomeiotica nelle antere di Ochna serrulata Walp. e il suo probabile significato nei riguardi dell'apomissia. [Apomeiotic sex reversal of the anthers of O. serrulata and its probable significance in relation to apomixy.] *Boll. Soc. Ital. Biol. Sperim.* 5(3): 286-289. 1930.—In the anthers of *O. serrulata*, groups of cells were found among the normal ones, which had the characters of ♀ apomeiotic gametophytes (as in *Antennaria*). These cells, perfectly analogous to those developed by the same plant in the ovules, show all the characteristics of apomeiotic growth. The apomeiosis of the sex-inversed cells is considered to be determined, like the inversion itself, by the acceleration of the vegetative factors in the plant. The factors of apomeiosis would then be strictly correlated with those of sex reversal, and the opomixy would, therefore, be the expression of an increase of vegetative (anabolic) factors.—*M. Comel.*

12852. HOLM, THEO. The apparent influence of inulin on the meristem in roots of Compositae. *Beih. Bot. Centralbl. Abt. 1.* 47(3): 359-377. 17 fig. 1931.—Inulin was observed in the roots of some No. American spp. of *Hieracium, Vernonia, Aster, Helenium* and *Prenanthes;* in the aerial organs it was found in the basal leaves of *Hieracium venosum* L., and in the stem of *Hieracium scabrum* Michx. It may occur in some roots and be absent from others in the same specimen; it may be present in some parts of a root,—apex, or base, or between, and totally absent from other parts of the same; it may be present in various tissues of the same root. It is most abundant in the meristem, close to the primary xylen; but it may occur in some quantity in the cortical parenchyma, seldom in the endodermis, occasionally in the pith, and in the young wood fibers.

It was not found in the epidermis, the exodermis, the cork, the phelloderm, the sclerenchyma, and the phloem. The presence of inulin appears to stimulate the meristem to divide, at the same time arresting its further development into secondary vascular tissue. The effect on the meristem is so conspicuous that fresh roots in which the inulin is not visible may still be determined as inulin-roots. The principal structural deviation depends on the position of the primary xylem, whether close to the pericycle, as in the inulin-roots, or close to the center of the stele, as in those free from inulin. The proximity to the pericycle depends mainly on the suppression of the activity of the meristem outside the proto-xylem. It is surprising that the meristem is the principle tissue, where the inulin occurs, inasmuch as active meristems do not as a rule contain reserve-food. Inulin-bearing roots are therefore distinctive. In *Prenanthes* it was clear that in young, tuberous roots the lateral roots traverse the cortex, and become free on the lower face of the tuberous root.—*T. Holm.*

12853. NESS, RUDOLF. Untersuchungen über die physikalische und chemische Veränderung reifender Hülsenfruchtsamen. *Bot. Arch.* [*Leipzig*] 27(1/2): 60-158. 16 fig. 1929.—Victoria peas, Schurig peas, horse beans, and yellow, white, and blue lupines were studied. The changes involved were fundamentally alike for all seed studied, except in N for the 3 lupines. The amount of water contained in the seed decreases with progressive ripening. Most rapid evaporation of water begins in the seed with yellow-ripeness and a little earlier in the pod. Loss of water from pods is faster than from seed. In the green and yellow-ripe stages, pods and seed have the same water content; before the green-ripe stage and after full maturity, seed have higher water content than pods; and in intermediate time, pods have higher water content. Water content is a more reliable measure of stage of ripening than is external appearance. The increase of dry wt. is slow up to green-ripeness; then it becomes more rapid and continues until shortly before yellow-ripeness. After yellow-ripeness the total dry wt. of the seed decreases slightly. Yellow-ripeness is the moment when increase in total dry wt. ceases. After harvesting, the total dry wt. of less mature seed may increase. Different seed on the same plant or different plants of the same crop reach the yellow-ripe stage at different times, so it is difficult to apply the term to the whole plant or crop. When crops are cut very early there is not enough food in the plant to mature all seed. Some are left to dwarf, while others mature by using up most of the food. This not only applies to pods in a single branch but to seed in a single pod. The pod furnishes about 70% of the substance for developing immature seed and the straw the rest.—*W. Crocker.*

12854. NEUBERT, HANS. Ersatzbildung beim Flachs. *Faserforschung, etc.* 9(1): 9-62. 80 fig. 1931.—Experiments showed that plants of *Linum usitatissimum, L. hiemale,* and *L. perenne* at almost any age are capable of extensive adventitious growth. Pre-existing or new formed buds were stimulated to growth by cutting off a part of the plant or coating it with plaster of Paris. Adventitious buds occurred only in the hypocotyl or in the zone of the cotyledons. When the tops of plants of *L. hiemale* and *L. perenne* were cut off, the dormant buds in the older wood and the adventitious buds in the region of the cotyledons were stimulated to growth. Coating with plaster of Paris caused the buds of *L. usitatissimum* and *L. hiemale* to have an enlarged leaf area. A portion of a shoot, with or without the tip, formed roots at the base when grown on blotting paper or sand. Hypocotyledonary pieces without buds produced new roots and shoots. A single cotyledon and foliage leaf or leaf portion always produced roots at the base. The marked ability of *L. usitatissimum* to form adventitious buds may be understood when we consider that it is derived from biennial or perennial spp., and that it contains growth energy derived from the transition from the perennial to the annual type. The ability of *L. hiemale* and *L. perenne* to form adventitious buds may have been due to the fact that only 1 yr.-old, vigorous plants were used.—*H. Neubert* (*transl. by H. H. Flor*).

12855. STANTIAL, HELEN. The sporulation of yeast. *Trans. Roy. Soc. Canada, Sect. 3.* 22(2): 257-261. 1928.—Yeast was cultivated in wort, washed on filter paper, and suspended in distilled water. Addition of orange, lemon, or tomato juice, or juice expressed from fresh lettuce, to the water suspension or to the original culture in which the yeast was grown (wort), gave abundant sporulation, not obtainable by growth on gypsum blocks or any of the ordinary methods. In 0.5 cc. of wort culture of yeast, pipetted into 25 cc. of water containing fruit or vegetable juice, about ¼ of the cells became asci. By proper adjustment of the components, nearly all the cells could be made to form spores. The result is ascribed to a vitamin or vitamin-like substance in the fruit juice; this is not bios I or bios II.

TROPISMS, GROWTH AND TURGOR MOVEMENTS

12856. BEYER, ADOLF. Experimentelle Studien zur Blaauwschen Theorie. II. Neue vergleichende Untersuchungen über Lichtkrümmung und Lichtwachstum bei normalen und dekapitierten Haferkeimlingen. *Zeitschr. Wiss. Biol. Abt. E, Planta* 5(3): 478-519. 2 fig. 1928.—Genetically pure seed of *Avena* and *Hordeum* were placed on moist filter paper or on moist soil and subjected to preillumination of definite intensities and for definite periods during the early stages of germination. The seedlings were then set in soil in small containers placed within a larger vessel in a dark, constant temp. room at 25.5° C. The relative humidity was maintained at 70% or higher. When the coleoptile extended 2-3 cm. above the soil, observations were made on growth at frequent intervals with a horizontal microscope during short alternate periods of darkening and illumination applied on opposite sides or from above with 2 small electric lights. In some instances the seedlings were rotated on a clinostat between the light sources. No parallelism was found between the light effects on growth and on curvature. In normal seedlings, increased illumination on one side caused definite bending although uniform illumination did not reduce growth as a whole. Under suitable conditions decapitated seedlings exhibited reduced growth but no phototropic curvature. Hence, no causal relationship exists between the phototropic and the light-growth reactions. In normal and in decapitated seedlings, the retarding action of light on growth decreases with decrease in intensity of growth in the dark. The absolute growth-inhibiting action of light is smaller on the decapitated than on normal seedlings but, expressed in % of growth in the dark, the retarding action is greater on the decapitated than on normal seedlings. Contrary to Vogt's conclusion, the final length attained by the *Avena* coleoptile increases with increase in temp. In comparison with fully etiolated plants, illumination of *Avena* seedlings in the first hrs. of germination modifies the character of the subsequent growth, lessens its duration, and reduces the final length attained. An increased growth produced by vertical over-head illumination was not obtained with side illumination, suggesting a possible qualitative distinction in the stimulus from the 2 forms of illumination. In oat seedlings guttation is dependent on a definite moisture content of the substrate so that it ceases when the soil moisture falls outside certain limits.—*W. W. Garner*

12857. PROTIĆ, GEORG. Untersuchungen über den Geotropismus der Achsenorgane und Blätter von Euphorbia lathrys. *Österreich. Bot. Zeitschr.* 77(3): 195-219. 2 pl., 2 fig. 1928.—The correctness of Haberlandt's starch grain statolith theory was tested by means of simple experiments. Statoliths were found in the endodermis of stem, branches, and leaves. Geotropism took place only in the presence of statolithic starch. In young and in well developed stems, geotropic response occurred in the apical 15-25 mm.; in older ones, 5-8 mm. In the 2nd growing period there were 2 reaction zones: the apical zone, and the region which marked the pre-

vious year's tip; the latter was the more susceptible. When the plant was placed in a horizontal position, the geotropic curvatures of the main stem and of the lateral axes in a horizontal position were about the same. The remaining lateral branches responded very slightly. In an inverted position the response to geotropism in the main axis began later than in the horizontal position. Immature leaves were slightly negatively geotropic.—*J. M. Haber.*

12858. UMRATH, KARL. Über die Erregungssubstanz der Mimosoideen. [The "stimulation substance" in Mimosa.] *Zeitschr. Wiss. Biol. Abt. E. Planta* 4(5): 812-817. 1927.

GERMINATION, DORMANCY, RENEWAL OF ACTIVITY

12859. AXENTJEFF, B. N. Über den Einfluss einiger Salze auf die Keimung der Samen von Amarantus retroflexus L. *Biochem. Zeitschr.* 211(4/6): 454-467. 1929.—When KNO_3 and $Ca(NO_3)_2$ stimulate the germination of above seed, they affect the embryos rather than the seed coats. They inhibit the swelling of the colloids of the embryo; hence any stimulation by the salts does not depend upon increased hydration of these colloids and, therefore, not on growth stimulation, but upon some other (undetermined) cause. Salts protect against the toxicity of ether and phenol. In this protection the anions and cations arrange themselves according to the lyotropic series. $Al_2(NO_3)_6$ also shows strong protective action.—*W. Crocker.*

12860. [DUNIN, I. S., and M. N. MĬAZDRIKOVA.] ДУНИН, И. С., и М. Н. МЯЗДРИКОВА. К вопросу о методе определения "минимума" воды, необходимой для прорастания семян. [Method of determining the minimum water quantity for seed germination.] [German summary.] Главный Ботанический Сад, Записки по Семеноведению (*Jard. Bot. Princ., Ann. Essais Semences* [*Leningrad*]) 7(2): 71-103. 1930.—The minimum water necessary for germination (*M*) as worked out by a new, very accurate method and corrected for substances leached out during swelling and germination, was greater in poorly germinating seed. Ten gm. samples are best for beet, wheat, etc. *M* increases with stage of germination. Quick germinating seed have slightly lower *M* value. *M* value for germination at 9° C. is higher than at 18-27° C. Use of optimum temp. for swelling and germination reduces loss from leaching. The sources of *M* in germinating seed are water imbibed during swelling, water vapor absorbed under certain conditions during germination, and water produced by respiration. The error involved in determining *M* by previous work was 1.4-8.4%; with the method developed, the error was reduced to 0.62%.—*W. Crocker.*

12861. [EGOROVA, A. A., M. N. BULATOVA, and Z. M. SCHULTZ.] ЕГОРОВА, А. А., М. Н. БУЛАТОВА, и З. М. ШУЛЬЦ. Материалы к познанию прорастания и созревания семян. [Materials for testing the germination and ripening of seed.] [German summary.] Главный Ботанический Сад, Записки по Семеноведению (*Jard. Bot. Princ. URSS., Ann. Essais Semences* [*Leningrad*]) 7(2): 58-63. 1930.

12862. MILLER, LAWRENCE P. The influence of sulphur compounds in breaking the dormancy of potato tubers. Preliminary report. *Contr. Boyce Thompson Inst.* 3(2): 309-312. 2 fig. 1931.—Many S compounds break the dormancy of potato tubers. Some effective ones are ammonium dithiocarbamate, thiosemicarbazide, thioglycollic acid, thioacetic acid, H_2S, methyl disulphide, ethyl mercaptan, thioglycol, and various derivatives of dithiocarbamic acid.—*L. P. Miller.*

12863. NIETHAMMER, ANNELIESE. Fortlaufende Untersuchungen über den Chemismus der Angiospermensamen und die äusseren natürlichen, wie künstlichen Keimungsfaktoren. I. Der Einfluss des Frostes auf die Keimfähigkeit. *Biochem. Zeitschr.* 197(1/3): 241-244. 1928.—Freezing at −10° C. did not break the rest period of highly dormant seed but partially destroyed the effect of light in aiding the germination of seed which respond to light. With seed which respond to numerous stimulants, freezing favored germination; but seed which germinate readily without stimulation were either unaffected or impaired in germination by freezing. Light and low temp. affect germination by means of changes produced within the seed.—*H. R. Kraybill.*

12864. ROSSI, ERNESTO. Sulla germinabilità del seme di "Pinus maritima Lam." in rapporto alla temperatura. [Germination of pine seed in relation to temp.] *Atti Ist. Bot. "Giovanni Briosi" e Lab. Crittogam. Ital. Univ. Pavia* 1: 107-115. 1929(1930).—Seeds of *P. maritima* heated to 190° C. lost their capacity for germination in 60 sec. Warming them to 50° C. only hastened germination, without injury, giving 85% of the germination at normal temp. When seeds were kept at 50° C. continuously for 100, 300, and 500 hrs., the initial germinations occurred after 17, 16, and 15 days respectively. It required 35 days at 22° C. to obtain an equal % of germination.—*E. Rossi (transl. by H. S. Wolfe).*

TEMPERATURE RELATIONS

12865. BĚLEHRÁDEK, JAN, et JAN MELICHAR. L'action différente des températures élevées et des températures normales sur la survie de la cellule végétale (Helodea canadensis Rich.). *Biol. Generalis* 6(1): 109-124. 3 fig. 1930.—Leaves from near the tips of vigorously growing shoots were subjected to different temp., held constant to within 0.1-0.2° C., for various time intervals, after which % of living and dead cells were determined by Ruzicka's neutral rose-methylene blue method. Cells appeared to succumb beginning at the base of the leaf, progressing toward the tips, and ending in certain patches some distance below the apex. At lower temp. the order of death was less well defined and often was reversed from that at higher temp. Unequal sensitivity of cells of the same leaf was held to be due to the injury of severing the leaf and to differential physicochemical states of the cells. The time of survival of cells when plotted against temp. appears to be expressed by the same degree of precision by the formula Q_{10} (log. of time plotted against temp. Celsius), the law of Van't Hoff-Arrhenius (log. of time against inverse of absolute temp.), and the equation of Porodko and Bělehrádek (log. of time against log. of temp. Celsius), since the difference between these formulae is less for the limited range of temp. applicable in these experiments. The coefficients of temp. involved in these formulae are always much higher for higher temp. than normal temp., the change occurring suddenly at 44° C. The unequal values of the temp. coeff. indicate that the mechanism of death from heat differs from that which accompanies death at lower temp.—*R. C. Friesner.*

RADIANT ENERGY RELATIONS, PHOTOPERIODISM

12866. LOJKIN, MARY. Some effects of ultraviolet rays on the vitamin D content of plants as compared with the direct irradiation of the animal. *Contr. Boyce Thompson Inst.* 3(2): 245-266. 2 fig. 1931.—Green plants grown in these experiments under ordinary greenhouse glass did not produce vitamin D. U.-v. rays from the solar spectrum impart very slight antirachitic value to lettuce, alfalfa, spinach, New Zealand spinach, and soy beans. Rays from the Hg vapor lamp supply these plants with appreciable calcifying properties. No antirachitic properties were produced in cabbage by u.-v. rays from either source. Irradiation with the rays of the Hg vapor lamp imparts measurably greater antirachitic properties to the cut plant than to the intact plant. The antirachitic substance formed in the living plant by u.-v. radiation is not destroyed for at least 24 hrs. Complete calcification of the bones takes place when young rats on Sherman's diet 84 are exposed to sunlight transmitted through a special u.-v. transmitting filter for 30 min. in winter or 15 min. during summer and spring. An exposure of 1 min. per day to the rays of a Hg vapor lamp transmitted through various filters gave complete protection

to rats on Sherman's rickets-producing diet 84. Wave lengths shorter than 285 mμ had little or no protective value on rats. The rays most effective in the cure of rickets in rats were within the limits of solar radiation, that is, longer than 290 mμ. The minimum exposure to u.-v. rays necessary to produce an appreciable amount of vitamin D in plant tissue is considerably longer than that required to impart complete protection in case of direct irradiation of the animal.—*Mary Lojkin.*

12867. **MEZZADROLI, G. e E. VARETON. Azione esercitata dal radio sulla germinazione dei semi. [Effect of radium on seed germination.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 12(1/2): 73-80. 1930.—Dry seed of various grains and legumes were exposed to the action of $RaBr_2$ and then germinated. A short irradiation had a favorable effect; longer ones were injurious. The most favorable results show an increase up to 80% in total length and wt. of plants coming from irradiated seed. The effect of the irradiation on the seed is lasting, as shown by seed germinated 2 mo. after treatment.—*B. F. Lutman.*

12868. **MEZZADROLI, G., e E. VARETON. Ulteriori ricerche sull'azione esercitata da un radio-oscillatore per onde ultracorte di λ=2-3 m., sulla germinazione dei semi e sull'accrescimento delle piante. II. Azione delle onde elettromagnetiche ultracorte sulle piante poste entro un circuito in resonanza con il radio-oscillatore. [Effect of short-wave radio oscillator on seed germination and plant growth. II. Effect when plants are placed within a circuit in resonance with the oscillator.]** *Zymol. Chim. Colloidi e Zucch.* 5(3): 88-94. 1930.—Seed and plants were subjected to the action of very short electromagnetic waves (λ=2-3 m.) and the sprouts were placed within the coil of a receiving oscillator circuit. The effect obtained was even greater than that found with interposition of the Lakhovsky oscillating circuit or obtained with the system of Lecher threads in the zone of greater intensity.—*Authors' conclusion (transl. by H. S. Wolfe).*

12869. **MEZZADROLI, G., e E. VARETON. Azione esercitata dalle onde elettromagnetiche ultracorte sul potere catalasico dei semi. [Effect of very short electromagnetic waves on the catalase activity of seed.]** *Zymol. Chim. Colloidi e Zucch.* 5(3): 95-98. 1930.—Very short waves (λ=2-3 m.) from a radio oscillator have a beneficial effect on seed germination, since the seed so treated showed an increase of catalase activity during the 1st days of germination. The catalase activity of treated seed was as great as that of controls 1-2 days older.—*Authors' conclusions (transl. by H. S. Wolfe).*

12870. **WIGODER, SYLVIA B. Effect of activated fluorescein on growing beans.** *Brit. Med. Jour.* 2(3641): 643. 1930.—A year's experiments on *Vicia faba* indicate that the intensifying effect of "activated" fluorescein on x-rays is negligible.

TOXIC ACTION

12871. **McCALLAN, S. E. A., and FRANK WILCOXON. The fungicidal action of sulphur. II. The production of hydrogen sulphide by sulphured leaves and spores and its toxicity to spores.** *Contr. Boyce Thompson Inst.* 3(1): 13-38. 8 fig. 1931.—The attached leaves of higher plants and the spores of fungi of all sp. (45) tested evolved H_2S when in contact with S. Sulphured strawberry plants at 35° C. produced 0.002 mgm. H_2S per hr. per sq. dm. of leaf surface. The H_2S production by spores of *Venturia inaequalis, Uromyces caryophyllinus, Puccinia antirrhini, Sclerotinia americana, Macrosporium sarcinaeforme, Pestalotia stellata, Glomerella cingulata,* and *Botrytis* sp. (*cinerea* type), was directly proportional to the number of spores, was independent of the pH of the medium within the range 4.0-8.0, and varied with different sp. In 12 hrs. at 30° C. the H_2S produced varied from 9.8% of wt. of spores for *Glomerella* to 0.14% for *Macrosporium.* The optimum temp. was 35° C., with complete inhibition at 60°, thus indicating an enzymatic reaction. Actual contact between spores and S is unnecessary, as H_2S production will take place through a collodion membrane or across an air space of 4 mm., the H_2S being produced on or within the spores. The presence of the S-reducing -SH group has been demonstrated in spores of *S. americana.* H_2S is highly toxic to the spores of the 8 fungi mentioned, the toxicity to H_2S and S varying in decreasing sensitivity as follows: *Venturia, Uromyces, Puccinia, Sclerotinia, Macrosporium, Pestalotia, Glomerella,* and *Botrytis.* When the production of H_2S by these spores is expressed in units equal to the amount of H_2S required to reduce their germination 50%, the 4 S-sensitive sp. controllable in the field with S produced more than 1 unit, while the 4 resistant sp. not controllable by S produced considerably less than 1 toxic unit of H_2S. An hypothesis, involving the diffusion of S vapor from the S particles to the spores and its reduction within the spore to form toxic H_2S, is presented to account for the fungicidal action of S.—*S. E. A. McCallan.*

12872. **SEYBOLD, A. Zur Kenntnis der oligodynamischen Erscheinungen. [Oligodynamic phenomena.]** *Biol. Zentralbl.* 47(2): 102-107. 1927.

12873. **THORNTON, NORWOOD C. The effect of carbon dioxide on fruits and vegetables in storage.** *Contr. Boyce Thompson Inst.* 3(2): 219-244. 6 fig. 1931.—Commercial fruits and vegetables held in storage 3-7 days withstood, without apparent injury, concentrations of CO_2 of 6-83%, depending upon the kind and variety tested. The concentration of CO_2 causing injury to, as well as that tolerated by each fruit and vegetable was determined at 6 storage temp. varying from 0° to 25° C. The noticeable effect of the gas on each fruit and vegetable is discussed separately. Low concentrations retarded coloration and in some cases caused noticeable changes in ripening, while high concentrations impaired the flavor, killed growing tissue, and promoted breakdown and surface discoloration of some fruits. The tolerance to CO_2 was influenced by ripeness, firmness, and freshness of the plant organ. An excess of moisture in the gas storage chamber increased the injury to most vegetables. Increasing the O_2 supply of the storage chamber before the addition of CO_2 retarded the apparent injury to celery, but had no noticeable effect on oranges. This work corroborates the observations of others that in the CO_2 injury to many plant organs insufficient O_2 in the storage atmosphere is an important factor.—*N. C. Thornton.*

ELECTRICAL PHENOMENA

12874. **BLINKS, L. R. The direct current resistance of Nitella.** *Jour. Gen. Physiol.* 13(4): 495-508. 2 pl. 1930.—The electrical resistance of *Nitella* cells to direct current is determined in a Wheatstone bridge, using a vacuum-tube detector, and string galvanometer. Very small currents are passed through the cells, to avoid stimulation. The galvanometer record shows typical transient effects in the living cells at opening and closing of the circuit, due to the development of back E.M.F. With 1 cm. contacts of tap water, and 1 cm. between comtacts the resistances of living cells are usually 1,000,000-2,000,000 ohms. They go as high as 3,500,000 ohms when the cells are in the best condition. The resistance falls to about 50,000 ohms immediately after killing. Leakage around the cell is small because the wall in imbibed with tap water. By measuring the resistance of the isolated wall (air-filled), and by varying the areas of contact with intact cells, the effective protoplasmic resistance is calculated. This is 100,000-700,000 ohms per sq. cm. of surface, with a typical value of about 250,000 ohms. This high resistance represents a low permeability for most ions, since the values are nearly as high with contacts of 0.01*M* NaCl, $CaCl_2$, LiCl, NH_4Cl, and $MgSO_4$. The resistances are greatly reduced however by solutions of KCl, which is correlated with a high mobility of the K^+ ion in the protoplasm. Electrical stimulation causes a marked reduction of resistance, which may be due to exosmosis of KCl.—*Author's summary.*

12875. **BROOKS, S. C., A. C. GIESE, and R. I. GIESE.**

Potential differences across natural membranes separating unlike salt solutions. *Jour. Exp. Biol.* 8: 124-132. 1931.—When the lower epidermis of the bulb scale of the onion separates 0.1*M* and 0.01*M* solutions of KCl, NaCl, or LiCl a transient "concentration" P. D. was observed, whose magnitude decreased in the order: K > Na > Li. The P. D. of 0.1*M*: 0.01*M* $CaCl_2$ is small and opposite in sign to that of the above chains. When the epidermis separates like concentrations of chlorides of K, Na, and Li, a cation "chemical" P. D. arises which is low but steady. When K-salts with different anions are present on the opposites sides of the membrane, the anion "chemical" P. D. is small or lacking. These facts are most simply accounted for by assuming that the epidermis is a mosaic of cation and anion permeable areas, the permeability to alkali metal cations much exceeding that for Ca ion or the anions tried. The cell walls may perhaps participate in the production of the bioelectric potentials observed in other plants.—*J. M. Robson.*

ANIMAL PHYSIOLOGY

GENERAL

(See also in this issue Entries 12070, 12078, 12090, 12599)

12876. **ARTHUS, MAURICE.** La physiologie pour tous. 142p. Payot et Cie: Lausanne, 1928. Price 2 fr.—This is a series of lectures to the general public delivered from the Lausanne Broadcasting Station. A selection of the facts of human physiology is presented in an attractive literary manner. The subject matter is divided into chapters dealing with the constitution of living beings, the blood and its circulation, digestion, respiration, the maintenance of body temp. and concludes with 3 chapters on the science of the common foods. The inter-relation of structure and function is kept well before the reader.—*D. J. Lloyd.*

12877. **FONTAINE, M.** Recherches expérimentales sur les réactions des êtres vivants aux fortes pressions. *Ann. Inst. Océanograph.* 8(1): 1-99. 16 fig. 1930.—Regnard's hypothesis that high pressures lacerate tissues could not be confirmed. Muscular tissue in particular imbibes fluid when placed under pressure in an isotonic medium. Even if compressed in air and placed in the fluid after decompression, imbibition still occurs. Compression and tetany appear to have similar effects on muscular tissue. As pressure is increased respiration in fish increases to a maximum and then decreases; in algae respiration decreases throughout. Study of the influence of pressure on cellular permeability and viscosity indicates that at 700 kgm. pressure (a depth of 7000 m.) irreversible changes occur in most forms of protoplasm.—*D. B. Dill.*

(See also in this issue Entries 12070, 12545, 12549, 12561, 12624, 12636, 12866, 12910, 12928, 12945, 12946, 12949, 13058, 13131, 13132, 13139, 13144, 13167, 13193, 13208, 13271, 13275, 13297, 13344, 13345, 13365, 13438, 13587, 14348, 14846)

12879. **ARNAUTOV, G., und E. WELLER.** Zur Wirkung des natürlichen und künstlichen Lichtes auf den Gaswechsel des Menschen. *Zeitschr. Ges. Exp. Med.* 76(5/6): 694-708. 5 fig. 1931.—In completely resting men the gaseous metabolism is greater under the influence of natural or artificial light than in the dark; the same holds true for pulmonary ventilation. Although the increase of these values is not great, the fact, that such increase was present in all experimental persons in different series with exact control of all other factors affecting the gaseous metabolism, seems to justify this conclusion.—*W. F. von Oettingen.*

12880. **BACHEM, A., and C. I. REED.** The penetration of light through human skin. *Amer. Jour. Physiol.* 97(1): 86-91. 1931.—An elaboration of the method of Stenstroem and Reinhard was used; the mounted skin specimen is placed in the opening of a screen and resting practically against the surface of a photographic plate. Specimens were used from: (1) cantharides blisters on the flexor side of the forearm; (2) strips from the ventral abdominal wall of fresh autopsy material cut with a microtone, while frozen, to the desired thickness; (3) tensed folds of the scrotum of living subjects, and scrotal strips from dead subjects. Visible and near infra-red rays were strongly absorbed by the blood of the corium and subcutaneous layers, with direct effects on the blood to be expected. The heating effect must be rather mild on account of the small absorption in the epidermis and the strong convection by the blood stream. The far infra-red has very little penetrating power; most of it is absorbed in the epidermis. The heat produced is slowly conducted away by the blood stream and by the air. Over-exposure of the germinal layer may lead directly to blistering. There is greater variation in percentage penetration of ultra-violet than in other parts of the spectrum. At 280 mμ, absorption in the corneum and prickle-cell layers is very pronounced. The great antirachitic effect of this wave-length must occur in or about these layers. On both sides of this band, near 300 and 250 mμ the penetration is greater, more radiation reaching the stratum Malpighii and the corium. These observations, with those of Hausser and Vahle, indicate that erythema production occurs in the germinal layer (or the corium) under the shadow of the upper layers. The stratum corneum and granulosum must play an important rôle in the light protection of these sensitive layers. From 250 mμ down the absorption in the horny layer increases rapidly. Near 200 mμ the absorption is so complete as to prevent any radiation from reaching the living layers of the skin.

12881. **BARCROFT, J., and F. VERZÁR.** The effect of exposure to cold on the pulse rate and respiration of man. *Jour. Physiol.* 71(4): 373-380. 1931.—The 4 experiments were carried out in 3 stages: (1) the subject lay naked but comfortably covered in bed until the pulse became steady; (2) the bedclothes were removed and the subject exposed for about ½ hr. to the cold, pulse rate and rectal temp. being frequently observed, and in 1 Du Bois spirometer observations being also made; (3) the bedclothes were replaced and observations continued—but not, as originally intended, until the temp. rose to the original reading, because this rise was exceedingly slow. The conclusions are: Apart from spasmodic rises in the pulse rate associated with shivering, the pulse rate falls with fall of body temp. The spasmodic rises associated with shivering may amount to 40% of the original pulse rate. The respiration shows marked summation of inspiratory movements during

the rigors which had very deep and sustained inspirations. The O consumption increases during the shivering fits by as much as 75% of its value during rest.

12882. **BĚLEHRÁDEK, J. Sur la signification des coëfficients de temperature.** *Protoplasma* 7: 232-255. 1929.—Because of the chemical heterogeneity of protoplasm the relation between the temp. and the speed of biological processes can not be expressed by the formula of van't Hoff nor by that of Arrhenius. The author proposes an empirical formula which gives a thermal coefficient that does not vary with the temp. even in the cases where the other formulae break down. It follows from the laws of heterogeneous systems that the speed of protoplasmic processes is limited by the speed of diffusion in the phases of the protoplasm and that these 2 rates are identical. The speed of diffusion being dependent on viscosity it follows that the thermal coefficients of biological reactions are only the thermal coefficients of the viscosity of the reacting protoplasmic phases. From figures of J. Loeb's it is demonstrated that in solutions of gelatin the thermal coefficient of viscosity can serve to evaluate the viscosity itself. This principle, applied to living protoplasm, justifies the conclusion that the temp. coefficients of physiological processes are indicative of the viscosities of the reacting protoplasmic phases.—*L. Moyer.*

12883. **BROWN, DUGALD E. S., and CECIL V. KING. The nature of the photogenic response of Photurus pennsylvanica.** *Physiol. Zool.* 4(2): 287-293. 1931.—The photogenic response is recorded by a photoelectric cell, the output of which, after suitable amplification, is led to a Cambridge-type string galvanometer. In the response of the ♂ the light intensity rises to a maximum and then diminishes along a curve exhibiting no discontinuities. In the ♀ the response usually exhibits 2 maxima. The magnitude of the response as indicated by the light intensity produced at the maximum varies widely with the number of stimuli and the frequency of stimulation. The duration of the response remains constant in those cases where the entire organ responds. The genesis of the response is considered as determined by: The fundamental luciferin-luciferase reaction; the successive stimulation of the cells in different regions of the organ; and the variation in light intensity in different regions of the photogenic organ and possibly within the limits of a single cell.—*Authors (courtesy Wistar Bibl. Serv.).*

12884. **CARMICHAEL, EMMETT B. The action of ultraviolet radiation on Limax flavus Linnaeus. I. The varying effects on non-pigmented and pigmented embryos.** *Physiol. Zool.* 4(4): 575-580. 1931.—Eggs from this nocturnal slug containing living embryos were treated with all the rays from a quartz mercury-vapor lamp (exposure, 3-20 min.). Pigmented embryos were easily injured by u.-v. rays; the deeply pigmented ones were especially sensitive, a few minutes' radiation being lethal. Non-pigmented younger embryos were not so easily injured as older pigmented ones. Control experiments ruled out the possibility of the effects being due to the increase in temp. of the surrounding atmosphere or to the effect of ozone. Other experiments show that the effects were due to u.-v. rays.—*Author (courtesy Wistar Bibl. Serv.).*

12885. **CHARITON, J., G. FRANK, und N. KANNEGIESSER. Über die Wellenlänge und Intensität mitogenetischer Strahlung.** *Naturwiss.* 18(19): 411-413. 1930.—Using yeast as a detector and Al, Zn and Cd arcs (also Hg vapor lamp) as senders, the mitogenetic effect was produced only below 2606 Å and could be obtained only by definite intensities. If the biological senders previously used emit rays identical with these, such emissions cannot be monochromatic and also require a definite time of exposure to produce an effect.—*L. S. Moyer.*

12886. **CORTESE, FRANZ. Ulteriori studi circa l'azione dei raggi ultravioletti sull'occhio. [Effect of ultraviolet on the eye.]** *Boll. Soc. Med.-Chir. Pavia.* 44 (5): 555-569. 2 fig. 1930.—U.-v. irradiation of 1 eye each of 10 adult rabbits (5 albino and 5 pigmented) showed that albino and pigmented were equally sensitive and equally unable to acquire actinoresistence. Changes were produced only in the anterior part of the eye, particularly in the cornea, and failed to affect the posterior part, particularly the retina. The difference between these results and those Cortese had previously obtained on young rabbits may be explained by the greater permeability to u.-v. rays of the cornea and the crystalline lens of young than of adult rabbits; by the law of Grotthus-Draper, the effect of u.-v. rays on the tissues is in proportion to the absorptive capacity of the latter for the rays. Bacteria isolated from an irradiated conjunctiva were no more resistant to u.-v. rays than were the same species from a non-irradiated conjunctiva. The diminution in numbers of bacteria in the irradiated eye is explained by the modification of the ambient of the conjunctival sac induced by the acute conjunctivitis, rendering the sac less suitable for bacterial life.

12887. **EISING, EUGENE H. Therapeutic and physical properties of ultraviolet irradiated petrolatum.** *Ann. Surg.* 93(6): 1231-1239. 7 fig. 1931.—Eising obtained unexpected therapeutic results from u.v. irradiated petrolatum, which he at first regarded as a vitamin action. Later, finding that irradiated petrolatum will produce an image on a photographic plate, he was led to attribute the therapeutic properties to a secondary radiant energy, derived from the u.v. rays. U.v. irradiation turns ordinary yellow petrolatum orange-brown and white petrolatum yellow; it has no effect on liquid petrolatum.

12888. **HARVEY, E. NEWTON, and PETER A. SNELL. The analysis of bioluminescences of short duration, recorded with photoelectric cell and string galvanometer.** *Jour. Gen. Physiol.* 14(4): 529-545. 1 fig. 1931.—The rapid fading of luminescence in extracts of the ostracod *Cypridina hilgendorfii* was studied by means of a photoelectric-amplifier-string galvanometer recording system. For rapid flashes of luminescence, the fading is logarithmic if the ratio of luciferin to luciferase is small; logarithmic plus an initial flash, if the ratio of luciferin to luciferase is greater than 5:1. The logarithmic plot of luminescence intensity against time is concave to time axis if ratio of luciferin to luciferase is very large. The velocity constant of fading in the case of rapid flashes of luminescence is approximately proportional to enzyme concentration, is independent of luciferin concentration, and varies approximately inversely as the square root of the total luciferin (luciferin + oxyluciferin) concentration. For large total luciferin concentrations, the velocity constant is almost independent of the total luciferin. The variation of velocity constant with total luciferin concentration (luciferin + oxyluciferin) and its independence of luciferin concentration is explained by assuming that light intensity is a measure of the luciferin molecules which become activated to oxidize (accompanied with luminescence) by adsorption on luciferase. The adsorption equilibrium is the same for luciferin and oxyluciferin and determines the velocity constant.—*From authors' summary.*

12889. **HESS, ALFRED F., and PHILIP E. SMITH. Excessive ultraviolet irradiation. Effect on the nutrition and the endocrine glands of rats.** *Amer. Jour. Dis. Children* 41(4): 775-782. 1931.—Two series of rats [♂ and ♀] (the 1st series litter-mates; the 2nd series, though not litter-mates, the progeny of the 1st) were irradiated with 3 intensities, mild, moderate and severe, with the mercury vapor lamp for 5-6 mos. or were given viosterol in small as well as in excessive amounts. The growth of the animals subjected to marked intensities of u.-v. or given large amounts of viosterol was as good as that of animals which had lived under similar conditions but had not been irradiated or given viosterol. No difference was noted at necropsy betwen the endocrine glands of the treated and those of the untreated animals.—*Author's summary.*

12890. **IWATAKE, H. On the variations in the temperature of the skin according to changes in the temperature of the environment.** [In Japanese, with English

summary, pp. 25-26.] *Jour. Oriental Med.* 14(3): 1931.—Sudden or slow change of thermal environment was produced (in a thermostatic "arm box,") on 2 young Chinese men and 1 Japanese girl, all with normal skins. (1) When the arm was suddenly introduced into the arm box: at 48° C., the skin temp. [S.T.] rose quickly at first, and more slowly later, reaching a nearly constant temp. of 43° in 15 min.; at 38°, S.T. took almost the same course, reaching 38° in 15 min., when it became stable; at 30°, which is nearly S.T. under normal conditions, the temp. of the box rose slightly owing to the warmth of the hand, consequently the S.T. correspondingly rose to 34° or 35° in 15 min.; at 20° the temp. within the box rose a little, and S.T. suddenly fell at first, but soon resumed its former level; at 13-10°, the temp. inside quickly rose to 15°, and S.T. fell to 25°, after which it became nearly constant.—(2) After the arm had been introduced into the box, it was warmed or cooled slowly by circulation of hot or cold water through the double walls of the box. The curve of S.T. ran in almost a straight line above 20° and crossed the line of the temp. of the box at 35°, making an angle of 15° or 18° with it. Under 20°, the S.T. made a slighter curve, bending toward the line of the environment. When the arm was kept in the box at a high temp., for example, 50°, long enough for the temp. of the arm box to equal the S.T., the box was cooled slowly, the S.T. followed a similar course to the one mentioned above. However, contrary results were obtained when the skin was cooled first and then warmed slowly. A comparison of the results of these 2 experiments shows that in the former the temp. is generally higher than in the latter though not in any great degree (the point of intersection of the temp. curve of the box and that of the skin was 37° or 38° in the former, and 35° in the latter).

12891. **KOSTYÁL, LADISLAUS. Über die Wirkung der Quarzlampenbelichtung auf die Eiweissfraktionen des Blutplasmas in vitro. [Action of quartz lamp lighting on albumin contents of blood plasma in vitro.]** *Biochem. Zeitschr.* 229(1/3): 100-108. 1930.—After exposure of 20 plasmas from 11 patients to quartz lamp irradiation, the changes in sedimentation rate of erythrocytes of the same patients were determined. The albumin colloids of blood in various diseases show various degrees of sensitiveness to quartz light. The accelerating action on blood cell sedimentation rate continues to a certain point and then falls. As tests on precipitation and swelling show, the sedimentation is often delayed, as if it were in albumin free solution, not because the lighting was stopped or another counteracting action interfered, but because the protein bodies passed into another condition characterized by aggregate formation and by breaking up of protein molecules, particularly of fibrinogen. In the breaking up, they lose the capacity of precipitation, of swelling and of neutralizing erythrocytes. In some cases, the sedimentation was maintained even after 120 min. exposure, the rate so accentuated that the fall is shotlike, even after the fibrinogen had lost it characters.—*Author's summary (transl. by P. M. Suski).*

12892. **KROPATSCH, ANTON, und KARL LINSER. Ein weiterer Beitrag zur Frage der Sensibilisation und Desensibilisation der Haut gegen UV.-Licht.** *Strahlentherapie* 29(2): 342-348. 4 fig. 1928.—A band of skin was exposed to ultra-violet (lamp 50 cm. distant, 5 min.), and the erythema allowed to fade out, leaving the band marked by faint pigmentation. A 2nd band, crossing the former perpendicularly, was exposed, and, in cases where the area treated earlier was desensitized, this desensitization extended 2-3 mm. on either side of it. When the earlier treated area was sensitized, as a rule no desensitized border was found. The width of the desensitized border varied with the amount of the 2nd dose. This desensitization can not be due to pigment formation; it may be due to a general depression of cell function, including pigment-producing power and sensitivity to u.-v., which spreads slightly.—*W. C. Boyd.*

12893. **RAJEWSKY, B. Die Strahlungsreaktion des Eiweisses und die Erythemwirkung.** *Strahlentherapie* 29(4): 759-772. 13 fig. 1928.—After a discussion of the reasons for the different conclusions reached by different workers on biological effects of ultra-violet radiation, the author outlines a "model research" for studying in vitro radiation effects similar to those in living tissue. This is done by irradiating an albumin preparation with u.-v. of varying wave lengths and counting the number of coagulated particles produced, using an ultra-microscope for the purpose. The number of such particles varies with the wave length of the radiation, other factors remaining the same. This variation parallels that in the production of the skin erythema by the same rays. —*E. H. Quimby.*

12894. **RÖHR, H. O. Über die unspezifische Umstimmung der Haut nach Bestrahlung.** *Strahlentherapie* 34(1): 157-189. 1929.—The first day after appearance of erythema following irradiation with a quartz lamp, urticaria-producing substances, such as histamine, atropine, morphine, produce an effect stronger than normal. After 5-6 days they produce less than the normal effect; this lowered sensitivity lasts 15-20 days. Methods (as pressure) which blanch the normal skin fail during erythema, and for some time the blanching produced is more transient. Reddening of the skin cannot be produced during the first 3 days of erythema, it can during the next 2-6 days, and for some weeks will last longer than normal, especially after strong stimuli. Adrenalin, during the first days, considerably reduces the erythema, though the effect on the capillaries is slower than normal, and disappears sooner. A stimulus (such as irradiation) was found capable of producing either hypersensitivity or hyposensitivity to new stimuli, depending on the interval elapsed.—*W. C. Boyd.*

12895. **WICHMANN, P. Zur biologischen und therapeutischen Wirkung der leuchtenden Wärmestrahlen.** *Strahlentherapie* 28(1): 189-196. 6 fig. 1928.—To determine whether light radiant heat has indirect as well as direct biological and therapeutic effects, histological studies were made of skin treated with the heat rays of ordinary and concentrated arc light, using various filters. Indirect therapeutic effects apparently exist. Especially noticeable is a selective effect of light heat rays on pathological tissue in the cutis. It is well known that treatment of certain diseases by means of the Finsen light is more effective than by radiant heat alone or by the mercury arc, a fact which can only be explained by the large amount of light radiant heat present in the Finsen light.—*O. Glasser.*

12907. COHEN, BARNETT, and PAUL W. PREISLER. Studies on oxidation-reduction. XVI. The oxazines: Nile blue, brilliant cresyl blue, methyl Capri blue, and ethyl Capri blue. [*U. S.*] *Public Helath Repts. Suppl.* 92. 1-67. 1931.—This is the first detailed potentiometric characterization of representative compounds of the oxazine class of dyes. They cover the region of electrode potentials lying approximately between the methylene blue and indigo disulfonate systems. The evidence indicates that Nile blue is an acid sulfate. Its solutions show colloid properties which affect the electrode potentials in a peculiar way. The 3 other dyes also exhibit salt and concentration effects but to a lesser degree. A notable characteristic is the ease with which these compounds react with water to form oxazones and intermediate products of oxidative hydrolysis. Moderate alkalinity and acidity accelerate such decompositions. Strictly speaking, these dyes remain intact only if kept away from water. Until more stable compounds are available the phenoxazines, cresyl blue, methyl Capri

blue and ethyl Capri blue can serve as indicators of oxidation-reduction. Their basic properties may make them desirable in cases where the acid indigo sulfonates cannot be safely employed.—*B. Cohen.*

12908. **COULTER, CALVIN B., and MOSES L. ISAACS. Oxidation-reduction equilibria in biological systems. II. Potentials of aerobic cultures of B. typhosus.** *Jour. Exp. Med.* 49(5): 711-725. 3 fig. 1929.—The reduction potentials of *B[acillus] typhosus* in culture in bouillon which is given access to atmospheric O show a negative drift that attains the values found in sterile bouillon when deaerated with nitrogen: *Eh*, −0.085 to −0.095 volt at pH 7.6. The potential reaches this level after 6-8 hrs. incubation, and is maintained at this point for several hrs. A slow decline to more negative values is then observed and continues for at least 48 hrs. when a potential of −0.145 volt may be attained. The bacteria influence the potentials in the first period of their growth by exhaustion of O from the culture, thus permitting the characteristic potential of the culture medium to become manifest, and do not contribute the substances responsible for the observed potentials. The decline in potential to values more negative than those of the culture medium occurs while the rate of dying of the bacteria approaches and exceeds the rate of multiplication; it is suggested that dissolution of bacteria liberates reductive substances. Cultures in 0.5% dextrose medium show a somewhat more negative potential after 18 hrs. growth than cultures in medium without dextrose. This may be due to the more rapid "turn-over" of the bacteria and the liberation of larger amounts of reductive material from dissolution of larger numbers of bacteria. The potential of cultures through which O is passed continuously does not show a negative drift at any time. This indicates that reductive substances of bacterial origin in the case at least of the typhoid bacillus do not influence the electrode potentials in the presence of O and confirms the importance of bacterial respiration as the means for the removal of O and the consequent establishment of characteristic reduction potentials in cultures.—*Authors' summary.*

12909. **ELEMA, B. Studies on the oxidation-reduction of pyocyanine. Part 2. Redox potentials of pyocyanine.** *Rec. Trav. Chim. Pays-Bas* 50(7/8): 807-826. 5 fig. 1931.—The oxidation-reduction potentials of pyocyanine were determined in the range of pH 1.3-11.5. In the more physiological pH region (6-9) the potentials were between those of methylene blue and indigo trisulphonate. Below pH 6 the reduction of the pigment has peculiar features. There is a remarkable colour change (red—green—colourless) during reduction. Moreover, the relation between *Eh* and % reduction indicates that reduction occurs in 2 steps each involving 1 electron. This abnormal behaviour is due to the formation of a half-way reductant which is not a meriquinone, but is a free organic radical.—*From author's summary.*

12910. **LUND, E. J., and JAMES B. MOORMAN. Electric polarity and velocity of cell oxidation as functions of temperature.** *Jour. Exp. Zool.* 60(2): 249-265. 1931.—The rate of O consumption and magnitude of the potential difference (P.D.) of different frog skins under constant conditions are independent variables. In the experiments reported the rates of oxidation in the different frog skins per gm. per hr. were practically the same. When several of frog skins are subjected alternately to different constant temp. for 3-hr. periods, the average Q_{10} of the observed P.D. is approximately 2.0 for the temp. range between 16.4° and 26.4° C. This large Q_{10} of E.M.F. cannot be accounted for on the basis of any of the common theories of the origin of bioelectric potentials which depend for their interpretation on the existence of differences in concentration of ions under ordinary conditions of stable equilibrium nor on simple diffusion potentials. The flux-equilibrium concept applied to an oriented oxidation-reduction system in the cell does account for the results. The E.M.F.'s of the frog skin and other similar systems exhibiting electrical polarity are measurable as E.M.F.'s of systems in the condition of flux of chemical processes (oxidations), and are not as systems in the condition of perfect reversibility. When the skin is subjected to temp. which are being alternately raised and lowered, there is a time lag between the change in direction of the drift in temp. and the change in direction of the drift in P.D. The details of these findings can be understood in terms of the flux equilibrium of the oxidation-reduction systems of the living cells in which the electric polarity resides.—*Authors (courtesy Wistar Bibl. Serv.).*

12911. **REISS, P. Les potentiels d'arrêt dans la division des oeufs d'oursin et de Sabellaria.** *Arch. Phys. Biol.* 8(1): 39-48. 1930.—By adding various oxidizing and reducing agents to sea water, the effect of different potential levels on the development of the eggs of *Paracentrotus* and *Sabellaria* was studied. Above about 700 mv. and below 200 mv. no development occurs.—*F. Bernheim.*

12912. **RONA, P., J. A. PARFENTJEV, und H. LIPPMANN. Die Oxydationskatalysatoren der Insekten.** *Biochem. Zeitschr.* 223(1/3): 205-212. 1930.—The ash of *Periplaneta americana*, of *Carabus nemoralis*, and of silkworm eggs was analyzed and the actions of the total ash and its fractions tested on cysteine oxidation. The cockroaches contained 0.03 mgm. Fe, 0.0075-0.008 mgm. Cu, 2.5 mgm. P, 0.11-0.13 mgm. Mg, and no Mn; the silkworm eggs 0.006 mgm. Cu and 0.042 mgm. Fe; Si was found in the front wings of *C. nemoralis;* traces of Pb were found in the cockroaches. The actions of the various fractions were tested on 3 mgm. cysteine-HCl and 2.66 mgm. Na pyrophosphate in a manometer. Cu played an important, if not an exclusive, rôle in oxidation. Apparently Fe, perhaps also Pb, participated.

12913. **SCHÖBERL, A. Cystein und Glutathion als Antikatalysatoren bei Oxydationen mit molekularem Sauerstoff.** *Ber. Deutsch. Chem. Ges.* 64(3): 546-561. 1931.—A study of the function of glutathion in the oxydation by O_2 of leuco methylene blue in acetic acid solution with cupriacetate as catalyst. H_2O_2 formation was shown. Addition of Mohr's salt reduced O_2 absorption. A possible rôle of Cu and Fe in oxidations by O_2 is suggested. Cystein, cysteinhydrochloride, and glutathion may hinder O_2 absorption by leuco methylene blue solutions completely (anticatalysts). The extent of inhibition depends on the concentration of the SH-groups. The H_2O_2 causes inactivation of the anticatalysts which are oxidized to the corresponding disulphides; cystin has but weak effect. Inhibition by SH-compounds possibly is due to formation of complexes with those Cu-ions which function in O_2 transport.—*A. Schöberl (transl. by H. T. Gebhardt).*

BIOCHEMICAL AND BIOPHYSICAL

12914. **COFFIN, C. C. Some new physico-chemical apparatus.** *Canadian Jour. Res.* 4(5): 540-543. 2 fig. 1931.—Detailed description of the "Volumestat," an apparatus for automatically maintaining a constant volume and registering its pressure, shown connected to a gas thermometer; and of a combined gas heater and thermoregulator.

12915. **GRANT, JULIUS. The measurement of hydrogen ion concentration.** 159p. Illus. Longmans, Green & Co.: New York, 1930.

12916. **HAUGE, SIGFRED M. The Van Slyke method for protein analysis as affected by fats.** *Jour. Amer. Chem. Soc.* 53(8): 3049-3052. 1931.—The method for protein analysis is affected by the presence of fat. The reactive constituent of the fat molecule is glycerol; fatty acids such as stearic acid, representing the saturated group, and oleic acid representing the unsaturated groups, are without effect. The significant effects produced by fat or glycerol are: an increase in the acid-soluble humin, in the phosphotungstic acid humin, and in the nonamino nitrogen, and a decrease in the amino nitrogen and arginine values. Carnauba wax, which is not a glyceride, had little, if any, effect on the Van Slyke method.—*Author's summary.*

12917. **KLEINMANN, HANS. Neuerungen in der Nephelometerapparatur, insbesondere über die Trübungsmessung steriler Systeme. [Improvements in the nephelometer, particularly in the measurement of turbidity in sterile systems.]** *Biochem. Zeitschr.* 234(1/4): 25-38. 1931.

12918. **KOK, J. A. FILEDT. Micro chloride determination in blood.** *Arch. Néerland. Phys. Homme et Animaux, Ser. SC.* 16(1): 132-135. 1931.—A modification of Votoček's method. A dilution of blood is deproteinized, some sodium nitroprusside is added, and $N/10$ $Hg(NO_3)_2$ is added until slight turbidity appears (due to the precipitation of mercury nitroprusside upon the exhaustion of the Cl ions originally present). Complete removal of protein is essential; 5 common deproteinizing agents are compared. Alcohol and Zn acetate preparation is unsuitable because Zn reacts with the nitroprusside; kaolin contains Cl, as do commercial and oxydum ferricum dialysatum; sulphosalicylic acid is free from these defects and gives complete removal of protein. Slight turbidity was detected by use of an electric beam.

12919. **LOTTRUP, M. C. Om Mikrometri af de røde Blodlegemer. [Micrometric estimation of the red blood cells.]** *Hospitalstidende* 72(19): 513-517. 1929.—When using the method of Bentzen and Gram it is necessary to determine the red blood cells and to make control determinations on normal individuals also; otherwise the results may be erroneous, even if the test has been done with the necessary exactness.—*K. C. Berthelsen.*

12920. **MACH, F., und W. LEPPER. Über die Verwendung von Kupfersulfat statt Quecksilber beim Aufschluss nach Kjeldahl.** *Landw. Versuchs-Stationen* 109 (5/6): 363-366. 1909.—The Kjeldahl digestion of foodstuffs is completed in the same time by the use of $CuSO_4$ and K_2SO_4 as with metallic Hg or $HgSO_4$. The K_2SO_4 can all be added at once at the start, since it is desirable to heat at first with a small flame to avoid loss of N by violent evolution of gas (especially with large samples). The distillation is carried out with NaOH; addition of Zn is to be avoided when the alkali contains nitrate. Graphite dust is recommended to prevent bumping, though this is seldom needed. On account of several advantages of the $CuSO_4$, we recommend that the method as it has been used be altered in accordance with wider studies.—*From author's summary (transl. by M. H. Keith).*

12921. **MARENZI, AGUSTIN D. La determinación colorimétrica de los fenoles de la orina. [Colorimetric determination of phenols in urine.]** *Rev. Soc. Argentina Biol.* 7(1): 13-25. 1931.—Theis and Benedict's method modified so as to adapt it to urine analysis. Folin and Denis and Goiffon and Nepveu's methods give figures that are too high.—*J. T. Lewis.*

12922. **MASON, HAROLD L. A study of glutathione. 2. The determination of reduced glutathione in tissues.** *Jour. Biol. Chem.* 86(2): 623-634. 1930.—Glutathione is allowed to reduce ferricyanide at pH 5.9 and the resulting ferrocyanide is estimated colorimetrically as Prussian blue. Cysteine is used as a standard. Reducing substances other than glutathione are estimated by repeating the procedure with addition of 0.5 cc. of 40 per cent formaldehyde which prevents oxidation of reduced glutathione (GSH) and permits calculation of GSH by difference. This method gives lower values than titration with iodine. It is more specific for GSH.—*H. L. Mason.*

12923. **MAYER, K. Ein neues Titrierkolorimeter. [A new titrating colorimeter.]** *Biochem. Zeitschr.* 231 (4/6): 314-316. 1 fig. 1931.

12924. **MENEGHETTI, E. Determinazione dell'argento negli organi e nei liquidi organici. [Determination of Ag in organs and body fluids.]** *Boll. Soc. Ital. Biol. Sperim.* 5(6): 813-814. 1930.

12925. **MOUNIER, P. (préface de L. BÉTHOUX.) Parvianalyse clinique des urines et des autres liquides de l'organisme. Techniques, sémiologie, interprétations.** 441p., 33 fig. Norbert Maloine: Paris, 1931.—The term "Parvianalyse" (parvus, small) is used in preference to semi-microanalysis to designate "the biochemical analyses made upon small quantities of products: biological liquids and reagents." The methods are designed to meet the needs of biochemists, physicians, laboratory technicians and others who lack the expensive equipment and special reagents used in microanalysis. Only 1-2 cc. of the liquid is necessary for a determination. Expensive equipment and delicate technique are eliminated. Although the book deals chiefly with urine analysis, consideration is given to other biological fluids: blood, feces, spinal fluid, etc. It is divided into 3 parts: general considerations, including descriptions of apparatus and reagents; methods and symptomatology, which contains microscopic and chemical methods for the analysis of normal and abnormal urine, and other biological liquids; and clinical interpretations of the results. In addition to many of the familiar quantitative clinical methods, there appear numerous others; some are original. The abnormal constituents of the urine and the interpretation of the results are discussed in detail.—*R. A. Greene.*

12926. **MÜHLBOCK, O., und C. KAUFMANN. Die gravimetrische Cholesterinbestimmung im Blut und Serum.** *Biochem. Zeitschr.* 233(1/3): 222-235. 1931.—After alcohol-ether extraction, removal of impurities, and precipitation of the free cholesterol in blood and serum, the filtrate of the cholesterol-digitonin precipitation was used directly for determination of cholesterol ester. Checked against colorimetric methods the gravimetric was much more exact, Bloor's colorimetric giving 76%, and Myers' 38% higher values.

12927. OWEN, SEWARD E. An electrical drop counter. *Science* 74(1905): 19-20. 1 fig. 1931.—An apparatus is described for recording such fluids as urine, saliva, bile, pancreatic and other secretions. A 22½ volt radio dry cell gives a suitable voltage supply.

12928. RAJEWSKY, B. Eine neue Messanordnung für kleinste Lichtintensitäten. [A new apparatus for measuring very small intensities of light.] *Strahlentherapie* 39(1): 194-200. 1 fig. 1930.

12938. ALTMANN, FRANZ. Das Verhalten der glykämischen Reaktion nach hohen, langdauernden Luftverdünnungen. *Zeitschr. Klin. Med.* 114(4/5): 642-661. 1930.—Blood sugar curves were made on 10 rabbits given glucose intravenously and by mouth. After 1 to 2 days in atmosphere corresponding to altitude 5000 to 8000 m., the animals were given glucose as before and the blood sugar curves repeated. The curves showed lower peaks with (in cases of peroral administration) a shift to the right. This effect is explained by a sympathetic hypotonia due to a rise in blood pH. Addison's disease, which gives a sympathetic atonia, and mountain sickness show very similar symptoms.—*Author's summary (transl. by C. M. Goss).*

12939. BÁLINT, RUDOLF. Über die Wasserstoffionenkonzentration des Blutes und des Harnes bei Gesunden und Kranken. *Zeitschr. Ges. Exp. Med.* 64(1/2): 288-294. 1929.—A defense of the indicator method of determining the pH of the blood in answer to the criticism of Kaltstein and Erdey-Gruz (*Biol. Abstr.* 4(3): 8370. 1930).—*R. Isaacs.*

12940. BARCROFT, JOSEPH, (with remarks by M. NICLOUX, P. PORTIER, and P. GIRARD). L'hémoglobine et son rôle biologique. *Réunion Plénière Soc. Biol.* 25-26 Mai 1928. 3-28. 14 fig. 1928.—The present review aims to demonstrate the relation between the biologically significant properties of hemoglobin, on one hand, and what is known of its physical and chemical properties, on the other. The various characteristics treated are: (1) The ability of hemoglobin to combine with O in proportions which depend on the partial pressure of the gas; a discussion of the structural chemistry of the blood pigment and related substances. (2) The buffer action of hemoglobin, whereby the blood is able to transport large quantities of CO_2 with only slight changes in the partial pressure of the gas. (3) Its high solubility in relation to the transport of large quantities of O to the tissues. (4) Adaptation of the O affinities of the blood pigments of different varieties of animals to their O requirements. This is effected by (a) specific hemoglobins, (b) variation in the environmental conditions (pH, salt concentrations, temperature) in which the hemoglobin acts. (5) Adaptation of the hemoglobin—in particular, the temp. coefficient of its equilibrium constant—to alterations in the external environment resulting from temp. differences. (6) O exchange between blood and tissues or lungs, as affected by the relation between intracellular pH and that of the plasma. An extensive bibliography is included.—*F. Hollander.*

12941. BARER, ADELAIDE P. A study of glycolysis. *Jour. Clin. Investigation* 10(3): 507-520. 1931.—A study of the rate of glycolysis in bloods from 80 patients with different diseases is presented. There is no correlation between age or sex and rate. The rate is markedly influenced by temp. Glycolytic studies should be performed at 37° C.,—the optimum for the disappearance of sugar from blood in vitro. Citrates and oxalates, when used as anticoagulants, retard glycolysis in drawn blood in proportion to the concentration. Fluorides

arrest glycolysis. Defibrination or heparinization does not interfere with the rate of glycolysis, and blood so treated should be used for glycolytic studies. The rate bears no relation to the initial glucose content of the blood. Glycolysis in vitro is not affected by insulin. Both erythrocytes and leucocytes are responsible for the glycolytic power of blood, and their number, type, age, and physiological integrity are important.—*From author's summary.*

12942. **BARRAL, ET., et PH. BARRAL. Précis d'analyse biologique clinique. II.** Sang. 2nd ed. 424p. 2 col. pl., 95 fig. J. B. Baillière et Fils: Paris, 1931. Pr. 40 fr.—The first half of this book contains a general discussion of the physical properties of blood. Hemoglobin and related pigments, regulation of pH, and alkaline reserve are well discussed. Normal and pathological variations of the above are described. The 2nd part is a laboratory guide, giving the directions for quantitative determinations of blood constituents and a brief discussion of the normal and pathological significance of each. Analytical methods described are mostly European although some American methods are given. Methods for practically all constituents of blood are included.—*M. R. Freeland.*

12943. **BECK, A., und H. J. LAUBER. Zur Frage der aktuellen Reaktion von Körperflüssigkeiten (Gelenkexsudaten, Sekreten, usw.).** *Arch. Klin. Chir.* 155(3): 469-485. 2 fig. 1929.—The present methods for the determination of the actual reaction of body fluids (synovial fluid, secretions, pus, spinal fluid, etc.), are discussed. The results of their measurements carried out on 43 cases, avoiding the errors previously existing in the methods, are given. The abnormal reaction for the seminal fluid is far on the acid side. In general, the regularity, as established by Schlade, holds true with the CO_2 tension and the reaction for each degree of inflammation. It is pointed out however, that in many cases the determination of these changes is not always suitable for clinical and prognostic use. A discussion of the difficulty experienced in measuring the actual reaction of fluids from open wounds and in the first stages of inflammation is given. An attempt is made to explain the favorable action of doses of acids and alkalies on the processes of inflammation and healing in a wound. —*J. E. Andes.*

12944. **BECKER, S. Über die Veränderung des Jodgehalts im Blut unter dem Einfluss der Schlammbehandlung.** *Zentralbl. Gynäkol.* 55(26): 2045-2046. 1931.—Mud (9-10 kgm. at 50°) containing 0.1, 1, 2, and 3% KI or NaI was placed on the abdomen of ♀ patients and mud without I in vagina for 20 min. daily for 15 days. There was no change in I content in saliva or urine; I in the blood decreased after 2 hrs., returning to normal at end of 24 hrs. This decrease was not due to the I content of the mud, since it occurred when mud free of I or loam was used; the author attributes it to an inhibitory action on the thyroid.

12945. **BOSMAN, LOUIS PIERRE, and HARRY ZWARENSTEIN. The effect of temperature on the carbohydrate tolerance in Xenopus laevis (South African clawed toad).** *Quart. Jour. Exp. Physiol.* 20(3): 231-243. 1930.—The normal blood sugar level at 20° C. is 44 mgm. %. Higher values were obtained at 5° C. and 10° C. Injection of glucose solution causes a rise and return to normal of the blood sugar which varies according to the temp.—*W. C. Russell.*

12946. **CAREDDU, G. Variazioni del pH e del contenuto di fosforo inorganico nel siero irradiato con raggi ultravioletti. [Variations of pH and inorganic P of serum irradiated by U. V. rays.]** *Biochim. e Terapia. Sperim.* 18(4): 109-115. 1931.—Following irradiation an increase of inorganic P content and an increase of pH values were shown by blood serum in vitro. In some samples of serum no variation of either followed irradiation; a relation between P content and pH value is therefore suggested.—*M. Comel.*

12947. **DAKIN, W. J. The composition of the blood of aquatic animals and its bearings upon the possible conditions of origin of the vertebrates.** *Nature [London]* 128(3219): 66-67. 1931.—Comparative and experimental physiology gives little support to the view that the regulated blood salinities of the vertebrates represent the salinity of the media in which their ancestors evolved that constancy. We can only accept the universal saline composition of the blood of the metazoa as a possible reflection of a long continued existence and probable origin in a saline medium.

12948. **DALLA VOLTA, AMEDEO. La reazione cloroemoglobinica nei tessuti del cadavere. [The chlorohemoglobin reaction in cadavers.]** *Boll. Soc. Ital. Biol. Sperim.* 3(1): 37-40. 1928.—Subcutaneous (or deeper) injection of a saturated aqueous solution of hydroxylamine sulfate or hydrochloride into cadavers gives a characteristic green coloration if gaseous putrefaction has started. This coloration is particularly rapid and intense if the injection is preceded by injection of a reducing agent, such as a saturated aqueous solution of $Na_2S_2O_4$.

12949. **DESCHWANDEN, J. von. Der Glutathiongehalt des Blutes im Hochgebirge und bei Bestrahlung mit natürlicher Höhensonne.** *Strahlentherapie* 39(2): 278-282. 1930.—The glutathione content of an unstated number of rabbits (10 wks. at 1360 m. above sea level; shaved before exposure) was determined before exposure and immediately and 1 hr. after irradiation. Before exposure the glutathione of the erythrocytes was increased; after 1 hr. in the sun it decreased. The author concludes that the specific respiratory function of the blood and of the erythrocytes is increased at this elevation and apparently decreased by irradiation.

12950. **DEZANI, SERAFINO. Il tenore in solfo totale del sangue umano. [Total S content of human blood.]** *Biochim. e Terapia. Sperim.* 18(1): 34-37. 1931.—The total S of blood in healthy subjects was: minimal, 1.648 gm. per liter blood; maximal, 2.314 gm.; average, 1.928 gm.—*M. Comel.*

12951. **EISNER, GEORG, und FRITZ LEWY. Über die Aufnahmefähigkeit roter Blutkörperchen für Lävulose.** *Biochem. Zeitschr.* 202(1/3): 91-98. 1928.—The authors obtain values for the amount of glucose taken up by red blood cells comparable to those previously obtained by O. Loewi. Levulose is taken up in such small amounts as to make its absorption questionable. The effect which insulin has in increasing the capacity of red cells to take up sugar is also questionable. The results are in agreement with the concept that the rôle of levulose in metabolism is different from that of glucose.—*J. M. Johlin.*

12952. **ENGELHARDT, W. A., und M. LJUBIMOWA. Glykolyse und Phosphorsäureumsatz in den Blutzellen verschiedener Tiere.** *Biochem. Zeitschr.* 227(1/3): 6-15. 1930.—The following are listed according to the intensity of phosphoric acid splitting in their erythrocytes:—cow, goat, horse, dog, pig, man, guinea pig, rabbit, corresponding except in the case of the pig to the organic P content. The following are listed according to the glycolytic capacity of their corpuscles—cow, goat, dog, horse, guinea pig, man, rabbit. This order agrees with that above omitting the pig whose corpuscles show no glycolytic power. The quotient

$$\frac{\text{mols of combined phosphoric acid}}{\text{mols of vanished sugar}}$$

is 0.2 to 0.3 for goats, cows, and horses, varying between 0.5 to 1.0 for dogs, man, guinea pigs and rabbits.—*E. Hyde.*

12953. **FABER, FRANS. Undersøgelser over Serumkalken og Serumfosforet i Barnet's førs te Leveaar. [Serum calcium and phosphorus in young children.]** 295p. Nielsen and Lydiche: Copenhagen, 1928.—A monograph dealing with a series of 123 children in which serum Ca and P were determined, under as far as possible the same conditions, in normal children and children with tetany and rickets. The effect of various therapeutic measures as salts of Ca and P, cod liver oil, parathyroid extract, and heliotherapy on the level of the serum Ca and P was studied both in the normal and the pathological children. The results are in general

agreement with those previously reported. In addition new work was done on normal children, and it was found that cod liver oil and heliotherapy increase the Ca content of the serum, which, however, later falls gradually to a normal level in spite of continued treatment. The serum P cannot be influenced by cod liver oil in normal children, while heliotherapy may cause a hyperphosphatemia. The methods employed are described in detail, and there is a review of the literature regarding the normal and abnormal amount of serum Ca and P in children and the various factors that may influence it, as medication and heliotherapy, both in man and animals. The material is well summarized (pp. 146-152) and amply illustrated with charts and tables. Detailed case reports fill 137 pages.—*G. L. Muller.*

12954. **FARKAS, G. v., und B. GRÓAK.** Über die elektrostatischen Eigenschaften des menschlichen Fibrinogens. *Zeitschr. Ges. Exp. Med.* 66(5/6): 596-613. 1929.—The precipitation optimum of fibrinogen varies according to the method of isolation and the buffer system employed. The use of half saturated NaCl and an acetate buffer results in an optimum precipitation at pH 4.8 (4.6) and at a second pH 5.6 (5.8). With a citrate-phosphate mixture it lies between 3.8 and 4.1. With the use of 27% $(NH_4)_2SO_4$ neither the acetate nor the citrate-phosphate buffer showed a precipitation optimum. There were, however, precipitation zones beginning on the alkaline side at pH 4.0-4.6 and extending into the more acid range. After 2 to 3 weeks in the ice chest, the precipitation optimum at pH 5.6 disappeared. A diminished electrolyte content accelerates this disappearance. The dual precipitation optimum is due to the presence of two different albumins which can be completely separated by precipitation at the isoelectric points in the presence of the acetate buffer. Both are capable of clot formation and exhibit an individual optimum. Dialysis causes denaturation.—*J. M. Johlin.*

12955. **FEULGEN, R., K. IMHÄUSER, und M. BEHRENS.** Zur Kenntnis des Plasmalogens. 1. Eigenschaften des Plasmalogens, Darstellung und Natur des Plasmals. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 180 (4/6): 161-179. 1929.—Plasmal was obtained from animal tissues as plasmalogen by treatment with HCl or $HgCl_2$. It is lipoidal in nature and has aldehyde reactions. Plasmalogen is associated with phospholipids after extraction of the tissue with H_2O and ethyl alcohol. The two are difficultly separated but the plasmalogen was shown not to be a phospholipid. Plasmal may be easily separated by saponification of the phospholipid and is a mixture of the higher fatty aldehydes.—*M. E. Turner.*

12956. **FORSGREN, ERIK.** 24-Stunden-Variationen des Reststickstoffgehaltes im Blute. *Acta Med. Scandinavica* 73(3): 213-223. 1 fig. 1930.—The residual N of the blood varies considerably in 24 hrs. without showing any characteristic relationship to the time of eating. The residual N may be highest in the morning, therefore there is no object in making this determination before the patient has had breakfast. The usual limits in renal insufficiency are 56 and 83 mgm. % while in a normal individual they are 26 and 45 mgm. %. Values may be obtained in azotemia approaching 40 mgm. %, while the upper limit of a sound individual may be exceeded. Because of this overlapping the greatest care should be used in interpreting individual results. These variations may be ascribed to rhythmical liver function.—*J. M. Johlin.*

12957. **FRANZA, R.** Influenza della leucocitosi sperimentale sulla produzione di ambocettori emolitici. *Boll. Soc. Ital. Biol. Sper.* 3(6): 714-719. 1928.—The author produced a marked leukocytosis of some duration in rabbits by the daily administration of nucleic acid, nucleinate of soda, and NaI. These animals were then subjected to injections of red blood cells of cows. A notable increase of specific hemolysins was noted as compared with control animals. The author attributes the increase in the hemolysins to the excitation of the hema- and lymphopoietic organs by nucleic acid, nucleinate of soda and NaI and to the functional hyperactivity of these tissues due to the action of the same drugs.—*R. Franza (transl. by J. DeCarlo).*

12958. **GÄRTNER, ST., und L. KOSTYÁL.** Zur Theorie der Kolloidreaktionen. I und II. *Zeitschr. Ges. Neurol. u. Psychiatr.* 128(5): 648-663; 664-672. 1930.—I. The protein of the cerebrospinal fluid was precipitated with ethyl alcohol in varying concentrations (80, 70, 60, 50, 40%) and the transmission of light through the resulting turbid solutions was measured with the Pulfrich photometer (using the Belák-Gärtner serum protein stability method for the fluid). From the calculated extinction coefficient, the mass of the precipitated protein was ascertained. By a similar method it was possible to determine the total proteins of the fluid (cf. earlier papers). Numerous calculations become possible on each chosen alcohol concentration. This makes it possible to obtain the protein quotient (globulin-albumin ratio). The protein quotients calculated for the 50 and 60% alcohol precipitation were 2.66-0.353 for fluids from normal subjects, and about the same (2.66-0.512) for fluids from paralytics. The precipitated total protein value for paralytics amounted to many times that of the normal. There is in paralysis, an equivalent protein increase to be considered. In exudative-transudative processes (Meningitis basilaris tbc., Paralysis postdiphtheritica, Poliomyelitis ant. acuta) the protein quotient is very high (7.34-10.18 and 1.50-1.70). It is concluded that in these diseases the protein increase consists chiefly of the finely dispersed albumin phase. The increase in the globulin—though absolute—is relatively low. The colloid reactions (gold sol and mastic) stand in strict accord with the qualitative and quantitative protein relationships. The albumin and globulin display an antagonistic action; the colloids are precipitated by the globulin while being protected by the albumin. In the case of normal protein quotient and an absolute but equivalent protein increase, one obtains a strong displacement of the colloid curve toward the left (Paralysis type). When the protein quotient is high, where the albumin shows a strong absolute and relative increase, and the globulin shows an absolute but not a relative increase, then a colloid curve is obtained which has a displacement toward the right characterized by a maximum precipitation only at the greater dilutions (Meningitis type). The changes in the electrolyte concentration and the salt content have an influence upon the course of the colloid curve. These exert their effects indirectly, as a result of the physico-chemical changes in the protein bodies.—II. The albumin obtained by dialysis of blood serum exhibited a protective action on the colloidal solutions, the globulin a precipitating action. In low concentration, the albumin also displayed a weak precipitating action. The cerebrospinal fluid in paralytics changes to the albumin state in the meningeal type, the meningitic fluids to the globulin state in the paralytic type. Ammonia increased the protein quotient and compressed therewith the colloid curve. Urea and chloral hydrate had no significant influence on the colloid reactions. After dilution of the cerebrospinal fluid of a meningitic patient with that from a normal subject, the colloid curve in half the cases may be compressed stepwise (Goebel); in the other half, they change over into the paralytic type, in which the changed colloid equilibrium stands in best agreement with changes in the protein quotient. Sera with different protein quotients gave, on dilution—in spite of equal protein content—different types of curves. Tubercular serum, diluted, gave a paralytic colloid curve; typhoid, on the contrary, gave a meningitic curve. The basis for this phenomenon is to be found in the protein quotients of the undiluted sera. Under the influence of u.-v. light the protein bodies of the fluids exhibited a change of state characterized by an increase in the hydrophilic phase (albumin) at the expense of the hydrophobic phase (globulin). Correspondingly the protein quotient increased considerably. The colloid curve, after the irradiation, as a result of

the increased protective action, flattened out considerably, in fact, showed entirely normal relationships. Also, the stability reactions of the formerly strongly positive fluids decreased to a low value, or became definitely negative.—*Authors' summaries (transl. by D. R. Briggs).*

12959. **HAMAZAKI, YUKIO, und MASATOSHI HAYAKAWA. Ueber Veränderungen der Milzflecke durch die Entmilzung.** (Japanese.) *Okayama Iggakkwai Zasshi* 39(9): 1927.—In an earlier study the author showed that the "spleen spots" of the greater omentum indicate a spleen-like structure, and that the histiocytes of the spleen spots belong to the reticulo-endothelial system. In the present study the author investigates the changes in the spleen spots in young rats after removal of the spleen. From the 20th day after operation until about the 100th the Fe content of the spleen spots increases. In 50 days the histiocytes assemble here and there to form giant cells, which contain large masses of hemosiderin. In later stages the compensatory function of the spleen spots in rats which have had the spleen removed appears to exceed that of the liver. In histologic alterations the spleen spots show marked individual differences, as in the liver. In the initial stages increase of histiocytes usually occurs, and in the middle stage hypertrophy and new formation of spleen spots, as well as accumulation of lymphocytes. It is noteworthy that in the late stage the nodular formation of lymphadenoid tissue in the inner zone and the increase of lattice fibers constitutes a morphologic as well as a functional compensatory reaction to extirpation of the spleen.—*A. Mori (courtesy Japanese Jour. Zool.)*

12960. **HAMSIK, ANTONÍN. Prosthetická skupina barviva krevního. [Prosthetic group of hemoglobin.]** *Spisy Lékařské Fak. Masarykovy Univ. Brno (Publ. Fac. Med. Brno.)* 6(54): 1-8. 1928.—Two procedures are described for preparing oxyhemin and chlorhemin. Oxyhemin may be obtained in 2 types which differ in crystalline form. One of these may be converted to protoporphyrin while the other yields another porphyrin. Reference to the original must be made for details of preparation.—*D. B. Dill.*

12961. **HEISSMEYER, KURT. Untersuchungen über die Veränderung des in Körperhöhlen ergossenen Blutes.** *Deutsche Zeitschr. Chir.* 231(2/4): 227-236. 1931.—Blood from the carotid of other rabbits was injected into the abdomen in an unstated number of rabbits, 10 cc. being retained for analysis; from time to time samples were removed by laparotomy. The O deficit, the O total capacity, Hb, and erythrocytes dropped abruptly during the first hour, had disappeared at about the 6th; the leucocytes dropped at first, rose abruptly at the 4th hour, and were still higher at the 6th; the lymphocytes and monocytes decreased, polynuclear leucocytes increased, transitional forms and eosinophiles showed little change. The blood reduction value sank slightly, the lactic acid slightly more, being ⅔ the initial value at 6 hrs.; methylglyoxal also sank distinctly. The decrease in glycolytic action the author attributed to an increasing absorption, not to injury, of the ferment.

12962. **HENDERSON, L. J. "Le sang" système physico-chimique. Traduit de l'anglais, C. VAN CAULAERT, et A. ROCHE.** Preface, **D'OCAGNE.** viii+ 298p. Les Presses Universitaires de France: Paris, 1931. Pr. 80 fr.

12963. **JOSAM, HANS. Über den Einfluss der Ovarien auf die Blutbildung.** *Zeitschr. Klin. Med.* 107(1/2): 151-161. 1928.—Studies were made of the hemoglobin, red and white cells, serum albumin, O absorption, and blood smears in dogs before and after ovariectomy, and in ovariectomized dogs after administration of ovarian extracts. Immediately after the operation there is a marked leucocytosis which soon subsides; this is due to the anesthesia and operation and not to ovarian extirpation. As indicated by an appearance of young red cells and an increased O absorption, removal of the ovaries stimulates the bone marrow. Castration does not produce a marked effect upon hemoglobin or red blood count. Injections of ovarian extracts also stimulated hematopoiesis.—*E. W. McHenry.*

12964. **JULLIEN, A. Sur les phénomènes de phagocytose par les cellules sanguines de la seiche.** *Bull. Soc. Zool. France* 53: 87-89. 1928.—The leucocytes of the cuttle fish leave the vessels by diapedesis. In normal tissues their infiltration does not result in phagocytosis, but if the tissues are irritated by introduction of foreign bodies, active phagocytosis of the irritant agent and of the altered tissue elements occurs.—*A. Jullien (transl. by L. C. Havens).*

12965. **JÜRGENS, RUDOLF, und HERBERT TRAUTWEIN. Über Fibrinopenie (Fibrinogenopenie) beim Erwachsenen, nebst Bemerkungen über die Herkunft des Fibrinogens.** *Deutsches Arch. Klin. Med.* 169(1/2): 28-43. 2 fig. 1930.—The only 3 cases of hemorrhagic diathesis with complete or nearly complete disappearance of fibrinogen hitherto known occurred in children. The same condition is reported in an adult. There was nearly complete absence of fibrinogen and a normal concentration of other coagulation components. Morphological investigation showed a carcinoma of the prostate and secondary fibrous changes in the bone marrow; evidently the bone marrow is involved in fibrinogen formation. Checking blood coagulation with heparin or hirudin over a period of days does not result in hemorrhagic diathesis. —*D. B. Dill.*

12966. **KAISER, ERNST. Experimentelle Untersuchungen über Wirkungen von Massage.** 41p. Dissertation, Universität Zürich, 1928.—Lymph flow from an open fistula on the upper leg of a patient was increased by massage of that leg. Two patients were brought into N balance and their N excretion was followed before and after massage. Contrary to the results of previous investigators no increase could be established but if anything a slight decrease. A further study was made of the efficiency of massage as a relief measure for chronic constipation. Glass balls were introduced into various parts of the alimentary canal of cadavers but it was found impossible to move them appreciably by massage from the outside. With the use of x-rays no stimulation of peristalsis in the intestine could be demonstrated as a result of massage. In ergographic experiments it was found that after complete fatigue a 5-10 min. recovery period did not suffice to restore the normal contractility of the muscle but a similar recovery period with massage was more than sufficient for this purpose so that the contractility was better than before the experiment began.—*W. O. Fenn.*

12967. **KNOTT, F. A. Active and inactive leucocytosis: a method of differentiation.** *Guy's Hosp. Rept.* 80(2): 208-212. 4 fig. 1930.—Washed emulsion of *Staphylococcus albus,* suspended in 2% Na citrate, is mixed with 4 times its volume of fresh blood (finger-prick). In leukemic patients, before any x-ray treatments, the myelocytes and myeloblasts, if any are present, are entirely non-phagocytic: none contain any cocci. Ascending the scale of maturity among the cells, the number of bacteria taken up by the different types of white cell varied greatly. In general the more immature the cell, the less its phagocytic power.

12968. **[KOSÍAKOVA, A. V.]** КОСЯКОВА, А. В. Распределение мочевой кислоты в плазме и шариках и влияние на него кислой и щелочной диэт. **[Distribution of uric acid in the blood plasma and in the blood cells, and the effect on this distribution of acid and alkaline diets.]** [German summary.] Русский Физиологический Журнал имени И. М. Сеченева (*Russ. Jour. Physiol.*) 13(1): 145-150. 1930.—Studies were made on 74 children, 38 of whom were on a mixed diet. 18 on an acid diet and 18 on an alkaline diet. A relatively stable colored standard was prepared which permitted the determination of uric acid according to Benedict. Uric acid is unequally distributed in the blood, predominating in the plasma. Different diets have no effect on this distribution. On standing of the blood the uric acid content decreases in the corpuscles, but remains practically constant in the plasma.—*S. A. Corson.*

12969. [LOMOVITSKIĬ, P. A., and A. D. OSNOVINA-LOMOVITSKAĬA.] ЛОМОВИЦКИЙ, П. А., и А. Д. ОСНОВИНА-ЛОМОВИЦКАЯ. К вопросу об определении функции кроветворных органов. [Function of hemopoietic organs.] Известия Томского Государственного Университета (*Trans. Tomsk State Univ.*) 78: 94-105. 1926.—The authors experimented on guinea-pigs (number not stated) injected subcutaneously with different doses of phenol, pyrogallic acid, aniline oil, toluylendiamin, nitrobenzol, lead, and phenylhydrazin. The authors examined also 16 patients with various diseases, all treated with As. Observation of the relationship between the fluctuations in number of erythrocytes, and their morphological changes, and resistance to hypotonic NaCl solutions led the authors to the following conclusions. In guinea pigs degeneration of erythrocytes was usually accompanied by increase of their maximal, and often also their minimal resistance to hypotonic NaCl solutions, although no complete parallelism was observed. Rejuvenation of the blood was not accompanied by decrease of the minimal resistance of the young erythrocytes. In As therapy no evident dependence between fluctuations of the number of the erythrocytes and their resistance could be observed.

12971. **NISIMARU, YASUYOSI. Bile pigment formation in the liver from hemoglobin.** *Amer. Jour. Physiol.* 97(4): 654-657. 1931.—In experiments on ♂ bullfrogs (no. not stated) suitable perfusion with dilute Hb solution was followed by bile pigment formation and elimination, proving that Hb is converted into bile pigment in the liver. Perfusion of Hb through the hepatic artery led to bile pigment formation but not perfusion through the portal vein. The appearance of bile pigment in the cystic duct after perfusion with Hb was inhibited by HCN.

12972. **PUPILLI, GIULIO. Sul comportamento di alcune sostanze coloranti di fronte ai globuli rossi di diversi animali.** [Action of some dyes on erythrocytes of different animals.] *Biochim. e Terapia Sperim.* 18(4): 116-127. 1931.—Acid dyes (tropaeolin 000 No. 1) added to a suspension of erythrocytes were distributed between aqueous solvent and corpuscles following the law of partition. On the contrary, basic dyes (methyl green, methylene green and rosanilin) added to suspensions are adsorbed by the erythrocytes.—*M. Comel.*

12973. **PURJESZ, BELA, MARTHA DANCZ, und KLARA HORVÁTH. Die Rolle des Plexus chorioideus bei der Ausscheidung des Liquor cerebrospinalis.** *Monatsschr. Psychiatr. u. Neurol.* 77(6): 319-347. 3 fig. 1930.—Assuming, on the basis of the work of Schlayer and his collaborators, an analogy between the choroid plexus and the kidneys, the authors poisoned 21 dogs by subcutaneous, intravenous, and intra-arterial injection of $HgCl_2$, K_2CrO_4, uranium nitrate and cantharidin. The resulting phenomena in the plexus included epithelial degeneration, distension of the vascular loops by blood, hemorrhages, signs of inflammation of the serosa, exudation and frequently cellular infiltration of the connective tissue. Parallel with these changes went degeneration and hyperemia of the renal tubular apparatus, frequently with renal hemorrhages or the picture of glomerulonephritis. The poisons which in the kidneys affected chiefly the tubular apparatus ($HgCl_2$, uranium nitrate and K_2CrO_4), in the choroid plexus showed the most distinct damage to the epithelium. Poisons which produced changes particularly in the kidneys, in the plexus affected especially the system of villous processes. The excretion of lactose and NaI under certain conditions was indicative of the degree of pathologic lesion present. Hence it appears that cerebrospinal fluid is produced in the plexus by a mechanism similar to that by which the urine is produced in the kidneys.

12974. **STUBER, BERNHARD, und KONRAD LANG. Über die Blutglykolyse als auslösendes Moment des Gerinnungsprozesses.** *Pflüger's Arch. Ges. Physiol.* 227 (3): 361-366. 1931.—About 6 cc. blood were removed by heart puncture from large, healthy rabbits, 10 gm. of a 50% glucose solution given the rabbits by sound, and 1-2 hrs. later a second blood sample taken; lactic acid and sugar were determined in both immediately after sampling and later during coagulation; lactic acid increased and sugar decreased during coagulation. A marked decrease in coagulation time, attributable to the increased glycolysis, occurred in the 2nd sample. A 4 cc. blood sample was removed by heart puncture. When the operation was done quickly no venesection hyperglycemia resulted; when the operation was bungled a psychic hyperglycemia appeared, due to binding and pain. The determination of lactic acid in blood glycolytic studies is important for it reflects the intensity of coagulation and, in contrast to sugar, may be determined with great precision.

12975. **TAUBENHAUS, M. Zur Lehre des Stoffwechsels im Unterdruck. IV. Über die Verteilung des Reststickstoffes auf Vollblut und Plasma bei Nahrungskarenz und bei Luftverdünnung.** *Zeitschr. Ges. Exp. Med.* 76(1/2): 210-219. 1931.—The residual N in whole blood of 3 normal rabbits was higher than in oxalate plasma of the same animals; this is ascribed to the higher residual N content of the erythrocytes. In 4 fasting animals this difference rose markedly. It can be explained by a previously determined increase of the undefined portion of the non-coagulable N in hunger. According to Folin and Berglund this is 2-5 times higher in the erythrocytes than in the plasma. The residual N of the erythrocytes in hunger varied according to the vascular region: in the hepatic vein it was higher than in the vena cava, highest in the portal vein. In 4 fasting animals kept at a pressure of 340-280 mm. Hg, in spite of the fact that the residual N was absolutely higher in the whole blood, the residual N of the erythrocytes was almost the same, but relatively lower, than in the fasting animals. This agrees well with the previously determined fact that the absolute residual N was increased in negative pressure chiefly by increase in urea in the blood (the urea is divided uniformly between plasma and erythrocytes according to most authors). In the various vascular areas in negative pressure (contrary to the condition in hunger alone) the erythrocytes of the vena cava were usually richer in residual N than those of the hepatic vein. Saturation of the blood with CO_2 caused no notable migration of the residual N from the plasma to the erythrocytes, and therefore a varying CO_2 tension cannot be made responsible for the difference between fasting and negative pressure or for the differences in the various vascular areas. The addition of substances decreasing coagulation (oxalate, citrate, fluoride) to whole blood did not change the residual N of the plasma. The characteristic shift of residual N content in fasting animals and those under negative pressure, in the rabbit at least, occurs predominantly in the erythrocytes.

12978. **WALLBACH, GÜNTER. Studien über die Zellaktivität. IV. Mitt. Histogenetische Untersuchungen über den Eisenpigmentstoffwechsel.** *Zeitschr. Ges. Exp.*

Med. 63(3/4): 426-495. 9 fig. 1928.—Iron pigments can not be formed from hemolysed blood. Storage of erythrocytes and subsequent formation of Fe pigment take place in rabbits after a single intravenous injection of washed erythrocytes of sheep, but by repeating such treatment and developing immunity, the injected erythrocytes do not come in contact with the storing cells. There is no storage of Fe pigment nor erythrophagocytosis in the spleen. The hemoglobin freed through hemolysis behaves exactly like a medicinal hemoglobin preparation when injected; it is not taken and changed either by the cells of the spleen or other organs, but is excreted by the kidneys. Attention must be called to the fact that the washing of the sheep erythrocytes has to be very thorough. If there is a trace of protein present in the supernatant liquid or if there is bacterial contamination, a very pronounced storage of Hb and Fe pigment takes place in the spleen. The foreign proteins in serum or bacteria act as a stimulus to the pulp cells of the spleen, resulting in storage of Hb or of Fe pigment. The decomposing erythrocytes play a secondary part only, as is shown in an experiment in which an intravenous injection of foreign serum was performed. A high degree of storage of Fe pigment was obtained by continuous immunisation of rabbits with proteus OX19. In plasma culture experiments on rabbit's spleen, it has been evident that in the normal uninfluenced culture of rabbit spleen a very fine, just noticeable, Fe pigment deposit occurred on the 4th day of incubation, and that, on the contrary, addition of blood to the plasma-medium retarded the growth, and caused a hardly detectable pigmentation only in 8-10 days. On the other hand, it was evident that the addition by itself of foreign serum (human) produced a marked pigment deposit by the 2nd day. While under common conditions only the large histiocytic macrophages store hemosiderin, after addition of serum all cells, including fibroblasts, take part in such storage. It is not at all necessary to add blood, in order to obtain these deposits; under normal conditions the blood present in explanted tissues is sufficient to be taken by the cells to the degree mentioned and to be elaborated into iron pigment.—*G. Wallbach (transl. by H. J. Ropshaw).*

12979. WASJUTOTSCHKIN, W., und M. RYBINA. Über den Einfluss des anorganischen Serums von Truneček auf den Blutchemismus des normalen Kaninchens. *Zeitschr. Ges. Exp. Med.* 64(3/4): 417-430. 1929.—Truneček's inorganic serum is a solution of the inorganic salts of the blood serum, with the exception of Ca, in a concentration 10 times greater than that in the blood. It has been advised in the treatment of sclerotic conditions. It was injected daily under the skin of the abdominal wall of rabbits in doses of 2 c.c. Studies of the chemical changes in the blood following a week or more of this treatment showed that there was a significant lowering of the Ca content of the blood and a tendency toward a lowering of the alkaline reserve. There was also at first some lowering in the blood sugar. The K content shows rather wide variations in the normal and no definite changes were recognized following this treatment. There were no changes in the cell content of the blood. The Ca tended to rise again as soon as the medication was stopped. In so far as Ca may be considered an element in the causation of sclerosing lesions, these results may be regarded as evidence of the value of this serum in the treatment of those conditions.—*R. G. Stillman.*

12980. WEYL, PAUL. Untersuchungen über die Blutzuckerregulation beim Säugetier. III. Die Einwirkung von erhöhter Aussentemperatur auf das Verhalten des Blutzuckers von Kaninchen und Hunden. *Biochem. Zeitschr.* 206(4/6): 485-502. 1929.—Hyperglycemia develops in rabbits usually within 5 min. on exposure to 32-37° C. for 5-7 hrs. Blood sugar decreases after 2-3 hours and usually returns to normal before the end of the experiment. However, the hyperglycemia persisted if the animals showed marked exhaustion. Neither hyper- nor hypoglycemia was induced in dogs by long or short exposures to high temp. (30-38° C.). The statement that blood sugar is lower at higher than at lower temperatures cannot be accepted.—*E. G. Schmidt.*

Med.* 74(5/6): 636-645. 1930.—The 23 experiments were performed on 6 Eck fistula and 2 normal dogs. Eck fistula dogs were fed either a meat free and carbohydrate rich diet or an exclusive meat diet, or were subjected to

a fasting period. Subsequently glucose was administered and a blood sugar curve obtained. After the meat-free diet no abnormal increase in the blood sugar usually resulted. Variable results were obtained after an exclusive meat diet. High curves were obtained when toxic symptoms and other injurious results of a meat diet occurred. One dog, which after 13 days on a meat diet remained normal, did not show any abnormal rise in the blood sugar curve. Differences in the curves for normal and for Eck fistula dogs were obtained after a fast of 50 hrs. and subsequent administration of glucose. With Eck fistula dogs the curves either rose steadily or showed a delayed return to normal. These results point to the importance of giving more exact data of the diet during the control periods in experiments on Eck fistula dogs.—*Authors' summary (transl. by H. Zwarenstein).*

12988. **HENDRICKS, WALTER A., MORLEY A. JULL, and HARRY W. TITUS. A possible physiological interpretation of the law of the diminishing increment.** *Science* 73(1894): 427-429. 1931.—The authors propose the following equation to describe the relation between the feed consumption and growth of an animal: $dW/dF = C - mW$, in which C represents the true efficiency of the feed for growth and mW represents the amount of feed used for other metabolic processes, expressed in terms of an equivalent amount of body tissue. This equation is derived from the differential form of the equation of the curve of the diminishing increment: $dW/dF = k(A - W)$, for $kA = C$, and $k = m$. The amount of feed required for metabolic processes other than growth during the time the animal consumes the increment of feed, $F_2 - F_1$, and makes a gain in live weight, $W_2 - W_1$, is deduced to be: $F_2 - F_1 - (W_2 - W_1)/kA$. The values of kA calculated from growth data for several groups of chickens show close agreement although the feed consumption of the comparable groups was unequal. The values of kA also are consistent with an experimentally determined value of the true efficiency of a given feed mixture for the growth of chickens.—*W. A. Hendricks.*

12991. **LEIGHTON, GERALD, and PETER L. McKINLAY. Milk consumption and the growth of school children. Report on an investigation in Lanarkshire Schools.** 20p. Dept. of Health Scotland: Edinburgh, 1930. Price, 3d.—Addition of milk to the diet of school children is reflected in a definite increase in the rate of growth both in height and weight. There is no obvious or constant difference in this respect between boys and girls; and there is little evidence of definite relation between the age of the children and the amount of improvement. The results do not support the belief that the younger derived more benefit than the older children. As manifested merely by growth in weight and height the increase found in younger children through the addition of milk to the usual diet is certainly not greater than, and is probably not even so great as, that found in older children. In the present investigation the effects of raw and pasteurized milk on growth in weight and height were equal.—*Authors' conclusions.*

12992. **McCULLOCH, W. E. Nutritive value of benniseed.** *Nature [London]* 127(3197): 199-200. 1931.—Attention is called to the high Ca (1.2%) and P (1.39%) content of the seed of *Sesamum indicum*, and to its nutritional value to the Munshi and Tiv people of Northern Nigeria, whose dietary is otherwise grossly deficient in Ca and protein. The Munshi women burn the seed-bearing heads after removing the seeds, and use the ash in their soups. As the plant seems to have a strong selective power for Ca, it might prove valuable to plant on soils poor in Ca and P.

ENERGY METABOLISM

12995. **BENEDICT, FRANCIS G., und ERNEST G. RITZMAN. Über die den Energieumsatz bei Schafen beeinflussenden Faktoren.** *Wiss. Arch. Landw. Abt. B, Arch. Tierernähr. u. Tierzucht* 5(1): 1-88. 11 fig. 1931.—This article discusses the results of a study on sheep carried out over a number of years at the New Hampshire Agricultural Experiment Station, in cooperation with the Nutrition Laboratory of the Carnegie Institution of Washington. The various types of respiration apparatus employed are described. The heart rate of sheep 7 or 8 hrs. after food is from 60 to 92 beats per min. The rectal temp. is slightly higher than that of cows or steers, ranging from 38.8° to 40.4° C. With fasting the heat production falls, until at the end of about 3 days it reaches a constant level. During this time the respiratory quotient falls to approximately 0.73. No reaction to environmental temp. was noted, for it was found that this may go down to 0° without noticeable influence upon the energy metabolism of the sheep. Huddling causes no lessening of the energy output. The metabolism during quiet standing is approximately 15% higher than that when the sheep is lying down. The average heat production of sheep 6 mos. of age or older and bearing at least a 6-mo. growth of fleece, 24 hrs. after food, corrected for the difference between the metabolism standing and lying, is 1275 calories per sq. meter of body surface per 24 hrs. Two or three hours after the sheep has eaten a protein-poor hay, its metabolism increases 30%. The factors of age, sex, and pregnancy were also studied.—*F. G. Benedict.*

12996. **BERKHOUT, P. J. TEDING van. Contribution à l'étude du métabolisme basal chez les habitants des tropiques.** *Mededeel. Dienst Volksgezondheid. Ned.-Indie.* 18(1): 1-16. 6 pl. 4 fig. 1929.—With the aid of a combination of a closed circuit system (method of Krogh) and of an open circuit system (method of Douglas and gas analysis according to Haldane) the basal metabolism of 12 Europeans, 3 Indo-Europeans and 12 Malaysians, all in good health, was determined. At least 6 observations were made on each, carried out on different days. The lowering of the basal metabolism in the Europeans agreed entirely with that observed during the past 8 or 9 years in Europeans in other tropical countries. The extreme limits in the 1st group (i.e., 12 Europeans and 3 Indo-Europeans) were calculated to the standard values of Dubois and Benedict, respectively −17.1% and −13.5%, to respectively +1.7% and +5.7%, the mean differences being respectively −9% and −5.4%. The heat production averaged 35.5 calories per sq. meter hour, with a probable error of ±0.48. The average of the standard values, calculated according to Dubois, was for the 15 subjects of this group 39.0 calories per sq. meter hour, with a probable error of ±0.2. The difference of these two averages was 3.5 calories, with a probable error of ±0.52. In the 12 Malaysians the extreme results compared to the standard values were, respectively, −17.2% and −15.1%, and respectively −3.3% and +2.0%; the average differences being respectively −11.41% and −7.70%. The heat production averaged 35.2 calories per sq. meter hour, with a probable error of −0.34, the standard Dubois values being an average of 39.75 calories, with a probable error of ±0.11. The difference of these 2 averages for this series was 4.55 calories, with a probable error of ±0.36. If it is granted that the

standard values hold good for the Malaysians so that the normals computed for them are not too high by more than a few percent, these observations show a lowering of the basal metabolism approximately equal to that observed in Europeans whose basal metabolism taken in the tropics is compared with the standard values calculated for a temperate climate. The differences found in the 2 groups of subjects between their average basal metabolism and the average of the standard values calculated for their basal metabolism cannot be attributed to chance, since these differences were more than 6 to 12 times the probable error.—*Author's résumé and conclusions (transl. by I. I. Lemann).*

12997. **BOHNENKAMP, H. Über die Energieumwandlungen im Herzmuskel.** *Verhandl. Phys.-Med. Ges. Würzburg* 52(2): 113-124. 5 fig. 1927.—The subject of "cardiac weakness" is alluded to, and, from this viewpoint, the total energy relations of the contracting heart are discussed. Measurements, by the author and his associates, show that work done by heart muscle and the rate of O consumption run independent courses; the latter attains a steady level some time before the maximum work is done against a succession of increased pressures. There is postulated an energy store, or chemical reserve, which arises at the end of the oxidation process and is not quantitatively related to oxidation over a given period of time. The nature of this store is suggested by experiments on anaerobic hearts (HCN, oxygen lack). The amount of work in each successive beat falls off regularly; the work-summation curve rises rapidly at first, then more slowly, approaching the horizontal. The stroke-work (per beat) is a function of the work already performed. Relationship is expressed in an equation having a proportionality constant, k. This factor remains unaltered if O is admitted. Glucose gives a much reduced value of k, but alanin has no effect. It is known (Weizsäcker) that in a heart fatigued by limiting the perfusion with Ringer's solution, the onset of fatigue is independent of the load; hence the amount of work performed by a heart seems to be without influence on the extent of metabolism. Experiments in the author's laboratory (auxobaric method) upon a large number of hearts support this conclusion. Since O consumption is not, then, a true measure of the energy of heart activity, the total heat production is sought. The author's findings, by improved methods, show that the heart, contracting a given number of times in a fixed period, but with different loads, yields equal amounts of energy. The all-or-none principle can thus be extended to the metabolism of heart muscle as well as to its mechanical response.—*H. S. Hopkins.*

12998. **COMEL, MARCELLO. Influence du phosphation sur les échanges gazeux de la bouillie musculaire à pH variable.** *Arch. Internat. Physiol.* 31(1): 1-19. 4 fig. 1929.—The phosphate ion exerts a remarkable action on the respiratory exchanges of muscular tissues of frogs, kept at various pH values. The respiratory exchanges are increased, and such action is exerted as well for pH values more alkaline than that of the muscular tissues of frog, as for those more acid than that of the isoelectric point of the muscular proteins. The action of the phosphate ion is attributed in first instance to its rôle in the metabolism of the muscle cell, especially in the synthesis and cleavage of the lactacidogen. The phosphate ion increases the oxidative cleavage of the carbohydrates by the muscle cells, during their respiration in O, at various pH values of the surrounding fluid. If the excised and hashed muscle tissues of the frog are kept in buffer solutions at pH values near the isoelectric point of the muscle proteins or more acid than that in O, the tissue absorbs O and eliminates CO_2 in smaller amounts than at pH value optimum, which corresponds to that of the tissue itself and is near the neutral point. Nevertheless at the very acid pH values tested the respiratory exchanges were yet measurable.—*M. Comel.*

[Variations of respiratory exchange and basal metabolism following local hypothermia due to direct cooling.]** *Riv. Patol. Sperim.* 5(4/5): 403-406. 1930.—Local cooling of a limited area of the body surface is followed by increased O consumption and heat production by the organism.—*M. Comel.*

13000. **KRAWTSCHINSKY, B. D. Die Wirkung der Gewerbearbeit auf das Basensäuregleichgewicht des Blutes.** *Arbeitsphysiologie* 4(3): 259-267. 1931.—The total CO_2, alkali reserve and lactic acid of the blood was determined in 50 foundry workers and 50 lathe workers before and after the day's work. The bloods of the foundry workers averaged 52.5 and 48.9 vols. % alkali reserve, and 15.3 and 25.4 mgm. % lactic acid before and after the work. The blood of the lathe workers averaged 48.7 and 46.0 vols. % alkali reserve and 12.5 and 19.2 mgm. % lactic acid. The higher lactic acid content of the foundry workers in the morning was ascribed to the greater severity of the work and also to the high temperatures of the environment, which hindered recovery. The fall of alkali reserve ran parallel with the rise in lactic acid in the blood. The correlation coefficient between daily changes in alkali reserve and lactic acid was $r = -0.57$ with foundry workers and $r = -0.39$ with lathe workers.—*T. M. Carpenter.*

13001. **SMITH, HOMER W., NICHOLAS FARINACCI and ANNE BREITWIESER. Metabolism of the lung-fish, Protopterus aethiopicus.** *Jour. Biol. Chem.* 88(1): 97-130. 1930.—About 15% of the total metabolism is attributable to muscular movements, muscular tone, circulation, and respiration; the rest to non-mechanical processes of an unknown nature. About 50% of the total metabolic energy is normally furnished in the active, fasting lung-fish by protein. The degraded N is excreted about equally as urea and ammonia, together with relatively constant quantities of SO_4 (presumably derived from protein S), PO_4, K, and creatine. During estivation the metabolic rate may sink to low levels, a considerable reduction occurring in the non-mechanical as well as the mechanical metabolism. This reduction appears to be attributable primarily to progressive emaciation. In the estivating fish also protein yields a large fraction of the metabolic energy, the protein N being almost quantitatively degraded to urea, which accumulates in the body to the extent of 1 to 2% of body weight in 1 year. Ammonia formation is apparently suspended. When returned to water the urea is quickly excreted as such, together with large quantities of SO_4. The excretion of creatine and of PO_4, on the other hand, begins at a low level and rises slowly to the normal, basal level; it would appear that these substances are either recatabolized, or that their anabolism is suspended, during estivation. In relation to the latter interpretation it is significant that muscular activity and muscular tone are reduced to a negligible level during estivation because of the complete immobilization of the animal. No acetone or acetoacetic acid can be detected in estivating fish, and uric acid is apparently decomposed.—*H. W. Smith.*

WATER BALANCE

13002. **DRESEL, KURT, und ZOLTAN LEITNER. Zur Physiologie und funktionellen Pathologie des Wasserhaushalts. II. Der Einfluss des Trinkens von Wasser und von Kochsalzlösungen auf Blutmenge, Blutzusammensetzung und Diurese.** *Zeitschr. Klin. Med.* 116(1/2): 185-205. 1931.—One group of normal human subjects was maintained on a salt-poor diet, another on a salt-rich diet for 3 days. Both were starved 14 hrs. and then sub-groups given either 500 cc. tea, or physiological or 4% salt solutions, by mouth. Blood volume, plasma, red cells, hemoglobin, serum chloride and serum protein were estimated before and 30 min. after this treatment.

Urine output and urine chlorides were noted after 4 hrs. Blood volume was increased after tea and physiological salt solution, and decreased after 4% salt intake in both groups, especially the salt-poor group. The variations were due chiefly to plasma changes. Serum chloride increased in all instances in those on salt-rich diets, and after 4% salt intake in those on salt-poor diets; it decreased in the others. Serum protein decreased in all cases. Diuresis was greater in all cases where a salt-rich diet preceded. The salt excretion was likewise more dependent on diet than on the amount of salt given in the experiment. The authors conclude that diuresis increases with the water or salt content of the blood and is greatest when both are increased.—*A. B. Gutman.*

13003. GOLDZIEHER, M., und J. KALDOR. Experimentelle Beiträge zur Rolle der Hypophyse im Wasserstoffwechsel. *Zeitschr. Ges. Exp. Med.* 76(5/6): 819-832. 5 fig. 1931.—The effects of diuretics, such as novasurol and theobromin, upon water metabolism and on the hypophysis were studied on guinea pigs. 24 animals were killed at intervals of ¼ to 6 hours following injections. The anterior lobe of the hypophysis showed modification of the eosinophiles, followed by a decrease in their number as they were replaced by transitional, and finally, by basophile cells. The hypophysis returned practically to its original normal state 6 hrs. after injection; the tissue changes apparently preceded onset of diuresis. These experiments suggest the discharge of a diuretic hormone from the anterior pituitary lobe, corroborating the demonstration of such a substance by Teel. The effect of diuretics combined with pituitrin was studied also on animals after their tissues had been blockaded by the injection of India Ink. Injection of India Ink alone produces increased diuresis, particularly if repeated several times. Pituitrin, which ordinarily restricts the elimination of water, produces a paradoxical diuretic effect in the blockaded animals. Novasurol also has a far greater diuretic effect in the blockaded animal than under normal conditions, but such excessive losses of water are successfully prevented by pituitrin. In the non-blockaded animal the antagonism of pituitrin to novasurol is almost negligible.—*M. Goldzieher.*

13005. HERRMANN, FRANZ. Über die Wasserbindung in der Haut. *Zeitschr. Ges. Exp. Med.* 76(5/6): 780-791. 1931.—In drying to constant weight at 105°, pieces of human skin and masses of the same skin after chopping, more water was usually given up by the pieces. Skin of aged individuals gave up water more easily than the normal. Unaffected skin of 12 tuberculous patients (10 lupus, 1 tuberculosis verrucosa cutis, 1 genital tuberculosis) gave up relatively little; compared with the chopped skin there appeared to be a particularly firm binding of the water, probably because of the high NaCl content of the skin. During Sauerbruch-Herrmannsdorfer diet in lupus, more water was given up by skin samples, corresponding to a decrease in inorganic salts. In a case of dermatitis herpetiformis this diet led to a decrease in water content and an increase in total N and dry matter in the skin. In gelatin samples the water held was found to be related to NaCl content.

13006. KIRCHHOFF, HEINZ. Der Einfluss von Solbädern auf den Wasserhaushalt des Kindes. 32p. Dissertation, Univ. Hamburg. Published by Kieler Zeitung G. m. b. H.: Kiel, 1929.—Water intake, water and chloride output through the urine, body weight, and blood concentration were measured in daily periods in 3 patients. The chief effect of a salt-water bath was to increase the body weight a few hours afterward by diminishing the extrarenal loss of water.—*E. F. Adolph.*

PROTEIN METABOLISM

13007. BERDNIKOW, A., et C. CHAMPY. Recherches sur la substance mucoïde de la crête du coq. *Compt. Rend. Soc. Biol.* 106(10): 804-805. 1931.—A technique for the isolation of this substance is described. It gives a colloidal solution in water, is soluble in weak alkalies and salt solutions, and contains the biuret group. It contains 1.5% P and 14.5% N. A concentrated solution gives histochemical reactions the same as those of sections of the comb but they differ from those of ordinary albumin.—*E. Weiner.*

13008. EIMER, KARL. Studien über den Kreatin-Kreatininstoffwechsel. I. Harnkreatinin und Ernährung. *Zeitschr. Ges. Exp. Med.* 74(5/6): 738-749. 1930.—It is demonstrated (by experiments on 4 subjects), contrary to the opinion widely held, that the creatinine excretion in the urine in normal subjects is not measurably influenced by ingestion of ordinary amounts of meat (200 gm. per day). This meat creatine in the diet (1 gm. per day) is either destroyed in the intestine by bacteria or burned in intermediary metabolism. A considerable increase in the meat content of the diet causes an increased elimination of creatinine in the urine, indicating a close relationship to the total N metabolism. Continued feeding of larger amounts of meat-creatine does not cause the appearance of creatine in the urine. The human organism can store creatine and later give it up gradually in the form of urinary creatinine.—*Author's summary (transl. by G. T. Lewis).*

13009. SLONAKER, JAMES ROLLIN. The effect of different percents of protein in the diet. V. The offspring. VI. Weight of mothers during gestation and lactation. *Amer. Jour. Physiol.* 97(4): 573-580; 626-634. 1931.—V. Albino rats (originally 180 in 5 groups, I, II, III, IV and V) were fed throughout life on synthetic diets containing 10, 14, 18, 22 and 26% protein respectively. The order of fertility of both sexes of the parents from highest to lowest % was groups II, I, III, IV, and V. The average number of litters and the average number of young born per pair from largest to smallest was in the same order. The sex ratio was highest in group II, lowest in V, and below normal in all groups. Results indicate a greater prenatal mortality of ♂♂ than of ♀♀. The mortality of the young during the nursing period was least in group II and greatest in V. With the exception of group V the mortality of the ♀♀ was greater than that of the ♂♂ of the same group. A greater postnatal vitality of the ♂♂ than of the ♀♀ is suggested. Cannibalism did not exceed the normal or vary sufficiently to warrant any conclusions. The weight at birth of the ♂♂ was greater than that of the ♀♀ of the same group. In general the weights tended to increase as the protein content of the diet became greater. The % of daily gain from birth to weaning age was lowest in group I and, with one exception, increased to group V with each addition of protein in the diet. The same order of weights found at weaning were, in general, maintained to the age of 280 days. In group II there survived a larger number of young, in proportion to the number born, than in any of the other groups, probably because of greater vigor. In general the rate of growth of the young increased as the % of protein in the diet increased.—*Author's summary.*—VI. The curve of average weights of 186 rat mothers during gestation changed gradually from a simple curve in group I to a compound curve in group V. This was probably due to an increasing deposition of adipose tissue during the early part of gestation. The maximal weight attained was correlated with the size of the litter born. The average % gained by the mother due to developing young was II, 22.53; I, 22.50; III, 20.87; IV, 14.49; V, 13.43. For each young born the per cents were: I, 9.84; III, 9.80; II, 8.42; V, 7.34; IV, 6.47. The loss of weight of the mothers while nursing was greatest in group I and became less as the % of protein in the diet increased. Data indicate that the quantity and quality of milk secretion was poorest in the group receiving 10% protein and increased as the protein content of the diet increased.

CARBOHYDRATE METABOLISM

13010. DEMUTH, FRITZ. Verteilung von Milchsäure und Calcium in Gewebekulturen. *Biochem. Zeitschr.* 234 (1/4): 247-256. 2 fig. 1931.—Demuth studied the production and distribution of lactic acid and Ca in tissue cultures of embryonic chick heart, Crocker X sarcoma, and Ehrlich mouse carcinoma. He found a greater production of lactic acid in the 2 latter types of cultures than in those of the normal tissue. The new-formed acid remains close to the explant. When large amounts of lactic acid accumulate in cultures Ca lactate precipitates in a ring in the medium about the tissue.—*W. Bloom.*

13011. EVANS, WILLIAM LLOYD, and ROBERT CASAD HOCKETT. The mechanism of carbohydrate oxidation. XIII. The action of potassium hydroxide on calcium hexosediphosphate. A comparison with that of glucose and fructose. *Jour. Amer. Chem. Soc.* 52(10): 4065-4069. 1930.

13012. FORSGREN, ERIK. Über die Einwirkung des Insulins auf die Leber. *Acta Med. Scandinavica* 70(2/3): 139-149. 1 fig. 1929.—The glycogen content of the livers of normal rabbits varied widely. An important cause of this variability was the varying assimilatory and secretory activity of the liver. The glycogen values rise during the assimilatory but decrease during the secretory phases. Insulin produces no noticeable effect on the liver glycogen values and does not interfere with the rhythmic activity of the liver. The sensitivity to insulin appears to vary with the rhythmic activity of the liver and to be greatest in the secretory phase if the glycogen content is low.—*O. W. Barlow.*

13013. FÜRTH, OTTO, und PAUL ENGEL. Über die Assimilierbarkeit und Toxizität razemischer Milchsäure. *Biochem. Zeitschr.* 229(4/6): 381-396. 1930.—The Warkany method for determining lactic acid in urine was not applicable to rabbit urine; since ether extraction of the lactic acid aided by the centrifugal apparatus of Lindt can not be avoided. 20-30% of fermentation lactic acid administered per os to humans appeared in the urine. In rabbits lactic acid by way of stomach was very much more toxic than heretofore assumed. While subcutaneous administration of 2.8-3.6 gm. per Kgm. exhibited no toxicity or only a very slight one according to Parnas, the authors found doses of 1.6 gm. per Kgm., one as low as 0.6 gm. per Kgm. in divided doses over 3 days, fatal. In mice, with subcutaneous administration of Na lactate, the fatal dose was 2-4 gm. per Kgm. Rats tolerated daily administration of 2 gm. per Kgm. for longer periods of time, and even much larger doses. In view of the high toxicity, especially when administered by way of the stomach in rabbits, also that in man appreciable amounts are excreted unchanged, the conclusion is reached that fermentation lactic acid is not a practical food constituent. No objection is raised to its limited use as an adjunct to lemonade, fruit juices and candy. Alkalosis induced by administration of Na_2CO_3 was without influence on the elimination of lactic acid in rabbits and toxicity in mice. Utilization of lactic acid in rabbits (per os) was not modified by epinephrine, phlorhizin, or large doses of glucose. Non-lethal P poisoning induced a very marked elimination of lactic acid in rabbits; after disappearance of the poisoning, a very high capacity for assimilating it was noted. In rats very large doses of lactate revealed no storage within the organism. A test with catalytic oxidation of lactic acid on the surface of charcoal revealed no differences in the attack of the *d* and I *l* components.—*W. F. Jacobs.*

13014. HANDOVSKY, HANS. Der Muskelchemismus unter dem Einfluss von Inkreten und Giften. *Pflüger's Arch. Ges. Physiol.* 220(1/6): 782-813. 4 fig. 1928.—Curare, ether, urethane, and $MgCl_2$ cause the lactic acid conc. of the muscles of rabbits to decrease. The total carbohydrate remains normal or is slightly increased. Curare and especially ether decrease the water content. Apomorphine and physostigmine greatly increase the lactic acid conc. This effect is prevented when a narcotic is given previously. A review of the author's previous work is given and an attempt is made to enumerate and interrelate the factors influencing the carbohydrate-lactic acid equilibrium.—*G. H. Hitchings.*

13015. HERRFARTH, FRITZ. Über alimentäre Galaktosurie. 17p. Dissertation: Univ. Berlin, 1929.—Dogs were fed 30 gm. of galactose. About ⅓ of the amount ingested was excreted in the urine within 12 hrs. A nitrogen sparing action of the galactose was noted in the 2nd 12 hr. period.—*G. T. Cori.*

13016. HOLMGREN, HJALMAR. Beitrag zur Kenntnis von der Leberfunktion. *Jahrb. Morph. u. Mikrosk. Anat. Abt. II, Zeitschr. Mikrosk.-Anat. Forsch.* 24(4): 632-642. 5 fig. 1931.—White mice given free access to food were killed every 2 hrs. day and night. Liver glycogen and biliary granules appeared alternately. Hepatic action showed a 2-phase rhythm: an assimilatory, predominating during the night, characterized by large cells filled with glycogen; a secretory, predominating during the day, with numerous cells containing biliary constituents staining with carmine. The rhythm was to some extent independent of food intake, and time of eating appeared to be without significance.

13017. KOTSCHNEFF, NINA. Zuckerbildung und Zuckerverteilung unter den Organen im nüchternen Zustande des Tieres und während der Verdauung nach Versuchen an angiostomierten Hunden. *Pflüger's Arch. Ges. Physiol.* 218(5/6): 661-666. 1928.—In fasting, sugar is passed from the liver into the blood stream. The sugar content of the hepatic vein is therefore higher than in other blood vessels; it is about 20% higher in the hepatic than in the portal vein. Other organs take out from the blood sugar that the liver has furnished. The largest quantities of sugar are used by the small intestine, the duodenum, and the pancreas. A great deal of sugar is retained by different muscle groups. In fasting conditions the kidneys use little sugar and the spleen almost none. The suprarenals use no demonstrable amount. With exclusive protein and fat diets the same sugar content of the blood is observed during digestion, in all vascular regions. The portal and the pancreatico-duodenal veins contain after carbohydrate food the largest quantity of sugar. The largest part of the sugar is retained by the liver. Of the small part that goes into the general circulation, the kidneys retain the most (up to 24 mgm. for 100 cc. blood) and the muscles up to 19 mgm. %. The spleen, during digestion just as in fasting animals, retains almost no sugar (up to 5 mgm. %).

13018. KRAWTSCHINSKY, B. D. Die Wirkung der Zweischichtenarbeit im Schmiedebetrieb auf den Organismus des Arbeiters. I. Biochemie des Schweisses, des Harnes und des Blutes. *Arbeitsphysiologie* 4(3): 268-277. 1931.—The composition and quantities of sweat and urine were determined with 5 workers forging rear axles of automobiles with a 3-ton hammer in which the work was carried on in a day shift of 8 hrs. and an evening shift of 7½ hrs., with 1 hr. and ½ hr. at rest respectively for meals. The values for the morning and evening shifts were as follows: 6.09 and 5.82 liters of sweat containing 7.31 and 8.20 gm. lactic acid, 14.98 and 20.42 gm. chlorides (Cl), and 0.96 and 1.44 gm. ammonia. The morning and evening urines contained 7.21 and 8.48 gm. chlorides and 1.14 and 0.99 gm. ammonia. There was no alteration in the blood chlorides, so that the loss in chlorides was from the tissues. Indications of the severity of the work were the large excretion of lactic acid and ammonia in the sweat and the increase over normal of the titrable acid and creatinine in the urine. The work of the evening shift was greater, as shown by a greater loss of body weight, the large excretion of lactic acid and ammonia in the sweat, and the greater excretion of titrable acids and creatinine in the urines of this shift.—*T. M. Carpenter.*

13019. PARTOS, ALEXANDER. Regulácia uhlohydrátovej výmemy. 3. Sdelenie. [The rôle of lactic acid in intermediary carbohydrate metabolism.] *Bratislavské Lekárske Listy* 9(1): 41-47. (English summary p. 14.) 1929.—Lactic acid in vitro increased glycogen cleavage by action of the hepatic prodiastase. Adrenalin, pitui-

trin, and ovarian extract accelerate glycogen cleavage in vitro, insulin inhibits it, and thyroid gland extract has little influence on it. Lactic acid administered simultaneously with the extracts speedily influenced glycogen cleavage. Applied simultaneously with insulin, it increased in vitro the hypoglycemia caused by insulin. It diminishes the hyperglycemia induced by adrenalin, pituitrin and ovarian extract, indeed it transforms hyper- into hypoglycemia. It has only a slight influence on the hyperglycemia caused by thyroidin.—*Author's summary.*

13020. **WACHSMUTH, W. Untersuchungen über den regulatorischen Reizablauf bei alimentärer Hyperglykämie.** *Zeitschr. Ges. Exp. Med.* 73(5/6): 645-658. 1930.—Experiments show that alimentary hyperglycemia is brought about by nervous stimulus from the intestine to the liver. These stimuli cause an emptying of the sugar depots. The duodenum is the most sensitive place from which to excite this reflex. Evidences are against a hormonal explanation. There is evidence to indicate that much depends on the irritability of the vegetative nervous system in the particular patient or animal studied.—*W. C. Alvarez.*

FAT METABOLISM

13021. **BARELLI, LUIGI. Il distretto epato-splenico e il suo apparato reticolo-istiocitario nel metabolismo dei grassi. (Hepato-splenic reticulo-histiocytic apparatus and metabolism of fats.)** *Arch. Ist. Biochim. Ital.* 3(2): 215-246. 6 fig. 1931.—Intraperitoneal injection of oil or of Sudan III in oil is not followed in the rat by progressive processes in the epithelium of the ear such as described in rabbits. The evolution of circulating sudanophile granulocytes from reticulocytes in the peripheral area of the spleen was followed in some rats. Giant cell metaplasia of the spleen occurred in some rats injected with Sudan III in oil. Visible fat in the liver was more frequently observed in winter than in summer.—*M. Comel.*

13022. **BEREND, N. Der Einfluss verschiedener Nahrungsmittel auf die Menge der vierfach ungesättigten Säuren im Blute.** *Biochem. Zeitschr.* 229(4/6): 323-328. 1930.—The feeding of lard and olive oil causes an initial fall and then a rise in the amount of tetra-unsaturated acids in dogs' blood. Feeding of carbohydrate and fat causes a more prompt increase, the initial drop being absent. Carbohydrate and protein caused no significant changes.— *R. G. Sinclair.*

13023. **FIORI, A. La formazione di lisocitina nella decomposizione spontanea della lecitina. [On the formation of lysocithin following spontaneous decomposition of lecithin.]** *Biochim. e Terapia Sperim.* 17(6): 267-271. 1930.—By prolonged heating lecithin, suspended in water while conditions of asepsis and absence of air are maintained, is decomposed, and formation of fats and lysocithins follows. The presence of cholesterol prevents the hemolytic action of the lysocithin formed by decomposition of lecithin.—*M. Comel.*

13024. **KIMURA, MASAKICHI. Experimentelle Studien über intravenöse Fettinfusion unter besonderer Berücksichtigung parenteraler Ernährung. V. Mitteilung. Zur Frage des Übertritts intravenös infundierter Fette in die Lymphbahn.** *Tohoku Jour. Exp. Med.* 14(2/3): 275-282. 1929.—Kimura concludes that the injected fat is taken up directly by the tissues and none goes by way of the lymph. This, he thinks, is due to the fact that, unlike crystalloids, fat has no osmotic pressure; the body is rather indifferent to it, and the fluids do not migrate to dilute it as they do with crystalloids.—*W. C. Alvarez.*

MINERAL METABOLISM

13025. **BARTH, E. Untersuchungen über den Bleigehalt der menschlichen Knochen.** *Virchow's Arch. Path. Anat. u. Physiol.* 281(1): 146-151. 1931.—Bones of 30 adults who had never had lead sickness nor worked with lead, and of 10 infants from 1 day to 4 mos. of age, were examined for lead by Schmidt's micro-method; so far as possible epiphysis, diaphysis, flat bones, and red marrow were examined separately. In infant bones 0.01-0.03 mgm. and in one instance 0.04 mgm. Pb per 3 gm. bone ash was found; in young adults 0.02-0.065 mgm., usually 0.03-0.05 mgm; in older persons 0.06-0.19 mgm., averaging 0.08-0.14 mgm. Less Pb was present in marrow than in bony tissue. Persons using water from lead pipes showed no more Pb than the others. Apparently very small amounts of lead are constantly ingested and laid down, innocuous, in the bone. Since it does not come from water, foods must contain traces.—*Author's summary (transl.).*

13026. **FLINN, FREDERICK B., and J. M. INOUYE. Some physiological aspects of copper in the organism.** *Jour. Biol. Chem.* 84(1): 101-114. 2 fig. 1929.—The wide distribution of Cu in plant and animal kingdom indicates that it plays an important rôle in metabolism. The authors present results of animal experiments on the absorption, excretion, and distribution of Cu in the various tissues after feeding by mouth. White rats fed 1059.5 mgm. Cu in the drinking water in 82 days, excreted 1020.78 mgm. in the feces, and 12.36 mgm. in the urine. By placing a tube in the gall bladder its excretion in the bile was measured, the results indicating that part of that recovered in the feces had been temporarily absorbed. White rats and guinea pigs fed 2 mgm. Cu per day for 12 mos. were killed and the Cu determined in brain, bones, hair, heart, kidney, liver, lungs, muscles, and spleen. The distribution of Cu in the blood of cats after placing Cu solution in isolated loop of intestine was observed, the results indicating a concentration of Cu in plasma twice that in the corpuscles. No change of blood pigment to methemoglobin was found. Feeding Cu by mouth to rats and guinea pigs for 18 mos. yielded no evidence that Cu produces hemolysis; in fact Cu may play an important rôle in blood formation. The weight curves of Cu-fed rats showed higher average weights than a control group.—*W. S. McEllroy.*

13027. **HARA, HIROMITI. Biochemical studies of bone. (First report.)** *Bull. Agric. Chem. Soc. Japan* 7(1/3): 22-23. 1931.—Abstract of Japanese paper in *Jour. Agric. Chem. Soc. Japan.*

13028. **HARPUDER, KARL. Versuche über den Salzhaushalt nach länger dauernder Verfütterung kleiner Salzmengen.** *Zeitschr. Ges. Exp. Med.* 76(5/6): 709-714. 1931.—Rats (4 experimental series each of 6-7 rats, and 6-7 fresh water controls) were fed NaCl, KCl, and $CaCl_2$ solutions, and a compound solution (NaCl 8 gm., Na_2SO_4 3 gm., $CaCl_2$ 3 gm., and m/50 KH_2PO_4 a liter) for 4-6 weeks, were killed, and the Na, K, and Ca contents of spleen, liver, heart, muscle, kidneys, skin, and blood were determined. Simple NaCl and $CaCl_2$ solutions gave no deposit. KCl provoked increase of K in spleen, kidneys, and probably also in the heart. The compound solution increased Ca content of the spleen, perhaps also of kidneys and heart; and increased Na content of liver and muscles of the extremities.

13029. **McGHEE, J. L. Metallized food in the regeneration of hemoglobin in rat and man.** *Science* 73 (1891): 347-348. 3 fig. 1931.—The author found that metals dissolve in milk to an extent sufficient to supply requirements for rapid regeneration of hemoglobin in rat and man. Cu alone is effective but less so than when accompanied by other metals, especially Fe. Much less mortality occurs among rats fed on metallized milk than when salts of the metals are used in anemia tests. These metals produce no odor, color, taste or other observed change in milk with the quantities used, unless exposed to air and milk.—*Author's conclusion.*

13031. **SATO, KYU. Mechanism of the formation of rhodan in the body and the region of the formation. II. On the cells of the liver forming rhodan. [In Japanese,**

with English summary, p. 4.] *Jour. Oriental Med.* 14 (1): 1931.—The author had previously reported that thiocyanate is formed in the liver and intestine of rabbits and in the liver of dogs. This study proves that the stellate and parenchymal cells of the liver have the function of forming thiocyanate. The blood of a dog, with the stellate cells of the liver blockaded with India ink, the parenchymal cells poisoned with C, Cl_4, and P and the bile duct ligated, showed a marked decrease of thiocyanate formation after an injection of propionitrile. A part of the thiocyanate formed in the liver is excreted into the bile by means of the stellate and parenchymal cells.—*Author's summary.*

13032. **SÜLLMANN, H.** Zur Frage der Eisenresorption. *Biochem. Zeitschr.* 234 (1/4): 241-246. 1931.—In a preliminary report the author concludes that Fe in food, in so far as it is transformed into the ionized state by digestion, is absorbed in the small intestine as diffusible ferrous bicarbonate.

13033. **TAYLOR, NELSON W., and CHARLES SHEARD.** Microscopic and x-ray investigations on calcification of tissue. *Proc. Soc. Exp. Biol. & Med.* 26 (3): 257-258. 1928.—Preliminary paper.

GROWTH

13034. **JACKSON, C. M.** Recent work on the effects of inanition and of malnutrition on growth and structure. *Arch. Path.* 7 (6): 1042-1078; 8 (1): 81-122; 8 (2): 273-315. 1929.—A supplement to the author's previous monograph on "The effects of inanition and malnutrition upon growth and structure" (1925). The literature is reviewed under the headings of total inanition and partial inanition, the latter term including the effects of dietary deficiencies of protein, minerals, water, and vitamins (A, B, C, D, E, F). Bibliography of 727 titles. —*C. M. Jackson.*

13035. **LUDWIG, WILHELM.** Vergleichende Untersuchung über Wachstumsgesetze. *Biol. Zentralbl.* 49 (12): 735-758. 6 fig. 1929.—Every growth law depends on the fact of a self-limiting cell increase. Since there are but 4 simple continually diminishing functions, only 4 simple growth laws can exist: (A) $\phi = K(c-t)$ specific growth velocity decreases with time; (B) $\phi = K(c-v)$ specific growth velocity decreases with body size; (C) $\phi = k/t$ specific growth velocity is inversely proportional to time; and (D) $\phi = k/v$ specific growth velocity is inversely proportional to size. (A) has not been used so far and (D) only in a form identical with (C). Hence all the numerous growth formulae and laws are either (B) (Robertson-Pearl) or (C) (Schmalhausen). Neither can be theoretically preferable, and actual curves exist illustrating each type. It is concluded that these laws are too simple for an adequate formal handling of growth and too complicated for a physiological analysis. The mathematical treatment of growth seems for the present to have exhausted itself, and needs to be sustained by a more descriptive method.—*G. B. Moment.*

13036. **LUDWIG, WILHELM.** Über vergleichende Wachstumsuntersuchungen. Eine Erwiderung an Professor Schmalhausen. *Biol. Zentralbl.* 51 (3): 116-119. 1931. —A note, based chiefly on criticism and interpretation of some of Schmalhausen's contributions.

ANIMAL PHYSIOLOGY

DIGESTIVE SYSTEM AND DIGESTIVE SECRETIONS

A. J. CARLSON, *Editor*

(See also in this issue Entries 12470, 12499, 12966, 12971, 13016, 13020, 13186, 13294, 13298, 13315, 13331, 13332, 13334, 13350, 13383, 13435, 14505, 14796)

13037. **AUSTIN, J. H., and GEORGE D. GAMMON.** Gastric secretion after histamine: sodium and potassium content and pepsin estimation. *Jour. Clin. Investigation* 10 (2): 287-307. 1931.—The contents of the fasting stomach were studied before and after administration of histamine in 28 subjects, 17 forming a high acid and 11 a low acid group, for volume rate of secretion, titration and chlorides; some in each group were also studied for measurement of N, K and Na. Studies were also made on 2 dogs with fundic pouches. The results indicate that the period of maximal Na secretion after histamine is before the period of maximal acid secretion and not as the acid secretion is subsiding. A late increase in Na secretion was inferred by MacLean and Griffiths (1928) from the increase in neutral chloride in the gastric juice during subsidence of acid secretion following various types of stimulus other than histamine. The occasional increase in Na concentration in this period in the present studies is due to fall in acid secretion and not to increased rate of Na secretion. The rate of N and Na secretion in the low acid group is approximately the same as in the high acid group, no higher. K from its constancy of concentration appears to be a constituent in about the same concentration in the gastric secretion whether this be highly acid or neutral. The correlation in rate of secretion of Na and of N suggests that they are constituents of 1 part of the gastric secretion, a part which appears to be mucoid in character. These results appear to be consistent with the studies of Gamble and McIver (1928) and Polland, Roberts, and Bloomfield (1928). The course of secretion in the fundus pouches is sufficiently like that in the gastric contents of the patients to suggest that the major factor in determining the character of the gastric secretion obtained in these patients is the secretion of the fundus.

13038. **BELONOGOWA, N. S.** Über den Einfluss der Darmmotilität auf den Urobilinogengehalt der Faeces und des Harns. *Deutsches Arch. Klin. Med.* 170 (4): 436-444. 1931.—Determinations during constipation, diarrhea, and normal defecation in patients showed that there was a significant loss of urobilinogen with normal intestinal motility, and decreased loss when motility was increased, and vice versa. This loss was caused both by resorption from the intestine and by decomposition within it, the latter being the greater. The excretion of urobilinogen with the feces afforded no absolute measure for hemoglobin decomposition, nor could the duration of decomposition and the life of the erythrocytes be deduced. Comparative determinations should take intestinal motility into consideration.

13039. **BODENDÖRFER, L., und A. R. SELL.** Über die Wirkung von äusseren Temperaturreizen auf die Sekretionstätigkeit des Magens. *Deutsches Arch. Klin. Med.* 169 (3/4): 166-179. 1930.—The effect of hot and cold stimuli to the skin upon gastric secretion was studied in 170 healthy and sick individuals. A reduction in the acid value and a lessening of the amount of juice resulted from application of heat, and an increase in the acid value and the amount of juice from cold. Influence on the amount of juice preceded that on the acid value. Apparently the point of temperature application to the skin had no differentiating influence. Temp. stimulus to the esophagus influenced the secretions in the same way. This reaction to temp. irritation of the skin was not observed in cases of carcinoma of the stomach or of anacidity. Cold and histamine had the same effect on secretion and strengthened the reaction of each other when used in combination.—*Authors' summary (transl. by R. R. Best).*

13040. **BREDNOW, W.** Zur Autoplastik der Magenschleimhaut. [English and French summaries, (2): 7*.] *Fortschr. Geb. Röntgenstrahlen* 43 (1): 91-94. 5 fig. 1931. —A capsule only slowly soluble in the stomach and filled with opaque material was swallowed, followed by

the usual opaque fluid. Pronounced gastric movements, not otherwise visible, could then be visualized.

13041. **BUTTIAUX, R., G. PIETTE, et A. CHAVEY. Dispositif permettant le prélèvement aseptique des biles humaines par tubage duodénal.** [Removal of human bile through a duodenal tube.] *Arch. Mal. App. Digest. et Mal. de Nutrition* 21(5): 619-622. 1931.

13042. **[CHASOVNIKOV, N.] ЧАСОВНИКОВ, Н. О ходе секреторного процесса в клетках покровного эпителия желудка у некоторых амфибий и млекопитающих. [Secretory process in the protective epithelium cells of the stomach in some amphibians and mammals.]** Известия Томского Государственного Университета (*Trans. Tomsk State Univ.*) 78: 345-364. 1 pl. 1926.—Mucous membrane of the stomach was studied in axolotl, salamander, cat, dog, rabbit, and rat. The author concluded that in these animals the protective epithelial cells of the stomach were real mucous elements, both morphologically and by nature of their secretions, differing from typical mucous cells only by their continuous function. They had no special differentiated cover. Secretion of mucus was twofold—slow in some cases, while in others (especially at the height of digestion or due to artificial irritation) it was so violent that part of the cell was torn away. Two main types of cells were distinguished: the active cells with a well-developed Golgi reticular apparatus, and cells with the secretory part associated with the nucleus and predominating over the reticular apparatus. The latter's chondriosome-fiber-forming activity makes it the important metabolic center of the cell.

13043. **CHOISY, R., et S. KATZENELBOGEN. Repas d'Ewald et épreuve de l'histamine. Résultats comparatifs.** *Arch. Mal. App. Digest. et Mal. de Nutrition* 21 (4): 455-464. 1931.—The Ewald test meal is as good a test of secretory function as the histamine test and hence should not be supplanted as a routine; additional complementary information may be gained by using both tests.—*F. R. Vanzant.*

13044. **DAHM, MAX. Die Bewegungen des Ösophagus im Röntgenbild.** *Fortschr. Geb. Röntgenstrahlen* 43(4): 464-475. 22 fig. 1931.—In addition to movements of distension varying according to the food, peristalsis was sometimes observed in the esophagus; pulsations from vessels and heart produced a pendulum motion. The thoracic portion was inactive.

13045. **DEDIČ, ST. Über physiologische Formierung und Motilität der Verdauungsorgane bei Habichten (Astur palumbarius).** [English and French summaries, p. 15*.] *Fortschr. Geb. Röntgenstrahlen* 43(3): 367-370. 12 fig. 1931.—Roentgenological examinations were made on 3 European goshawks with Ba suspension. The crop was found to serve as a provisional food storehouse. The actual gastrointestinal tract showed no marked deviation from that of the human digestive organs.

13046. **DELHOUGNE, FRANZ. Über den Gehalt des Magensaftes an phosphorhaltigen Substanzen.** *Deutsches Arch. Klin. Med.* 170(5/6): 609-613. 1931.—In 10 healthy subjects with normal gastric juice, P-containing substances averaged 2-4 mgm. %; in 15 with subacid gastric juice, values up to 20 mgm. % were found, the highest appearing in those who did not react to histamine. Hyperacid stomachs showed values near normal. In dogs there was 2-4 mgm. % P; after corrosion with 100 cc. 50% alcohol twice daily for several weeks, producing a severe atrophic gastritis, the P contents rose steadily. It is probable that the gland cells of the stomach excrete no phosphoric acid, and that P is present in the gastric juice in organic union.

13047. **ENGELMANN, B. Arbeitspausen und Nahrungsresorption bei körperlicher Schwerarbeit.** *Arbeitsphysiologie* 4(3): 217-226. 5 fig. 1931.—The absorption of carbohydrate, fat, and protein was determined with a subject who carried out severe muscular work under conditions corresponding to hard physical labor in actual life. The absorption was not decreased by beginning the tasks immediately after eating nor was absorption improved by pauses longer than usual in actual practice. —*Author's summary (transl. by T. M. Carpenter).*

13048. **FLÖSSNER, O., und F. KUTSCHER. Beiträge zur Biochemie der Selachier. 1. Untersuchungen über die Leber von Raja clavata.** *Zeitschr. Biol.* 88(4): 390-394. 1929.—Chemical analysis was made of the livers of 11 fresh specimens of *R. clavata*. In the water soluble extract the following substances were found: Adenin, cholin, neosin, histidin, acanthin, sarcolactic acid, n-valerianic acid and traces of volatile acids. These results differ from those of Kutscher and Berlin on the liver of the shark, from which they were able to isolate besides acanthin also betain and cholin.—*A. C. Ivy.*

13049. **GALPERIN, S. J. Neue Angaben über die Tätigkeit des präpylorischen Sphincters. I. Die Wirkung der Scheinfütterung auf den Übergang der Nahrung aus dem Fundus in den pylorischen Teil des Magens.** *Zeitschr. Ges. Exp. Med.* 74(1/2): 114-127. 1930.—The 22 experiments were performed on a dog with 3 fistulae, pyloric, fundal and duodenal. The first series of experiments confirmed observations of Orbeli and Chosroev, showing that fat introduced into duodenum inhibits the passage of food from the fundus to the pyloric part of a stomach. The dog was then esophagotomized. The next experiments showed that during sham feeding there is complete or partial reflex closure of the prepyloric sphincter, which lasts during whole period of sham feeding and divides the stomach into 2 separate cavities—fundic and pyloric. An essential part of the reflex effect of a sham feeding is due to the mechanical stimulation of the oral mucosa. During vomiting movements, which are caused not only by apomorphin (Cannon, Roschansky) but also by the sticking of food in the throat and upper portion of the esophagus, strong and protracted contractions of the prepyloric sphincter were observed. The "psychic" impetus (excitation by the feeding) has apparently a tonic effect on the prepyloric sphincter.—*P. S. Kupalov.*

13050. **GARIN, CH., et P. BERNAY. La gastrophotographie. Premiers résultats.** *Arch. Mal. de App. Digest. et Mal. de Nutrition* 21(5): 558-562. 1931.—Description of the scope of the method of examination, its limitations and possibilities.—*F. R. Vanzant.*

13051. **GOLDSTEIN, BORIS. Zur Physiologie des isolierten Pankreas. V. Über den Mechanismus der Sekretinwirkung.** *Zeitschr. Ges. Exp. Med.* 75(1/2): 182-193. 1931.—Dog's isolated pancreas perfused with Ringer-Locke solution does not secrete on secretin stimulation when the perfusate is bicarbonate-free, but secretes copiously as soon as the perfusate is changed for Ringer-Locke containing 0.15% $NaHCO_3$ and no secretin; on the other hand, no secretion follows perfusion with secretin preceded by perfusion with bicarbonate. Similarly, the increased secretion of adrenaline by the isolated suprarenals under the action of secretin only occurs when the perfusate contains bicarbonate. The author concludes that secretin becomes bound in the tissue cells, which secrete only when their environment becomes more alkaline, this being effected by the power of the fixed secretin to attract bicarbonate. The stronger the secretion of secretin juice by the pancreas, the greater is its alkalinity, whereas the enzyme concentration falls. The volume of juice secreted in a given time depends on the concentration of bicarbonate in the perfusate, the salt passing quantitatively from the latter into the secretion. The higher the concentration of secretin in the perfusate, the longer the secretion lasts; the total quantity of the secreted juice in any experiment is proportional to the square root of the secretin concentration in the perfusate.—*R. J. Brocklehurst.*

13052. **HAUROWITZ, FELIX. Der Abbau des Blutfarbstoffes im Verdauungstrakt des gesunden Menschen.** *Arch. Verdauungs-Krankh.* 50(1/2): 33-46. 1931.—On a blood- and chlorophyll-free diet the author took 50 cc. blood per os. Most of the pigment appeared in the feces as protohemin (85-90%), some in the free, pyridine-soluble form, some combined with lipids and protein

products of decomposition, perhaps as heminproteose. From the second day increasing amounts of deuterohemin (total 5-8%) appeared in addition to the protohemin; only a small part of the pigment was decomposed to porphyrines. The remainder, 2-3%, was excreted as a protoporphyrine fraction, 0.5-1% as a deuteroporphyrine. Excretion of coproporphyrine was not affected by ingestion of blood. Deuterohemin, proto- and deuteroporphyrine arise by decomposition, not by digestion; only derivatives of protohemin were obtained by treatment of human blood pigments with pepsin-HCl followed by trypsine digestion. In tests in vitro no pigment was found in the original form, for the gastric juice transforms it in a few minutes; soda-trypsine solution or an excess of trypsine acted slowly and original pigments were still present after 24 hrs. Thus in subjects with achylia, unaltered pigments would be expected in the feces.

13053. **KOSCHTOJANZ, CH. Beitrag zur Physiologie des Embryos (Embryosecretin).** *Pflüger's Arch. Ges. Physiol.* 227 (3) : 359-360. 1931.—HCl extracts were made of various sections of the digestive tract and of embryonal tissue and fluids of a large number of dog embryos, chicken embryos to the 14th day of incubation, and human embryos of 3, 3½, and 4½ mos., and newly born kittens that had not yet nursed, and injected into the femoral vein of a dog with temporary pancreatic fistula. The extract from the duodenal mucosa of the dogs (6/14 cm. long), kittens, and the human embryo of 4½ mos. called forth the typical secretin effect; the other intestinal extracts and those from liver, stomach, meconium, and amniotic fluid did not. These results indicate that secretin has a specifically hormonal nature, and that its formation is related to a definite morphological structure; its appearance at a specific stage of development shows that the highly active secretin is formed only in completely differentiated tissue, here the cephalad end of the small intestine.

13054. **ABELIN, I. Thyroxin und Thyreoidea.** *Biochem. Zeitschr.* 228 (1/3) : 233-249. 1930.—When rats were fed thyroid substance for 6-9 days, no glycogen was stored in the liver; but after 2 to 3 mos. without thyroid feeding, deposition was resumed; the livers stored glycogen in small but significant amounts. This change in response suggests to Abelin the well known defense reactions in connection with various antigens. When thyroxin was substituted for thyroid and given, in comparable quantities, parenterally instead of by mouth, the defense reaction did not occur after the 2nd period of injections; furthermore, the respiratory exchange was materially increased. Abelin points out that while iodothyreoglobulin has been found in the blood stream, thyroxin has not; which supports his view that thyroxin is not a true thyroid hormone but a fragment of a larger, protein-thyroxin molecule, and suggests a basis for its relative toxicity as a foreign substance not occurring normally in the body.—*H. B. Torrey.*

13055. **ALBRIGHT, FULLER, WALTER BAUER, JESSIE REED COCKRILL, and READ ELLSWORTH. Studies on the physiology of the parathyroid glands. II. The relation of the serum calcium to the serum phosphorus at different levels of parathyroid activity.** *Jour. Clin. Investigation* 9 (4) : 659-677. 1931.—From an analysis of 354 simultaneous determinations of serum Ca and serum inorganic P in patients at varying degrees of hypo- and hyperparathyroidism, it would appear that one rises as the other falls to such a degree that their product remains roughly constant. It is pointed out that such a constancy implies a slight reduction of P at high levels of Ca but a marked increase of P at low levels of Ca. The question is raised whether this constancy represents the direct expression of a law or whether it is merely a close approximation to some law. In this connection it is pointed out that if Ca and phosphate are precipitated in the bones as secondary Ca phosphate and if the effect introduced by serum protein can be shown to be constant there may be chemical support to such a constancy. The effects of serum protein, the thyroid hormone, the species of organism, the phenomenon of growth and pH on the product of Ca × P are discussed. It is believed that dysfunctions of the parathyroid glands belong to that group of Ca disorders in which the body fluids contain a normal amount of Ca phosphate but in which the relation of the Ca to the phosphate is abnormal. However, at very high levels of Ca a secondary phenomenon occurs. P is no longer excreted in the urine and serum P abruptly rises. This results in a disorder of Ca metabolism where the body fluids contain an increased amount of Ca phosphate and leads to Ca phosphate precipitation in tissues other than bone. The data give no clue as to whether with parathyroid administration the serum Ca rises because the serum P falls, or whether the serum P falls because the serum Ca rises. Based on this data alone one supposition is as logical as the other.—*Authors' summary.*

13056. **BACQ, Z. M., and S. DWORKIN. The heart rate after sympathectomy and vagotomy and the blood sugar as affected by posterior hypophyseal extracts (pitressin and pitocin).** *Amer. Jour. Physiol.* 95 (3) : 605-613. 1930.—In 6 normal cats pitressin, injected intravenously, caused a prompt reduction in heart rate (confirming Gruber's observations). In 4 normal cats pitocin had little effect. In 4 surviving vagotomized cats, pitressin reduced the heart rate, but to a level still far above the average basal rate for a normal animal. In cats surviving excision of both sympathetic chains, the action of pitressin upon heart rate was dependent upon the presence or absence of (central) vagus innervation to the heart. Slowing occurs when the vagi are present [2 cats]; marked acceleration when these nerves have been sectioned [4 cats]. Both pitressin and pitocin, given intravenously [to 6 normal cats], caused a prompt rise in blood-sugar concentration. The hyperglycemia may last as long as 2 hrs. In 5 sympathectomized cats the glycemic effect of pitressin was somewhat less than in normal animals, but not markedly so.—*Authors' conclusions.*

13057. **BAYER, GUSTAV von. Hypophyse und Chromatophorenreaktion.** *Endokrinologie* 6 (4) : 249-254. 4 fig. 1930.—Description of a "white" frog in which the lack of color was not due to a loss of pigment, but rather to the persistent contraction of the pigment cells. Sections of the hypophysis show a cyst-like formation replacing the pars intermedia. Since melanophore expansion and contraction were absent it is assumed that the pars intermedia secretes or liberates a melanophore-activating principle.—*B. Cunningham.*

13058. **BERGFELD, W. Der Einfluss des Tageslichtes auf die Rattenschilddrüse mit Berücksichtigung des Grundumsatzes.** *Endokrinologie* 6 (4) : 269-298. 15 fig. 1930.—Experiments carried out at Freiburg indicated a definite relationship between the function of the thyroid of the rat and light, darkness interfering with proper functioning. Later experiments at Bern indicated the

same differences, but to a much less degree. The author thinks the differences may be due to the quality of light, the Freiburg rats receiving more ultra-violet. Basal metabolism studies made of the Bern rats showed about 10% increase in O consumption and CO_2 output in favor of the "light rats." The heat production was slightly higher, but not significantly so, in the animals in the dark. The thyroid effect is not transmitted through the sympathetic nervous system.—*B. Cunningham.*

Gén.* 28(4): 816-821. 1930.—The suprarenal gland is, in the dog, richer in glutathione than any other tissue; the average value being 482 mgm. glutathione per 100 gm. fresh tissue. The glutathione content is reduced by ovariotomy, and increased during gestation. Venous suprarenal blood is particularly rich in glutathione.—*W. R. Fearon.*

13060. **BORST, MAX. Ueber Beziehungen zwischen Hypophysenvorderlappenhormon (Prolan) und der maennlichen Keimdruese.** *Deutsche Med. Wochenschr.* 56(27): 1117-1120. 5 fig. 1930.—Experiments were made on ♂ white mice (62 receiving prolan and 51 controls) divided into 3 age groups, No. I consisting of mice up to the 26th day of life (with immature sexual glands), No. II, mice 26-40 days old (with maturing sexual glands), and No. III, mice more than 40 days old (sexually mature animals). The germinative portion of the testicle in Group I was especially responsive to the stimulus of prolan; Groups II and III showed increasingly greater resistance and a variable reaction of the interstitial tissue.

13061. **BRÜDA, B. E., und W. M. KREINER. Reticuloendothel und Homoiotransplantation.** *Deutsche Zeitschr. Chir.* 228(6): 421-423. 1930.—After castration of 30 ♀ rats and establishment of the castrate type of vaginal secretion, 18 of the rats were irradiated with the x-ray and 12 left unirradiated. The ovaries of normal ♀ rats were grafted into 12 of the irradiated and 6 of the non-irradiated rats 24 hrs. after irradiation. This implantation was followed by reestablishment of the sexual cycle in all cases; but the change continued for a 6 mos. observation period, only in the case of the previously irradiated rats (with 1 exception); in those not irradiated, the cycle ceased in 2 mos. The control animals showed no change. This indicates that x-ray irradiation produces a better healing of implants, which is attributed to an inhibition of the action of the reticulo-endothelial system.

Biol.* 100(14): 1220-1221. 1929.—Thyroidectomy causes a great decrease in the maximum metabolism, and a decrease in thermogenic accommodation. Thyroid extract treatment increases the maximum metabolism.

13065. **CHARLES, A. F., and D. A. SCOTT. Action of proteolytic enzymes on crystalline insulin.** *Trans. Roy. Soc. Canada, Sect. 5, Biol. Sci.* 24(1): 95-99. 1930.—Insulin in its purest form is a crystalline protein. Whether its activity is due to the whole protein or is associated with a part of the protein, e.g., a peptide or an amino acid, is of interest. When insulin protein is broken into simpler substances by means of acid or alkaline hydrolysis the activity of the insulin disappears very early. "In fact, the potency of the insulin disappears long before any splitting of the protein can be detected. For this reason it seemed desirable to investigate the hydrolysis of insulin by other means, e.g., by proteolytic enzymes, and, further, to carry out these digestions on crystalline insulin." Crystalline insulin was digested by purified trypsin and by purified pepsin. Destruction of potency proceeded more rapidly than did digestion of the protein. It is concluded that "crystalline insulin cannot be broken down into a simpler, physiologically active substance by the proteolytic action of pepsin or of trypsin."

13066. **DEUTICKE, HANS JOACHIM. Über den Einfluss der Hypophyse auf die Tätigkeit des quergestreiften Muskels.** *Pflüger's Arch. Ges. Physiol.* 227(1/2): 24-44. 4 fig. 1931.—The effect of removal of the hypophysis on muscular contraction was tested in frogs. Artificial stimulation of the excised gastrocnemius of one leg was tested; 5 to 8 days after hypophysectomy, a similar test was made on the remaining gastrocnemius. Control animals gave comparable results to such tests and no effect was found as the result of operative exposure of the gland without removal. After removal of the hypophysis fatigue to isotonic contraction was induced much more rapidly. The tensions developed in isometric contractions with an initial stretch of 25 gm. were much below normal (often 50% or more). Improvement was seen with daily subcutaneous injections of extracts of either anterior or posterior lobes. These extracts had no definite effect on normal frogs.—*H. C. Bazett.*

Some evidence indicating the presence of a third or renal hormone in the posterior lobe of the pituitary gland.** *Amer. Jour. Physiol.* 89(2): 273-279. 1929.—Experiments on spinal cats and bladder fistula dogs indicate that the renal activity of "oxytocin" is more than 50 times that of a pressor equivalent of "vasopressin" and 25 times that of a like amt. of standard pituitary powder. This is taken as indicating the presence of a 3rd or renal hormone in extracts of the posterior lobe of the pituitary gland which is chemically separate from the pressor and oxytocic hormones.—*Author's summary.*

13068. **DRZEWICKI, STEFAN. Über den Einfluss der Schilddrüsenextirpation auf die Zauneidechse.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 114(2/3): 155-176. 9 fig. 1928.—A relationship has been established between the shedding process and the function of the thyroid gland in the lizard, *Lacerta agilis.* After thyroidectomy the formation of the horny layer of the skin becomes continuous, i.e., no new epidermis and no new boundary layer are formed; hence the layers do not become detached. The skin loses its luster and becomes rough and wrinkled, due to the extraordinary growth of the horny layer. This disappears when the skin is shed. Lack of the thyroid also causes xerophthalmia, resulting from a horny, many-layered conjunctival epithelium over the cornea which cannot be shed. This also disappears upon shedding. Growth of the young lizard is prevented by thyroidectomy. Also a hypertrophy of the accessory thyroid gland (post branchial body), due to formation of large colloid filled follicles, is noticed. In the thymus tissue large cysts are formed filled with an acidophilic substance.—*P. E. Claus.*

13070. **FREI, W., und MACK A. EMMERSON. Der Serumkalkspiegel beim Rinde mit besonderer Berücksichtigung der Beziehungen zum Geschlechtsapparat.** *Biochem. Zeitschr.* 226(4/6): 355-380. 1930.—The influence of age and of sexual factors was studied on 25 normal ♂ calves, 3-12 wks. old, 25 normal bulls, 1-6 yrs. old, 25 castrated steers, 1-10 yrs. old, 25 ♀ calves, and

150 cows 1-15 yrs. old. The conclusions are: Calves have more serum Ca than grown animals. The serum Ca content of the female calves is somewhat greater than that of the males. In cows the blood Ca decreases with increasing age. The Ca content of the serum in estrus is at a somewhat higher level than in anestrus. The exact sequence of the serum Ca variation in a cow shows a fall of the blood Ca before estrus, then in estrus a quick ascent until toward the end or shortly after estrus, when the Ca value again falls and in the corpus luteum phase rises slowly. Pregnant cows have less serum Ca than nonpregnant. Castration of male cattle seems to lower the blood Ca content, but increases it, however, in female animals. The cystic degeneration of the follicle in the ovary of cattle is associated with an elevation of the serum Ca content. The Ca content of the cystic fluid is somewhat greater than that of the blood serum. Injection of progynon (placental extract) into a cow causes a lowering of the serum Ca for several hours. The injection of sistomensin (ovarian extract) had a brief effect in the opposite direction, as also did injection of the extract of anterior pituitary. The variations of the serum Ca content are considered in relation to variations in the sympathetic-parasympathetic balance and with the endocrine organs.—*From authors' summary (transl. by G. L. Kelly).*

13071. [GAL'PERINA, R. K.] ГАЛЬПЕРИНА, Р. К. Некоторые наблюдения над теплорегуляцией у животных с травмированной эндокринной системой. [Thermic regulation in animals with lesions of the endocrine system.] [French résumé.] Архив Биологических Наук (*Arch. Sci. Biol.*) 30(5/6): 549-559. 1930.—Eleven dogs and 1 rabbit were observed. Hot and cold baths were used as mechanical stimuli. After a period of observation, the endocrine glands of the animals were surgically altered and the observations resumed. Dogs with lesions of the parathyroids displayed no change of thermic regulation in response to cold, but overheating provoked a considerable increase in body temperature and was not well borne, often leading to convulsions. Lesion of the thyroid lowered the average body temperature. The animals reacted normally to overheating, but cold caused the temperature to fall more sharply than in normals. However, thyroidin restored the thermic balance. The partial lesion of the suprarenal glands and their comparative insufficiency always increased the average body temperature. Overheating was met with a normal reaction, but cold, instead of the normal lowering of the temperature, induced its increase.

13074. **HADLEY, CHARLES E. Color changes in excised and intact reptilian skin.** *Jour. Exp. Zool.* 58(1): 321-331. 1930.—The melanophores of isolated patches of the skin of *Anolis iodurus, A. carolinensis,* and *A. watsoni* respond directly to changes in illumination, thus making it probable that such a reaction is common to the genus. The melanophores of *A. iodurus* expand maximally following intraperitoneal injection of 0.5 cc. of 1:9 solution of pituitrin in Ringer's solution and remain expanded when the animal is exposed to a white background, to which the animal normally responds by rapid melanophore contraction. Intraperitoneal injection of adrenalin in Ringer's solution (1:10,000) produces melanophore contraction with subsequent failure of reaction to background. The melanophores of excised skin patches from *A. iodurus* expand rapidly when the skin is exposed to solutions of either pituitrin or adrenalin. The opposite effects produced upon melanophores of intact and excised skin by adrenalin indicate that direct action of adrenalin upon melanophores of an intact animal is unlikely, but the consistent expansion of melanophores of intact and excised skin stimulated by pituitrin solution admits of the possibility of a direct response of melanophores to pituitrin in the intact animal.—*Author (courtesy Wistar Bibl. Serv.).*

13078. **JUHN, MARY, G. H. FAULKNER, and R. G. GUSTAVSON. The correlation of rates of growth and hormone threshold in the feathers of fowls.** *Jour. Exp. Zool.* 58(1): 69-111. 3 pl. 1930.—In the Brown Leghorn cock and capon the regenerating plumage shows different rates of growth in distinct and readily recognized areas. The more rapidly growing feathers require higher concentrations of the chemically prepared female hormone for the female reaction than feathers having a slower growth rate and, conversely, the more rapidly growing feathers revert to the male type before the more slowly growing feathers after cessation of female-hormone injection. The order of reversion in time of feathers having different threshold values for the female hormone after interruption of injections may therefore be used as an estimate of the concentration of the persisting hormone. Repeated daily injections of female hormone (dissolved in olive oil) increase the concentration effective in female-plumage modification to a certain degree. An estimate of this hormone summation is arrived at by comparing the female-hormone response recorded in feathers having different thresholds when alternate cycles of injections and intervals without injections are repeated during the time of feather regeneration.—*Authors (courtesy Wistar Bibl. Serv.).*

13082. **MARCHLEWSKI, L., et BOL. SKARZYŃSKI. Absorption of ultraviolet light by some hormones and**

allied substances. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. A: Sci. Math.* 4 (5A): 241-254. 5 fig. 1929.—Absorption spectra of the hydrochlorides of *d*, *l*-ephedrine, *l*-ephedrine, and ps-ephedrine are approximately the same when examined in non-polarized light. While the absorption caused by ephedrine is weaker and of quite a different character from that caused by adrenaline, the intensity of absorption of ultraviolet light by adrenaline, pyrocatechol, and dihydroxyphenylalanine is of the same order. The absorption spectra of two preparations of synthetic thyroxine were found to agree approximately. Values for *o*-hydroxytyrosine are given.—*A. M. Woodruff.*

13083. **MIGLIAVACCA, ANGELO. L'insulina e i suoi rapporti con l'ovulazione. (Con dimostrazione di preparati microscopici.) [Insulin and its relation to ovulation.]** *Boll. Soc. Med.-Chir. Pavia* 44(4): 453-460. 1930.—Insulin was subcutaneously injected into 7 white rats, 5 clinical units daily for 30 days into 4 rats and 10 units daily for 20 days into 3 rats. All gained weight under treatment. One rat (10 units daily) was killed 15 days from beginning treatment, 1 rat (5 units daily) at the end of treatment, 2 rats (5 and 10 units respectively) a month after the end of treatment. The ovaries of all these animals showed a remarkable increase in the number of corpora lutea and a consequent arrest in the growth of graafian follicles. The 3 remaining rats were mated but remained sterile, a result which Migliavacca attributes to the ovarian modification. He believes that insulin acts directly on the ovary, but does not deny the possibility that it may act indirectly through the anterior pituitary.

13084. **MUKHERJEE, HARENDRA NATH. The production of hypoglycaemia in rabbits by oral administration of precipitated insulin.** *Jour. Physiol.* 70(2): 182-183. 1930.—The phosphotungstate precipitate obtained from crude insulin when administered by mouth definitely lowers the blood-sugar level. In many cases the effect is as marked as after subcutaneous administration of insulin, as evidenced by marked hypoglycaemia (a blood-sugar level as low as 0.015% has been observed), paralysis and convulsions appearing within 1-2 hrs. of the oral administration in rabbits. The effect on diabetic patients is also very marked and definite beneficial results such as decrease in hyperglycaemia, polyuria and glycosuria have been obtained in patients following oral administration for a few days. The substance does not appear to have toxic effect when thus administered. The tungstic acid precipitate of crude insulin has also been tried in a few cases (rabbits) and appears to be equally effective. The animals showing marked hypoglycaemia appear to have an increased tendency to bleed, as there is some difficulty in stopping the bleeding; this disappears on subcutaneous administration of glucose.—*Author's summary.*

13092. **SIMS, H. des B., and D. A. SCOTT. Spectroscopic properties of insulin.** *Trans. Roy. Soc. Canada, Sect. 5, Biol. Sci.* 24(1): 117-119. 2 pl. 1930.—Amorphous insulin from a stock powder, with a potency of 13 units per mgm., and crystalline insulin, with a potency of 25 units per mgm., were studied. Amorphous insulin gave bands in the emission spectrum at 4216, 4917, 4182, 4168, 4158, and 4153 Å; crystalline insulin showed bands in the absorption spectrum at 2890-2820, 2775-2700, and 2440, 2870-2820, and 2410 Å.

13093. **SLAWSON, CHESTER B. Crystallographic description of Theelin.** *Jour. Biol. Chem.* 87(2): 373-374. 1 fig. 1930.

13094. **TERNI, TULLIO. Sul significato biologico del corpo ultimobranchiale. [Biological significance of the post-branchial body.]** *Atti R. Ist. Veneto Sci. Lett. ed Arti* 87(2): 197-206. 2 fig. 1927/1928.—The weight of the post-branchial body of the fowl was determined for various ages from the 6th day of embryonic life to 1 yr. of age. Absolute weight increases rapidly in the embryo, more slowly in the chick, and reaches its definitive value (around 16 mgm.) at 3 mos. Weight of the post-branchial body (p) relative to the weight of the body (P), $[p \times 1000]/P$, reaches its maximum value at 16 days of age, and decreases thereafter at least to 1 yr. This growth rhythm is different from that of the thyroid.

Tadpoles (*Bufo vulgaris*), in lots of about 20, were fed (1) post-branchial body, (2) parathyroid, (3) thyroid, (4) thymus, and (5) muscle of fowl. Feeding began April 15, when the tadpoles were about 12 mm. long; appearance of the posterior limbs was somewhat tardy in the lot fed postbranchial body, as compared with that fed thyroid. Those fed thyroid metamorphosed at the end of May; by the beginning of July those fed post-branchial body were mostly dead; the survivors had not begun to metamorphose. Those fed parathyroid and thymus did not metamorphose. This evidence, the author believes, supports his earlier conclusion that the post-branchial body of the fowl has an endocrine function.

13095. **TSAI, C., and F. HSU. Plasma calcium and inorganic phosphorus following intravenous injection of parathyroid extract: a study on the source of mobilized calcium.** *Chinese Jour. Physiol.* 4: 265-272. 1930.—Four adult healthy dogs were injected intravenously with Collip's parathyroid extract, and plasma Ca and inorganic P were estimated both before and at frequent intervals after the injection. Both Ca and P rise after injection, the elevation of P being about 2 hrs. behind that of Ca. The recovery of the inorganic P is much slower, probably due to a slower rate of excretion. The rate of the absolute value of increase of these 2 constituents is approximately 2: 1, thus supporting the hypothesis that the mobilized Ca and P are derived from Ca phosphate of the bone.

13096. **WEIL, RUDOLPH, und MARTIN LANDSBERG. Über die Wirkungsweise des Schilddrüsenhormons.** *Biochem. Zeitschr.* 207 (1/3) : 186-193. 1 fig. 1929.—Reviews the literature indicating that the thyroid hormone acts primarily on protein metabolism. Presents the results of experiments showing that the addition of thyroxin increases the rate of autolysis of liver broth. Thyroxin action is explained on a physico-chemical basis which includes a discussion of its influence on cell permeability. The question of whether or not the thyroid hormone acts principally through the sympathetic nervous system is considered.—*C. B. Davis.*

Microsc.* 25: 257-269. 6 fig. 1929.—The Sertoli cells of the seminiferous tubules in urodeles have 3 functions. Ordinarily, as with other vertebrates, they contribute nutriment to the spermatozoa, which, grouped isogenically, insert their heads into the cytoplasm of the Sertoli cells. At moments of periodic sexual activity, when the seminiferous tubules suddenly void their spermatozoa, the Sertoli cells are transformed into large glandular cells that fill the tubules by a process comparable to the formation of corpora lutea in the mammalian ovary and, according to the author, thenceforth assume an endocrine function and elaborate the sexual hormone. Finally, under various physiological or experimental conditions, the Sertoli cells can be phagocytic to the spermatozoa if their expulsion is retarded or prevented. The development of these 3 functions depends on local or general factors.—*M. Aron (transl. by E. W. Count).*

13098. **BARFORD, L. J. Sex determination.** *Lancet* 220 (5610) : 554. 1931.—Letter. Case in which date of intercourse and menstrual periods were known and gestation was 330 days from date of intercourse, resulting in ♂ child although in maximum girl time according to Erskine. (*Lancet* 220 (5608) : 440. 1931.)

13100. **BRANDSTRUP, E. On the passage of some substances from mother to fetus in the last part of pregnancy. II.** *Acta Obstetr. et Gynecol. Scand.* 11 (1/2) : 85-111. 1931.—The experiments show that in rabbits—as previously demonstrated in man—the amino-acid concentration is normally higher in the fetal blood than in the maternal; also that an increase of the amino-acid concentration in the mother is at once followed by a passage of amino-acid to the fetus, until balance is established between the 2 circulations. This passage proceeds slowly; as a rule it takes at least 2-3 hrs. before an approximate equilibrium is reached. The fetal surplus of amino N in man at parturition and in rabbits before the injection has been cited as conclusive evidence of a vital cell function in the passage of amino-acids from mother to fetus; the conclusion here reached is that no decisive importance may be attached to the slight surplus of amino N in the fetal plasma as a suggestion of a vital function exerted by the chorionic villi. The fetus is probably supplied with its protein in such a way that the amino-acids in the fetal blood are bound by the fetal tissues and organs in which the protein synthesis takes place, the quantity and quality being determined by the individual fetal cells. When there is a fall in the amino-acid concentration of the fetal blood, amino-acids pass over from the maternal blood by diffusion through the placenta.

13101. **DETRE, LADISLAUS. Über die menstruellen Veränderungen der roten Blutkörperchen.** *Zeitschr. Ges. Exp. Med.* 59 (1/2) : 240-247. 1928.—The author examined the blood, hemoglobin and premenstrual volume of 9 regularly menstruating women. He concludes that the red blood cells of the premenstrual stage are of the same size as those in circulation earlier, but that these cells are poorer in hemoglobin. Stimulation of the bone marrow occurs either as one of the extra-genital symptoms of the premenstrual phase or is a secondary finding accompanying changes in metabolism. These changes accompany premenstrual acidosis. Theoretically, the erythrocyte curve shows a premenstrual maximum, an intra-menstrual decrease and interval minimum. It is probable that the increase of the acid substances in the blood causes the increase in the number of red blood cells. The regular recurring changes in the acid substances are coincident with the changes in the count of the red blood cells in the normal non-pregnant woman.—*J. E. Lackner.*

13102. **DULZETTO, FILIPPO. Sulla distruzione della membrana vaginale come indice della maturità sessuale della femmina del ratto (Epimys norvegicus Erxleben). [On the destruction of the vaginal membrane as an indication of the sexual maturity of the ♀ rat.]** *Boll. Soc. Italiana Biol. Sper.* 3 (1) : 40-43. 1928.—Before puberty the vagina of the rat is closed by a membrane which is destroyed by a peculiar process at a definite time in the sexual life. This may be taken as the index of sexual maturity in the rat, as the follicular phase then starts, and the ♀ is in heat. By mating 29 ♀♀ immediately after the opening of the vagina, it was found that pregnancy sometimes begins on the day of copulation.—*F. Dulzetto (transl. by P. Popenoe).*

13103. **FUJITA, T., und SH. SUGIMURA. Zur Physi-**

ologie der Samenleiterbewegung. 1. Die Form der Samenleiterbewegung bei direkter und indirekter Reizung. *Tohoku Jour. Exp. Med.* 13(3/4): 341-356. 1929.—Indirect (hypogastric) stimulation of the rabbit or guinea pig vas deferens, either in situ or after removal from the body, induced a rapid and powerful contraction with longitudinal shortening, thickening and increased rigidity. The contraction began at the urethral end and spread quickly along the vas, which persisted in the contracted condition for a considerable time. This was identical with the normal reflex movement. In direct stimulation the contraction began at the point of stimulation and spread in both directions, but more markedly toward the exterior since the vesicular and middle portions were more irritable than the testicular end. The lumen decreased with the contraction, due to constriction of the circular musculature. The movements of the vas deferens of the dog and cat were essentially the same but not so forcible. There was no evidence of a peristaltic or anti-peristaltic type of movement. Indirect stimulation of vas deferens in situ, and after injection of India ink solution at the cut vesicular end, indicated that while the contents are immediately expelled toward the vesicular end, subsequent relaxation of the musculature may produce a back flow. This suggests the possibility of aspiration of substances present outside the opening of the vas deferens. Hence, the pathogenesis of acute ascending infectious epididymitis, and of epididymitis antiperistaltica of Oppenheim, may be explained without the assumption of anti-peristaltic movements in the vas deferens.—*K. E. Mason.*

13104. **GAUDENZ, DOMENIC. Beiträge zur Biologie zweieiiger Zwillinge an Hand von 142 Sippschaftstafeln aus dem Engadin.** 38p. Dissertation, Universität Zürich, J. J. Meier: Zurich, 1928.—Environmental factors seem to have no influence on the frequency of twin births. The hereditary influence, on the contrary, is proved. 208 siblings with twins (142 of them di-ovular) have been studied in a region (the Rheto-Roman part of Switzerland) known during centuries for its excessive consanguinity. In ½ of the cases the heredity can be proved in the ancestry of the mother; in a little less than ⅔ of the cases the ancestry of the father; and in the rest, in heredity on both sides. The old theory of a double ovulation is no longer tenable, since the father has inherited the property of causing the birth of twins. No connection between psychic degeneration and twin births was found. No deviation of the sex proportion, as first assumed by the author, could be established.—*D. Gaudenz.*

13105. **GUILBERT, H. R., and G. H. HART. Some effects of varying calcium and phosphorus intake on the estrus cycle and reproduction in the rat.** *Hilgardia* 5 (5): 101-118. 2 fig. 1930.—In an experiment with rats which was collateral to an extensive project on factors influencing reproduction in range cattle, a diet containing 0.22% P with a Ca: P ratio of approximately 4: 1 seriously interfered with growth and sexual maturity of female rats placed upon the diet at weaning time. Diets containing 0.18 to 0.22% P with a ratio of approximately 4: 1 fed to rats from sexual maturity to about 100 days of age caused ovulation to be irregular or to cease entirely. This level appeared adequate to maintain normal estrus cycle after about 110 days of age. Increasing Ca in the diets had the effect of intensifying P deficiency. A diet containing 0.22% of Ca with other factors adequate did not limit growth, estrus, gestation or lactation through 2 successive lactation periods.—*H. R. Guilbert.*

13106. **GUNN, R. M. C., and H. R. SEDDON. Testicular grafts on rams.** *Veterinary Record* 11(18): 494-499. 1931.—Apparently normal living, but not growing, testicular and epididymal tissue has been recovered as long as 24 days after grafting merino rams. Absorption of testicular tissue grafted on to the parietal tunica vaginalis of the scrotum appears to be rapid, usually occurring in young rams within one year. There is no good evidence here provided of any beneficial influence on body weight or wool production as a result of testicular grafting, or of injections of pulped testis or saline extract of testis.—*Authors' summary.*

13107. **HALLGREN, W. Mjölksekretion hos föl. [Lactation in foals.]** [German summary.] *Skandinavisk Vet. Tidskr.* 21(2): 48-59. 1 fig. 1931.—Of 7 cases of lactation in newborn female foals observed, in 1 secretion of a very large amount (approximately 1000 cc. within a few hrs.) permitted chemical and morphological examinations. The composition varied little from that of normal mare's milk. The foal died within a few hrs.; necropsy showed no significant changes in the udder except enlargement (weight approximately 500 gm.). The sex organs were not thoroughly examined. Histologically the ovaries appeared juvenile. The author concludes that "witch's milk" in foals is merely a secretion from the glands of individuals previous to puberty, and is not chemically or morphologically different from the milk of adults. The cause of the process may be a developmental anomaly of the udder or the endocrine glands (suprarenal capsule and hypophysis).—*Author's summary (transl. by C. W. Turner).*

13108. **ISHIKAWA, HYOZABURO. The life duration of cock spermatozoa outside the body.** *World's Poultry Congress* 4(Sect. A): 90-94. 1 pl.; résumé sect. p. 12. 1930.—A salt concentration of 0.81-0.90% was most favorable for continued activity. Semen diluted 5-10 times with a 1.0% physiologic salt solution survived longer. The effect of reaction was also tested using caustic soda, the best results being obtained with a concentration of 0.002%. Sunlight shortened life somewhat because of increased activity, but there was little difference between diffused light and darkness. Semen diluted 10 times with hen's blood suffered injury. Life duration in an egg-white solution was 390 min. as compared to 170 in 1.0% salt solution.

13109. **IWANOW, E. E. Zur Frage der Energetik der Spermatozoenbewegung.** *Zeitschr. Züchtung B. Tierzücht. u. Züchtungsbiol.* 20(3): 404-418. 1931.—Spontaneous movement of dog spermatozoa continues some hrs. in an anaerobic medium containing an entirely inadequate amt. of O to satisfy their normal O needs. This movement of dog spermatozoa under anaerobic conditions apparently has no relation to their CO_2 output. Spontaneous movement of dog spermatozoa is possible in a medium where, because of the addition of KCN, cellular respiration has almost entirely stopped. The energy required for movement does not arise from oxidative processes. Spermatozoan respiration consists obviously (as with muscles) in the elimination of the products of the catabolism which takes place under insufficient O supply. In the presence of O, spermatozoa are very active, even in very concentrated suspensions, but under anaerobic conditions, where the contractile capacity of the spermatozoa is markedly lessened, the spontaneous movement persists for a variable period of time, but only if they have enough room for their movements.—*Author's summary (transl. by H. W. Mossman).*

[Hermaphroditism versus reversal or intersexuality in the time phase: testis dexter-ovarium sinistrum in the pig.]** *Berliner Tierärztl. Wochenschr.* 47(33): 533-537. 5 fig. 1931.

13113. **LANZ, T. von, und MALYOTH. Neue Untersuchungen zur Biologie der Samenfäden. I. Die Entwicklung unserer Methode zur Bestimmung der Wasserstoffzahl im lebenden Organ. II. Zur Steuerung der Samenfäden im männlichen Genitalapparat.** *Sitzungsber. Gesellsch. Morphol. u. Physiol. München* 38: 52-70. 8 fig. 1927/28(1928).—A description is given of a new gold-iridium hollow needle electrode for potentiometric determination of pH in very small amounts of fluid in the living organism. By means of this apparatus it was found that the pH in the testis was 7.2; in the sperm reservoir of the cauda epididymis, 6.6; the prostatic secretion, 7.1 and the seminal vesicle secretion, 6.3. The pH of the contents of the cauda epididymis does not depend on the spermatozoa, since it was the same in the empty sperm reservoir, and after blockage of the duct system between testis and epididymis. It appears to depend on secretory activity of the duct epithelium. The spermatozoa in the testis are therefore motile and migrate, probably in the direction of ciliary action, into the ducts of the epididymis. Here the increased pH lessens their activity and they become stored in large numbers for ejaculation. During this storage period the buffers of the epididymis secretions are transferred to their protoplasm and "ripen" them. During ejaculation their latent motion is released through the alkalinity of the prostatic secretion. The acid contents of the seminal vesicle secretion in the rat does not come in contact with the true seminal fluid, but is coagulated to form the vaginal plug. The reaction in different portions of the ♂ genital tract is not dependent on spermatogenesis but on the presence of the gonads in the body. Total castration inactivates the epithelium of the epididymis and standardizes the pH concentration of its secretion against that of the blood.—*T. von Lanz (transl. by K. E. Mason).*

13114. **LINDEMANN, RUTH. Zur Frage der cyklischen Veränderungen der menschlichen Scheide.** *Zeitschr. Mikrosk.-Anat. Forsch.* 13(3/4): 373-387. 5 fig. 1928.—Lindeman examined 40 specimens of vaginal mucosa from healthy women during their sexual life. These specimens represented each day of the menstrual cycle. She also examined vaginal mucosa of 7 women in the physiological climacterium (of various lengths of time) and the vaginal mucous membrane of 3 amenorrheic women during their active sexual life (amenorrhea was due to shock, lactation, and x-ray). She concludes that there are various stages of progressive and retrogressive changes in the vagina. These are not typical pictures of the various menstrual phases because they can also be found during pregnancy, after delivery, during the climacterium, and in various amenorrheic states. The blue cornified zone described by Diercks as characteristic of the menstrual period has been found in all stages of the menstrual cycle as well as in the climacterium and during pregnancy.—*J. E. Lackner and S. S. Schochet.*

13115. **McCLEAN, DOUGLAS. Further observations on testicular extract and its effect upon tissue permeability.** *Jour. Path. and Bact.* 34(4): 459-470. 1931.—Further observations have shown that the increased permeability does not depend upon any active vascular or nervous response in the injected animal. The extract causes swelling and distortion of the fiber bundles of the dermis; a similar effect is produced by extracts of spermatozoa and by protamine salts, both of which diffuse in the dermis. Preliminary observations indicate that these extracts increase the permeability of ova and this may be related to the change occurring at fertilization. Observations on the surface tension of these extracts and upon the effect of tryptic and peptic digestion are recorded. The active substance has not yet been isolated.—*D. McClean.*

13116. **McKENZIE, FRED F., and RALPH W. PHILLIPS. Some observations on the estrual cycle in the sheep.** *Amer. Soc. Animal Product. Rec. Proc. Ann. Meet.* 23: 138-143. 1930(1931).—97 ewes and 25 ewe lambs were observed during 2 breeding seasons. Nutrition seemed to influence markedly the onset of the breeding season, which occurred the latter part of August with Hampshires, Shropshires, and Southdowns. Estrum in the ewe is described. Teaser rams were used constantly, and the duration of estrum (247 periods) averaged 26.8 hrs., 74% of all periods being 18-36 hrs. Estrum in the Hampshire ewes was significantly longer than in ewe lambs. The estrual cycle averaged 16.6 days (116 cycles); 79% were 14-16 days. There appeared no significant differences due to age or breed in the length of the estrual cycle. The optimum time in estrum at which to breed would seem to be the latter part of the period. A day's starvation during the early part of the breeding season had no noticeable effect on the onset of the first estrum.—*Authors' summary.*

13117. **NISHIZAKI, SH. Supplement to experimental research on the biological significance of the adrenal function in the process of pregnancy and parturition.** *Japanese Jour. Obstetr. & Gynecol.* 12(4): 386-390. 1929.—Experimental details lacking. Excision of adrenals, unilateral or bilateral, in rabbits and albino rats produced higher mortality in pregnant than in non-pregnant animals, especially at the time of labor. Living offspring were produced. Animals fed with tyrosin to accelerate function of medullary substance were benefited during pregnancy and labor. Pregnant rats and mice showed greater tolerance to injected adrenalin.—*M. Goettsch.*

13119. **RIDDLE, OSCAR. Studies on the physiology of reproduction in birds. XXIX. Season of origin as a determiner of age at which birds become sexually mature.** *Amer. Jour. Physiol.* 97(4): 581-587. 1931.—Under standard conditions in which the temperature factor would seem to be the chief seasonal variable, measurements were made of the age of attainment of sexual maturity (production of first egg) in 404 doves and 316 common pigeons belonging to 10 races. Within each of these races some ♀♀ were reared from eggs laid in each month of the year, and a measure obtained of the influence of this varying season of origin upon age at maturity. Birds from eggs of Sept.-Jan., inclusive, matured earliest; those from other months at markedly older ages—36% older in pigeons and 52% older in doves. In general, pigeons mature at an earlier age than do ring doves. Different races within either of these species mature at unequal ages and thus reveal genetic factors, probably involving the anterior pituitary, which also condition the establishment of maturity. Under the most favorable conditions now known a dove or pigeon must be approximately 4 months old before it will produce an egg. If an age of 4-5 mos. is reached during the fall the maturity is delayed, if reached during Feb.-July maturity is hastened, by endocrine conditions (thyroid, perhaps pituitary) connected with this part of the year. The author's earlier studies have shown that this season of accelerated maturity is also the season in which, even in mature birds, thyroid size and activity are decreasing. This rule probably applies to birds generally. A seasonal factor has been found in practically all aspects of sex and reproduction thus far studied in doves and pigeons.—*Author's summary.*

13120. **RIDDLE, OSCAR, and PELA FAY BRAUCHER. Studies on the physiology of reproduction in birds. XXX. Control of the special secretion of the crop-gland in**

pigeons by an anterior pituitary hormone. *Amer. Jour. Physiol.* 97(4): 617-625. 5 fig. 1931.—The response in doves and pigeons of the 2 dorsolateral areas of the crop (which normally enlarge at the end of the brooding period and then secrete the "crop-milk" fed to the young) to the several pituitary hormones was tested in 108 doves and pigeons, including 33 controls, 56 birds injected with anterior lobe extracts, 10 with posterior lobe extracts, and 9 with luteinizing hormone from pregnant urine. Other hormones and substances had earlier been found ineffective. The luteinizing hormone, the posterior lobe extracts and one (commercial) anterior-lobe extract (antuitrin) were without effect on the crop-glands; 3 other anterior lobe extracts (1 growth hormone, 1 sex maturity hormone, 1 glycerin extract) produced enlarged and functioning crop glands without exception in 29 birds tested, including nestling young and 16 ♂♂. All the effective extracts were known to contain the sex maturity hormone; all probably contained at least small amounts of the growth principle. Which anterior-lobe hormone influenced the crop-gland was not determined. A previously effective preparation tested, after heating for 13 hrs., at 99° C., on 4 birds had no effect on the crop glands. The crop-gland response was obtained in one pigeon after section of the nerves supplying the area, and is therefore not regulated or conditioned by the nerves. The authors conclude that, if this is a specific response to the growth hormone, it is the best method of testing and standardizing that hormone.

Otol.-Rhinol. et Broncho-Oesoph.* 9(7): 769-782. 1930.—Discussion of the author's theory of the existence of "auditory accommodation" by refraction of acoustic waves by the curved gaseous lens enclosed by the tympanum.

13122. **BONAIN, A. Étude sur les fenêtres labyrinthiques et leur role fonctionnel.** *Arch. Internat. Laryngol. Otol.-Rhinol. et Broncho-Oesoph.* 9(7): 783-796. 1930.—Comparing the phylogeny of the apparatus of equilibrium and hearing of the various animal species, Bonain concludes that the fenestra ovalis, the membrane of the tympanum and the chain of ossicles serve solely to protect the labyrinthine organs and to effect "auditory accommodation," and that the fenestra rotunda, being the most direct and most permeable means of access for the acoustic waves to the auditory sense organs, serves to transmit sounds to the internal ear.

13123. **BOWEN, R. E. Movement of the so-called hairs in the ampullar organs of fish ears.** *Proc. Nation. Acad. Sci. U. S.* 17(4): 192-194. 1931.—Sensory hairs of the ampullar organs of *Ameiurus nebulosus* in some cases move actively. Some cristae were seen in which no movement was observed. When movement was seen the number of hairs moving in any one crista varied from one to many. Present evidence does not indicate that there is more than one type of hair cell. In some cases the movement of the hairs was a lashing with whip-like strokes; in others the hairs moved without curving; in still others there was wave-like movement involving the entire length of the hair. Some hairs were seen beating in unison. There were no definite periods of movement and of rest. The rate of movement of the hair cells was not the same for all of the hairs which were seen moving.—*Author's summary.*

13124. **BRESSLER, JOSEPH. Illusion in the case of subliminal visual stimulation.** *Jour. Gen. Psychol.* 5(2): 244-251. 1931.—By means of a psychophysical test, the stimulating strength of three sets of arrows was measured and found to be subliminal. Two of these sets of imperceptible arrows were found to be of equal stimulating strength and the 3rd set to be stronger than the former but still under the threshold. The responses of these stimuli were measured. The Müller-Lyer illusion was effective in evoking a response even when the arrows were so faint that they were not visible to the observer. The magnitude of this response varies directly with the strength of the stimulus, as determined with the customary psychophysical tests. The illusion created by the imperceptible arrows was smaller than that created by clearly visible arrows in proportion to the intensity of the stimulus.—*Author's summary.*

13127. **GELDARD, FRANK ARTHUR. Brightness contrast and Heymans' law.** *Jour. Gen. Psychol.* 5(2): 191-206. 1 fig. 1931.—Brightness contrast is given its correct expression in terms of the reciprocal relations maintained when two local retinal areas are simultaneously stimulated. Stating the contrast problem in these terms, a disparity is found between two groups of experimental findings. The claim that stimulation of a peripheral portion of the retina sensitizes the fovea is controverted by Heymans' Law, which states that the reverse condition obtains. An experiment is described in which simple contrast thresholds were determined without peripheral stimulation and again under conditions of varying intensive degrees of such stimulation. Crude data derived from this experiment show a relatively insignificant deviation from the results to be expected if Heymans' Law were applicable. However, correction for pupillary changes reverses the trend of measures. A quantitative statement of brightness contrast is found to be given by the formula $RL=K \log I+C$, and the values fitting these data are ascertained. Heymans' Law is evaluated in terms of the present results and is found to be an artifact of faulty treatment of experimental findings. Particularly is the claim repudiated that former experiments substantiating the law have demonstrated the presence of "central inhibition." A second, more direct attack is described in which similar thresholds were obtained under conditions of pupillary control. These results confirm the relationship found in the first work. A caution is issued against the generalization of the statement arrived at, two further situations being described in which it is shown that the facilitation effect breaks down at certain limits. In conclusion it is indicated that a systematic exploration of the retina would be necessary to establish the spatial relations involved in brightness contrast.—*Author's summary.*

13128. **GRAHAM, CLARENCE H., and WALTER S. HUNTER. Thresholds of illumination for the visual discrimination of direction of movement and for the discrimination of discreteness.** *Jour. Gen. Psychol.* 5(2): 178-190. 1 pl. 1931.—An apparatus, patterned after that used by Hecht and Wolf with bees, was used with human subjects to determine the thresholds of illumination necessary for the discrimination of direction of movement and for the discrimination of direction of

lines. The results show a marked difference in the illuminations required for the two responses. At the highest reciprocal of the visual angle tested, only about one-thousandth of the illumination required for the movement discrimination is needed for that under stationary conditions. It is suggested that the movement situation elicits a temporally controlled response while the stationary situation elicits a spatially controlled response. In discussing the experiment by Hecht and Wolf on the visual acuity of the honey bee, the authors point out that the bees were discriminating on the basis of direction of movement rather than on the basis of the discreteness of stationary visual stimuli, which is the typical acuity situation.—*Authors' summary.*

13129. GRANIT, RAGNAR, [et al.] Comparative studies on the peripheral and central retina. IV. RAGNAR GRANIT, and WILLIAM A. DAVIS. Temporal summation of subliminal visual stimuli and the time course of the excitatory after-effect. V. RAGNAR GRANIT, and EDWARD L. HAMMOND. The sensation-time curve and the time course of the fusion frequency of intermittent stimulation. VI. C. H. GRAHAM, and RAGNAR GRANIT. Inhibition, summation, and synchronization of impulses in the retina. *Amer. Jour. Physiol.* 98(4): 644-653; 654-663; 664-673. 1931.—IV. A flash of light lasting 0.0113 sec. is adjusted to a strength just below the absolute threshold of vision. When this flash is followed by a second subliminal of still shorter duration, it is found that the second flash sums with the after-effect of the first to give a visible effect. The shorter the interval between the flashes, the smaller the quantity (intensity × duration) with which the second subliminal is capable of raising the after-effect of the first to threshold value. By measuring this quantity at various intervals between the flashes it has been possible to determine the level of the subliminal excitatory remainder as a function of time.—V. The development of the fusion frequency as a function of time of exposure has been studied in central and peripheral vision with a 1° and a 3° area. The fusion frequency increases first rapidly, then slowly with time of exposure. The higher the intensity, the steeper the rise and the longer the time to the maximum. Increase in area affects the time course of the fusion frequency, as does an increase in intensity and as does the moving of a large area towards the periphery (at 10°). The curve showing the development of the sensation of brightness has been obtained under conditions identical with those used in measuring the time course of the critical frequency. In plotting the 2 sets of data to the same abscissae (time of exposure) and correlating them it becomes evident that the 2 functions are different, in spite of the fact that the flicker phenomenon is an index of brightness. The nature of this discrepancy is analyzed. —VI. An apparatus was used in which 2 beams of light centered on 2 adjacent semicircular test patches can be varied independently as to intensity and flicker. When the 2 semicircles are of equal brightness and flicker synchronously they give a higher fusion frequency than each taken singly. When only 1 beam is flickered and the other one adjusted to give the same brightness as the flickered patch when fused the presence of the steadily illuminated semicircle raises the fusion frequency of the flickering semicircle. In this case, however, the effect is less than in the case when both are flickered. It is concluded that synchronization of impulses favors interaction over lateral channels. Since a steadily illuminated area is capable of raising the fusion frequency in an adjacent area, it is further concluded that part at least of the interaction, but probably the whole process, involves a true spatial summation. When the 2 semicircles are at different levels of brightness the fusion frequency of the darker is unaltered or lowered by the presence of the brighter, whereas the fusion frequency of the brighter is increased by the presence of the darker, provided the difference between them is not too great. The removal of the summation on the darker must be due to inhibition, since the results obtained with the brighter show that summation is bound to appear unless actively inhibited. Also the "darker" semicircle would sum with an equally "dark" adjacent patch. By showing that when 2 adjacent areas are at different levels of brightness, the brightness difference is exaggerated by a specific mechanism, which well may be a retinal form of contrast, the results explain how it is possible at high intensities to retain visual acuity and the faculty of discriminating brightness in spite of the increased summation over lateral channels. The inhibition is especially well developed in the fovea. No evidence of inhibition at high intensities in the periphery has been obtained. The predominance of summation in the periphery explains its low visual acuity and deficient brightness discrimination at degrees of eccentricity where convergence of receptors and scatter of light are of less significance.—*Authors' summaries.*

13131. HOSOYA, YUJI. Über die Altersverschiedenheit der Ultraviolettabsorption der menschlichen Augenmedien. *Tohoku Jour. Exp. Med.* 13(5/6): 510-523. 5 fig. 1929.—Experiments on the absorption of ultraviolet light from a nickel arc lamp and the Hilger quartz spectrometer were carried out on 16 human eyes removed 8-15 hours after death. The total eye, as well as the various parts of the eye of a fetus, absorbs ultraviolet less than those of a child. The absorption limit for the cornea is near 2,984 Å, for the lens at about 3086 Å, and for the total eye at about 3099 Å. These limits remain the same during fetal life from the fourth month on. After birth the absorption value increases with age. The lens of the fetus and the child transmits ultraviolet light up to 3,100 Å. A weak transmission, which however disappears completely with increasing age, was observed for the range of 3,100-3,800 Å.—*O. Glasser.*

13132. HOSOYA, YUJI. Fluoreszenz der einzelnen Augenmedien und Sichtbarkeit des ultravioletten Gebietes des Spektrums. *Tohoku Jour. Exp. Med.* 13 (5/6): 524-538. 1929.—Studies of the range of waves which cause a fluorescence in the various parts of the eye were undertaken on eyes of animals and human beings with homogeneous light obtained from various light sources by means of a Hilger quartz spectrograph. No appreciable differences were found in the fluorescence of eyes of animals or of human beings. All parts of the eye except the lens show a definite fluorescence for rays from 3,650 to 3,100 Å. Fluorescence of the lens is also caused by violet light of a wave length of about 3,700 Å. The strongest fluorescence was observed in the lens, less in the retina and cornea, and still less in the vitreous and aqueous parts of the eye. The maximium intensity of the fluorescent spectrum in the lens is near 5,500 Å. Ultraviolet radiation can easily be noticed up to about 3,100 Å.—*O. Glasser.*

13133. JOHANNSEN, DOROTHEA E. A quantitative study of binocular color vision. *Jour. Gen. Psychol.* 4 (1/4): 282-308. 1930.—The results of stimulating the two eyes simultaneously with different colors by the method described may be summarized as follows: (1) The color of the member of the pair which has the longer wave-length dominates the binocular field more than that of the shorter; (2) those pairs of colors, the members of which are separated by the smallest number of wave-lengths or j.n.d.'s, mix the most readily and completely; (3) the nearer together the two colors in wave-length, the fewer the fluctuations; (4) the color having the greater intensity has the greater dominating power; (5) the less the absolute brightness of the colors, the more readily they mix; (6) the more alike in brightness the colors, the more readily they mix; (7) with adaptation, the shorter wave-lengths tend to lose more in brightness than the longer; (8) when the fixation points are in focus, the positive dominance difference tends to be increased; (9) regular and fairly rapid

blinking tends to bring back the weaker color, though individual differences here are large; (10) when the eye is previously adapted to the color having the shorter wave-length of a pair, the dominance difference is increased in a positive direction; adaptation to the longer wave-length tends to decrease the size of the dominance difference.—*Author's summary.*

(Über die homonyme keineswegs cruciate Innervation der Musculi recti interni von dem Oculomotoriuskern beim Nystagmus.)** *Pflüger's Arch. Ges. Physiol.* 228(1/2): 198-212. 7 fig. 1931.—Since the investigations of Bernheimer it is known that the internal rectus muscle is supplied with both crossed and uncrossed fibers from the oculomotor nuclei. The present experiments seek to determine whether the internal recti are innervated by both these fibers or only one during horizontal nystagmus. A description is given of the hypothetical pathways of the impulses from labyrinth to internal recti, and the details of the operative approach to these fibers. The authors used cats throughout. After section of one posterior longitudinal bundle in its course between the abducens and trochlear nucleus the horizontal nystagmus on the homolateral side became weaker. The nystagmus on the contralateral side did not change. If now the external recti muscles were dissected away together with the external insertions of the retractor bulbi muscle the nystagmus ceased in the homolateral side and became weaker on the contralateral side. From these results the authors draw the conclusion that during horizontal nystagmus the internal recti are innervated only by fibers from the homolateral oculomotor nucleus. —*F. H. Adler.*

13137. **ACHELIS, J. D. Über Umstimmung der Sensibilität.** *Pflüger's Arch. Ges. Physiol.* 226(2): 212-238. 8 fig. 1930.—Estimations were made of the chronaxie values required for stimulation of nerve trunks in man in order to produce sensations referred to some peripheral area, when this area was exposed to various procedures. After exposure of this peripheral area to ultra-violet light there is in the latent period before erythema develops a lengthening of chronaxie in the more central nerve trunks. On release of a stasis of several minutes' duration there is a lengthening of chronaxie associated with, but apparently not dependent on, the sensations of heat and tingling induced. Sometimes the lengthening is preceded by a temporary shortening, and particularly with short periods of stasis and sensations of cold on release the chronaxie may be shortened. With gradual application of warmth chronaxie is shortened, but it is lengthened when heat erythema is induced. Mechanical injuries to the skin produce also some lengthening. Cold, if brief so that deep effects are avoided, shortens chronaxie; if prolonged so as to give deep effects chronaxie may be lengthened. Drinking a large quantity of water causes an initial lengthening and a later shortening of chronaxie in the diuresis phase. Exposure of another area to warmth, if inducing a general sensation of warmth, may lengthen chronaxie; exposure to cold may similarly shorten chronaxie in the opposite limb. The author considers chronaxie of a sensory nerve to be shortened by all changes which increase local sympathetic tonus and to be lengthened by all that decrease this tonus.—*H. C. Bazett.*

13138. **ANTONA, SERAFINO d'. Per la conoscenza delle funzioni termo- e glicoregolatrici del corpo striato. Contributo anatomo-clinico. [Clinical and anatomical contributions to the knowledge of the thermo- and glyco-regulatory functions of the corpus striatum.]** *Riv. Neurol.* 1(2): 97-116. 1 pl. 1928.—The author reviews experimental evidence pointing toward the corpus striatum playing a part in heat-regulation and in regulation of combustion of carbohydrate. He describes a case of right hemiplegia accompanied by a persistently higher skin temperature on the same side and a vasomotor disturbance resulting in edema and ulceration of the right leg. Hyperglycemia and glycosuria appeared two days after the apoplectic seizure and persisted. Death occurred on the 20th day and autopsy revealed a recent localized area of ischemic necrosis occupying the posterior ⅔ of the putamen on the left and involving the corona radiata and the knee of the internal capsule. The lesion appeared destructive rather than irritative and the author concludes that the hyperthermia, other vasomotor phenomena and glycosuria were a result of loss of function in the region of the putamen.—*R. M. Moore.*

13139. **BATTLE, HELEN I. A note on lethal temperature in connection with skate reflexes.** *Contr. Canadian Biol. and Fish.* 4(31): 495-500. 1929.—Experimental studies on loss of reflex excitability indicate by their low values that the skate (*Raja erinacea* and *R. radiata*) when uniformly heated apparently dies, primarily from failure of some co-ordinating mechanism (presumably in the higher nerve centers), which failure occurs at a temperature in the neighborhood of that at which the automatic mechanism of the heart becomes inactive, a point at which all other tissues are still functional.—*H. I. Battle.*

13140. **BERGAMI, GINO. Ricerche sulla resistenza elettrica a varie frequenze del preparato retina-nervo ottico, in seguito a stimoli lunminosi. [Electrical resistance for varied frequencies of the retina-optic nerve preparation following stimulation with light.]** *Boll. Soc. Ital. Biol. Sperim.* 5(5): 746-747. 1930.—During excitation of the retina-optic nerve preparation of frogs by light, the resistance persisted unchanged, whereas the resistance due to cellular membranes diminished. A diminution of resistance was noted with very low electric frequencies, while no variation was shown at high frequencies. The current was obtained at varied frequency by means of oscillators, and its variations registered by a galvanometer.—*M. Comel.*

13141. **BIANCALANI, GISELDA, e RENATA SOCAL. Ulteriori ricerche biochimiche intorno ai lipoidi dei centri nervosi cerebro spinali. (2a comunicazione). [Further biochemical studies on the lipins of the cerebrospinal nervous centers 2.]** *Arch. Fisiol.* 28(2): 282-288. 1930.—At birth all lipins are already present in the brain. They increase with age (old subjects were not studied however). This increase could be attributed essentially to cholesterol, sphingomyelin and kephalin. Lecithin, cherasin, phrenosin, myelin and leukopolin also increased from birth on. In the spinal cord the lipins are all present at birth except kephalin. They increase afterwards. They are present in greater amounts than in the brain, lecithin excepted.—*M. Comel.*

13142. **BLIER, ZACHARY A., and NATHANIEL KLEITMAN. Conditions affecting the linguo-maxillary reflex.** *Amer. Jour. Physiol.* 94(1): 118-124. 2 fig. 1930.—Cephalic anemia produced in anesthetized dogs (number not stated) by peripheral vagus stimulation, pulmonary inflation, and occlusion of the cephalic blood vessels, did not produce a consistent augmentation of the linguo-maxillary reflex. Stimulation of the central end of the cut sciatic nerve, or the vagus, or of visceral afferent fibers, caused an immediate abolition of the linguo-maxillary reflex, with a quick return to normal upon cessation of the stimulation. The resistance to fatigue of the linguo-maxillary reflex varied with individual dogs. In 1 animal 90,000 successive stimulations produced no evidence of fatigue. The linguo-maxillary reflex is not "ultimate," as in progressive depression of the central nervous system it disappears before the knee jerk. A new reflex, closure of the mouth upon electrical stimulation of the soft palate, is described. The authors designate it as the palato-maxillary reflex.

13143. **BRATIANU, S., et C. GUERRIERO. Nouvelles recherches expérimentales sur les cellules à fonction colloïdopexique de l'encéphale et sur la microglie de Del Rio Hortega.** *Arch. Anat. Microscop.* 26(3): 335-372. 6 pl. (2 col.), 5 fig. 1930.—As a result of experiments on adult and young rats and on mice the authors conclude:—The reticulo-endothelial system in cerebral tissue is made up of the adventitial mesenchymal cells of Maximow and of histiocytes found in the axes of choroidal villi. These elements, acting independently or together, have the functions of blockage, colloidopexy and phagocytosis. Under normal circumstances the histiocytes of the choroid plexus are activated first but in various pathological conditions the periadventitial mesenchyme cells also take part in the function of blockage. Microglia is not colloidopexic under any conditions but, as well as the adventitial cells, can show pictures of pseudoflocculation due to the phagocytosis of remains, previously imbibed, of the coloring matter which is found in the neighborhood of the cells, or even to the coloration in the cell itself of such remains. Phagocytosis is performed by histiocytes of the choroid plexus, the juxtavascular mesenchymal cells, the microglia of Hortega and oligodendroglia. Compound granular corpuscles can arise from microglia, oligodendroglia, mesenchymal cells and histiocytes of the choroid plexus. Microglia and neuroglia show the disassociation between the power of phagocytosis and the colloidopexic function, which they do not possess. Microglia in the neighborhood of arterioles and veins is paravascular; in the neighborhood of capillaries it is in relation with the vascular adventitia. The neurone never shows the colloidopexic function, but when it is altered or dead it presents a diffuse coloration of the protoplasm and nucleus or of one of these 2 components.—*Authors' general conclusions (transl. by E. A. Linell).*

13144. **BRUMAN, F. Ein Beitrag zur Physiologie der zentralen Temperaturregulation.** *Pflüger's Arch. Ges. Physiol.* 222(1/2): 142-158. 5 fig. 1929.—The temp. of 3 parts of the body (liver, muscle, skin or brain) of rabbits under the influence of heat-puncture was determined by the thermoelectric method and photographic registration. Immediately after the puncture came a fall of temp. and then a rapid rise followed by relative constancy. The liver temp. increases first, the skin last. In general, the temp. moves parallel in parts simultaneously observed. In regard to localisation of the heat center, injury of the ventricle is of great importance, but the method of heat-puncture does not solve the problem of localisation of the temp. regulating center. Irritation of the brain stem with fine electrodes and pulsating current and simultaneous determination of the temp. of 3 parts of the body of rabbits showed effective irritation-spots in the thalamus, hypothalamus, striatum and septum pellucidum, but the experiments did not give exact localisation of body-temp. regulating places in the brain.—Experiments on cats with especially fine electrodes showed important changes of temp. but these also did not give the exact localisation of temp. regulating centers in the brain.—*F. Bruman.*

13145. **CLARK, D. A. Muscle counts of motor units: a study in innervation ratios.** *Amer. Jour. Physiol.* 96 (2): 296-304. 1 fig. 1931.—A method is described for counting the total number of fibres in skeletal muscles. The motor nerve fibers and muscle fibers have been counted in 5 examples of M. soleus and 3 examples of M. extensor longus digitorum of the cat. The fiber of "red" muscle has been found stronger and of greater density than the fiber of "white" muscle. "Innervation ratio" has been defined as the ratio of the number of motor nerve fibers supplying a given muscle to the number of its muscle fibers. An innervation ratio of about 1:120 has been found for M. soleus, and 1:165 for M. extensor longus digitorum.—*Author's summary.*

13146. **DORSEY, JOHN M., and LEE EDWARD TRAVIS. Effect of alcohol on the patellar tendon reflex time in dogs.** *Arch. Neurol. & Psych.* 24(1): 48-51. 6 fig. 1930.—Alcohol consistently but irregularly reduced the patellar tendon reflex time in 5 dogs, the effect being comparable to that obtained in human subjects. This study lends further support to the proposition that the central nervous system of higher animals is a pyramid of dependencies subserving superstructures which maintain their dominance by virtue of their inhibitory effect on the subjacent and possibly adjacent structures they environ. Increase in action current duration following injection of alcohol was not detected in the case of dogs.

13147. **FACHINI, GIUSEPPE. Modificazioni della latenza del riflesso acustico nelle cavie in seguito a ripetuti stimoli. [Variations of latency of the acoustic reflex in guinea pigs as induced by repeated stimuli.]** *Boll. Soc. Ital. Biol. Sperim.* 5(4): 524-527. 1930.—The latency of the acoustic reflex of guinea pigs is increased when the animal is submitted to frequently repeated sound stimuli; the increase in the latency being in proportion to the number of stimuli.—*M. Comel.*

13148. **FOÀ, CARLO, e ACHILLE PERONI. Primi tentativi di registrazione delle correnti d'azione del nervo acustico. [Attempts to register the action currents of the acoustic nerve.]** *Arch. Fisiol.* 28(2): 237-241. 1930.—Five experiments were done on *Thalassochelis carretta,* using an amplification system (constituted of 3 triodes), non-polarizable Zn electrodes and the Einthoven's galvanometer as registering instrument. Acoustic stimuli (sounds of organ pipes) were used. Whatever the pitch of the sound, the nerve gave always a discontinuous electric response: its rhythm mantained the number of 50-60 waves per sec., the indentations of the curve being sometimes rather regular, sometimes superposed, but always noticeable. The fixity of the electric response, independent of the frequency of the stimulus, may be due to different factors: to the stimulus itself, to the nerve, to the excitation process. The constancy of the electrical response leads the authors to attribute to the acoustic centres alone the analysis of sound.—*M. Comel.*

13149. **GAVRILESCU, N. Sulla resistenza elettica del tessuto nervoso in funzione delle temperature e sotto l'azione dell'etere e del cloroformio. [Electrical resistance of nervous tissue as a function of temp., and on the effect of ether and chloroform.]** *Arch. di Sci. Biol.* 13(1/2): 39-52. 3 fig. 1929.—Electric resistance of the nervous tissue diminishes with rising temp., but not so regularly as that of an electrolyte solution. Under constant temp., the electric resistance of the surviving nervous tissue rises to a certain value, afterwards diminishing quickly, doubtless on account of putrefaction. Electric resistance of nervous tissue, in situ or surviving, rises under the action of anesthetics; also in dead tissue and in the juice from the white matter of the brain.—*A. Jappelli.*

13150. **GERARD, R. W. The response of nerve to oxygen lack.** *Amer. Jour. Physiol.* 92(2): 498-541. 12 fig. 1930.—Resting and action potentials in the sciatic nerve of the grass frog and the bull frog, and the peroneal nerve of the dog were studied by the slow galvanometer

under asphyxial conditions and on return to O. Resting potentials were steadily lowered in an asphyxiated region and returned in O. Action potentials first rose and then fell to zero, and on return to O rose rapidly to high values. In asphyxia the Fleischl effect was reduced, the refractory period prolonged and the fibers blocked. The higher the metabolism the faster was the onset of block. The results are interpreted to mean that block is due to an exhaustion of the oxidizable reserve rather than to an accumulation of metabolites.—*B. R. Lutz.*

13151. GROEBBELS, FRANZ. Der Aufbau des extrapyramidalen Systems der Wirbeltiere nach funktionellen Reflexgruppen. *Zeitschr. Ges. Neurol. u. Psychiatr.* 128(1/4): 69-81. 1930.—The extrapyramidal system shows as a whole an increasing complexity as we pass up the vertebrate scale. This has occurred not only in its more frontal portions but also in what were more caudal and originally palaeocephalic systems. Since the system is distributed over many parts of the brain it is not possible to regard it as being composed of a hierarchy of physiological centres.—*H. Woollard.*

13152. HINSEY, J. C., S. W. RANSON, and H. H. DIXON. Responses elicited by stimulation of the mesencephalic tegmentum in the cat. *Arch. Neurol. & Psych.* 24(5): 966-977. 2 pl. 1930.—The tegmental response elicited by stimulation of the mesencephalic tegmentum in the region of the red nucleus in an unspecified number of cats was characterized by ipsolateral flexion and contralateral extension in the fore limbs and varying responses in the hind limbs. In cats on which no operation was performed, the ipsolateral flexion relaxed quickly on cessation of the stimulation while the contralateral extension was followed by a prolonged tonic afterdischarge. Stimulation of the basis pedunculi in the region of the corticospinal tracts caused quick contralateral flexion in the fore and hind limbs. In these experiments, the tegmental response was found to occur following section of the decussation of Forel, bilateral section of the dorsal roots of the 1st 3 cervical nerves, removal of the cerebellum and the substantia nigra and bilateral section of the medial longitudinal fasciculi. It was not found to occur on stimulation of the tectum or on the ipsolateral side following hemisection caudal to the red nucleus and the decussation of Forel. These observations, together with the other evidence, suggest that the pathway is ipsolateral down into the reticular formation, from which it may be mediated over the reticulospinal tracts.—*Authors' conclusions.*

13153. JUNGMANN, HANS, und RICHARD THIEL. Über Chronaxie-Veränderungen an Nerven und Muskeln der Extremitäten des Menschen bei peripherer Kreislaufstörung. *Zeitschr. Ges. Neurol. u. Psychiatr.* 129(5): 647-665. 1930.—This is a communication on chronaxie prolongation which occurs in the extremities under consideration, due to vasomotor disturbances. With experimentally caused peripheral disturbances of the circulation of the extremity the chronaxie changes found by Bourguignon and Laugier under similar conditions for the extensor musculature and the nervus radialis were confirmed. These changes in the upper extremities hold only for the extensor groups, not for the flexor groups and the median nerve. In these no changes occur in chronaxie following stoppage of the veins or constriction of the arteries. The nervus ulnaris takes, under these circumstances, a middle position between the flexor and extensor groups, while its chronaxie from peripheral disturbances of the circulation does not always change. In the leg only slight changes in the chronaxie appear after peripheral disturbances of the circulation. These changes concern exclusively groups with original average chronaxie. In experiments with pathologically increased chronaxie of the flexor musculature of the arms, the same changes follow experimental disturbances of circulation as in the normal.—*Authors' summary (transl. by M. Caldwell).*

13154. KISS, PAUL von. Die Untersuchung der vegetativen Innervation des Herzens mittels Elektrokardiographie. *Jahrb. Kinderheilk.* 130(3/4): 210-214. 1931.—When Aschner's pressure was applied to 5 patients on the 2nd lead, reactions varying from undisturbed rhythm to cardiac standstill of 10 sec. were obtained. A possible explanation is that a heart in labile equilibrium, under the action of a vagotropic stimulus, undergoes a primary deviation toward the vagic. The later compensating secondary sympathicotonia, or that appearing without a compensatory interval, might be explained by the fact that the stimulus involving the peripheral sensory fibers extends to the sympathetic fibers and produces tachycardia. Whether this secondary sympathetic stimulus, which probably acts through the autonomic centers, acts on the suprarenals, giving rise to an increased production of adrenalin and hyperadrenalemia, is not clear.

13155. KNORRE, H. von. Klinische Erregbarkeitsstudien (Chronaxie). *Deutsches Arch. Klin. Med.* 168 (1/2): 1-51. 1930.—The observations of the disturbances of the chronaxie values were made on a number of muscles rather than on only one. A characteristic configuration, designated as "chronaxie relief," was found in the relations of the chronaxie values of certain muscles to one another. In latent tetany there is an acclivity of the chronaxie; also in hyperventilation, varying with the different muscles. In diabetic coma and in circulatory insufficiency there is a reversal of the "chronaxie relief." The chronaxie of the separate muscles shifts with the alteration of the metabolism along a curve whose lowest point corresponds with the beginning acidosis of the tissues—toward the left in diabetes and circulatory insufficiency and to the right with an increased alkalinity, as in latent tetany and in hyperventilation. Lead poisoning shows a characteristic curve to the left, presenting 3 stages corresponding to the chronaxie. The metabolism of the organism is exactly characterised by the chronaxie values, and thus the dosage of such drugs as digitalis and insulin can be objectively measured.—*Author's summary (transl. by W. H. Gantt).*

13156. LAUGIER, H. La chronaxie. *Bull. Soc. Philomath. Paris* 18(2): 1-10. 1929.—Short general account; definition of chronaxie, its application to general and comparative physiology, pharmacology, electrodiagnosis and electrotherapy; its rôle in the function of the centers.—*H. Laugier (transl.).*

13157. LINDE, PAUL, und GUNNAR NORLIN. Ist der Adrenalintremor mit Störung des Orientierungsvermögens der Hand verbunden. *Skand. Arch. Physiol.* 60(1/4): 221-224. 1930.—In 22 typewriting experiments (18 made before and after epinephrine injections, and 4 control experiments with tests equally spaced but without injection) on 12 persons, and a small number of needle-threading tests, no disturbance of the orientation of the hand was observed following injection of epinephrine. These results indicate that epinephrine does not affect the central nervous system, and tend to support the view that the tremor is peripherally produced.

13158. LÜSCHER, E. Die Funktion des Musculus stapedius beim Menchen. *Zeitschr. Hals-, Nasen-, u. Ohrenheilk.* 25(4): 462-478. 1930.—The movements of the tendon of the stapedius muscle were observed directly in living persons in a second case with a large perforation of the ear drum. Tones between 650 and 12,000 vibrations had a constant cochlear reflex as a result. Conversational voice and Barany's alarm instrument acted at 20cm. distance from the opposite ear. The reflex could also be elicited by osteotympaneal sound conduction. The stapedius reflex showed fatigue by sustained tone and there was reflex deafness after 1-1½ min. at the most. Duration of fatigue depends upon pitch and is longer with high than with low tones. Recovery was complete as a rule within a few minutes. It was concluded that both the fatigue of the reflex and also the sensibility to sound are due to an alteration of the irritability of the perceptive apparatus. The fatigue affects the sensory side of the reflex arc. The ease with which the reflex is elicited by sounds is charac-

teristic of its summation. The reflex shows generally in the same way as auditory sensibility: the specific biological activity of the various pitches, sound analysis and fatigue.—*E. Lüscher* (*transl. by A. E. Taft*).

13159. **MARINESCO, G., O. SAGER, und A. KREINDLER. Chronaximetrische und pharmakologische Studien über die Enthirnungsstarre.** *Pflüger's Arch. Ges. Physiol.* 225(2/3): 313-339. 6 fig. 1930.—The muscles of decerebrate cats exhibit fibers differing in excitability which is decreased in fibers close to the motor point. The decrease is greater in the rigid muscles than in the antagonists. The chronaxie of the nerve is always that of the smallest value of the fibers of the corresponding muscle (fibers at the motor point). The elicitation of the neck and labyrinth reflexes is associated with a decrease in nerve and muscle chronaxie (at the motor point) in the muscles exhibiting an increase in tonus, but not in the fibers with greater chronaxie (neighborhood of the motor point). The intravenous injection of curare resulted in a decrease or disappearance of decerebrate rigidity and an increase in chronaxie of the muscle at the motor point, but not of the nerve; the neck and labyrinth reflexes disappeared. Cocaine caused a large increase in decerebrate rigidity, accompanied by evidences of stimulation (rotation of the body, rhythmic tail movements). The chronaxie of muscle fibers with the higher value increased to a definite extent, and those of smaller value often to a less extent. Intravenous injection of $CaCl_2$ decreased or abolished decerebrate rigidity, with an increase of the chronaxie at the motor point (lesser value), as well as that of the corresponding nerve. The chronaxies in the immediate neighborhood of the motor point (greater value) suffered a decrease in value. Choline subcutaneously was followed by an increase in decerebrate rigidity, with an increase in chronaxie of the fibers with higher value but no change at the motor point. The existence of muscle fibers having two different values in the decerebrate cat indicates two different functional systems of innervation. One may consider an analogy in human pathology with pyramidal and extrapyramidal motor systems. The catch mechanism of the muscle of the decerebrate cat may thus be explained through the consideration of fibers of two different types of irritability, and the effect upon them of drugs.—*Authors' summary* (*transl. by C. H. Thienes*).

13160. **MORLEY, JOHN. The significance of the afferent impulses from the skin in the mechanism of abdominal pain.** *Lancet* 217(5546): 1240-1244. 4 fig. 1929.—The writer has repeated and confirmed the experiments of Weiss and Davis, who found that the localized spontaneous pain and hyperaesthesia of the skin in acute inflammatory abdominal diseases could be relieved or abolished by local subcutaneous infiltration with novocaine. He does not agree, however, with the statement of these authors that such experiments prove Mackenzie's theory of a viscero-cutaneous reflex and maintains that the results are not inconsistent with the theory of a peritoneo-cutaneous radiation. To support this assertion the writer cites two cases of perforation of a duodenal ulcer with pain in the right shoulder region. Infiltration of the painful area of skin with novocaine diminished or abolished the shoulder pain in these cases. At operation under spinal anesthesia it was found that the contact of a swab with the under surface of the left cupola of the diaphragm produced severe shoulder-tip pain on the left side, whereas the similar application of a swab to the right cupola gave very little pain referred to the skin area anesthetised with novocaine. In acute obstructive cholecystitis the inflamed gall bladder enlarges in a downward direction, so that the fundus comes into contact with the anterior parietal peritoneum further and further down as the enlargement progresses. The area of maximum pain creeps gradually lower as the gallbladder descends. The author considers that this phenomena illustrates peritoneo-cutaneous radiation and is opposed to the theory of a viscero-cutaneous reflex.—*E. A. Linell.*

13161. **MÜLLER, L. R. Über die Gegensätzlichkeit in der Lebensinnervation.** *Deutsche Zeitschr. e. Nervenheilk.* 111(1/6): 102-110. 1 pl. 4 fig. 1929.—Not only the activity of the heart and the stomach is regulated by antagonistic innervation of the sympathetic and the parasympathetic, as was formerly known, but also the activity of other organs, as the glands of the skin. The centers are found throughout the thoracic and lumbar part of the cord, in the intermedial region of the grey matter, the efferent fibers leaving through the posterior roots.—*W. J. C. Verhaart.*

13162. **NEUSCHLOSZ, S. M. Über die Bedeutung der K-ionen für den Tonus des quergestreiften Skelettmuskels. V. Mitteilung. Die tonische Komponente des Strychnintetanus und ihre Beeinflussung durch peripher angreifende Agenzien.** *Pflüger's Arch. Ges. Physiol.* 213 (1/2): 40-46. 1926.—The increased binding of K which accompanies the central nervous increase in muscle tonus brought about by strychnine is unaffected by curare. It can be decreased by atropin, as was previously shown for the stimulation contracture of isolated muscles. This strongly supports the view that tonic impulses pass from the central nervous system to the muscle through the receptive substance, and produce the same effects in contractile elements as does ordinary stimulation.—*Author's summary* (*transl. by S. C. Brooks*).

13163. **PERRINI, F. Influenza del lavoro muscolare sul rifleso patellare. [Influence of muscular work on the patellar reflex.]** *Arch. Sci. Biol.* 11(1): 28-54. 6 fig. 1928.—In repose the patellar reflex is usually greater in the left than in the right leg; it is increased following muscular work. Contraction of a single muscle on one side (e.g., the quadriceps cruralis) increases the patellar reflex. The author concludes that the superior nervous centers inhibit the patellar reflex, and that this inhibition is weakened by fatigue.—*P. Popenoe.*

13164. **POPPI, UMBERTO. Funzione e struttura delle cellule del "Tuber cinereum." [Function and structure of the cells of the tuber cinereum.]** *Policlinico* [*Sez. Pratica*] 37(38): 1382-1383. 1930.—In view of the presence of neutral fats and lipids in the cytoplasm, of the intracellular granulations recalling those of the hypophysis and the suprarenals, and of the rich supply of communicating arteries of the tuber cinereum, Poppi raises the question whether the cells of the tuber cinereum are mere reservoirs or have an endocrine function of their own.

13165. **QUINAN, CLARENCE. The principal sinistral types: an experimental study particularly as regards their relation to the so-called constitutional psychopathic states.** *Arch. Neurol. and Psych.* 24(1): 35-47. 4 fig. 1930.—While right- and left-handedness has long been a subject for study, the significance of habitual preference for the right or left eye (first noticed about 50 yrs. ago by Joseph Le Conte), has been generally neglected. In private practice Quinan had observed that sinistrality and dextrality correspond to certain qualitative psychologic differences. In the present study each subject automatically registered his own handedness and eyedness by the use of 2 test objects, a ball to throw and a wooden pistol to sight. The types of unmixed dextrality and sinistrality are designated respectively as RR and LL (the 1st letter indicating the dominant hand and the 2nd the dominant eye) and the mixed types as RL and LR respectively. Of 1,000 students examined with reference to handedness and eyedness, 704 were RR; 185 were RL; 40 were LL; 36 were LR; 35 are classified as ambilaterals and other types. Therefore, 26.1% of these are sinistrals. Nearly the same percentage of sinistrals was found in a study of 317 Chinese school children. There seems to be a marked tendency for sinistrals to concentrate in certain of the esthetic vocations. On the basis of data collected from 815 students, it can be stated that sinistrals are definitely more musical in their tastes than dextrals. In a survey of 693 neuropsychiatric patients, it was found that in dementia praecox and in most other forms of mental

disease the percentage of sinistrals was 30.4, while in a mixed group of persons with constitutional psychopathic states the average value was 54.1%. It is suggested that sinistrals, especially those of the RL type, are apt to show signs of constitutional instability.

13166. **RESWJAKOFF, N. P. Zur Theorie der dekrementiellen Leitung im Nerven.** *Pflüger's Arch. Ges. Physiol.* 226(1): 86-98. 8 fig. 1930.—Using the sciatic nerve of the frog (*Rana temporaria*) and twitches of the gastrocnemius muscle as indicator, isotonic KCl, distilled water, and heat as agents to impair conduction, four types of experiment were performed. Either warming the distal portion of the affected region or making it the anodal region for a constant current gave transient restoration of conductivity which had just disappeared. Rapid shortening of the area exposed to heat had a similar effect. In a modification of Lodholz's experiment with 4 electrodes on the affected region numbered from the proximal end, stimulation failed first at 1, next at 2, next at 3, and finally at 4. Stimulation at all 4 electrodes was from the same inductorium at the same coil distance. Electrodes 1 and 3 were cathode on closing, 2 and 4 on opening of the primary circuit. There is no mention of the location of cut branches of the nerve or of controls for spread of current. The author considers these results as evidence in favor of the theory of decremental conduction.—*G. P. McCouch.*

13167. **SATO, HIROSHI, und MAMORU NEMOTO. Einfluss der Erwärmung des Karotidenblutes auf die Atmung des Hundes dessen Corpora striata ausgerottet sind.** *Tohoku Jour. Exp. Med.* 14(2/3): 135-145. 6 fig. 1929.—Heating of the carotids, so that the pharyngeal temp. rose to about 42 degrees and the anal to 38, caused an acceleration (from 11 to about 100 per min.) and an augmentation of the respiratory excursion in 8 dogs whose corpora striata had been removed, and this acceleration was equal to or greater than in dogs with corpora striatae intact. Narcosis was not employed in the experiments. After the period of heating, there was, especially in the normal dogs, a gradual decrease of the tachypnea and then apnea or Cheyne-Stokes breathing. The acceleration lasted from 10 to 120 min.—*Authors' summary (transl. by W. H. Gantt).*

13168. **SEGAAR, J. Zentrale Innervation bei normalen und "manege"—Krebsen. [Central innervation in normal and rotating crustaceans.]** *Tijdschr. Nederland. Dierkund. Vereen.* 1(3): 113-117. 1 fig. 1929.—Central stimulation in the crab (*Cancer, Astacus*) produces contrary results from peripheral stimulation. The possible causes of this and of circular movements of a crab which has lost half its brain are considered.—*G. E. Johnson.*

13169. **STRUGHOLD, HUBERT. Beiträge zur Kenntnis der Refraktärphasen der Eigenreflexe beim gesunden Menschen. Der Einfluss der Atembewegung auf den Patellar- und Achillesreflex.** *Zeitschr. Biol.* 88(4): 346-362. 2 fig. 1929.—If the stimulus for releasing the knee jerk or the ankle jerk be applied within the refractory phase there is a slight increase in the strength of the response during normal inspiration which is doubled during deep inspiration. Also the refractory period is shortened to ½ its ordinary value. There is no change if the stimulation be applied outside the refractory time. The author concludes that there is a reflex facilitation from the respiratory muscles on the reflex apparatus of these particular tendon responses.—*M. Beck (transl. by H. Woollard).*

13170. **ULLMANN, E. V. Zur Frage des subkortikalen Phonationsmechanismus (Lokalisation des rhombencephalen Phonationszentrums).** *Monatsschr. Ohrenheilk. u. Laryngo-Rhinol.* 60(2): 122-127. 4 fig. 1926.—The capacity for phonation is retained, when the cortex and subcortical ganglia are totally extirpated down to the level of entry of the eighth nerve. Accordingly, the nuclei situated in the caudal part of the rhombencephalon are sufficient to release phonation, upon stimulation of sensory nerves. Careful experiments failed to demonstrate any influence of the cerebellum upon phonation.—*Author's summary (transl. by C. E. Kellogg).*

13171. **VIZIOLI, FRANCESCO. Ancora sul fenomeno di Piotrowski. [Further considerations of Piotrowski's phenomenon.]** *Riv. Neurol.* 1(2): 137-145. 1928.—An antagonistic reflex in the lower leg (principally the anterior tibialis muscle) is found in normal, neurasthenic, and hysterical persons so generally as to justify considering it more or less normal; it is closely associated with the general reflex sensitivity of the individual. Hence it has little value for diagnosis in neuropathology. —*P. Popenoe.*

13172. **WACHHOLDER, KURT. Die allgemeinen physiologischen Grundlagen der Neurologie. I. Teil. Allgemeine Physiologie der Reizung und Erregung.** *Fortschr. Neurol., Psychiatr. u. Grenzgebiete* 1(6): 253-266. 1929.—The article is a review of recent work on irritability.

13173. **WENDEROWIC, E. Das myelogenetische Studium des Nervensystems nach Flechsig als eine der Grundlagen zur Erkenntnis seiner Struktur und Funktionen u. a. des Verhaltens und über die Beziehungen zwischen physiologischer und morphologischer Untersuchung.** *Arch. Psychiat. u. Nervenkrankh.* 90(5): 789-804. 1930.—Physiologists and anatomists have both overemphasized the importance of their particular fields in the solution of problems of the central nervous system. Each has taken the lead in certain researches but his work has required confirmation and elaboration by the other before a complete understanding has been attained. Even behavior is not clearly understood until anatomical and physiological explanations have been elaborated. The field of nervous and mental disease is too complicated for anyone to have a firm grasp of every phase of the situation and the ideal method of research is painstaking and considerate consultation and collaboration between men of different training. In the field of morphology alone there are fiberanatomists, architectonic anatomists, cellular histologists, comparative anatomists, specialists in the vegetative nervous system, etc. A knowledge of brain anatomy is essential to the study of the mind.—*J. M. Nielsen.*

13174. **ALTENBURGER, H. Der Einfluss des Sympathicus auf die Tätigkeit des quergestreiften Muskels beim Menschen.** *Zeitschr. Ges. Neurol. u. Psych.* 132(3/4): 490-501. 1931.—In 2 patients with complete unilateral cervical sympathectomy records were taken of the contractions of the upper lip on the two sides following stimulation of the N. facialis. On the operated side more rapid fatigue was observed; the height of the individual twitch decreased; its duration was increased; the tetanus contraction height and the frequency necessary for a complete tetanus were decreased.—*W. O. Fenn.*

13175. **ALTENBURGER, H., und F. W. KROLL. Chronaximetrische Ermüdungsstudien.** *Zeitschr. Ges. Neurol.*

u. Psych. 132(3/4): 484-489. 1931.—Chronaxie determinations were made on the hand extensors in fatigue. Irregular results were obtained in voluntary contraction. After strong faradic stimulation there was first a decrease of chronaxie from 0.36 σ to 0.1 σ after 3 min. stimulation followed by an increase to 1.4 σ after 14 min. stimulation and then gradual recovery. Simultaneous observations on the contralateral side showed a decrease of chronaxie but no increase. This is a reflex not a hormonal phenomenon since it occurs only in the homologous contralateral muscle group.—*W. O. Fenn.*

13176. **BETHE, ALBRECHT. Die passive Kraft menschlicher Skelettmuskeln.** *Pflüger's Arch. Ges. Physiol.* 222(3): 334-349. 7 fig. 1929.—By means of a dynamometer, measurements were made of the force exerted by the arm in different positions during maximal voluntary contractions (active force). With the arm in corresponding positions similar measurements were made of the force exerted when the dynamometer was pulled away from the subject by the experimenter (passive force). The resisting, or passive, force was uniformly larger than the active force. The ratio varied with the training of the individual from 100:108 to 100:160, the average being 100:112. The force exerted by the legs in extending, as in rising from a squatting position, was 300-600 kgm. The passive force so exerted was 50% greater. A length-tension diagram was plotted by measuring the maximum force exerted by the legs in different degrees of extension, these being the successive positions assumed during the take-off for a high jump. The area of this diagram suffices to explain the height to which the center of gravity of the body is raised in jumping. It was found, however, that the subjects could jump down from much higher levels and still land in a squatting position. This indicates that the passive exceeds the active force. The movements of the center of gravity in the jumps were followed by moving pictures. In one subject the length-tension diagram showed 65 kgm. m. available for jumping; the work actually done in jumping up was 61 kgm. m. This subject was, however, able to "catch himself" after jumping down from such a height that his muscles had to absorb 150 kgm. m., the passive force exerted.—*W. O. Fenn.*

13177. **BOZLER, EMIL. Über die Tätigkeit der einzelnen glatten Muskelfaser bei der Kontraktion. 3. Registrierung der Kontraktionen der Chromatophorenmuskelzellen von Cephalopoden.** *Zeitschr. Wiss. Biol. Abt. C, Zeitschr. Vergleich. Physiol.* 13(4): 762-772. 8 fig. 1931.—A method is described for the registration of chromatophore movements in *Loligo vulgaris*. The movements are caused by contractions of smooth muscle cells. The time necessary for contraction after electric stimulus at 21° was in many cases only 1/7 sec., never more than ½ sec. After 13 min. with 20 stimuli a sec. the muscle was not completely fatigued. These contractions could be superimposed upon a varyingly shortened condition, caused by a tonic contraction of the same cells. The tonic contraction was inhibited by faradic stimulation. The behavior of the muscle fibers agreed in all important details with that of the sphincter muscle of pecten, which consists of 2 parts, a shortening muscle and a tonus muscle. This substantiated the earlier assumption of the existence of 2 physiologically different, contractile mechanisms in the same cell, corresponding to the 2 components of the pecten muscle.

13178. **CARDOSO, D. M. Permeabilidade muscular e phosphageno. [Muscular permeability and phosphagen.]** *Arch. Inst. Biol. Defesa Agric. e Animal* 4: 191-208. 1931.—Determinations of phosphagen were made in the gastrocnemius and sartorius muscles of *Leptodactylus ocellatus*, kept in an isotonic solution of sucrose or in Ringer solution. The phosphagen is broken down by the sucrose, but the rate of this breakdown is lowered at low temperatures. This phosphagen breakdown seems to be the immediate cause of the reduction of excitability. At 0° C. the phosphagen is very stable, and the muscles do not lose their excitability in sucrose solution.

13179. **CATTELL, McKEEN, T. P. FENG, W. HARTREE, A. V. HILL, and J. L. PARKINSON. Recovery heat in muscular contraction without lactic acid formation.** *Proc. Roy. Soc. [London] B* 108(757): 279-301. 7 fig. 1931.—Muscles poisoned with mono-iodo-acetic acid (Lundsgaard) contract without producing lactic acid. After contraction in O a delayed heat production occurs, similar to that which in normal muscles is associated with recovery. After the first 1 or 2 contractions of a poisoned muscle the "recovery" heat may be of normal amount in relation to the initial heat. After 30 or 40 twitches it is less than the normal, but still a considerable fraction of it. The heat production rate in O of a muscle poisoned with iodo-acetic acid and exhausted may remain, for long periods, far higher than that of a normal resting muscle. If the O be removed for a period the heat rate falls, and a "heat-deficit" occurs which is partly, but only partly, balanced by a "heat-excess" when O is readmitted. In a twitch or a short tetanus, as found by others, the ratio of tension developed to heat produced is entirely unaffected by poisoning with iodo-acetic acid. Functional recovery in O after stimulation, can be demonstrated under certain conditions, in muscles poisoned with iodo-acetic acid. The persistence of "recovery" heat when functional recovery has been eliminated suggests that one effect of iodo-acetic acid is to interfere with the mechanism by which the energy released in oxidation can be employed in driving the endothermic reactions necessary for functional recovery. It does not interfere with oxidation as such, at least in the concentrations used.—*From authors' summary.*

13180. **FENN, WALLACE O. The oxygen consumption of muscles made non-irritable by sugar solutions.** *Amer. Jour. Physiol.* 97(4): 635-647. 1931.—The immersion of muscles in isotonic sucrose solutions is accompanied by a small contraction of the muscle, an enormous increase in the O consumption, an increased loss of phosphoric acid, an increased lactic acid concentration, a loss of irritability, and an electrical change in the muscle which is temporarily negative but predominantly positive. Mixtures of small amounts of isotonic solutions of NaCl, $CaCl_2$, and KCl with isotonic sugar solutions behave like isotonic solutions of these salts without sugar. The immediate increase in the O consumption caused by sugar is increased by NaOH and decreased by HCl. As a rule, O consumption remains high almost indefinitely in sugar solutions unless these solutions are constantly renewed or unless they receive additions of electrolyte. Apparently any electrolyte so added brings the O consumption back to normal levels. In spontaneous non-irritability no rise in O consumption is caused by sugar, K or other agents causing contracture. Previous treatment with K prevents the rise in O consumption due to sugar. Previous treatment with sugar prevents the contracture and the rise in O consumption due to K. It is suggested that sugar non-irritability, K non-irritability and spontaneous non-irritability are all due to the same fundamental cause, which is probably a critical shift in the electrolyte balance across the cell membrane.—*Author's summary.*

13181. **GELLHORN, E. The recovery contracture in muscle; a new general salt effect.** *Biol. Bull. Marine Biol. Lab.* 60(3): 397-408. 10 fig. 1931.—If the sartorius or biceps of *Rana esculenta* is stimulated with condenser discharges in periods of 5 min. with a frequency of 45-150 per min. and stimulation periods alternate regularly with recovery periods of the same duration, a recovery contracture is brought about in the beginning of the 2nd and each following stimulation period provided the muscle is allowed to recover in an aerated salt solution. Wide changes in the K and Ca concentration of the Ringer's solution are without influence. The contracture also occurs when isotonic solutions of Na or Li salts are employed. The phenomenon is suppressed by replacing the salt with a non-electrolyte. The following observations are in favor of the assumption that the

contracture is a recovery contracture: (1) The phenomenon does not occur if the frequency is too low to produce even a slight fatigue; (2) it decreases from the 2nd to the 4th stimulation period, i.e., with increasing fatigue; (3) the changes in the shape of the contractions (Funke's Nose) during the recovery contracture show a temporal sequence just the opposite of that in fatigue. It is assumed that changes in the surface layer of the muscle cell bring about the recovery contracture. In favor of this hypothesis are the facts: (1) The recovery contracture is increased with increasing duration of the electrical discharges which were used to stimulate the muscle; (2) non-electrolytes which suppress the phenomenon bring about changes in the surface layer of cells.—*Author's summary.*

13182. **[GERSHUNI, G. V.]** ГЕРШУНИ, Г. В. Влияние симпатической нервной системы на прямую и непрямую возбудимость скелетной мышцы при механическом раздражении. [**The influence of the sympathetic nervous system on the direct and indirect excitability of skeletal muscle under mechanical stimulation.**] [English summary.] Русский Физиологический Журнал имени И. М. Сеченева (*Russ. Jour. Physiol.* 13(1): 129-144. 6 fig. 1930.—Studies were made on the sartorius muscle of the frog (*Rana temporaria*) using the Hofmann-Blaas apparatus. The mechanical excitability of the sartorius muscle is not the same in different parts of the muscle. In determining the threshold values for mechanical excitability of the most sensitive (according to Hofmann-Blaas-neural regions) regions of the muscle no difference was found between the reaction of the normal muscle and that of the muscle deprived of sympathetic innervation. In muscle with or without somatic innervation, stimulation of the sympathetic fibers does not cause any change in the mechanical irritability of the neural regions of the muscle. On stimulation of the sympathetic nerve, the indirect excitability of the muscle under mechanical stimulation undergoes changes characteristic of sympathetic effects. There is an increase in excitability which continues to rise after cessation of the stimulus and returns to the normal condition a fraction of a sec. after the end of stimulation. —*S. A. Corson.*

13183. **GRAY, J. The mechanism of ciliary movement. VI. Photographic and stroboscopic analysis of ciliary movement.** *Proc. Roy. Soc.* [*London*] *B* 107(751): 313-332. 3 pl., 10 fig. 1930.—A technique is described for obtaining a photographic record of the movement of a single living cilium and of recording the position of the cilium at suitable intervals of time. At 15°C. the abfrontal cilia of *Mytilus* have a cycle of approximately 0.35-0.45 sec.; the lateral cilia, 0.1-0.05 sec. The wave of curvature which passes along these cilia travels with an average velocity of 0.5 mm. per sec. The form of a metachronal wave can be reconstructed from the form of beat of its constituent cilia. Metachronal waves on the lateral epithelium of *Mytilus* travel at an approximate velocity of 160 μ per sec. at 15°C. and with a frequency of 16 per sec. The difference in phase between two adjacent cilia in the lateral epithelium lies between 0.001-0.003 sec.—*J. Gray.*

13184. **HANDOVSKY, HANS, und HELGA HINTNER. Über ein besonderes Verhalten der arbeitenden Skelettmuskeln kastrierter männlicher Kaninchen.** *Pflüger's Arch. Ges. Physiol.* 223(1/2): 221-231. 9 fig. 1929.—Muscles from castrated ♂♂ of the same dry weight as those from normal ♂♂ or ♀♀ contain more lactic acid. Stimulus of the M. tibialis anterior of the castrated ♂ showed that it fatigued much more quickly than the normal ♂. Stimulus of the N. ischiadius produced vasodilatation in both normal and castrate ♂♂. Therefore the fatigue of the castrate ♂♂ could not be accounted for by a poor circulation. Rather they seem unable to use lactic acid as efficiently as normal ♂♂.—*N. M. Payne.*

13185. **HEIDERMANNS, CURT. Vergleichend physiologisch-ökologische Untersuchungen an Ermüdungserscheinungen der Skelettmuskeln der Anuren.** *Zool. Jahrb. Abt. Allgem. Zool. u. Physiol. Tiere* 47(4): 723-758. 23 fig. 1930.—With 2 stimuli per sec. the gastrocnemius muscle of the different species of *Rana* is more easily fatigued than that of *Bufo vulgaris, B. calamita, Bombinator pachypus, Pelobates fuscus,* and *Hyla arborea,* but the last is just as easily fatigued as *Rana* with a load of 100 times the weight of the muscle. A line drawn so as to connect the top points of the single contractions is characteristically different for each species. The area enclosed by the top point line and the base line is a relative measure for the endurance. In tetanic stimulation the fatigue generally increases in proportion to the load, but in some species it is independent of the load. Animals collected in different ecological conditions show different reactions even after having been kept in a uniform environment.—*J. F. Wiedemann.*

13186. **HILDEBRAND, G. Y. Studies in the masticatory movements of the human lower jaw.** *Skand. Arch. Physiol.* 61: (Suppl.) 1-190. 203 fig. 1931.—This paper presents a detailed study of the movements of the infradental and uppermost condyle points in adults with normal and abnormal bites during empty chewing and mastication of various kinds of food. The usual methods of inspection and photography were employed, but in addition methods of kinematography and Roentgen kymography were developed. These registered both speed and movement of light weight indicators attached to the moving points of the jaw. In empty sagittal gliding the condyle movement is about 10 mm. The curve of the infradental point in normal cases is determined only by the overbite of the front teeth, as long as the front teeth are in contact. In empty frontal gliding in cases with deep overbite the infradental curve is determined entirely by the front teeth and canines; in other cases by both the teeth and the condyles. The character of frontal gliding in the horizontal plane, as in the caudal movement, is that of a combined movement of rotation and displacement. The condyle path commences on Camper's plane about ½ in. ventrally from the porion, goes down over the tub. artic. and up on its ventral side, finishing approximately at Camper's plane. The curve of mastication in the frontal plane is as follows: the mouth is opened to a third or rather more of the caudal position; the mandible is then moved obliquely, cranially, laterally, and usually to the side having the best conditions of articulation, to a maximal lateral position. The mandible reaches the occlusal position after an eventual gliding of the lower denture against the upper. The curve of mastication in the sagittal plane resembles the curve in the empty caudal movement. In mastication the condyles in the caudal movement go down side by side not quite to the top of the tub. artic. When the infradental point swings aside the median condyle goes down onto the tub. artic. in all likelihood medially; the lateral condyle however goes a corresponding distance backward and laterally. The nature of the food does not as a rule influence the character of the mastication curves in any respect. Crushing and grinding curves resemble each other so closely that the reasons are not clear for maintaining a distinction between these two types of movement. Deviations from the normal types of masticatory curves occur in non-normal cases. The masticatory side is as a rule chosen where most teeth are in contact during lateral gliding. The masticatory movements are not believed to be responsible for extreme wearing of the teeth.—*W. J. Meek.*

13187. **LEHNARTZ, EMIL. Über Verknüpfung des Aufbaus und Abbaus von Tätigkeitssubstanzen des Muskels.** *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 184 (1/2/3/4): 1-55. 5 fig. 1929.—When muscle press juice was made alkaline and buffered with $NaHCO_3$ a synthesis of phosphocreatine, and simultaneously a decomposition of lactacidogen and pyrophosphoric acid occurred. Addition of myoadenylic acid greatly accelerated the synthesis of pyrophosphate, but inosinic acid and adenosine were not active. It is suggested that the reversible deaminization of adenylic acid which occurs

in activity is bound in some way with the pyrophosphate metabolism.—*G. H. Hitchings.*

13188. LEHNARTZ, MARGARETE. Besteht ein bestimmtes Verhältnis zwischen Milchsäure- und Ammoniakbildung bei der Muskelkontraktion? *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 184(5): 183-195. 1929.—When a muscle was regularly stimulated at long intervals (4 sec.) the NH_3 content failed to increase whereas the lactic acid conc. rose rapidly. With shorter intervals of stimulation considerable NH_3 was produced. Thus there is no constant ratio of lactic acid to NH_3. Isometric, auxotonic, and isotonic contractions gave identical results. The failure of NH_3 to increase is attributed to resynthesis of the NH_3 precursor.—*G. H. Hitchings.*

[Lateral musculature of fishes as related to their ecology.] [In Ukrainian.] Збірник Математично-Природописно-Лікарської Секції Наукового Товариства ім. Мевченка у Львові (*Coll. Math.-Nat. Hist. Med. Sec. Sci. Soc. Shevchenko, Lwow*) 27(1/82): 16 pl. 2 fig. 1928.—A biometric study of the rhythmic motion of the lateral musculature of fishes. As a rule the coefficient of rhythmic motion is highest for caudal myotomes. In symmetrically compressed fishes the coefficient is low and the same for the whole body. In asymmetrically compressed forms the coefficient is likewise low, but higher for caudal myotomes. For sireniform and arrow-shaped forms the coefficient is the same throughout the body especially with the longer forms. In flattened fishes the coefficient is highest for the most flexible part of the body. In general the part of the body that is most active in propulsion has the highest coefficient of rhythmic motion.—*I. Rusov* (*transl. by R. F. Shaner*).

13193. RYCHLEWSKA, H. O cieple spalania mięśni żywych. [The heat of combustion of living muscles.] [French summary.] *Acta Biol. Exp.* [*Varsovie*] 1(Paper 2): 1-16. 1928.—The heat of combustion was determined in the bomb calorimeter. Match muscles were used, one set being burned in the fresh state and the other after desiccation. Drying increased the heat of combustion 1.74 ± 0.63%, showing that the processes occurring in drying are endothermic. A similar difference was found when the results were compared in terms of the amount of C found in the muscles. The heat of wetting of the dried material was determined and found to be only ¼ of the difference between the heats of combustion of the fresh and the dried muscles.—*W. O. Fenn.*

13194. BECK, CLAUDE S., and WILLIAM V. COX. The effect of pericardiostomy on the mechanics of the circulation. *Arch. Surg.* 21(6[part I]): 1023-1039. 6 fig. 1930.—In 8 experiments on dogs, the opening of the pericardial cavity to atmospheric pressure was followed by: 1) a definite sustained rise in venous pressure; 2) a fall of from 8-30 mm. of Hg in the arterial pressure, prolonged in 1 experiment, in others transient; 3) a decrease of from 15-30% in the min. vol. output of the heart. There was a return to almost normal output following closure of the pericardial opening. The production of these changes is a pressure phenomenon. Atmospheric pressure acts as an air tamponade on the heart and the great vessels within the pericardial cavity. It also produces dilatation of the pericardial cavity similar to that produced by the effusion of fluid. The authors name this mechanism pneumocardiac tamponade.

13195. BISCEGLIE, V. Sull'attività contrattile degli espianti di cuore embrionale in condizioni normali e sotto l'influenza di alcuni ormoni. [Activity of cultivated embryonic heart under normal conditions and under the influence of hormones.] *Arch. di Sci. Biol.* 13(1/2): 53-72. 1929.—The experiments were on cultures of heart muscle from chick embryos. At 2 or 3 days all heart segments possess automatic activity, contracting at most 82 times per min. At a more advanced stage of growth the automatism disappears from the ventricles, finally on the 6th or 7th day the right auricle possesses a more striking activity. As first noted by Fischer and Olivo, if two fragments of embryonic heart, of the same or different chicks, are cultivated together, after 20 hrs. culture the beat of both fragments becomes synchronous. Thyroid excites, insulin and folliculin depress, the activity.—*A. Jappelli.*

13196. BROEMSER, PH., und OTTO F. RANKE. Über die Messung des Schlagvolumens des Herzens auf unblutigem Weg. *Zeitschr. Biol.* 90(5): 467-507. 10 fig. 1930.—Using a simple schematic model of the circulation, there were derived, under various hypothetical conditions, several dimensionally correct equations which express the relation between stroke volume, pulse frequency, duration of systole and diastole, systolic and diastolic pressure and the volume-elasticity modulus of the air cushion in the schema. The derived equations were applied to a complicated model provided with an elastic tube which replaced the air cushion. From the cross-section of the tube, pulse-wave velocity and duration of systole, a simple relation was derived for the air-cushion which permitted the calculation of the cushion action of the tube during a pulsating flow through it. The derived formulae contain only values which, besides the stroke volume, can also be determined with little trouble on the actual human circulation from two pulse curves, a blood pressure measurement and a roentgenogram of the aorta. The validity range of the different equations for the actual circulation was proved by experiments on rabbits and dogs with which the values found in the equations and the volume flow in the aorta ascendens were simultaneously measured. In addition, there was determined a purely numerical fac-

tor, Z, introduced into each of the dimensionally correct equations. The following equation was determined as fitting best the relations in the circulation under widely varying conditions:

$$V = \frac{Z_F Q S T \left(\frac{p_s - p_i}{2} - p_d \right)}{D \rho c} \qquad (F)$$

in which: V = stroke volume; Q = cross section of the aorta ascendens; p_s = systolic, p_d = diastolic pressure; p_i = pressure immediately behind the incisura (all pressures measured in the aorta ascendens); S = systolic duration, D = diastolic duration; T = pulse duration; ρ = blood density; c = pulse wave velocity in the aorta; Z_F = pure numerical factor. The numerical factor, Z_F, remains almost constant in the same animal under marked circulatory changes, and has nearly the same value in the different kinds of animals. The equations offered suggest a new method for determining the stroke volume of the heart which is also applicable to man. Besides the stroke volume a value for the air-cushion action of the aorta and large vessels can be calculated and also a value for the frictional resistance in the entire peripheral vascular area. Table with experimental results from 6 animal experiments, with 80 single experiments.—*O. F. Ranke (transl. by M. Dresbach).*

13197. **DANIELOPOLU, D., L. MARCU, und G. G. PROCA. Die reflexogenen Zonen der Carotis. III. Der Effekt der mechanischen Reizung am zentralen und am peripheren Ende des Vagosympathicus.** *Zeitschr. Ges. Exp. Med.* 63(1/2): 157-162. 7 fig. 1928.—Experiments on dogs show that direct mechanical stimulation of afferent, not efferent, fibers of the exposed vago-sympathetic trunk may produce marked respiratory and cardiovascular reactions. In man it is probably stimulation of the carotid sinus which causes the effects commonly ascribed to pressure on the vagosympathetic.—*M. Dresbach.*

13199. **ELLIS, LAURENCE B., and SOMA WEISS. The measurement of capillary pressure under natural conditions and after arteriolar dilatation; in normal subjects and in patients with arterial hypertension and with arteriosclerosis.** *Jour. Clin. Investigation* 8(1): 47-67. 1929.—A study was made of the capillary pressure by the skin blanching method under natural conditions and in skin in which an arteriolar flare had been created by intradermal injection of histamine. The latter measurement was shown to have a quantitative relationship to arteriolar pressure. The average capillary pressure in 10 normal subjects was 9 mm. Hg; in 23 patients with arterial hypertension 12 mm.; and in 13 patients with senile arteriosclerosis 13 mm. The average arteriolar pressure in normal persons was 55 mm. Hg; in hypertensive patients 108 mm. and in arteriosclerotic patients 48 mm. Hypertension is due to an increased resistance in the vascular circuit. Evidence is presented that this resistance lies in the arteriolar portion, as it does in normal persons, and, in the absence of marked arteriosclerosis, is functional in character. Hypertension may be a compensatory phenomenon designed to maintain normal tissue oxidation through a normal capillary blood flow. Evidence for the basic difference between arterial hypertension and senile arteriosclerosis is given.—*L. B. Ellis.*

13200. **FILIP, LADISLAV. Electrocardiogramme post mortem.** *Rev. Med. L'Est* 57(13): 393-398. 1929.—A woman, struck down by apoplexy on the street, was carried into a near-by hospital to receive treatment, and, by chance, into the electrocardiographic laboratory. After all efforts to revive her had failed and all signs of life had disappeared, the body was connected with an electrocardiograph. At once (21 min. after the apoplectic stroke and at least 6 min. after clinical death) the galvanometer began to register pulsations at the rate of 33 per min. The curve showed in the first lead atypical ventricular complexes of pure diphasic form, such as are seen from the simple contraction of a muscle with bipolar registration; in the 2nd lead a little notch complicated the curve, which became lower in the 3rd lead. No P or auricular wave could be discerned. This rhythmic beat of 33 per min. continued for 130″; then followed an extrasystole, a pause of 20″, a new ventricular complex differing from the first lead by a notch, another pause, and so on, the ventricular complex being complicated toward the end by the appearance of a new wave—perhaps the "X wave" of Martini and Sekell. The rhythmic activity did not disappear entirely until 30′ after the stroke or 15′ after clinical death.

13201. **FOGELSON, L. J., und M. J. SCHEWLAGINA. Über die Atrio-ventrikulare Automatie. I.** *Zeitschr. Kreislaufforsch.* 21(9): 256-261. 5 fig. 1929.—The destruction of the sinus node is responsible for clinical cases of atrio-ventricular rhythm. In 1 case atropine caused a slowing of the heart and no shift in the origin of the impulse. Adrenalin caused a change to sinus rhythm. The number of cardiac contractions is determined by the location of the origin of the impulse, decreasing from the atrial to the ventricular portion of the node.—*H. M. Krueger.*

13202. **GANTER, G. Ueber die Vorgänge im Kreislauf bei der Arbeit.** *Arch. Exp. Pathol. und Pharmakol.* 138(5/6): 276-300. 15 fig. 1928.—By tying off all the branches of the right iliac down to the arteria femoralis the blood supply is limited to the muscles supplied by the sciatic of the same side. On compressing the abdominal aorta the constriction in this isolated circulatory field can be measured by the rate of fall in a manometer connected to the left iliac. On tetanic stimulation of the sciatic the circulatory area of the corresponding extremity undergoes at first a sharp vasoconstriction which however begins to pass off before the end of stimulation. After stimulation there is a marked dilatation. The initial constriction is due to stimulation of vasoconstrictor fibers in the sciatic; both reflexly and directly. On elimination of all nervous effects by the administration of ergotamine a certain amount of increased peripheral resistance still remains which is due to mechanical compression from the muscular contraction. The subsequent vasodilatation cannot now be abolished in any way. It is believed to be due to the direct action of the acid products of muscular activity. If the resistance in a fore limb is recorded it will be noted that a reflex vasoconstriction follows stimulation of the pinched end of the cut sciatic or compression of the artery to the muscles of the hind leg. This constriction in the distant fore leg is reflex, for it is abolished by ergotamine. It depends upon stimulation of the vasomotor center by the acid content of the blood which comes from the active or asphyxiated muscles. It can be delayed by preventing the venous return from the muscles concerned. If this vasoconstriction be prevented by ergotamine, a vasodilatation takes place which is due to the direct action of the acid products on the vessels of the fore limb. Ordinarily the reflex predominates over direct stimulation. In certain regions poorly provided with vasomotors, such as the coronaries, the direct action of the metabolites is more important.—*W. J. Meek.*

13208. **KIRK, ESBEN.** Untersuchungen über den Einfluss des normalen Schlafes auf die Temperatur der Füsze. *Skand. Arch. Physiol.* 61(1/3): 71-78. 5 fig. 1931.—In bed-ridden patients the temp. of the skin of the foot rises 2-6° C. shortly before sleep comes on. Sleep appears at about 35.5° and a maximum of about 37° is quickly reached. Following this there is a fall of some 2° and then a 2nd rise shortly before waking. At waking the temp. falls quickly to normal. This series of events agrees with that reported by Ipsen for narcosis. The changes are believed to be physiological, depending on reductions in tonus of skin arteries. In decompensation the initial rise may be long delayed and in old debilitated patients there may be a fall of temp. as sleep comes on.—*W. J. Meek.*

13209. **LAMPERT, FELIX.** Experimenteller Beitrag zur Denervation des Herzens. *Arch. Klin. Chir.* 155(4): 597-601. 1929.—In 25 dogs the stellate ganglion was removed and in a few the middle cervical also. The animals were then observed from a few days to 1½ years. No histological changes in heart muscle were detected. The animals were able to run 12-15 kilometres without fatigue. The heart increased in size following the operation. Electrocardiograms showed only a transitory negative T on removal of left stellate. The reaction to adrenalin was unchanged. There were no changes in condition of the hair nor any signs of muscular atrophy. Decrease in surface temperature, and in some cases pigmentation of the iris and relaxation of the nictitating membrane were noted.—*W. J. Meek.*

13210. **LIAN, C., O. VIAU, et C. VIDRASCO.** L'atypie ventriculaire en electrocardiographie. (Conception generale et valeur semeiologique.) *Ann. Med.* 26(1): 48-65. 5 fig. 1929.—This article gives a discussion of the question of QRS aberration; the relationship between abnormal ventricular complexes and cardiac insufficiency; the significance of atypical ventricular complexes; and finally the diagnostic, prognostic and therapeutic problems in patients having QRS aberration and heart disease. The authors studied the degree of QRS aberration or its absence in 250 cases. Eighty-four of these had slight, 54 moderate, failure, 45 marked heart failure, 29 doubtful failure and 39 cases had no sign of cardiac insufficiency. They conclude from their studies that while heart failure and QRS aberration are often associated, they are not necessarily related; and that although abnormality of the QRS complex is an important and serious finding, it is not an invariable accompaniment of cardiac failure. In addition to a brief discussion of the diagnostic and prognostic features of these cases they also state that, contrary to the belief of some writers, digitalis, ovabain and quinidine may be used in cases showing QRS aberration if moderation and caution are employed. Several excellent simultaneous electrocardiographic and arterial (brachial) tracings are shown.—*H. E. Jordan.*

Kioto* 12(2): 215-227. 5 fig. 1929.—Experimental investigations supplied the data for the construction of a scale with which to interpret the tambour-excursion values of sphygmographic (kymographic) records and thus to determine the degree of blood pressure. Measurement by this scale of any given point on the sphygmogram shows its specific value. Preliminary adjustment of the initial tracings is necessary to secure absolute values. Percentage values are obtainable by the method used.—*G. Miura (transl. by H. E. Jordan).*

13214. **MIURA, GEN.** Untersuchungen des Radial pulses. II. Mitteilung. Klassifikation der Formen des Radialpulses und über verschiedenes auf die Pulskurve Bezügliches. *Acta Scholae Med. Univ. Imp. Kioto* 12(2): 239-250. 1 fig. 1929.—On the basis of the percentage value of the sphygmogram 540 pulse curves of various diseases were classified in 3 groups. The pulse curve, Type I, is characterized by a maximal crest of normal apex and by little or uncertain or negligible elasticity elevation. In Type II the apex of the maximal crest is also normal, but the ascending limb indicates elasticity elevation. Pulse curve, Type II, is further divisible into 3 series depending upon the height of the incisura and the form of the recoil elevation. Type III has a rounded crest with high anacrotic notch. Pulse curves of this type are divisible into 2 series according to the elevation of the incisura. The sphygmogram reveals also certain modifying factors of the pulse curve such as age, blood pressure, and frequency and amplitude of the pulse.—*G. Miura (transl. by H. E. Jordan).*

13215. **MIURA, GEN.** Untersuchungen des Radialpulses. III. Mitteilung. Untersuchung des absteigenden Schenkels *Acta Scholae Med. Univ. Imp. Kioto* 12(2): 251-258. 5 fig. 1929.—On the basis of clinical experimental investigations, the condition of the peripheral resistance could be determined from the form of the ascending limb of the pulse curve. In cases of increased peripheral resistance, the ascending limb of the curve of the radial pulse shows an even slope; decrease of peripheral resistance is indicated by a subterminal concavity.—*G. Miura (transl. by H. E. Jordan).*

13216. **ORSI, ARRICO.** La regolazione e le alterazioni del ritmo cardiaco secondo le teorie attuali. [Regulation of cardiac rhythm and its alterations according to present theories.] *Clin. Med. Italiana* 59(2): 85-86. 1928.—A review of modern teaching and extensive literature. The author states essentially that the regularity of the cardiac rhythm under normal conditions and its pathological alterations have been explained until a few years ago from a unitary point of view, namely: that an impulse starting from the sinus node spreads over the auricles, reaches the node of Tawara and finally spreads to the ventricles over the bundle of His and its branches. Against this view several dualistic theories have been directed, among others that of Géraudel which regards the contraction of auricles and ventricles as independent of each other. These different theories are explained and their applicability in different syndromes is put to the test. The dualistic theories have, however, encountered such difficulties of elucidation that the unitary view still persists, abundantly supported by physiological and clinical experience.—*L. Braun (transl. by G. Bachmann).*

13217. **PATRIZI, L. M.** Le recenti esperienze e ipotesi sul seno carotideo non infirmano l'interpretazione classica del fenomeno Czermak-Concato (bradicardia da stimolo

meccanico diretto del vago). [The recent studies on carotid sinus do not invalidate the classic interpretation of Czermak-Concato's phenomenon (bradicardia following mechanical stimulation of the vagus).] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 668-671. 1930.—Bradycardia following mechanical stimulation of the vagi should not be attributed to stimulation of the reflexogenous area of the carotid sinus, nor to any reflex; it follows too quickly after stimulation.—*M. Comel.*

13218. POL, B. van der, and J. van der MARK. The heartbeat considered as a relaxation-oscillation and an electrical model of the heart. *Arch. Néerl. Phys. Homme et Animaux* 14(3): 418-544. 18 fig. 1929; also in *Philosoph. Mag.* 6: 763-775. 3 pl. 1928.—In § 1 and 2 the principal properties of sinusoidal and relaxation oscillations are described in general; in § 3 the characteristic properties of relaxation oscillations are described in more detail. In § 4 a system is described, based on the conception that the heartbeat is a relaxation oscillation, which shows the properties of the heart rhythm and its anomalies (system of 3 degrees of freedom). § 5 describes an electrical model of the heart, which gives, by means of relaxation oscillations produced by neon-tubes, the rhythmic properties of normal and abnormal heartbeat. The activity of each part of the heart corresponds to the flashing of neon-tubes. § 6 gives the experiments performed with the aid of this model and shows electrocardiograms of the normal rhythm, of the different stages of partial heartblock, of complete heartblock and the various types of extrasystolae; moreover it is shown how the model follows the law of all or nothing. § 7 gives the conclusion; the period of the heartbeat is determined by a relaxation-time (here a diffusion time). Finally some new possible anomalies of the rhythm are given, which can be produced by the model and were derived theoretically, but which, as far as is known to the authors, are not yet discovered or recognised in the real heart.—*B. v. d. Pol.*

13219. REIN, H., und R. ROSSLER. Die Abhängigkeit der vasomotorischen Blutdruckregulation bei akuten Blutverlusten von den thermoregulatorischen Blutverschiebungen im Gesamtkreislaufe. *Zeitschr. Biol.* 89(3): 237-248. 9 fig. 1929.—The manner in which warm blooded organisms are able to maintain a vasomotor control of both blood temperature and pressure at the same time has been investigated by means of a Reins "Thermo-Stromuhr." The average amount of blood passing through various vessels is measured simultaneously with the arterial pressure. The vessels generally chosen are the vena cava (in the closed thorax); the portal vein; the left renal vein and a peripheral vessel. The animal is submitted to different conditions which necessitate its regulating both temperature and pressure. The vessels that had already contracted to regulate the temperature are also the first that contract to regulate pressure. On the other hand those regions of the blood system where dilatation takes place to regulate the temperature are not used for the control of pressure. Thus an animal under low temperature conditions regulates its blood pressure almost exclusively by means of the peripheral vessels whereas the vessels of the splanchnic region play practically no part. Animals under high temperature, however, utilise their abdominal vessels almost exclusively for regulating pressure. The blood supply to the kidneys is profoundly influenced in temperature regulations whereas it is not used for regulating pressure.—*H. Rein (transl. by C. H. O'Donoghue).*

13220. RISER, et SOREL. La circulation cérébrale étudiée par la microphotographie. *Rev. Oto-Neuro-Ophtalmol.* 7(7): 485-492. 4 fig. 1929.—Of the 2 methods of studying the cerebral circulation, (1) registration of the cerebrospinal fluid and (2) registration of the cerebral volume and pulse, Riser and Sorel declare the 1st worthless because the pressure of the cerebrospinal fluid depends on too many factors and the 2nd, though more precise, difficult of interpretation in certain particulars. They describe a method of direct examination of the brain by trephining, opening the dura mater and illuminating the exposed field with a powerful light. For the purposes of photography (since each thoracic dilatation moves the brain 2 or 3 mm. and puts the object out of focus) natural respiration is suspended by blocking the roots of the phrenic nerves with "scurocain," and artificial respiration is established. The vessels are kept under observation, and, whenever an interesting modification is observed, respiration is interrupted for a few seconds, until a negative can be taken. The action of acetylcholin, epinephrine and CO_2 on the cerebral circulation was studied in the dog. Acetylcholin produced rapid diminution of the cerebral volume following rapid subsidence of arterial pressure. This is not due to spasm of the cerebral arteries, for comparative photography shows that the caliber of the arteries does not change; it is, instead, directly connected with general vascular hypotension and marked slowing of the systoles, reducing the blood in the viscers. Epinephrine, intravenously injected, caused a marked increase both in cerebral volume, and in arterial tension. Inhalation of CO_2 produced a diminution of cerebral volume, not great but distinct, which is not due to vascular spasm, for in ¾ of the cases the arterial vessels were immediately slightly dilated. These apparently contradictory phenomena are reconciled by the consideration that the slight arterial dilatation is compensated by the considerable drain of venous blood into the thorax produced by the forced and numerous inspirations following inhalation of CO_2. The experiments show the ease with which the brain can be passively engorged with or emptied of blood, and the need of supplementing plethysmography with direct observation and microphotography in the study of cerebral circulation.

13221. ROUS, PEYTON, and H. P. GILDING. Is the local vasodilatation after different tissue injuries referable to a single cause? *Jour. Exp. Med.* 51(1): 27-39. 2 pl. 1930.—Experiment shows that the vascular contraction responsible for Bier's spotting prevails over the local vasodilatation due to mechanical injury of the skin, and causes the local reddening to blanch. It is without effect, however, upon the local vasodilatation caused by histamine pricked into the skin. The results raise doubts concerning the validity of the hypothesis referring all local vasodilatations to the action of a single chemical substance or set of substances ("H substance"), liberated within the tissues.—*Authors' summary.*

13222. SCHERF, D. Über die Wirkung von Säure- und Alkaliinfusionen sowie von Änderungen des Gasgehaltes des Blutes auf die Extrareizbildung im Säugetierherzen. VII. *Zeitschr. Ges. Exp. Med.* 73(3/4): 382-401. 5 fig. 1930.—The following results were obtained with the dog heart, left in situ and treated beforehand with aconitine: (1) After injection of a 10% solution of NaH_2PO_4 an extrasystole originated regularly in the right heart; every other previously existing rhythm was suppressed. (2) Larger quantities of a 1 to 2% solution of lactic acid had the same action. (3) Correspondingly small amounts of a 10% soda (Na_2CO_3) solution removed the extrasystoles in the majority of the experiments; larger quantities, however, elicited a right sided extrasystole similar to that of the acids. (4) In 15 of 19 experiments the existing bigeminy was temporarily abolished by asphyxia. (5) An analysis of this action by the breathing of different gas mixtures yielded the result that extrasystoles are very sensitive to an accumulation of CO_2, but under the experimental conditions they do not react to a lack of O. (6) The extrasystole centers are much more sensitive to these very different disturbing agents than are those of the normal stimuli.—*Author's summary (transl. by M. Dresbach).*

13224. STIÉNON, E. Le pouls veineux jugulaire physiologique et son interprétation. *Ann. Inst. Chir. Bruxelles* 29(5): 81-89. 1928.—Tracings were made simultaneously of the heart beat and of the jugular

pulse. Three positive waves and two negative ones represent a complete heart beat. The first venous pulse wave corresponds to the presystolic period and the auricular systole; the second wave to the protosystolic period and the ventricular systole. The first negative venous pulse wave corresponds to the mediosystolic period and the closure of the auriculo-ventricular valve. The third positive wave corresponds to the teleosystolic or protodiastolic period, the increase of intra-auricular pressure, and the opening of the tricuspid valve. The second negative wave corresponds to the teleodiastolic period and the ventricular diastole.

13225. **WITTING, VITO, J. MARKOWITZ, and FRANK C. MANN. The rôle of glycogen in the contraction of the perfused heart of the rabbit.** *Amer. Jour. Physiol.* 94(1) : 35-40. 1930.—The unperfused hearts of 21 rabbits starved 3-6 days and subjected to convulsions from strychnine (to exhaust the glycogen) contained 0.06%-0.25% (av. 0.12%) glycogen. The hearts of 10 rabbits not subjected to strychnine convulsions (3 well fed, 7 starved 3 days) perfused with glucose-free Ringer-Locke's solution showed a glycogen content (0.03-0.13%, av. 0.094%) much below that in 7 normal rabbits starved for 3 days (0.33-0.50%, av. 0.40%). The hearts of 4 rabbits containing traces (less than 0.1%) of glycogen and perfused identically had approximately the survival period of about 4 hrs. The consumption of energy of the perfused heart is believed to be sufficiently great so as to preclude the possibility that hearts deficient in glycogen can obtain their energy from the oxidation of the remaining traces of this substance. It would appear from these observations that when glycogen is present in a heart, it is used by preference, but that when it is gone, some other foodstuff can serve as a source of energy. The value of glucose in the perfusing fluid for the heart is considered. On the basis of the authors' observations, it is suggested that the beneficial effect of glucose is not due to the fact that it is converted into glycogen.

13226. **ZWAARDEMAKER, H., et PH. ARONS. Sur l'origine de l'automatine.** *Arch. Néerland. Sci. Exactes et Nat.* Ser. 3C 12(4) : 520-528. 3 fig. 1928.—Automatine is an active automatic cardiac substance formed from the inactive mother-substance: automatinogen. The beta rays from K act on the automatinogen converting it to the active form: automatine. The nodal tissue, because it has an affinity for the substance, contains automatine in much larger quantities than are found elsewhere. Within physiological limits automatine has a positive chronotropic action on the heart.—*H. Zwaardemaker (transl. by C. Brooks).*

13229. **ANAN, SHINJI. Über die Gefässwirkung des Tetrahydro-β-naphthylamins.** (In Japanese.) *Nagasaki Igaku Kwai Zasshi* 5 : 681-695. 1927.—Small doses of tetrahydro-β-naphthylamine produce in the perfused rabbit's ear a well marked vasoconstriction after a preliminary dilatation. A somewhat weaker constrictor effect is produced in the rabbit's kidney. Constriction is also produced in the perfused frog's legs. The vasoconstrictor action of this drug is abolished by ergotamine, caffeine, ethylene diamine and large doses of atropine. Therefore it probably acts on the sympathetic nerve endings.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by A. J. Clark).*

13230. **ANDERSON, H. H. Effect of morphine sulphate by mouth on oxygen consumption in normal humans.** *Proc. Soc. Exp. Biol. & Med.* 27(2) : 102-103. 1929.—Doses of .1 mgm. to .5 mgm. per kgm. generally produced a decrease in O consumption. Respiratory rate was unchanged, pulse rate was somewhat increased. Pulse pressure was decreased in some cases and increased in others.

13231. **ANDERSON, HAMILTON H., and CHAUNCEY D. LEAKE. The oral toxicity of emetine hydrochloride and certain related compounds in rabbits and cats.** *Amer. Jour. Trop. Med.* 10(4) : 249-259. 1930.—The minimal lethal dose of emetine hydrochloride given orally in enteric coated capsules is 15 to 20 mgm./kgm. for rabbits and cats. Of emetine bismuth iodide it is 50 mgm./kgm. for rabbits and 30 to 40 mgm./kgm. for cats; of emetine antimony iodide it is 30 mgm./kgm. for rabbits and 15 to 20 mgm./kgm. for cats; of auremetine it is 100 to 125 mgm./kgm. for rabbits and 30 to 40 mgm./kgm. for cats, and of iso-amyl cephaeline phosphate it is 300 to 350 mgm./kgm. for rabbits and 200 to 250 mgm./kgm. for cats. Postmortem examination revealed degenerative injury to cardiac and smooth muscle and to liver and kidney following lethal doses of all these drugs. Since the minimal lethal dose of emetine hydrochloride by mouth is in the same range as that given subcutaneously, fairly complete absorption from the gut is indicated. Again, since the minimal lethal dose on single subcutaneous injection or on single dose by mouth is in the same range as when given in small divided doses daily, an extremely slow rate of elimination or detoxification of the drug is indicated. The significance of the toxic range of such a drug as emetine is discussed.—*Authors' summary.*

13232. **BEHRENS, BEHREND, und REINHOLD PACHUR. Zur Pharmakologie des Bleies. II. Die Verteilung und der Zustand kleinster Bleimengen im Blut. [Pharmacology of lead. II. 13236. BODANSKY, MEYER. The conversion of cyanide into thiocyanate in man and in alkaline solutions of cystine. *Jour. Pharmacol. & Exp. Therap.* 37(4): 463-474. 1 fig. 1929.—KCN in small amounts, by mouth, produced as marked an increase of the SCN content of the saliva as did an equimolecular amount of KSCN, similarly taken. This argues for the physiological conversion of CN into SCN. Evidence was presented to show that KCN reacted with cystine to yield SCN. This reaction occurred to a slight extent even in neutral sol., but was more pronounced in alkaline sol. of cystine. The amount of SCN produced was not influenced by varying the amount of KCN from 0.5 to 4.0 molar equivalents of the cystine, nor by varying the alkalinity between 0.05 and 1.0 M Na_2CO_3. On the other hand, heating the alkaline cystine solutions, before treating with CN, markedly increased their power to form thiocyanate. Apparently the S which was liberated in the alkaline decomposition of cystine (labile S) oxidized the KCN to SCN. A smaller portion of the SCN produced under these conditions was present in organic combinations as α-amino-β-sulfocyanopropionic acid.—*Author's summary.*

13237. BRAGA, C. Sull'azione farmacodinamica dei principi attivi della "Capsella bursa pastoris." [Pharmacodynamic action of the active principles of shepherd's purse.] *Ateneo Parmense* 2(2): 99-123. 1930.—A dealcoholized ext. produced a veratrin-like picture in frogs and a progressive diminution in heart rate even though atropine had previously been given. In dogs and rabbits the alcoholic preparations gave a fall in blood pressure with cardiac acceleration. A similar result was obtained in rabbits with watery preparations. The vessels of the isolated perfused ear of the rabbit were dilated, this dilatation being antagonized by epinephrine. The tone of the isolated uterus of guinea pigs and cows was lowered, but the pregnant uterus of these animals and of the human as well was stimulated.

13238. BURN, J. H., and M. L. TAINTER. An analysis of the effect of cocaine on the actions of adrenaline and tyramine. *Jour. Physiol.* 71(2): 169-193. 1931.—The main conclusions from experiments on the heart-lung preparation of the dog and isolated organs and tissues of dogs and cats are: (1) Epinephrine action is increased, that of tyramine and ephedrine diminished or abolished by cocain, both on the heart in the heart-lung preparation, and on the vessels of the hind limbs perfused by means of the Dale-Schuster pump. (2) On the isolated auricles of the cat the augmentor action of epinephrine as well as the augmentor action of tyramine is abolished by cocain; similarly on the virgin or nonpregnant uterus of the cat the inhibitor action of epinephrine as well as the inhibitor action of tyramine is greatly lessened or abolished by cocain. (3) On the isolated intestine of the cat the inhibitor action of tyramine is abolished by cocain, while that of epinephrine is variably affected. Ephedrine inhibits both the uterus and the intestine of the cat, but the diminution of these inhibitions by cocain is much more difficult to demonstrate. On the isolated cat's heart perfused with Ringer, perfusion with a weak solution of cocain, 1 in 10,000,000, diminishes the effect of epinephrine and tyramine on the heart. If, however, instead of perfusing cocain through the heart, a single dose is injected into the cannula, the injection of epinephrine immediately afterwards is followed by a greatly increased effect; the injection of tyramine immediately after the injection of cocain is followed by a diminished effect. (4) If the pupil of a cat's eye is denervated by extirpation of the superior cervical ganglion, and time allowed for full degeneration of the nerves, the pupil is now dilated by a much smaller dose of epinephrine than before, but it is not dilated at all by large doses of tyramine. Similarly only very large doses of ephedrine have even a slight dilator action. (5) Further evidence is given that tyramine has, in large dose, a histamine-like action on the vessels. It is suggested that in many respects tyramine stands between epinephrine and histamine in its physiological effects. (6) It is shown that cocain has a vaso-dilator action on the perfused hind limb, that it stimulates the virgin cat's uterus and the cat's intestine, which are inhibited by epinephrine and tyramine, and that it has no stimulant effect on the isolated auricles. It is not, therefore, a general stimulant of sympathetic endings.—*Authors' summary.*

13239. CASSINIS, U., e L. BRACALONI. Curva alcoolemica ed alcoolurica alimentari nel riposo e negli esercizi fisici. [Alimentary alcoholemic and alcoholuric curves during rest and during muscular exercise.] *Arch. Fisiol.* 29(1): 19-30. 2 fig. 1930.—During rest, and when alcohol is administered in one dose, the alcoholemic curve has a parabolic shape, showing a maximum ½-1 hr. after ingestion. The alcoholuric curve is increased, and its values are higher than those of the alcoholemic one. The rise of the latter is slower when the alcohol is taken fractionally. During running the alcoholemic content shows a marked diminution. Walking and rowing also produce a lowering of the alcoholemic curve. The alcoholuric curve has, during muscular exercise, a shape not very different from that during rest, but the quantity of alcohol eliminated during work is less than during rest. During both rest and work only a small fraction of the ingested alcohol is eliminated through the kidneys. The subjects suffer from alcohol administration, and the time necessary to perform a given exercise is greater when alcohol is taken than when the subject is fasting.—*M. Comel.*

13240. CATTELL, McKEEN, and DAYTON J. EDWARDS. Epinephrin action in relation to the hydrostatic pressure effect on the contraction of cardiac muscle. *Amer. Jour. Physiol.* 96(3): 657-661. 1931.—Epinephrine stimulates the contraction of cardiac muscle perhaps more strongly than any other known chemical substance; purely physical means (hydrostatic pressure) produce even more striking effects of the same general nature. The question of the mutual effect of these 2 agents on each other's action was studied on the isolated auricle (16 experiments) or ventricle (13 experiments) of the terrapin heart, which was so arranged that the tension of the isometric contractions was optically recorded from a torsion wire lever. The tissue was kept immersed in a chamber containing Ringer's solution to which pressure was applied or epinephrine added as required. The tension data were obtained from photographs of the response of non-rhythmic preparations to single break induction shocks. Usually the preparation was stimulated regularly at 1-min. intervals. Results indicate that the stimulating action of increased hydrostatic pressure on the tension developed by cardiac muscle is augmented by the presence of epinephrine. This augmentation is greater than the stimulation produced by epinephrine alone, indicating a synergistic action between these 2 agents. Through the combined action of pressure (1200-1600 lb.) and epinephrine (1:250,000) the average value for the tension developed was increased 70.9% in the case of the auricles and 121.4% in the case of the ventricles.

13241. CHOU, TSAN-QUO. The alkaloids of Chinese Corydalis ambigua, Cham. et Sch. (Yen-Hu-So). Part

III. Corydalis I and Monomethyl ethers of Corydalis F and G. *Chinese Jour. Physiol.* 3(3) : 301-306. 3 fig. 1929.—From the tubers of Chinese Corydalis (Yen-Hu-So), besides the 8 alkaloids (Corydalis A-H) already reported, another new alkaloid, Corydalis I, has now been isolated from fraction "2." It crystallises out in prisms; m.p. 104°; specific rotation +112.5°. It forms well crystallised salts; oxalate, prisms, m.p. 185°; hydrochloride, needles, m.p. 236°; hydrobromide, needles, m.p. 241°. Corydalis I produces a slight depression of the central nervous system in mice and rats, followed by severe convulsions ending in death. In frogs, the same depression is observed, but no convulsions. Corydalis F forms a monomethyl ether having a molecular formula $C_{21}H_{25}O_4N$, m.p. 140° C and specific rotation −275°. Corydalis F is probably l-corypalmine isolated for the first time. Corydalis G gives rise to the formation of corydaline (Corydalis A) when methylated. This proves that Corydalis G is corybulbine.—*Author's summary.*

13242. **CIUCA, M., et I. ALEXA. Traitement de la Malaria par le Stovarsol.** *Arch. Roum. Pathol. Exp. Microbiol.* 1(1) : 105-114. 1928.—Stovarsol (160 to 250 mgm. intraven.), with a total maximum dose of 1.5 gms. daily, caused a disappearance from the blood of schizogonia and gametes. Nine of 20 benign tertiary malaria patients showed marked kidney damage, as shown by the urine findings. The drug was practically without effect, administered by mouth.—*M. G. Mulinos.*

Infektionskr.* 110(3) : 516-521. 1929.—The prophylactic effect of the arsenic-pyridin compound BR 34a was found (in a series of 8 experimental mice and 4 controls) recognizable but unreliable; the therapeutic effect of its early employment was marked and unmistakable (8 out of 12 experimental mice surviving, 2 controls dying on the 4th day).

13244. **COMEL, M. Studii sulla sindrome paratireopriva. II. Azione preventiva dell'ergosterolo irradiato in dosi eccessive. [Studies on parathyroid deficiency. II. Preventive action of overdosage with irradiated ergosterol.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 11(9) : 857-860. 1930.—When a treatment with overdoses of irradiated ergosterol, subcutaneously administered, has preceded parathyroidectomy, no tetany follows it, although hypocalcemia is developed. P rises in serum, but never so much as in non-treated dogs. In a later stage Ca and P contents revert to normal values; no tetany is developed. Most animals show indefinite survival in good health. Probably a progressive hypertrophy of aberrant parathyroid tissue follows, while ergosterol would aid the animal in sustaining a first stage of acute parathyroid deficiency.—*M. Comel.*

13245. **COSTA, AURELIO. Ricerche sperimentali sul potere ipoglicemizzante del lievito di birra somministrato per via enterica. [Hypoglycema following peroral administration of beer yeast.]** *Boll. Soc. Ital. Biol. Sperim.* 5(6) : 878-881. 3 fig. 1930.—Administration of Levurinose Blaes (desiccated beer yeast) was followed by diminution of: (1) hyperglycemia caused by intravenous glucose administered to rabbits; (2) of the "glycemic area" following peroral administration of glucose; (3) of the glucose content of blood of normal rabbits. However, during the 1st hr. after yeast administration hyperglycemia occurred.—*M. Comel.*

13246. **DANIELOPOLU, D., und R. BRAUNER. Die Wirkung des Cholins auf die Morphologie des Blutes.** *Zeitschr. Klin. Med.* 115(1/2) : 261-270. 1930.—Secondary anemia was produced in 2 dogs by bleeding, and 1 treated thereafter with 7 daily injections of acetylcholine (15 mgm.-0.1 gm.). On the 7th day the red blood cells (R.B.C.) far exceeded the number before bleeding (4,000,000-2,032,000-4,820,000). The other dog showed an increase in R.B.C. but not to equal the initial count. A 3rd dog was bled, left untreated for 6 days, during which there was some increase, then treated for 10 days with injections of 0.02-0.03 gm. acetylcholine when the R.B.C. had attained the original count. The increase in reticulocytes was much more pronounced during acetylcholine treatment; the Hb did not increase proportionally to the R.B.C. Three patients with pronounced anemia were treated with acetylcholine chloride. As in the dogs, there was an increase in the R.B.C. and Hb; there was an increase in reticulocytes, and often in polychromatophilia. The authors were uncertain whether the action of choline is directly on the hematopoietic organs or by way of the autonomic system.

13247. **DAVIS, E. Relations between the actions of adrenaline, acetylcholine, and ions, on the perfused heart.** *Jour. Physiol.* 71(4) : 431-441. 2 fig. 1931.—Experiments were performed on the perfused frog heart, and repeated on the isolated perfused rabbit heart. A perfusion switch and a frog heart cannula for heart perfusions are described. *R[ana] esculenta* is less sensitive than *R. temporaria* to adrenaline; and high adrenaline concentrations in Ringer of low Ca^{++} content can cause initial depression of the *R. esculenta* heart. The stimulating effect of adrenaline is enhanced in low Ca^{++} concentration and H^+ excess; acetylcholine has a reduced inhibitory effect in low K^+ concentration and OH^- excess. After perfusion with Ringer pH 9.5 (rabbit heart) and pH 9.9 (frog heart) an "OH^- paradox" similar to the "K^+ paradox" is seen. After the frog heart has been perfused with Ringer pH 4.0-4.5, there is practically no beat on changing to normal Ringer. In normal Ringer + adrenaline, however, a normal beat is obtained, but the heart stops again in Ringer without adrenaline.

13248. **DAVIS, LOYAL, and LEWIS J. POLLOCK. The effect of atropin upon skeletal muscle tonus.** *Amer. Jour. Physiol.* 93(2) : 379-383. 1930.—Atropin, hyoscin, scopolamin and duboisin have long been known to diminish, and in some cases to abolish, muscle rigidity in some way hitherto unexplained. In 20 atropinized decerebrate cats, neck, labyrinthine and nociceptive reflexes could be elicited without qualitative or quantitative change, and crossed extensor thrusts could be evoked easily. Only one reflex activity was always affected, the muscle proprioceptive reflex. Hence it is concluded that the action of atropin on rigidity in decerebrate animals is due to its effect on the muscle proprioceptive arc.

13249. **DELARIO, A. J. Paths of absorption and excretion of sodium tetraiodophenolphthalein.** *Jour. Lab. and Clin. Med.* 16(4) : 329-340. 2 fig. 1931.—Experiments on dogs to determine the source of the uniform, homogeneous shadow seen in the large intestine after intravenous or oral administration of Na tetraiodophenolphthalein showed that, given orally or rectally, it is absorbed in both the small and the large intestine; given intravenously, it leaves the blood stream in 2-4 hrs. About 60-70% is excreted (probably unchanged) by the liver, beginning in 1-2 hrs., reaching a maximum in 5-7 hrs., and continuing a little at a time for 6-7 days. 5-10% is excreted (some in inorganic state) in the urine, and about 25% from the large intestine. Some dye is rendered insoluble as the dye-containing bile meets pancreatic juice. Fat causes greater amount of the dye to be rendered insoluble in the small intestine. Fat causes greater liver secretion of the dye, and probably greater gall bladder absorption.

13250. **DELLEPIANE, G. Ricerche chimiche sulla eliminazione dell'ossi-iodopiridon-acetato di sodio, iniettato nell'organismo per via endovenosa. [Studies on the elimination of Na oxy-iodo-pyridon-acetate endovenously administered.]** *Boll. Soc. Ital. Biol. Sperim.* 5(3) : 426-431. 2 fig. 1930—The elimination of uroselectan may be studied by radiological examination, by the determination of specific gravity of urine (which is increased) and by I determination in successive samples of urine.—*M. Comel.*

13251. **DIETRICH, S. Untersuchungen über Diabetes und Insulinwirkung. XI und XII. [Researches on diabetes and insulin action. XI and XII.]** *Arch. Exp. Pathol. und Pharmakol.* 125(5/6) : 326-342. 1927.

13252. **DOMAGK, G., und W. KIKUTH. Die Behand-**

lung der Hundepiroplasmose mit Trypaflavin. *Zentralbl. Bakt. Abt. I. Orig.* 118(7/8): 401-406. 1930.—Dogs infected with *Babesia canis* responded better to trypaflavin than to any other treatment. The fatal intravenous dose was 30 mgm. per kgm. body weight; the tolerated dose, 20 mgm. per kgm. Of 14 dogs each treated with one intravenous dose, 5 dogs received 15 mgm. per kgm., 6 received 10 mgm., and 3 received 5 mgm.; 2 of those receiving 15 mgm. were permanently deparasitized, the peripheral blood of the others remaining parasite-free for 12-19 days. Similar quantities given intramuscularly in a single dose to 6 dogs cleared the peripheral blood for 7-15 days. Of 10 dogs in the acute stage of the disease treated with single doses of 15-7.5 mgm., 7 survived, though the peripheral blood was parasite-free for but 2-17 days. The authors add that, while intramuscular treatment is slightly less effective than intravenous, 2-3 intramuscular doses at intervals of 5-6 days produced complete recovery.

13253. **DUNLOP, H. A. Adrenaline vasodilatation.** *Jour. Physiol.* 67(4): 349-355. 7 fig. 1929.—The volume of a skinned limb of a cat under ether anesthesia increased when 0.05 mgm. epinephrine was injected intravenously; this dose produced a marked rise in blood pressure. 0.005 mgm. caused a fall in blood pressure; obstruction of the abdominal aorta enhanced, clamping of the common iliacs diminished this response. During the fall in blood pressure there occurred usually a shrinkage in intestinal volume. Cardiac impairment was not observed during the fall in blood pressure. It is concluded that the lessening by ether of the effect of adrenaline on the heart enables the vasodilator action of this substance to reveal itself in the blood pressure tracing, but the principal cause of the fall in blood pressure is a diminution of vasoconstriction, whereby the dilator action is unmasked.—*G. T. Cori.*

13254. **DURHAM, FLORENCE M., J. H. GADDUM, and J. E. MARCHAL. Reports on biological standards. II. Toxicity tests for novarsenobenzene (neosalvarsan).** *Med. Res. Council [London] Spec. Rept. Ser.* 128: 6-40. 8 fig. H. M. Sta. Office: London, 1929. 9 d.—This 40 page report concerns itself with the details of providing a sound, practical test for the toxicity of novarsenobenzene and certain allies. The subject is attacked from three standpoints: the comparison of the unknown with an international standard specimen; the analysis of the variable factors occurring in the animal material; a statistical analysis of the results. Comparison is also made with similar tests used in other countries. A practical test is recommended. Owing to the fundamental nature of the problems involved, and the recognised experience of the authors in this field, this work has much wider general application than its unassuming title suggests. All persons engaged in quantitative pharmacological work would be well advised to consult the original.—*O. S. Gibbs.*

13255. **DWORKIN, SIMON. Insulin and heart rate after sympathectomy and vagotomy.** *Amer. Jour. Physiol.* 96(2): 311-320. 1931.—Insulin (3.3-6 units per kgm.) produced marked acceleration of the heart rate (due to central sympathico-adrenal impulses) in 2 out of 9 normal cats; in the others the heart rate was either unchanged or slowed (owing to central vagus stimulation or peripheral action). In a cat in which the sympathetic chains were removed, the vagi being left intact, the heart rate was retarded by insulin. While after section of the vagi, sympathetics being left intact, the heart rate was so rapid and variable as to make insulin tests unreliable, in 2 out of 3 cats so treated insulin was followed by considerable acceleration. In 2 out of 3 cats (4 out of 5 observations) in which the sympathetics to the adrenals and liver were cut, the cardiac nerves being left intact, insulin slowed the heart rate. Dworkin concludes, in accordance with findings of Bulatao and Carlson, that, while both divisions of the autonomic nervous system may be stimulated during insulin hypoglycemia, the vagus influence predominates in organs innervated by both sets of nerves. In 6 completely sympathectomized cats with heart denervated insulin had a delayed action upon the heart rate, manifested in a prolonged, though not marked slowing. This slowing developed gradually, attaining the maximum long after the lowest blood-sugar level had been reached, and some time after injection of glucose. Injected without previous insulin administration, glucose had no definite effect on heart rate in these animals. The slowing could be promptly abolished by atropine sulphate.

13256. **EATON, PAUL, and JOSEPH KRAFKA, Jr. The effect of silver nitrate, gold chloride and adrenalin on the size of the endothelial cells of arteriole, capillary and venule.** *Amer. Jour. Physiol.* 89(2): 310-314. 1 fig. 1929.—The endothelial cells in the intestines of cats injected with toxic doses of the drugs were studied in camera lucida enlargement, 100 measurements being made in each class. A comparison of the average area, length and maximum width of endothelial cell in arteriole, capillary and venule when subjected to $AgNO_3$ only, shows an increase in area associated with an increase in width. The increase in area under $AuCl_3$ is also associated with an increase in width of the cells, consistent with an increased dilatation; however, there is an increase in the arteriole and venule as well as in the capillary, hence the Au seems to be a general endothelial poison and not entirely a capillary poison. Adrenalin produces an effect on the endothelium, consisting characteristically of a series of large lobate interlocking processes, such as might be produced by local decrease in surface tension, or a change from a gel to a sol state, while the musculature shows circular constriction. No logical explanation of the contraction of the capillary cells under adrenalin is at hand The cells widen, but at the same time shorten to reduce the surface area, an effect which is readily possible in the thin walled capillary. The fact in itself is indicative of an independent activity of the endothelium, since a passive dilatation due to vascular pressure should produce a larger area than shown by the Au if the increase in size of the venule endothelium is produced by the same factor.

13257. **EITEL, HERMANN. Über eine empfindliche Methode des Urannachweises und die Lokalisation des Urans im tierischen Organismus bei der Uranvergiftung.** *Arch. Exp. Pathol. u. Pharmakol.* 135(3/4): 188-193. 2 fig. 1928.—The presence of uranium in dilutions of 1: 500,000 could be demonstrated by measuring the fluorescence of the metal in certain portions of the spectrum by means of the Hanauer ultra-violet analytical lamp. Uranium nitrate was injected into guinea pigs and rabbits and deposition in various organs studied. Deposition occurs only in the cortex of the kidney. The heart, liver, lungs, small intestines, muscle, and skin were uranium free.—*O. W. Barlow.*

13260. **FLOREY, H., A. SZENT-GYÖRGYI, and M. E. FLOREY. Methods for testing for the presence of adrenal cortex hormone.** *Jour. Physiol.* 67(4): 343-348. 5 fig. 1929.—Respiration was recorded in 2 cats decerebrated and adrenalectomized. No respiratory failure as reported by Vincent and Thompson was obtained in 5 and 9 hrs. after operation. Rapid fatigue of tetanized

muscles from adrenalized cats was observed. Lowering blood pressure by bleeding also hastened fatigue. Contraction could be restored for a short time in a fatigued muscle from adrenalectomized cats by adrenaline administration. Raising the blood pressure by injection of gum saline causes a return of contractions in a fatigued muscle. It is concluded that content of adrenal cortex hormone can not be satisfactorily determined by measurement of recovery from fatigue of muscles from adrenalized animals.—*O. O. Stoland.*

13261. **FORBES, HENRY S., HAROLD G. WOLFF, and STANLEY COBB. The cerebral circulation. X. The action of histamine.** *Amer. Jour. Physiol.* 89(2): 266-272. 1 fig. 1929.—From 21 experiments on 10 cats under amytal, 11 experiments on 5 cats under ether, and 2 experiments on cats under both amytal and ether, the authors conclude that vessels of the brain react to intravenous injection of histamine in a very different manner, depending on whether the animal is under ether or amytal anesthesia. Under amytal the vessels of the brain dilate (following intravenous injection of histamine) and the cerebrospinal fluid pressure rises. The same results follow small doses of histamine in non-anesthetized man. Under ether the vessels of the brain are already dilated, and little if any further dilatation follows the intravenous injection of histamine; instead they often become narrower and cerebrospinal fluid pressure falls. Local application of histamine to the surface of the brain always results in dilatation of the pial vessels, without noticeably affecting intracranial or systemic vascular pressures. Intravenous injection of histamine (in animals under amytal) causes great pial artery dilatation in spite of a coincident fall in systemic arterial pressure. Chemical changes in the blood are often more powerful than alterations in blood pressure as a means of regulating the caliber of the pial blood vessels in mammals.—*Authors' summary and conclusion.*

Soc. Ital. Biol. Sperim.* 5(4): 514-516. 1930.—The anions of salicylate, benzoate, cyanide and tartrate exercise an inhibiting action on tonus and automatic movements of frog's stomach. For all but tartrate an exciting action may precede the stage of inhibition.—*M. Comel.*

13264. **FUJITA, MASAO. Über die Wechselwirkung zwischen Chinin und Adrenalin an überlebenden glattmuskeligen Organen, im Vergleich zu derjenigen zwischen Atropin und Adrenalin.** (German.) *Okayama Igaku Kwai Zasshi* 39: 1545-1560. 1927.—The antagonistic action of quinine on adrenalin was studied on the isolated organs of rabbits. The stimulating effect of adrenalin is changed to inhibition when the organ has been treated in advance with 0.003-0.02% quinine solution. The experiments were performed on the uterus, round ligament of pregnant rabbits, tube, vagina, bladder, trigone and vas deferens. In organs in which adrenalin has an inhibiting effect treatment with quinine does not reverse its action. The same doses of quinine have no effect on Ba or pilocarpin action. The effect of quinine on the adrenalin action is explained by the assumption that quinine paralyzes the stimulating sympathetic fibers faster and to a higher degree than the inhibiting fibers. The action of quinine and atropin in reversing the adrenalin effect are compared. A quinine solution needs 5-6, an atropin solution 1-2 min. in order to paralyze the augmenting sympathetic fibers to the same degree. In further experiments the inversion of adrenalon action was studied. Quinine has an even stronger effect on adrenalon than adrenalin.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by G. T. Cori).*

13265. **FUJITA, MASAO, und FUJINO GENZÔ. Pharmakologische Untersuchungen an den Uterusadnexen in verschiedenen physiologischen Zuständen mit Berücksichtigung des zugehörigen Uterus. II. Versuche am Lig. latum und Lig. retundum der Katze.** *Folia Pharmacol Japonica* 8(4): 227-236. (German summary *Breviaria* 1-2.) 4 fig. 1929.—Several drugs were studied in various physiological conditions of the uterus, on the 2 ligaments. Seven poisons acted the same as on the uterus, and in all physiological conditions: papaverine inhibited; Ba, strophanthine, morphine, physostigmine, cocaine and Ca stimulated; quinine stimulated in small, but inhibited in large doses; veratrine acted much as on uterus, chiefly stimulating. The other poisons varied in action with the physiological condition, which action often differed from that on the uterus. Adrenaline relaxed the non-pregnant and puerperal round ligament, and the broad ligament in all conditions, while the pregnant and puerperal uterus was stimulated. The stimulating action of pilocarpine on both ligaments was very weak, being absent, or inhibiting in late pregnant and puerperal condition. Pituitrin had no marked action on either ligament, except at the end of pregnancy, and in the puerperium, when the action was very powerful. On the round ligament of the virgin cat inhibition often occurred. Nicotine and K produced, in all conditions on both ligaments, first inhibition, then stimulation, while on the pregnant uterus nicotine usually, and K often, caused stimulation. On the basis of these observations the innervation of both ligaments of the cat must be from the mixed fibers of the sympathetic; but the excitor fibers, being weaker in relation to the inhibitor, as in the uterus, are always suppressed in favor of the inhibitor in the broad, and in the round except during pregnancy. The parasympathetic fibers appear to be very weak in these adnexa. The condition of the musculature may also play a rôle in the action of the poisons. —*Authors' summary (transl. by R. H. M'Gonigle).*

13266. **GALBRAITH, WALTER W., and W. ARTHUR MACKEY. Uroselectan: a preliminary experimental note.** *Brit. Jour. Urol.* 2(2): 122-128. 5 fig. 1930.—Experiments were made on 7 young rabbits of 2 kg. wt., doses of 1.34 gm., 4 gm., 6.5 gm., and 10 gm. of a 40% solution of uroselectan (representing the human dose, per kgm., and multiples thereof) being injected into the ear vein. Roentgenograms were made at once and frequently thereafter; catheter specimens of urine were examined chemically and microscopically from 5 hrs. to 40 days thereafter; at the end of 24 hrs. a left nephrectomy was done in 6 animals. The rabbits showed no ill effects from the treatment; 1 showed a trace of albuminuria, 1 a larger amount, but was later found to be suffering from spontaneous focal nephritis which underwent no exacerbation because of the treatment. By kinking 1 ureter, an attempt was made to produce hydronephrosis in the 7th rabbit, but the lumen was occluded and obstruction anuria resulted. Two doses of 4 gm. each produced no appreciable ill effects.

13267. **GAY, HAROLD H. I. Effect of intravenous injections of sodium sulphide and sodium cyanide on reflex response of anterior tibialis muscle.** *Proc. Soc. Exp. Biol. & Med.* 26(9): 825-826. 1929.—Preliminary paper.

13268. **GESSNER, OTTO. Ueber die Gefässwirkung der Krampfgifte Strychnin, Pikrotoxin u. Samandarin.** *Arch. Exp. Pathol. und Pharmakol.* 129(5/6): 261-270. 3 fig. 1928.—Strychnine, picrotoxin and samandarine are inactive on the carotid strip of the calf. They constrict the vessels of the frog (method of *Läwen-Trendelenburg*). The action is reversible especially for picrotoxin but not for strychnine. The rise in blood pressure by

concentrations which produce spasms is due to central irritation.—*H. Graf.*

13269. **GESSNER, OTTO. Ueber das Gift der Ringelnatter (Tropidonotus natrix). I. Die Wirkung des Ringelnatterblutes auf das isolierte Kaltblüterherz.** *Arch. Exp. Pathol. u. Pharmakol.* 130(5/6): 374-383. 4 fig. 1928.—With the isolated frog or toad heart, arrest is produced by the defibrinated blood, plasma, or serum of *T. natrix*, either undiluted or diluted 1:5 (sometimes 1:10) with Ringer's solution. The heart usually stops in systole, more rarely in the middle position or in diastole, but always with very pronounced subsequent contraction of the cardiac muscle. The cardiac principle of the blood of *T. natrix* is certainly not a digitalis-like substance, since sensitization to Ca is not observed. This principle is very likely a saponin-like substance as it resembles the saponins (Quillaja saponin) in pharmacological action. The content of the cardiac principle in the blood of *T. natrix* is not constant.—*L. W. Butz.*

Med.* 115(3/4): 446-453. 2 fig. 1931.—Duodenal intubation and cholecystography showed that atropine or holopon atropine facilitated emptying of the gall-bladder, particularly when the drug had acted 4-5 hrs.

13277. **GREMELS, H. Über den Einfluss von Diuretica auf den Sauerstoffverbrauch am Starlingschen Nierenpräparat.** *Arch. Exp. Path. u. Pharmakol.* 140(3/4): 205-219. 3 fig. 1929.—The normal isolated kidney consumes from 40-100 cc. of O per kgm. per min. Certain diuretics, e.g., salyrgan, novasurol, strophanthin and digitoxin, produce with diuresis an increase in O consumption. Extract of the posterior lobe of the hypophysis decreases O consumption. Thyroxin has no influence on O consumption of the kidney. NaCl diuresis does not increase O consumption. O consumption runs parallel to N excretion.

13278. **GRUBER, CHARLES M. XIX. The arterial blood pressure and the blood flow in skeletal muscles in unanesthetized cats as influenced by the intravenous injection of epinephrin.** *Amer. Jour. Physiol.* 89(3): 650-661. 1929.—Epinephrine in small doses caused a rise in blood pressure during its intravenous injection in unanesthetized cats but this was followed by a prolonged fall lasting for several min. In some animals only a fall was noted. Epinephrine intravenously in small doses in unanesthetized cats caused a dilatation of the vessels of skeletal muscles like that observed in anesthetized animals even though no change in blood pressure was registered on the kymograph. No difference was noticed in the effect of larger doses of epinephrine in unanesthetized animals from that commonly observed in anesthetized animals. Epinephrine in large doses caused vaso-constriction in skeletal muscles, simultaneously with the marked rise in blood pressure. A fall in blood pressure below the normal level was observed following the increase in blood pressure from large doses of epinephrine. Concomitantly with the fall there was an increase in the blood flow from skeletal muscles.

13279. **GRUHZIT, O. M. Local microscopic changes following the administration of antisyphilitic drugs.** *Arch. Dermatol. and Syphilol.* 19(6): 922-944. 26 fig. 1929.—Administration of the arsphenamine type of drugs intramuscularly in dogs invariably results in the formation of sterile abscesses. At the end of 8 wks. the healing has shown little progress. The Hg compounds produce the same type of injury but in lesser degree. The injured areas are more rapidly fibrosed and absorbed. Bi thioglycollate causes least injury and is followed by most rapid healing.—*E. A. Smith.*

13284. **HEUBNER, WOLFGANG. Über allobiotische**

Wirkungen. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Kl.*] 1929(1): 60-64. 1929.—Experiments are reported with *o*-hydroxyquinoline (A) and iodohydroxyquinoline sulphonic acid (B) on the changes of N in dogs with balanced intake or fasting. The daily excretion was determined for N and for the drugs used. It was demonstrated with fair regularity that a few days after (A) the excretion of N fluctuated, usually with increase in urine on 3rd day. The chief effect occurred in fed animals after most of (A) had left the body. (B) behaved like (A) only in fasting animals and more weakly. Intravenously (B) also had action on urinary N in fed animals. Noteworthy with this sulfoacid is the slowness of excretion, especially in fasting, and the high proportion excreted into the intestines, especially after larger doses. A typical allobiotic reaction could not be proven for (B) but is not excluded for (A).—*W. Heubner (transl. by E. V. Lynn).*

13285. **HEYMANN, WALTER. Untersuchungen über die pharmakologische Wirksamkeit des Blutserums.** [Pharmacological action of blood serum.] *Arch. Exp. Pathol. und Pharmakol.* 125(1/2): 77-88. 1927.

13286. **HUNT, REID, and R. R. RENSHAW. Further studies on the relation of heterocyclic compounds to the autonomic nervous system.** *Jour. Pharmacol. and Exp. Ther.* 37(2): 177-191. 1929.—The action upon cats of the following compounds was investigated chiefly from the standpoint of "muscarine" and "nicotine" effects upon the autonomic nervous system: (1) Quaternary compounds of quinoline and its homologues. The ethiodides of quinoline, quinaldine, lepidine, 6-methyl-, 2, 4 and 2, 6 dimethyl-quinoline, did not have a muscarine or nicotine action. (2) Compounds and derivatives of nicotinic and picolinic acids. The phenyl esters of picolinic and nicotinic acids had no action on the autonomic nervous system; the methiodide of nicotinic acid had a weak nicotine action. Methyl (β carbamido) pyridinium iodide had a weak muscarine action; the corresponding phenyl compound was inactive; the ethyl-phenyl compound was very toxic and had a weak paralyzing nicotine action. The special relation of methyl and pyridine groups in certain classes of compounds to muscarine action was observed in several compounds of this series. The introduction of an acetyl group into the amino group of some of these compounds did not increase the muscarine action—in striking contrast to the effect of the introduction of an acetyl group into the choline (Hunt and Taveau, 1906). (3) Ethers. The phenyl ether of hydroxyethyl-N-methyl-pyrrolidinium iodide had an intense stimulating nicotine action (comparable to that of the phenyl ether of choline); analogous ethers of pyridinium and piperidinium compounds were almost inactive.—*R. Hunt.*

13287. **ISHII, RAIJI, und SAKATA SHINZŌ. Über die Beziehung zwischen der Gefässerweiterung durch Pharmaka und der Glykogenolyse.** [Orig. in Japanese.] *Folia Pharmacol. Japonica* 8(4): 269-275. (German summary, *Breviaria*, 5.) 1929.—To see whether the effect of adrenalin on the liver is due to change of vessel caliber or to a specific action, perfusion experiments were done on the toad, comparing constant pressure perfusion with constant outflow perfusion, and determining the amounts of sugar released. Quinine, papaverin and silicic acid depress glycogenolysis, histamine and sodium nitrite increase it. The amount of sugar liberated in this fashion depends not upon the width of the liver vessels, but upon the rate of perfusion flow.—*Author's summary (transl. by C. Reynolds).*

13288. **ISHIKAWA, Y. Pharmacological studies of codeine and thebaine.** [Original in Japanese; summary in English.] *Sei-I-Kwai Med. Jour.* 46(10): 1-4. 1927.—Morphine hydrochlorate, nitrosomorphine, codeine phosphate, nitrocodeine, thebaine hydrochlorate, oxycodeinone hydrochlorate, and dihydro-oxycodeine hydrochlorate increased the reflex excitability of the frog spinal cord. Injection of morphine hydrochlorate produced tetanus, except in frogs which had been warmed. The tetanus produced by morphine and its O derivatives resembled that produced by strychnine or picrotoxin. Injection of codeine, morphine, or dihydro-oxycodeine produced clonic movements in the tails of mice. Thebaine produced clonic convulsions of the limbs but no tail reaction. The minimum lethal dose of the drugs tested for the frog ranged from .5 mgm. per 10 gm. in the case of thebaine hydrochlorate to 7 mgm. per 10 gm. of dihydro-oxycodeine. The minimum lethal dose of drugs tested for the mouse ranged from .25 mgm. per 10 gm. of thebaine hydrochlorate to 5 mgm. per 10 gm. dihydro-oxycodeine. In general the toxicity of the drugs of the morphine-codeine series was of the same order for the mouse as for the frog.

13289. **JACOBS, WALTER A., and EDWIN L. GUSTUS. Strophanthin. XVII. Dehydration and lactone cleavage in isostrophanthic acid derivatives.** *Jour. Biol. Chem.* 84(1): 183-190. 1929.—Treatment of β-isostrophanthic lactone acid (I) with acetic anhydride and acetyl chloride produced a neutral, crystalline substance, $C_{25}H_{30}O_7$ (II), similar to that obtained from duodephanthondiacid. Apparently in (II): the stable lactone group of (I) was retained; the labile lactone group was opened with formation of a substituted succinic anhydride; the resultant exposed hydroxyl was removed by dehydration, forming a double bond; and the remaining free hydroxyl (2) was acetylated. The reaction occurred only when the end carboxyl of (I) was free, since the methyl ester yielded only the acetate of hydroxyl (2). Heating α-isostrophanthic lactone acid (methyl ester) with dry methyl alcohol and a little HCl formed the neutral unsaturated dimethyl ester, $C_{25}H_{34}O_7$, isomeric with the dimethyl ester of (II). The isomerization was produced not by alkali but by the free HCl. Detailed discussion and description of methods are included in the original.—*W. A. Peabody.*

13290. **JOEL, ERNST. Experimenteller Beitrag zur Behandlung der akuten Morphinvergiftung.** *Arch. Exp. Pathol. und Pharmakol.* 132(1/2): 63-76. 1928.—Experiments on rabbits, rats and mice to diminish the symptoms of acute morphine poisoning by injections of atropine were negative; atropine combined with morphine increases its action. Atropine alone in proper doses accelerates the respiration of the normal but not of the morphinized animal. Lobeline regulates the respiration of morphine poisoning even in cases of complete irregularity treated by atropine without any success. On mice it was shown that between lobeline and morphine there is an antagonism not only of their special effect upon the respiratory centers but also of the mechanism of their central action.—*H. Graf.*

13291. **JONG, H. de. Experimenteele Katatonie.** *Psychiatr. en Neurol. Bladen.* 1929(6): 481-486. 1 fig. 1929.—Average doses of bulbocapnine (alkaloid of Corydalis cara) produce a series of symptoms, resembling human catatonia, in higher animals, which have a well-developed cerebral neo-cortex. Animals without neo-cortex (frogs, serpents, fishes, etc.) give only hyperkinetic symptoms, when higher doses of bulbocapnine are given; they never present catalepsia. Very small doses of bulbocapnine produce sleep; large doses produce epilepsy in higher animals.—*H. de Jong.*

13292. **KEITH, NORMAN M., MARY WHELAN, and EDWIN G. BANNICK. The action and excretion of nitrates.** *Arch. Internal Med.* 46(5): 797-832. 1930.—Experiments on 6 normal dogs and 4 normal human subjects, and clinical tests in 6 cases of renal disease confirmed the diuretic action of nitrates, the best results being obtained from NH_4NO_3, apparently because, on absorption, the NH_4 radical is readily converted into urea, leaving the nitrate portion of the molecule free to act. Toxic results were rare.

13293. **KIONKA, H. Untersuchungen über Alkohol. III. Die Schwankungen im Alkoholgehalt des menschlichen Blutes.** *Arch. Exp. Pathol. und Pharmakol.* 128(3/6): 133-145. 1928.

ture of the larynx and oesophagus.] *Arch. Exp. Pathol. und Pharmakol.* 128(3/6): 192-201. 1928.

13295. **KOSDOBA, A. S. Zur Frage der experimentellen Adrenalinämie. I.** *Arch. Klin. Chir.* 156(1/2): 284-308. 4 fig. 1929.—Intraven. injection of epinephrine produced pathological changes in the blood vessels of rabbits. Divided doses of a unit dose of epinephrine produced greater changes than a unit dose given at one time. In the early stages of the process of blood vessel change the media shows the greatest effects. This change in the media of the vessels is believed to be associated with later production of high blood pressure in epinephrinized animals and it is the media change rather than the blood sugar increase which determines the toxicity of epinephrine. Prolonged dosage with the drug produced a partially necrotic media with Ca and connective tissue plaques and edema of the connective tissue. The adventitia was swollen and split partially in layers and in some cases the lumina of the vasa vasorum were obliterated. There was perivascular infiltration. The intima showed thickening of the connective tissue layer, and degeneration and desquamation of the endothelium. Mechanically, rise in the blood pressure was produced by hypertrophy of the muscles of the media, hypertrophy of connective tissue of the adventitia and partial necrosis of the endothelium and overdevelopment of the connective tissue of the intima.

13296. **KOSTYÁL, LADISLAUS von. Über die Calciumwirkung auf das vegetative Nervensystem bei Kindern.** *Zeitschr. Kinderheilk.* 50(2): 249-252. 1930.—The action of Ca on epinephrine sensitivity was tested in 24 children. Ca was amphotonic, or more frequently vagotonic. The vagotonic or sympathicotonic action on the blood pressure did not always correspond in the same person to the action on epinephrine sensitivity. Ca allows the 2nd phase of epinephrine sensitivity to appear more sharply.

13297. **KOZA, F. Pokus o výklad mechanismu působení plynových uhličitých lázní u arterielní hypertense. [Mechanism of carbonic acid gas baths.]** (With English, French and German summaries.) *Bratislavské Lekárske Listy* 9(11): 1163-2029. 2 fig. 1929.—The author traced the influence of the CO_2 bath in 50 cases of severe hypertension in a special apparatus. The temperature of the bath was 22 to 27°C.; its duration 20 min.; the baths were given either daily or every 2nd day. The patients experienced no subjective sensations of any kind while in the bath, and the skin did not change color. By measuring the CO_2 expired, it was proved that far less carbonic acid penetrated into the body in dry carbonic acid gas baths than in wet ones. All the cases examined reacted with fall of blood pressure. The CO_2 baths had a very favorable sedative effect on the climacteric disturbances of women, even if the blood pressure was not increased. These baths had a similarly satisfactory influence on arterial hypertension with angina pectoris. The author traced the influence of the carbonic acid on the blood pressure in rabbits with permanent arterial hypertonia that was induced in them artificially. The carbonic acid was applied in a threefold manner: 1, in the gas bath in airtight surroundings; 2, by means of intraperitoneal insufflation; and 3, by sterile application of water impregnated with carbonic acid. The animals reacted by fall of blood pressure, usually amounting to ⅔ the value of its artificial rise. In the gas bath, the blood pressure sank more slowly and the decline of pressure did not persist as long as after intraperitoneal insufflation. The infusion of sterile water heated to 37°, and impregnated with carbonic acid, causes an artificially induced hypertension to drop less intensely than insufflation does. Carbonic acid gas baths probably develop a direct influence on the peripheral vascular region. The direct action of carbonic acid on the central nervous system prevents its accumulation.—*Author's summary.*

13298. **KRATINOFF, A. G., und M. A. NOVIKOWOA. Über den Einfluss des Cholins auf die Bewegung des Verdauungstractes.** *Zeitschr. Ges. Exp. Med.* 65(3/4): 427-440. 7 fig. 1929.—By the balloon method, the effect of intraven. injections of choline on the motor activity of the digestive tract was studied in dogs and cats. With ether or chloroform narcosis, choline had little or no effect on the activity of the small intestine. With morphine, morphine-chloroform-ether or barbital narcosis, choline produced in dogs typical stimulant action on the intestinal tract. With the two latter methods of anesthesia, two phases may be distinguished, a primary depressant phase, which is paralleled by an increase of blood-pressure, followed by a second stimulant phase. This double action is especially pronounced after previous intraven. administration of pilocarpine. In decerebrate cats and dogs, choline produced a typical stimulant action. From this it appears that the condition of the neuro-muscular apparatus is an important factor in the action of choline and the paradoxical depression of choline should not be due to the choline proper, but to an existing depression of the neuro-muscular apparatus of the digestive tract.—*W. F. von Oettingen.*

13299. **KREITMAIR, H., und U. HINTZELMANN. Über sklerotische Organveränderungen, insonderheit der Arterien. I. Mitteilung: Versuche mit aktivierten Ergosterin.** *Arch. Exp. Pathol. u. Pharmakol.* 137(3/4): 203-214. 6 fig. 1928.—Very large doses of irradiated ergosterol cause deposition of Ca not only in the bones but in various organs of laboratory animals. These deposits are especially seen in those organs classed as having an acid secretion. Tremendously large doses cause a solution of Ca from the bones. The Ca is deposited in normal tissue, not in necrotic cells.—*Author's summary* (*transl.* by *C. Reynolds*).

13300. **KUBOTA, SEIKO. Some notes on the study of Chinese drugs.** *Far East. Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 583-586. 1927[1928].—Brief review of the literature, with notes.

13301. **KUROSE, IWAO. Über die Beziehung der Hypophyse zum Diabetes insipidus. Über die antidiuretische Wirkung der Hypophysenextrakte, inbesondere dieselbe des Pituitrins beim Diabetes-insipidus-kranken. II. Pharmakologische Analyse der Wirkung des Pituitrins auf die Gefässe.** (Japanese.) *Okayama Igaku Kwai Zasshi* 39: 2173-2200. 1927.—The author concludes, as a result of perfusion experiments, that the anti-diuretic action of pituitrin is largely due to contraction of the blood vessels of the kidney. While atropin is capable of suppressing the effect of adrenalin, that of pituitrin is as little affected as is that of caffein or of the Ba salts. This permits the assumption that pituitrin acts directly upon the vascular muscle or more peripherally than atropin. Atropin, in certain concentration, increases the effect of pituitrin upon the blood vessels of the liver, the stomach and the intestine. Ergotoxin has the same influence as atropin. The action of adrenalin is less than the action of pituitrin. Strong solutions of spartein annihilate the vascular action of adrenalin as well as that of pituitrin; weak solutions, on the other hand, sometimes increase the action of pituitrin.—*Author* (*courtesy Japanese Jour. Med. Sci. IV*) (*transl. by B. Fantus*).

13302. **KUWATA, SATORU, und MITSUHARU HARIMA. Untersuchung über Calystegia sepium R. Br. var. japonica Makino. I. Über die blutzuckerspiegelherabsetzende Wirkung vom Wasserextrakt derselben.** (Japanese.) *Yakugaku Zasshi* 548: 881-888. 1927.—A blood sugar reducing substance in the watery extract of this plant appears evident from the fact that 4-5 hrs. after administration, a low degree hypoglycemia is found. Further, 4-5 hrs. after administration, the hyperglycemia produced by giving adrenalin and glucose together, or glucose alone, is depressed. Due to its own high carbohydrate value, there is always a transitory increase (alimentary) in blood sugar.—*Author* (*courtesy Japanese Jour. Med. Sci. IV*) (*transl. by R. H. M'Gonigle*).

13303. **LABES, RICHARD. Über den Einfluss des Sauerstoffes auf die Adrenalinwirkung am Carotisstreifen.** *Arch. Exp. Path. u. Pharmakol.* 127(3/4): 148-152. 1928.—Strips of arteries were kept in Ringer solu-

tion through which H was bubbled. After a change from H to O the tone of the arterial strip was not altered. After 20 min. of anaerobiosis addition of adrenalin had little, after 45 min. or more it had no effect on the tone of the vessel. The artery at this time was not dead, for when O was admitted, adrenalin caused a prompt contraction. After prolonged anaerobiosis Ba salts also failed to cause a contraction.—*G. T. Cori.*

13307. **LILJESTRAND, S. H. The action of pseudoephedrine. I. On the isolated uterus and bladder.** [Chinese summary.] *Chinese Jour. Physiol.* 3 (3) : 249-268. 12 fig. 1929.—Both pseudoephedrine and ephedrine, within a certain range of concentration, act like adrenaline in relaxing the resting rat uterus (ps-ephedrine similarly relaxes the contracted fundus vesicae). Pituitrin contracts the uterus strips relaxed by the ephedrines; on oestrous uteri, however, the latter had only a slight depressant action following pituitrin. The levo-isomer, ephedrine, in various preparations of rat uteri, was from 10 to 50 times as effective as the dextro-rotatory pseudosalt. This high ratio was much reduced in experiments on other uteri and on the urinary bladder. The possible reversed action of ps-ephedrine on the rat uterus in higher dilutions than 1 in 1,000,000 was investigated, in some cases increase of tone being obtained. Results were not conclusive. Ps-ephedrine acts like pituitrin on guinea pig, rabbit and human uterus strips. But its latent period is much longer. It has a similar action on the trigone vesicae and on the relaxed fundus vesicae. The action of ps-ephedrine on the rabbit uterus is not reversed by ergotoxine as is that of adrenaline. The same fact obtains in the case of the trigone vesicae, which is innervated by the sympathetic. In both cases after ergotinization, adrenaline inhibits the ps-ephedrine action. Adrenaline also inhibits pituitrin effects, after ergotoxine. Ps-ephedrine action is of long duration in all cases. Its toxicity is relatively low; it is slowly decomposed in the tissues. It brings a contracted fundus strip down and a relaxed strip up to a median degree of tonicity. This action-inversion, depending on the tissue state, resembles that occurring with adrenaline which has been shown to affect smooth muscle according to the state of the contractile mechanism. Ps-ephedrine action is predominantly musculotropic, with marked similarity to pituitrin in the nature and length of the curve of change of tone. It is, however, much milder in action, its effect being tonic rather than contractive. Higher concentrations (1 in 5 to 10,000) give prompt and pituitrin-like effects in the rabbit uterus. In only one or two experiments were these effects absent in the pregnant rabbit uterus, in which case pituitrin also was ineffective. Other pregnant uteri gave relatively greater effects. The ratio of effectiveness of the two ephedrine isomers, while very high in their heterodox "adrenaloid" action on the rat uterus, which was shown to resemble the effect of oxygen privation, falls to almost parity in rabbit and human uteri. The probable ratio in the former was 4 to 1 in favor of ephedrine, but the latter drug was remarkably indifferent to human uterine strips.—*Author's summary.*

13312. **MACKEITH, M. H. The pharmacological action of certain synthetic alkaloidal bodies.** *Quart. Jour. Pharm. & Pharmacol.* 2 (2) : 169-173. 1929.—Twelve compounds representing steps in the synthesis of strychnine were prepared. The pharmacologic effects of these compounds were studied on frogs and rabbits. No strychnine-like action was observed with any preparation. Only 4 compounds were active, i.e., fatal, in dosages of 200-700 mgm. per kgm. of frog.—*O. W. Barlow.*

13313. **MAHLO, E. Über die Wirkung einiger Eukalyptusölarten auf Askariden.** *Arch. Kinderheilk.* 87 (1) : 46-53. 1929.—Using in vitro tests with adult ascarids from the pig, none of the eucalyptus oil products examined had fatal effects comparable to oil of chenopodium, which killed the worms in 10 to 20 min. up to dilutions of 1 : 2500, and in 30 to 45 min. at 1 : 5000.—*N. R. Stoll.*

13314. **MALOFF, G., und I. BURDI. Zur Pharmakologie der Venen. I. Mitteilung. Nervenreizversuche an der isolierten Froschleber.** *Pflüger's Arch. Ges. Physiol.* 227 (1) : 90-99. 4 fig. 1931.—The liver and duodenum of the frog with sympathetic innervation were isolated and perfused according to a method of Beresin, and flow through the vessels determined by a drop method. Usually the nerves were stimulated simultaneously, sometimes singly, by use of a "Schlittensapparats" or the alternating current of the laboratory. A 5 min. interval intervened between successive stimulations. Stimulation of the splanchnic effected a brief vasodilatation followed by a constriction. The dilatation was more pronounced, the stronger the current. A seasonal variation of tone was evidenced by the more marked vasodilator effect in autumn frogs. With lowered perfusion pressures the vasoconstrictor effect was increased. K, either in excess or as in a Ca-free Ringer's solution, produced a decreased vasoconstrictor effect, while Ca tended to increase both the effect of the vasodilators and vasoconstrictors. Atropine in 1 : 50,000 or greater concentrations decreased the effectiveness of nerve stimulation, in weaker concentrations there was little effect and that upon vasoconstrictors; ergotamine may abolish the effectiveness of nerve stimulation; however, atropine in 1 : 1000 to 1 : 20,000 or ergotamine in the perfusing fluid produce constriction of the vessels; sodium nitrite tends to increase their caliber. With adrenalin in dilute solution the effect of nerve stimulation was to increase the amount of vasoconstriction. The authors suggest that the parasympathetic system may take part in the innervation of these vessels.—*B. McGlone.*

13315. **MAMMOSER, LAMBERT F., and T. E. BOYD. Influence of various chemical agents on the absorption of histamine from the intestine.** *Proc. Soc. Exp. Biol. & Med.* 26 (9) : 765-767. 1929.—When 5 mgm. of histamine

dichloride per kgm. body wt. was introduced into the duodenum no change in blood pressure was observed. If 5 to 10 cc. of chloroform diluted with 1-2 vol. of paraffin oil was added there was a prompt and prolonged fall in blood pressure. HCl .4%, 20-40 cc. CCl_4, or ethyl alcohol 15-30% concentration 20-30 cc. when introduced into the duodenum with the histamine lowered blood pressure. NaF in 1% solution gave negative results. In the colon histamine alone produced no fall in blood pressure. When it was preceded by alcohol or .4 HCl it produced a marked fall.

13316. **MARSCHAK, M., und L. KLAUS. Untersuchungen ueber die Wärmeregulation. I. Mitteilung. Ueber die Wirkung der Wasser- und Kochsalzaufnahme auf den Kochsalzgehalt in menschlichen Schweiss und Blut bei hoher Umgebungstemperatur.** *Arch. Hyg. u. Bakt.* 101(5): 297-307. 1929.—Perspiration was collected from the forehead on filter paper. The subject was naked in 50% relative humidity. When no water was drunk, 1000 cc. of H_2O and 7 gms. of NaCl were excreted in 2 hrs. Drinking 2100 cc. of H_2O doubled these amounts. Twenty gms. of NaCl added to the 2100 cc. of H_2O had no effect on the amount excreted but prevented loss from the blood.—*F. Bernheim.*

13317. **MASCHERPA, PIETRO. L'azione farmacologica del chetocineole. Nota I. Azione generale e sull'apparato circolatorio. [Pharmacology of chetocineola. General effect on the circulatory system.]** *Arch. Internat. Pharmacodyn. et Thérap.* 36(1): 81-98. 1929.—This camphor like drug was structurally identified by Cusmano in 1912. In solutions of 1 to 1000 it retards slightly, 2 to 1000 definitely retards, and 5 to 1000 completely inhibits germination of lentils. On intact frogs .001 gm. intraperitoneally produced an initial excitement in 15 min. with torpor in 25 min. and recovery in 40 min. .05 gm. suppressed voluntary movement in 10 min., reflexes in 15 min. with prolonged torpor, and larger doses were followed by paralysis and death. In guinea pigs 0.5 gm. produced paralysis in 20 min., death in 3 hrs. A similar dose was toxic to dogs. Compared with camphor chetocineola has greater toxicity for the nervous system. On the vascular system 0.03 gm. to 0.1 gm. slowed the heart. By Straub's perfusion method 0.1 gm. greatly decreased amplitude and strength of beat, more so than camphor in the same dose. After atropine the slowing of rate does not occur and following chloral there is little change in amplitude, a reaction similar to that of camphor. Chetocineola in intravenous doses of .15 gm. produces a fall of arterial pressure in the dog. The general results of the experiments point to a camphor-like action on the central nervous system with epileptiform reaction in dogs.—*C. W. Greene.*

[Argentina]* 15 (1): 55-58. 1928.—Given by mouth to several species of birds with hemoproteus infection it had a definite and constant action on the parasites in blood and tissues, and also destroys avian trypanosomes.—*E. A. Molinelli.*

13319. **MEYER-NOBEL, KARL. Über die Beeinflussung künstlich erzeugter Krämpfe durch chronische Darreichung von Bromnatrium.** *Arch. Exp. Pathol. und Pharmakol.* 130(5/6): 365-373. 1 pl. 1928.—It has been shown that daily doses of 0.4 gm. of NaBr per kgm. over a period of 3 weeks can produce a typical poisoning. The intoxication can be rapidly corrected by the administration of NaCl. NaBr fed to animals in small dosages over a longer period, although not significantly affecting the animals, raised and even more than doubled the M.F.D. of picrotoxin. The relation between the Br concentration in an organism and the inhibition of the actions of convulsants is approximately linear.—*O. W. Barlow.*

13320. **MUNCH, JAMES C. Bioassays. A handbook of quantitative pharmacology.** 958p. 16 fig. Williams & Wilkins Co.: Baltimore, 1931. Pr. $10.—This book was prepared as a critical compilation and digest of over 17,000 references in the field of quantitative pharmacology. Over 5,000 references are included in the book itself. It is the author's hope that this compilation of available information will prevent unnecessary duplication of efforts, and will point out the need for further research based upon the information now on hand. The necessity for standardization of drugs upon animals is stressed throughout the book. Where the same samples of material have been tested by more than one method (chemical or physiological), results have been tabulated to show the nature of agreement obtained. The need for the use of a sufficient number of test animals is stressed, and the accuracy of results to be expected when assays are performed by properly trained workers is emphasized. Simple methods for statistical procedure are outlined, and formulae developed for use in determining the accuracy of experimental results. In general available information has been arranged under the various animals used. After a short historical sketch of each drug, or group of drugs, the available chemical methods for qualitative and quantitative determinations are given, with especial reference to the toxicological aspect. Information is presented on animals arranged in order of increasing zoological complexity (unicellular organisms, leeches, fish, frogs, mice, rats, rabbits, cats, dogs, monkeys and men). At the close of each section a "conclusion" is given suggesting the method of assay which is preferable and giving the accuracy of this method if such information is available. The various drugs and chemicals are grouped according to the nature of their principal pharmacological action, or according to the most suitable method of standardization. (Nervous System, Circulation, Respiration, or Muscles). An entire chapter is devoted to glandular products. Miscellaneous assays (anthelmintics, mydriatics and miotics, vitamins, etc.) are combined in the last chapter of the book. Each section of the book is considered a separate entity and has its own bibliography. Three appendices are given: (1) An index of tables; (2) An index of animals, showing the tests which may be conducted upon each animal; (3) A subject index.—*J. C. Munch.*

13321. **NAVRATIL, E. Ein Beitrag zur Kenntnis der Apomorphinwirkung.** *Arch. Exp. Pathol. und Pharmakol.* 131(3/4): 159-170. 10 fig. 1928.—Apomorphine decreases the amplitude of the ventricle and the origin and conduction of impulses in the auricle of the frog and turtle heart; these changes are reversible on washing with Ringer's solution. The characteristic responses of the ventricle to epinephrine, acetylcholine, choline, and muscarine, which are prevented by apomorphine, do not return. The inotropic effect of accelerator and vagus stimulation is destroyed due to ineffectiveness of accelerator and vagus substances rather than to failure of their liberation. The action of $BaCl_2$ on the frog heart and perfused vessels is not changed by apomorphine. The vaso-constrictor action of epinephrine in the frog vessels is destroyed, but the pressor action in rabbits is not affected.—*E. E. Nelson.*

13322. **NIKOLAEFF, M. P. Über die Wirkung des Pituitrins und Insulins auf die Sekretion und Gefässe der isolierten Nebenniere. [Action of pituitrin and insulin on the secretion and the blood vessels of the isolated adrenals.]** *Arch. Exp. Path. u. Pharmakol.* 140 (3/4): 225-236. 1929.—Solutions of pituitrin in Ringer-Locke solution increase epinephrine secretion in direct proportion to their concentration. Solutions of 1: 100,000,000 as a rule do not exert any influence on this secretion. Insulin acts much the same as pituitrin though its action is slower, but of longer duration. Repeated perfusion of the same adrenal by pituitrin or insulin produces a diminishing effect. A concentration of from 1:1000 to 1: 10,000 of pituitrin produced first a dilation, then a constriction, and then a return to the initial size. In weaker concentrations the constriction stage was shortened, in concentrations of 1: 100,000,000 it was lacking altogether, and the initial stage was a dilation.

Insulin in the same concentration acted differently on different adrenals.

13323. **NYIRI, WILLIAM, and LOUIS DuBOIS. Experimental studies on heart tonics. II. The application of biometric methods to digitalis standardization.** *Jour. Pharmacol. Exp. Ther.* 39(1): 99-109. 1930.—A question as to the practicability of applying biometric methods to digitalis standardization is raised. Data are presented to prove that Van Wyngaarden's formula is misleading and permits too great a range of experimental variation, i.e., assays which vary more than 100% may be within the rule. The suggestion is made that terms of probability should be applied with caution to biologic experiments.—*O. W. Barlow.*

13324. **OKAZAKI, YOSHITADA. Über die Uteruswirkung des Pituitrins.** (Japanese.) *Folia Pharmacol. Japonica* 6: 98-117. 1927.—The observation of Sahakos that the effect of pituitary upon the isolated uterus of the rabbit depends upon its condition as regards pregnancy is confirmed. On the non-pregnant uterus it has a marked exciting effect, while on the uterus in the beginning or the middle of pregnancy with fresh corpus luteum it exerts no effect or is inhibitory. This lack of action is probably to be ascribed to a hormone secreted by the corpus luteum. Other agents acting upon the uterus are not as markedly influenced as is pituitary.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by B. Fantus).*

13325. **OLMSTED, J. M. D., and GEORGE GIRAGOSSINTZ. Effect of amytal anesthesia on glucose tolerance.** *Proc. Soc. Exp. Biol. & Med.* 27(2): 103-106. 1929.—In amytal anesthesia the pyloric sphincter of the stomach was closed so tightly that sugar introduced into the stomach could not enter the duodenum. Sugar absorption from the duodenum was diminished when sugar was introduced.

13326. **OTTO, R. Untersuchungen über die Toxine europäischer Viperinen.** *Zeitschr. Hyg. u. Infektionskrankh.* 110(1): 82-92. 1929.—The venoms investigated were *Vipera ursinii, V. berus, V. ammodytes, V. aspis,* and *Mesocoronis.* The several venoms differed from each other in toxicity, but that of *Mesocoronis* was distinguished from the others as regards biological properties, resistance to heat, and relation to various antivenins. This venom must contain a large amount of thermostable neurotoxin.—*R. Otto (transl. by Lewis W. Butz).*

13328. **PANTSCHENKOW, M. M., und A. A. KIRSTNER. Die quantitative Bestimmung des Chinins im Blute.** *Arch. Schiffs-u. Tropen Hyg.* 32(32): 137-140. 1928.—Blood is mixed with $NaHCO_3$, heated to dryness, and the pulverized dried blood extracted with ether. The extract is evaporated and to the residue H_2SO_4 is added. The quinine sulphate thus formed is irradiated in the dark with ultraviolet light. The quinine fluoresces, and by comparison with a standard solution, the concentration is determined. The method is sensitive to quinine 1:2,000,000, and detects the presence in the blood of this substance and of its isomer, quinidine, after administration to patients in the usual way.—*H. S. Wells.*

13329. **PEARL, RAYMOND, FLORENCE BARCLAY WHITE, and JOHN RICE MINER. Age changes in alcohol tolerance in Drosophila melanogaster.** *Proc. Nat. Acad. Sci.* 15(5): 425-429. 1 fig. 1929.—A preliminary report on the results of the effect of absolute alcohol vapor on flies of different age and sex. The general result was that as flies grow older they become anesthetized more quickly, i.e., their alcohol tolerance is reduced. This seems to prove B. Gompertz's assumption that the physiological process of senescence follows a geometrical progression.—*B. W. Rhamy.*

13330. **PETERSEN, W. F., S. A. LEVINSON, and SERGIUS ARQUIN. The relation of the reaction to epinephrine to the potassium-calcium ratio and other ratios.** *Arch. Internal Med.* 42(2): 256-269. 3 fig. 1928.—Twenty-six normal and 123 pathological cases were examined for their blood pressure response to epinephrine (0.5 cc. 1:1000 sol. subc.). According to the results, the individuals were divided into sympathetic and parasympathetic groups. In a general way, but with many individual exceptions, the sympathetic group is characterized by more permeable skin capillaries, a lower blood K:Ca ratio, a higher serum globulin, a lower blood CO_2 combining power and a lessened muscular electrical reactivity in comparison with the parasympathetic group. Twelve exophthalmic goiter patients, similarly examined, corresponded closely with the most marked sympathicotonic group.—*R. G. Smith.*

13331. **POLLAK, STEPHAN. Beitrag zur Leberfunktionsprüfung mittels intravenöser Galaktoselösung.** *Wien. Arch. Inn. Med.* 21(2): 311-314. 1931.—After administration of galactose, 40 gm. perorally and 20 ccm. of 40% solution intravenously the following day, the blood sugar (B. S.) in normals reached almost identical maximums in 15-30 min. In acute parenchymal injuries, proportional to the severity of the lesion, there was delayed rise in B. S. after peroral, and delayed and lower maximum value after intravenous administration. In chronic parenchymal injuries (alcoholic cirrhosis, intoxication, and stasis cirrhosis) there were delayed and lower maxima respectively. In hepatargia the B. S. curve was almost flat; in obstructive jaundice it resembled the normal.—*From author's summary (transl.).*

13332. **POPOFF, P.** Приносъ къмъ изучването на хологога и фармакодинамичното имъ въздействие върху чернодробната секреция. **(Beitrag zum Studium der Cholagoga und ihre pharmakodinamische Beeinflussung der Gallensekretion.) [Contribution to the study of cholagogues and their pharmacodynamic influence on the secretion of bile.]** [In Bulgarian.] Годишникъ на Софийския университетъ, Ветеринарномидицински факултетъ *(Jahresber. Univ. Sofia Vet. Med. Fakultät.)* 5: 105-174. 1929.—The author tested about 50 substances on 45 dogs. Acting most strongly: atophan, atophanyl, sodium salicylate, lactic acid, camphoric acid, thymol; less strongly, peppermint, caraway, and anise oils, gamboge, chloral hydrate, boldo leaves, etc. The liver fixed basic substances as well as acid. The former gave no noteworthy, enduring increase of bile; but a specific influence was attributable to the latter.—*A. Kalojanoff (transl. by E. V. Lynn).*

13335. **RABBENO, A. Ricerche sull'azione farmacologica dell'acqua di mare. Nota III. Sulla produzione di urina e sull' eliminazione dei cloruri in seguito ad iniezioni endovenose di acqua marina. [Urinary flow and chloride elimination after venous injection of sea-water.]** *Arch. di Sci. Biol.* 14(1): 26-40. 3 fig. 1929.—The curves drawn from the data of urine secretion, toxicity, diuresis, chloride elimination following an intravenous injection of sea-water are all of the same shape.—*A. Jappelli.*

13336. **RABBENO, A. Ricerche sull' azione farmacologica dell'acqua di mare. Nota IV. Sulla produzione di urina e sull'eliminazione dei cloruri in seguito ad iniezioni endovenose di cloruro sodico. [Urinary flow and chloride elimination after venous injection of NaCl.]** *Arch. di Sci. Biol.* 14(1): 41-57. 3 fig. 1929.—After intravenous NaCl injection it may be noted that water and chloride output through the urine is greater than after sea water. Glycosuria, which may be present after sea water, is always present after NaCl.—*A. Jappelli.*

13337. **RABBENO, A. Ricerche sull'azione farma-**

cologica dell'acqua di mare. Nota V. Riassunto generale e commento critico. [Pharmacological action of sea-water.] *Arch. di Sci. Biol.* 14(1): 58-75. 1929.—A review and deductions drawn from the preceding notes I-IV. Sea-water, injected into veins of rabbits, is more toxic than a NaCl solution, and less diuretic. Toxicity, diuresis, chloride elimination vary with the injection velocity. Greater toxicity of sea-water can perhaps be referred to the greater content of Mg and to Ca deficiency.—*A. Jappelli.*

13338. **RAYMOND-HAMET.** Tropine et atropine. *Compt. Rend. Acad. Sci.* 188(11): 820-822. 1 fig. 1929.—Experiments on the intestine, in situ, indicate that tropine is antagonistic to atropine.

13339. **RAYMOND-HAMET.** Action vasculaire de l'éphédrine chez le chien normal, chez le chien yohimbinisé et chez le chien ergotaminisé. *Rev. Pharmacol. et Thérap. Expérim.* 1(4): 264-332. 1929.—Removal of both suprarenal capsules and section of both major and minor splanchnics did not diminish the rise of blood pressure produced by ephedrine. Three mgm. ephedrine per kgm. produced a prolonged, marked vasoconstriction of the spleen; and 0.1 to 3 mgm. per kgm. a similar vasoconstriction of the kidney in situ. In dogs doses of yohimbine sufficient to cause an epinephrine-reversal suppressed the renal vasoconstriction of ephedrine, diminished but did not reverse the blood pressure rise, but did not abolish the increase of cardiac tone or rate. Ergotamine in the dog prevented the vasoconstrictor action of ephedrine on the kidney and spleen, reduced, but did not reverse, the blood pressure rise, and did not abolish the increased tone or acceleration of the heart. Contrary to Curtis, epinephrine causes a marked fall and ephedrine a marked and prolonged rise of blood pressure when given in successive equimolecular doses to ergotaminized dogs. On the ergotaminized animal the blood pressure fall and the cardiac actions of epinephrine are proportional to the doses within minimal and maximal limits. Ergotamine in large doses, caused profound functional changes in the heart, with decreases in rate and force. Epinephrine, on the contrary, tends to re-establish the normal function of the ergotaminized heart. With successive injections of moderate doses of epinephrine (0.05 mgm.) in ergotaminized dogs, the first injection causes a marked rise in blood pressure followed by a fall, with a new base level established higher than before the 1st injection; whereas after the 3rd injection, one sees a feeble rise as compared to the one preceding and a drop which establishes a base level much lower than before this injection. Simultaneous study of the cardiac contractions shows that the 1st and 3rd injections exhibit their action on a heart contracting almost normally. The cardiac action of the 1st injection is therefore considerably greater than that of the 3rd, so that, for the 1st injection, it is the cardiac effect rather than the vasodilator action which is predominant, while for the 3rd injection, the vasodilator is more significant. On the other hand, a large dose of epinephrine (2 mgm.) which causes an extremely long and marked increase in cardiac rate and amplitude in the ergotaminized animal, produces, after a brief rise, a fall of carotid pressure which brings the base level much below the initial value. Here the vasodilator action is so powerful that it overcomes the marked cardiac effects.—*Author's conclusions (transl. by M. A. Seidenfeld).*

13340. **REHSTEINER, RICHARD.** Die Bedeutung der Nervenversorgung für die Acetylcholin-Contractur und den Zuckungsablauf des Skelettmuskels. *Pflüger's Arch. Ges. Physiol.* 217(3/4): 419-429. 1 fig. 1927.—A comparative study of effect of acetyl-cholin on denervated frog's muscle with effect on homologous muscle of other side with nerve intact, showed that cutting the ischiatic nerve sometimes rendered the muscle more sensitive, at other times less. The cutting of posterior roots had no definite effect on the action of acetyl-cholin. Cutting of anterior roots caused, after 9-12 days, a definite although not constant increase of sensitiveness on the operated side. The frequency of tetanic jerks and the rapidity of recovery of tired muscle were not influenced by cutting the nerve roots.—*Author's summary (transl. by T. H. Glenn).*

13342. **ROFFO, A. H., y O. CALCAGNO.** El plomo en el tratamiento del cancer. [Lead treatment in cancer.] *III. Prensa Med. Arg.* 15(28): 1225-1239; (29): 1263-1282. 18 fig. 1929.—Twenty-six patients with tumors of different types and localisation were treated with several salts of Pb and colloidal Pb prepared electrically with high and low voltage. No favorable results were obtained, sometimes they were unfavorable. No toxic symptoms were seen as toxicity of preparations was low. Sometimes when using colloidal Pb cuprocyanid secretion and odor diminished, a result due to the Cu. Tissue cultures of normal and neoplastic cells are not inhibited by even slight concentrations of colloidal Pb. Colloidal Pb vanadiate and Pb cuprocyanid inhibit growth, this is not due to the Pb as the effect persists when these salts of K are used instead of Pb. The same results are seen when studying the cytolytic power of normal and neoplastic cells in vitro.—*E. A. Molinelli.*

13343. **ROSENBLUETH, ARTURO, and TEODORO SCHLOSSBERG.** The sensitization of vascular response to "sympathin" by cocaine and the quantitation of "sympathin" in terms of adrenalin. *Amer. Jour. Physiol.* 97(2): 365-374. 1931.—The action of $NaHCO_3$, glycine, $CaCl_2$ and cocaine on the rises in blood pressure produced by injections of epinephrine in Elliott's preparation was studied in young decerebrate ♂ cats. Of these cocaine proved to be the only effective sensitizer. Cocaine is more toxic to animals deprived of their adrenal glands than to intact animals. The higher the dose of cocaine, within limits set by toxicity, the more marked are its effects. Cocaine does not increase the effectiveness of epinephrine in accelerating the heart but it sensitizes smooth muscle to epinephrine. There is a close similarity between the action of cocaine as a sensitizer of smooth muscle to epinephrine and its rôle as sensitizer to the action of sympathin. This evidence favors the view of the identity of epinephrine and sympathin. In animals with the brain pithed, the adrenals extirpated, the sciatics cut and the sympathetic chains severed at the 3rd lumbar ganglion, stimulation of the lower portion of the sympathetic, which causes contraction of pilo-motor muscles, produces a rise in blood pressure after cocaine injection which continues after the stimulus has ceased and which disappears very slowly (5 min.). Shutting off the circulation in the posterior part of the animal by pulling on a thread passed beneath the cava and aorta behind the renal vessels causes a quick rise of pressure and a quick fall when the thread is released; stimulating the lower end of the abdominal sympathetic chains during the pull on the thread produces a persistence of the rise in blood pressure after the thread is released and the stimulus stopped. The pressure falls slowly after this and is similar to the one mentioned above. The quantitation of sympathin in terms of epinephrine shows (on the average) that in a typical instance it is necessary to inject 2.4 cc. of epinephrine (1/500,000), the first 0.6 cc. at a rate of 0.1 cc. per 5 sec., the following 0.9 cc. at a rate of 0.1 cc. per 10 sec. and the last 0.9 at the rate of 0.1 cc. per 20 sec., in order to match the rise in pressure occasioned by half-min. stimulation of the sympathetic. The total amount of epinephrine thus injected is 0.000005 gm. The store of sympathin is limited under the conditions of the exp. The 1st stimulus is the most effective and the later stimuli (3 or 4) become rapidly incapable of producing any further results on the blood pressure.—*Authors' summary and conclusions.*

13344. **ROSKIN, GR., und K. ROMANOWA.** Arzneimittel und ultraviolette Strahlen. I. Mitteilung. Die Chininwirkung auf die Zelle bei gleichzeitiger Bestrahlung derselben mit ultravioletten Strahlen. *Zeitschr.*

Immunitätsforsch. 62(1/2): 147-157. 1929.—Small doses of ultraviolet rays from a quartz mercury arc have a stimulating effect upon the multiplication of Paramecium caudatum. Traumatic changes after radiation often do not appear until later generations. Equal doses of ultraviolet rays given simultaneously with diluted quinine solutions (1:100,000 to 1:300,000) quickly cause death of the paramecia, although the quinine solutions alone are not toxic. This effect seems to depend to some degree upon the lability of the plasma under the influence of the radiation and to a greater degree upon the definite increase in toxicity of the quinine solutions because of the irradiation. Plasmochin solutions (1:10,000) ordinarily kill paramecia after 3 days but when simultaneously radiated with ultraviolet rays, death takes place in a few min.—*O. Glasser.*

13345. **ROSKIN, GR., und K. ROMANOWA. Arzneimittel und ultraviolette Strahlen. II. Mitteilung. Die kombinierte Wirkung von ultravioletten Strahlen und Novarsolan auf Trypanosoma equiperdum.** *Zeitschr. Immunitätsforsch.* 62(1/2): 158-163. 1929.—Various doses of novarsolan (1:2000, 1:3000, 1:4000) have been found to have no curative effect upon mice infected with Trypanosoma equiperdum. The same doses immediately followed by ultraviolet radiation of the mouse lead to a complete sterilization of the tissue. Novarsolan in dilutions of 1:5000 and 1:6000 with subsequent irradiation usually does not produce this complete effect but seems to defer the recurrences.—*O. Glasser.*

13346. **RYDIN, HOKAN. Der Einfluss von Decholin auf den respiratorischen Umsatz von Ratten.** *Biochem. Zeitsch.* 200(1/6): 401-406. 1928.—Decholin is a very strong cholagogue and if the liver is concerned in the causation of the specific dynamic action of food the administration of decholin should increase the basal metabolic rate. Decholin given intraperitoneally or per os augmented the basal metabolism by about 12%, thus supporting the theory under consideration.—*L. H. Hyman.*

13347. **SCHMIDT, A. A., und KLARA TULJTSCHINSKAJA. Die Widerstandsfähigkeit des Insulins gegenüber einigen Bakterien.** *Biochem. Zeitschr.* 231(4/6): 352-364. 1931.—Equal volumes of active and inactivated (60° C. for 1 hr.) emulsions of *Bact[erium] coli communis, Staphylococcus aureus,* and *Streptococcus hemolyticus* of 4-6 milliards per cc. and pH 7.5 and of insulin solution (10 units per cc. in physiological saline at pH 7.5) were mixed, kept at 37° for 24 hrs., then tested on rabbits for insulin activity. Control solutions of 1 cc. insulin at pH 7.5 and 1 cc. physiological saline, and 1 cc. active emulsion and 1 cc. physiological saline, were also kept at 37° for 24 hrs. None of the insulin solutions were inactivated. A similar experiment with *B. coli* freshly obtained from the intestine of the dog had the same result. One volume of an insulin solution (20 units per cc.) was added to 4 volumes of bouillon and warmed to 60° for an hr. on each of 3 days. The medium was then used to culture *S. aureus, B. coli communis* and 2 anaerobic types isolated from the dog's intestine. One anaerobe, which gave an odor of putrefaction, caused inactivation of insulin, the other 3 did not. It would appear that the insulin molecule is attacked by proteolytic but not by peptolytic ferments; that it would be inactivated in the colon but not in the small intestine.

13348. **SCHWARZ, CARL, und HELMUTH SASSLER. Die alimentäre Glykämie in Phlorrhizindiabetes, ein Beitrag zur Phlorrhizinwirkung auf die Leber.** *Biochem. Zeitschr.* 198(4/6): 250-258. 1928.—Dogs were used and normal blood sugars as well as the course of alimentary glycosurias determined. Thereafter the animals were depleted of glycogen by injection of phlorhizin subcutaneously on 3 successive days during which time and for 2 additional days they received no food. All blood sugar determinations were made at similar times and in like manner. During the time of phlorhizin injection the blood sugar reached markedly low values but during the 2 following starvation days, it again became normal. Then the animals were given food corresponding to that in the original alimentary glycosuria experiments, either the normal high carbohydrate or the exclusive meat diet. It was noted that the peak of the blood sugar curve was reached later, rose higher and dropped more slowly in phlorhizinized than in normal dogs. These observations were interpreted as indicating injury to the glycogen forming and storing function of the liver since the renal disturbance was no longer manifested at the time of the observations.—*W. W. Herrmann.*

13349. **SCHWARZ, F. K. THEO. Die magnetische Suszeptibilität von Körperflüssigkeiten, ein neues Kriterium für die hämatopoietische Wirkung von Antianaemica.** *Zeitschr. Ges. Exp. Med.* 76(1/2): 99-107. 4 fig. 1931.—The monometric method of Quincke proved superior to one involving the angle of deviation in determining the magnetic susceptibility (M.S.) of body fluids. The results for distilled H_2O, urine, gastric juice, blood, ascites, serum, and cerebrospinal fluid varied from -0.73 to $-0.40 \cdot 10^{-6}$, similar to values of related fluids. In variations of Hb content within 10% no change in M.S. was found. A stable hemolytic anemia of about 40% Hb was then produced in rabbits (about 15) by 14 daily injections of 5 cc. distilled H_2O (M.S. of rabbit blood, Hb of 80% was $-0.50 \cdot 10^{-6}$. Daily intravenous injections of 1 cc. of 0.05% electroferrol were then made in 6 rabbits, of 0.1% colloidal siderac in 8, for 14 days; 2 served as controls (M.S. of siderac $+7.52 \cdot 10^{-6}$; electroferrol $+7.07 \cdot 10^{-6}$). There was a rapid rise in Hb with colloidal siderac, a less rapid rise with electroferrol; a parallel rise in M.S. was apparent as soon as the Hb variations exceeded 10%. The M.S. is a measure of the hematopoietic action of intravenously administered Fe solutions.

13350. **SCOLARI, ENEA GIUSEPPE. Dimostrazione istochimica delle vie di eliminazione del solfocianuro di potassio nelle ghiandole salivari. [Chemical demonstration of the means of elimination of potassium sulphocyanate in the salivary gland.]** *Boll. Soc. Med.-Chir. Pavia* 42(4): 589-600. 1928.—If a rabbit is injected with a considerable amount of KSCN, this is eliminated through the salivary gland, and mainly through the cells of the excretory ducts. The salt must be found in the salivary gland in a large quantity to render it visible by means of a precipitation with $CuSO_4 + H_2SO_3$. The organs must be loaded with it. The experiment is certainly artificial, because the animal is overloaded with a salt which normally is found only in very small quantities; and because normally the salivary secretion is not as active as under the conditions of this experiment. The most important fact noted is that the elimination of KSCN through the salivary glands is decidedly oriented towards the cells of the ducts.—*Author's summary (transl. by R. M. Biondi).*

13351. **SEIDEL, WERNER. Die Wirkung des Ergotamins (Gynergen) auf den Blutzuckerspiegel beim Kaninchen und beim Menschen. [The action of ergotamin (gynergen) on the blood sugar in rabbits and man.]** *Arch. Exp. Pathol. und Pharmakol.* 125(5/6): 269-277. 6 fig. 1927.

13352. **SIEGMUND, H., und F. KAMMERHUBER. Über Unterschiede in der Reaktionslage des Uterus von Kaninchen, Ratte, Maus und Meerschweinchen.** *Zentralbl. Gynäkol.* 55(9): 521-523. 1931.—The rabbit uterus under the influence of the corpus luteum lost contractility and tonus and did not react to posterior lobe hormone (P.L.H.); under similar circumstances the rat uterus reacted promptly. Extracts of corpus luteum from cattle and swine inhibited the response of the rabbit uterus but not of the rat uterus to P.L.H. The mouse reacted similarly to the rat both for P.L.H. and for epinephrine (loss of tonus and contractility); the guinea pig showed the same behavior to P.L.H. The author expresses no opinion as to whether a difference in hormone equilibrium or the uterus itself was responsible for the difference in reaction.

13353. **SINGER, E., und F. HODER. Oligodynamie**

in Gewebskulturen. *Arch. Exp. Zellforsch.* 8(3): 443-446. 1929.—Cu, Ag and Hg limit growth and migration of tissue cells (spleen cultures from guinea pig) and may kill tissues. Au, Pt and Pb exerted only a stimulating action on growth. It may be that these substances did not diffuse well enough through the culture medium to be toxic. Zn and glass were neutral. Mg and Fe did not exert an oligodynamic action.

13354. **SINGER, E., und F. HODER.** Wirkung von Alkoholen auf Gewebskulturen. [Action of alcohols on tissue cultures.] *Arch. Exp. Zellforsch.* 8(3): 447-451. 1929.

13355. **SINTON, J. A., W. BIRD, and B. F. ORR.** Studies in malaria with special reference to treatment. Part X. Quinine-troposan in the treatment of chronic benign tertian malaria. *Indian Jour. Med. Res.* 16(2): 333-339. 1928.—Treatment with quinine-troposan, the quinine salt of 2-oxy-5-acetylamino-phenyl arsenic acid, resulted in a relapse rate less than that usually seen after the cinchona alkaloids or quinine-stovarsol, but greater than that after plasmoquine alone or with quinine. The authors recommend that as with their other arsenical treatments the liver be protected by sugar and the kidney by bicarbonate-citrate administration, and elimination promoted by daily morning dosage with 4 gm. magnesium sulphate. Under these conditions 0.9 gm. troposan (with 1.125 gm. quinine) daily for 14 days appeared well tolerated by 44 patients.—*W. T. Dawson.*

13356. **[SMORODINTSEV, I. A., and E. V. SERKOVA.]** СМОРОДИНЦЕВ, И. А., и Е. В. СЕРКОВА. О выносливости мышей и морских свинок по отношению к экстрактам из тмина. [Tolerance of mice and guinea pigs against extracts of Carum seed.] [French summary.] Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии [*Russ. Jour. Trop. Med., Med. & Vet. Parasitol.*] 7(6): 408-411. 1929.—Seeds of Carum were treated with water, alcohol, and ether, and experiments conducted on 18 mice and 3 guinea pigs. Toxicity of dry residue of water extract was insignificant, toxic dose being as high as 1.43 gm. per 100 gm. weight of the mouse. Smaller quantities caused rapid and considerable loss of weight. Alcohol extract was more toxic; doses from 0.9 gm. to 1.3 gm. per 100 gm. weight caused death within 10-15 min. Smaller doses are not fatal, but cause persisting inflammation at the site of injection. The animal loses weight; sight is also affected—3 mice became blind. Ether extract, being insoluble in salt or water solutions, could not be tested.—*B. Van Rosen.*

13357. **STIRLING, R. F.** The treatment of canine piroplasmosis. *Far East. Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 647-653. 1927[1928].—Trypan-blue is a specific for piroplasmosis caused by *P. canis*. The formation of abscesses following the use of trypan-blue administered subcutaneously is of rare occurrence, if the solution employed for injection is duly sterilized, ordinary antiseptic precautions are taken and a suitable site is chosen for injection. Good results have been obtained by the use of tryparsamide in repeated doses in piroplasmosis due to the *P. gibsoni*. *Tryparsamide* will also rid the blood of *P. canis*. Tryparsamide can be safely used subcutaneously.—*Author's summary.*

13358. **STROSS, W.** Untersuchungen über die Wirkungsweise einiger Analeptika. III. Mitteilung. Hexeton. *Arch. Exp. Pathol. und Pharmakol.* 130(5/6): 349-364. 1928.—The paralytic effect of hexetone on frog's vagus is the same as camphor. Hexetone stimulates the heart after alcohol, but has no effect after chloroform. On the isolated heart with distended atrium or perfused with chloral, quinine or low Ca, hexetone does not show stimulation. In rabbits (urethane anesthesia) hexetone intravenously during constant ventilation, e.g., artificial respiration or pneumothorax, in some cases raises the blood-pressure but not for so long a time as coramine, nor to the same degree as cardiazol.—*H. Graf.*

13359. **SZUREK, STANISLAUS A.** Efficiency and advantages of calcium gluconate as a therapeutic agent. *Proc. Soc. Exp. Biol. & Med.* 26(9): 773-776. 1 fig. 1929.—Ca gluconate was as effective as Ca lactate in preserving the lives of thyroparathyroidectomized dogs. Ca gluconate is water soluble and tasteless. When injected subcutaneously and intramuscularly it was relatively painless.

13360. **THIENES, C. H.** Nicotine tolerance in the white rat. *Proc. Soc. Exp. Biol. & Med.* 26(9): 845-846. 1929.—Preliminary paper.

13361. **TIEFENSEE, KURT.** Pharmakologische Studien an der Bronchialmuskulatur. II. Über die Bedeutung der Blutbeschaffenheit für den Tonus der Bronchialmuskeln und ihr Ansprechen auf Gifte. *Arch. Exp. Pathol. und Pharmakol.* 139(3/4): 139-153. 1929.—Effects of alterations in alkalinity of the blood of decapitated cats upon the response of the bronchial muscle to pilocarpine, atropine, epinephrine. Pilocarpine no longer constricts the bronchi, but still slows the heart, when the blood is artificially (inhalation of air enriched with CO_2, etc.) made less alkaline. Discussion of theory of asthma.—*W. T. Dawson.*

13362. **TIEMANN, FRITZ.** Über das Atemzentrum lähmende und erregende Substanzen. [Effects of stimulant and depressant substances on the respiratory center.] *Arch. Exp. Pathol. u. Pharmakol.* 135(3/4): 213-227. 1928.—In morphine, chloral and avertin poisoning, vagus depressants increased the depression of respiratory activity in the rabbit and a depression of the excitability of the center occurred in the absence of vagal depressants. In chloral poisoning the excitability of the center decreased as the dosage increased. In avertin narcosis, an inexcitability of the vagus occurs and the effects of vagal depressants may be diminished. CO_2 was the best stimulant of the respiratory center studied. Lobelin and atrinal were less effective and atropin was ineffective. CO_2 lobelin and atrinal modify the depressant effects of vagus stimulation. Lobelin in large doses paralyzes the respiratory center and under such conditions increases the effects of vagus depression.—*O. W. Barlow.*

13363. **UHLMANN, FR.** Über eine neue Wertbestimmungsmethode für Digitalispräparate. *Arch. Exp. Path. u. Pharmakol.* 122(3/4): 219-227. 3 fig. 1927.—The method suggested consists essentially of injecting into the abdominal vein (frog) the preparation to be assayed. The time required to produce standstill of the heart by 0.005 c.c. of a 1:10,000 ouabain solution (7 min. on the average) is set at a value of 1 as the unit of activity and the principal commercial digitalis preparations, as well as other cardiac drugs, are compared with it.—*Author's summary (transl. by M. Dresbach).*

13364. **UTEWSKAJA, S. L.** Über den Einfluss der Staphylokokken auf die Funktion der Gefässe. *Zeitschr. Ges. Exp. Med.* 60(5/6): 583-590. 7 fig. 1928.—Filtrates of bouillon cultures of staphylococcus as well as extracts of the bacilli influence the circulation of the isolated rabbit's ear by affecting the vessel tonus. The filtrates of bouillon cultures of staphylococcus have a vaso-constrictor effect in direct proportion to the concentration of the filtrate, and are vaso-dilator in dilutions of 1-10,000 or less. The tonus change in the blood vessels of the isolated rabbit's ear affected in this way is not altered by heat but may be altered by alcohol. The effective agent belongs apparently to those complex toxins which result from bacterial metabolism and which are found in the medium in which the bacteria occur.—*D. Perla.*

13365. **VIVO, G. del.** A proposito dell'azione di alcuni olii essenziali sulla pigmentazione. [Action of essential oils on pigmentation.] *Gior. Ital. Derm. e Sifil.* 71(2): 467-480. 1 pl. 1930.—Experiments on 9 children and 3 young persons showed that, of the essential oils of which cologne water is ordinarily composed, only the oils of bergamot and cedar induce pigmentation in the skin exposed to the sun; the other oils are inactive. The author concludes that these oils, having entered into solution with the acids of perspiration, may be decomposed by solar irradiation (artificial irradiation had no such effect), and that among the products of decom-

position may be an irritant or revulsive substance.—*From author's summary (transl.)*.

13366. **WALLBACH, GÜNTER. Studien über die Zellaktivität. 11. Umstimmungen des Organismus, gezeigt an der Verteilung eingeführter speicherbarer Substanzen.** *Zeitschr. Ges. Exp. Med.* 60(5/6): 709-749. 1 fig. 1928.—Using mice, the influence of single injections of physiological salt solution, iodoform, pepton pantopon, insulin, adrenalin, serum, thyroid extract, pituitrin, lithium carmine on the subsequent distribution of such dyes as India ink, trypan blue, Berlin blue was studied. By changes in the vital staining capacity of different tissues the author was able to study the effects of different substances on cellular activity. Since the same drug produced variations in the staining capacity to different dyes, the author believes that each dye demands for its entrance into the cell a different physiological action. Physiological salt solution stimulated vital staining in the liver and spleen, iodoform depressed and peptone stimulated the liver Kupffer cells, pantopon stimulated the Kupffer cells but not the splenic reticulo endothelial elements; insulin markedly depressed the activity of the Kupffer cells; serum diminished and adrenalin had little effect; hypophysin stimulated the liver Kupffer cells, as did thyroid extract. The dye and the drug were injected simultaneously into the tail vein. The curves made from comparative histological quantitative estimates of dye distribution at intervals of 20, 40, 60, 80 and 100 min. following the injections can be but crude representations. Normal control curves are not given.—*D. Perla.*

13367. **WATANABE, KEIREI. Untersuchungen über die Wirkung des Stragmins, des Tetrahydroberberinchlorids, auf den Verdauungskanal.** (Japanese.) *Jikken Showaki Byogaku* 2: 1070-1076. 1927.—Stragmin has only a very weak action in frogs and rabbits. Given internally to man it slightly increases the gastric acidity, acts in small doses (0.3 gm.) as a mild laxative, but in large doses (1 gm. t.i.d.) is quite constipating.—*Author (courtesy Jap. Jour. Med. Sci. IV) (transl. by C. Reynolds).*

13371. **WOLFF, HAROLD G. The cerebral circulation. XI. The action of acetylcholine. Action of the extract of the posterior lobe of the pituitary gland. Action of amyl nitrite.** *Arch. Neurol. and Psychiatry* 22(4): 686-699. 3 fig. 1929.—The method consists, in brief, in the use of a small window screwed into a trephine hole in the skull. In the rim of this window are 2 small holes into which needles are soldered. The surface of the brain is exposed. The window is put in place, and then spinal fluid or Ringers solution may be irrigated through the needles to wash out the space under the window and to bring the intracranial pressure back to normal. With a microscope placed over the window, lateral illumination allows an observation of pial vessels up to magnification of 200 diameters. Direct measurements and photographs of the pial vessels were made, and their changes were checked with the concomitant changes observed in the general blood pressure and with the intracranial cerebrospinal fluid pressure. It was observed that the intravenous injection of acetylcholine causes dilatation of cerebral arteries, veins and minute vessels, usually a rise in cerebrospinal fluid pressure and a fall in systemic arterial pressure. Extract of the posterior lobe of the pituitary gland causes constriction of pial arteries, arterioles, veins, venules and minute vessels. Inhalation of amyl nitrite causes dilatation of all cerebral vessels, a fall in systemic arterial pressure and a rise in cerebrospinal fluid pressure. These observations indicate that in the regulation of the diameter of cerebral blood vessels, the chemical content of the blood may be of greater importance than its pressure.—*H. G. Wolff.*

Trans.* 3(2): 173-178. 2 pl. 1929.—Rabbits' and dogs' ears were removed immediately after death by bleeding. Locke's solution containing adrenalin or $NaNO_2$ was infused into the Arteria auricularis posterior. The rate at which drops of liquid came out of the Vena auricularis was recorded on an electrically equipped kymograph. At suitable intervals ears were fixed, sectioned and studied histologically. Large numbers of measurements were made of the thicknesses of artery walls and component layers under the influence of adrenalin and sodium nitrite, making possible a quantitative expression of the action of these substances.—*W. N. Berg.*

13374. **YAMAGUCHI, TOMOTAKA. Studien über Flüssigkeitsaustausch. V. Hormonale Beeinflussung des intermediären Flüssigkeitsaustausches im gesunden und sog. nierenkranken Zustande des Hundes.** (German.) *Tohoku Jour. Exp. Med.* 9: 551-616. 1927.—The action of 4 hormones, thyreoglandol, insulin, pituitrin and adrenalin, when injected into sound dogs, and dogs poisoned by cantharidin and uranium, was to change blood and tissue imbibition; such changes being greatest on cantharidin tissue, least on normal. Thyreoglandol shortened the interval before appearance, and also the degree, of tissue imbibition. These changes were ascribed to cell asphyxia due to an acute hyperthyroidism. That blood dilution, in diseased conditions, need not always be small was shown for uranium dogs. Insulin produced a considerable hyperchloremia, not qualitatively modified by the so-called kidney poisons. Adrenalin, by influencing mechanically the force of the fluid exchange, produced increased tissue tension, which, through blood imbibition, inhibited extra-vascular water exchange; so that blood thickening is not always produced by vascular contraction.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by R. H. M'Gonigle).*

13375. **YOSHIMATSU, GUNSHI. Ueber das Verhalten der aromatischen Ester gegen Organauszüge. II. Mitteilung. Ueber die Wirkung des Organextraktes auf Benzoesäureisobutylester, Benzoesäureamylester, Benzoesäureglycerinester, Salicylsäureisobutylester und Salicylsäureamylester.** *Acta Scholae Med. Univ. Imp. Kioto* 11(4): 617-638. 1929.—The author investigated the reaction of glycerin extracts from organs of the pig with the various aromatic esters and recorded the hydrolysis of tributyrin. Among the aromatic esters, the salicylic acid ester is hydrolyzed much more difficultly than the benzoic acid ester and the isobutylester is hydrolyzed much more easily than the amyl ester. All aromatic esters that were investigated are much more hydrolyzable by the glycerine extract of liver; while tributyrin is more readily hydrolyzed by pancreas pulp. According to these results, the aromatic esters behave towards extracts of animal organs just as do the simple esters.—*F. R. Greenbaum.*

13376. **YUNOKI, SH. Pharmacological investigation**

of placental vessels of rabbits. I. Effects of uterine tonics on placental vessels of rabbits. II. Effects of sympathetic and parasympathetic poisons on placental vessels of rabbits and question of presence of vasomotor [innervation] in the said vessels. III. Effects of vegetable drastics on placental vessels of rabbits. IV. Effects of diuretics belonging to purin derivatives on the placental vessels of rabbits. V. Effects of heavy metallic compounds on placental vessels of rabbits. *Kinki Fujinka-Gakkai Zasshi* 11(4): 619-723. 1928.—I. Vasomotor innervation in placental vessels has not been demonstrated with certainty, anatomically or physiologically. The placental vessels of rabbits were irrigated with various drugs to ascertain the presence of vasomotor nerves. The drugs used were: 9 representative ergot preparations, epinephrine HCl, pituitary extract, quinine HCl, cotarnine HCl, and hydrastinine HCl. Ergotamine tartrate, histamine, and tyramine (effective ingredients of ergot preparations), had always the greatest contractive effect on placental vessels, and were not affected by atropine or ergotamine. Thus these drugs supposedly affect the placental vessel muscle directly. Epinephrine HCl had almost no effect. Pituitary extract produced at first a slight contraction, but immediately slight dilatation followed.—II. Excised placental vessels of rabbits were perfused with sympathetic and parasympathetic poisons, in a study of vasomotor innervation of these vessels. Epinephrine, a strong sympathetic stimulant, was almost ineffective. Physostigmine, cocaine and other drugs regarded as attacking the muscle fibres of vessels and the nerve endings had a very intense effect. Drugs such as pilocarpine and atropine, believed to stimulate or paralyze the sympathetic and parasympathetic nerve ends acting antagonistically in other organs, showed effects on the placental vessels only. It is believed, from previous results, that in many respects the action of these drugs on the placental vessels of rabbits is not confined to muscular fibers of the blood vessels. There is considerable evidence that there is a vasomotor innervation to the placental vessels; but it would seem from the effects of these drugs that if present the vasomotor innervation in the placental vessels is extremely undeveloped and consequently much different as compared with the vasomotor nerves in other regions of the body. Accordingly the effects of these drugs on the placental vessels differ greatly from the effects on other organs. —III. The excised placentas of rabbits were irrigated with Locke's solution containing extracts of various vegetable drastics:—colocynth, aloes, cascara sagrada, rhubarb, and senna. Colocynth and aloes caused dilatation, but the effect of the latter was much weaker than that of the former. Cascara sagrada and senna produced intense contraction. Rhubarb, when diluted, caused a slight dilatation, but in stronger solution a temporary dilatation was followed by contraction; and with a concentrated solution an intense contraction was caused from the commencement of irrigation. The action of these drastics on the excised placenta is presumably attributable to their attack on the muscular fibers of the blood vessels. From the fact that rhubarb extract produced at first a dilation and then a marked contraction, it is impossible to exclude innervation entirely from the consideration of the subject.—IV. In perfusion experiments caffeine (and caffeine sodio-benzoate) produced an intense dilatation in the placental vessels of rabbits, while theobromine sodium salicylate (diuretin) and especially theocin sodium acetate caused an intense contraction. It is very interesting that these drugs, very similar in composition and effect in other regions, acted in an opposite way on the placental vessels. It may be that these purine derivatives have their point of action on the muscular fibers of the placental blood vessels. But in respect to the action of caffeine, the presence of vasomotor nerves must be taken into consideration.—V. Compounds of Hg, As, Bi, Pb, and Sb, which are soluble in water and do not coagulate albumin, were used in perfusion experiments. The effects of these on the excised placental vessels of rabbits differed from their effects on the blood vessels of other regions. Arsenic compounds (arsenious acid and arsoval) and a Pb compound (lead acetate) always produced contraction with an effective dose. An Sb compound (tartar emetic) and a Bi compound (bismuthyatren A) produced dilatation when attenuated, but when not attenuated caused contraction after a temporary dilatation. A Hg compound (Novasurol) caused contraction in most cases, after a temporary slight dilatation. It is believed that the contraction produced by all these metallic compounds in the excised placental vessels of rabbits is to be mainly attributed to their attack on the muscular fibers of the blood vessels, and that dilatation is attributable to vasomotor action.—*S. Yunoki.*

13377. **ZAWADOWSKY, B. M., und A. A. TITAJEV. Über den Einfluss organischer und anorganischer Jodpräparate auf die Mauser und Depigmentierung des Hühnergefieders.** *Wilhelm Roux' Arch. Entwicklungsmechan. Organis.* 113(3): 582-600. 5 fig. 1928.—Thyroxine, when injected into fowls, causes depigmentation and moulting. Crystalline I causes a slight depigmentation of the newly grown feathers at the site of injection but no moulting. Iodotyrosine and tryptophane with I when injected into fowls caused but feeble moulting and depigmentation. The speed of growth of the feathers growing at the site of operation and the determination of the influence of thyroxine and of thyroid gland on the growth of new feathers were determined. The effect of thyroxine on the plumage of fowls is suggested as a useful test for thyroid activity. Seasonal variations in the stability of the feathers to thyroxine were found. A possible chemical relationship between the thyroxine molecule and moulting is discussed.—*E. C. Kendall.*

Laegevidensk.* 90(8) : 813-852. 9 fig. 1929.—Based on 95 preparations of human stomachs, 87 from gross resection. Inflammation is usually confined to the pyloric gland region, while the fundus glands are attacked much later. In 27 cases with ulcus ventr., in 12 with duodenal ulcers and in 5 with stenosed scars, chronic antrum gastritis was always evident. The gastric ulcer has always developed in the pyloric gland region. In 24 operated cases, diagnosed as ulcer, where no ulcer or scar was present, chronic antrum gastritis was found. The origin of the secretory anomalies of gastritis is in the pyloric gland region, for the stimuli to and regulation of secretion of gastric juice by the fundus glands is initiated here. Hypersecretion and hyperacidity may be caused by the irritation of acute inflammation of the specific antrum epithelium. Chronic achylia is thus a result of chronic antrum gastritis. In many cases with chronic achylia the fundus gland region was quite sound. 14 cases of cancer ventr. and 5 of suspected carcinoma were studied. The so-called hyperplastic atrophic gastritis and especially polypous gastritis are true precarcinomatous conditions. Of 7 observed cases, 4 displayed definite passage to carcinoma and in an 8th, though not histologically verified, liver metastasis occurred.—*C. S. Leonard.*

[Giant cells in the faucial tonsils: histopathology of tonsillar changes in the incubation stage in measles.]** *Virchow's Arch. Path. Anat. u. Physiol.* 281(2) : 323-329. 2 fig. 1931.

13387. **FISHER, A. MURRAY, and JAMES P. BECK. Death in asthma. Report of a case with autopsy.** *Jour. Allergy* 2(3) : 149-160. 5 fig. 1931.—In a man of 32 with a typical history of asthma for 2 yrs., no definite allergic etiologic substance was found, but his allergy was thought to be bacterial in origin, and he apparently died of asphyxia during an acute attack. Small holes were found in both lungs with an escape of air into the pleural cavities, but without collapse of the lungs. The histologic picture in the lungs is characteristic of that in asthmatics, the chief findings being in the bronchioles: Plugging of the narrowed lumina of the bronchioles with thick mucus containing many eosinophils and Curschmann's spirals; great infolding of the mucosa of the bronchioles; a thickened hyalinized basement membrane; hypertrophy of the muscle wall; and infiltration of the mucosa, submucosa and mucous glands with many eosinophils and plasma cells. The tracheal mucosa contains a similar infiltration. There are also marked emphysema and hypertrophy of the right ventricle.—*Authors' summary.*

13388. **GOLDSTEIN, ISADORE, and DAVID WEXLER. Niemann-Pick's disease with cherry-red spots in the macula. Ocular pathology.** *Arch. Ophthalmol.* 5(5) : 704-716. 1 pl. (col.), 12 fig. 1931.—The prominent features were: degeneration of the ganglion cell layer of the retina, corresponding closely to that described in Tay-Sachs' disease; vacuolation of the cells of the nuclear layers, causing a striking honeycombed appearance; presence of pigmented, vacuolated cells in the choroid; presence of vacuolated histiocytes about the scleral vessels and in the episclera, and an infiltration of these cells among the fibers of the sclera; a group of ganglion cells in the episclera, in intimate contact with the ciliary nerves, exhibiting changes similar to those of the cells of the brain and of ganglion cells elsewhere in this case: granular degeneration of Nissl's substance, swelling of the cell and vacuolation of the cytoplasm. —*Authors' summary.*

13389. **HABERLAND, H. F. O. Experimentelle und klinische Studien über Kryptorchismus.** *Arch. Klin. Chir.* 163(4) : 603-613. 10 fig. 1931.—One or both testes were returned to the abdomen in 18 dogs more than 1½ yrs. old and in 8 mature guinea pigs; in the latter the testes are usually intraabdominal except at the mating period. All dogs showed adhesions between the divided gubernaculum Hunteri and the abdominal wall or peritoneum. Torsion of the pedicle occurred in 7 dogs, the direction being 6 to right, 4 to left (10 testes displaced); thereupon in 2 dogs each the divided gubernaculum Hunteri of the right and the left testis was united to a tag of peritoneum, but torsion was indifferent; the author attributes the slight predominance of right side to intestinal peristalsis directed to the right side of the abdomen. No adhesions or torsion occurred in the guinea pigs. Atrophy of the testis occurred in both dogs and guinea pigs. In none was libido affected, particularly not by the bilateral operation. The author concludes that

the body refuses to house any organ not present physiologically; malignant degeneration, however, is not to be feared, tumors being found in only 0.75% of inguinal or abdominal testes (veterinary statistics).

13390. **HANGARTER, WERNER.** Zur Histologie der Gynäkomastie. *Deutsche Zeitschr. Chir.* 231(2/4): 262-267. 1931.—In 2 ♂ gynecomastic breasts, the tissue structure lay within the physiological limits of the normal ♀ breast. The author regards gynecomasty as a secondary ♀ sexual characteristic in the ♂.

13391. **HAYNES, F.** Experimental dust inhalation in guinea-pigs. *Jour. Hyg.* 31(1): 96-123. 6 fig. 1931.—Guinea-pigs (19 groups, 12 in a group) were exposed to the various dusts for 2 hrs. a day for 2 wks.; 2 pigs were killed soon after the last exposure and the others in pairs at various intervals thereafter. The most deadly of all dusts examined was precipitated silica. Less dangerous, but all producing fibrosis, were, in order of decreasing toxicity: flint, slate, aluminium hydroxide, precipitated chalk, magnesium carbonate, and carborundum. In the concentrations used, calc-spar and emery were border-line dusts, indicating that their inhalation in any considerable quantity would cause fibrosis. Wood charcoal inhaled in large amount produced a slight fibrosis. Colloidal coal, when inhaled in massive amounts, is potentially dangerous, shale under similar conditions rather more so. Haematite, talc, and molecular mixtures of soluble silica with aluminium hydroxide and magnesium carbonate respectively caused no permanent lesions in the lung. All inhaled particles are rapidly ingested by certain cells (dust cells or phagocytes) of the alveolar epithelium, which remain in the lung parenchyma until they have ingested an amount of dust constituting the cell's saturation load (which varies with the different dusts), when it sooner or later becomes detached from the alveolar wall and either migrates into the lymphatics or becomes free in the alveolus. In the former case it passes into the pulmonary lymphoid tissue and thence to the bronchial lymph glands; in the latter, it passes up the bronchial tree to be either coughed out or swallowed. Dust cells which speedily leave the alveolar wall are principally eliminated by the bronchi. A dust cell eliminated from the lung via the lymphatics may be arrested in the periatrial lymphatics on account of its bulk. The dam thus produced offers obstruction to the passage of other dust cells shed into the alveoli. Groups of free dust cells in the obstructed alveoli form plaques, which degenerate and liberate their dust. This is again ingested, and the irritation caused by such a process may lead to fibrosis. The continued presence of dust-laden cells in the lymphatics may set up a foreign body irritation, with resulting fibrosis. Most inhaled particles contain some soluble matter: if harmless, the cell is stimulated to detach itself from the alveolar wall, and so remove the dust; if toxic, the solute affects the viability of the phagocyte, which becomes less able to detach itself. At the same time the solute irritates the neighboring tissues, with consequent fibrosis. While many dusts cause pulmonary fibrosis, silica is the dust par excellence predisposing to tuberculosis, doubtless due to its influence in forming a medium suitable for not only the survival but the proliferation of the tubercle bacillus in the lung. The harmful effects of soluble silica may be neutralized by simultaneous administration of basic dusts such as aluminium hydroxide or magnesium carbonate, though the latter are themselves harmful when inhaled alone. It is suggested that their respective solutes combine to form monosilicate. Monosilicates appear to have no harmful effect on the lung. Heavy inhalations of any dust may cause pulmonary damage. The intensity of the initial pulmonary reaction to a dust is very generally in inverse ratio to the degree of eventual damage caused by the dust.

13392. **HICKLING, R. A.** [Vital staining of malignant cells in a peritoneal effusion.] *Jour. Path. and Bact.* 34 (6): 789-791. 1 col. pl. 1931.—A description of the reactions to neutral red of living malignant cells from a peritoneal effusion, and from a portion of infiltrated omentum removed at operation, with notes on the contrasts between these cells and the cells commonly found in effusions.—*R. Wochenschr.* 39(7): 97-101. 3 fig. 1931.—A sweat gland adenoma in a dog is described, remarkable in containing the palisade arrangement of cell nuclei, a structure hitherto described only in human tumors of mesenchymal origin, typically in neurinomas. It is now shown to occur in animal tumors of ectodermal origin.—*M. C. Marsh.*

13394. **LEYTON, OTTO, HUBERT M. TURNBULL, and ALLEN B. BRATTON.** Primary cancer of the thymus with pluriglandular disturbance. *Jour. Path. and Bact.* 34(5): 635-660. 4 pl. 1931.—The authors describe 2 cases in which a small-celled medullary carcinoma of the thymus was associated with great hypertrophy of the cortex of the suprarenal bodies, functional hypertrophy of the thyroid gland, infiltration of the medulla of the suprarenal bodies with lymphocytes and plasma cells, and fatty infiltration of the centers of the hepatic lobules. One patient, a boy aged 11, developed within a month fatness of the face, conspicuous hypertrichosis of the face and prominence of the abdomen. The other, a man of 31, developed during less than a year increasing fatness of the neck and trunk, and striae atrophicae upon the abdomen. Both patients on admission to hospital had diabetes mellitus.—*H. M. Turnbull.*

13395. **LIPSCHÜTZ, B.** Ergebnisse cytologischer Untersuchungen an Geschwülsten. XIV. Untersuchungen über das Chondrom und Chondrosarkom der Maus. *Zeitschr. Krebsforsch.* 33(4): 333-347. 1 fig. 1931.—The author reports characteristic changes in the cells of mouse chondroma and chondrosarcoma similar to those previously reported by him in animal and human tumors,—the so-called plastin reaction and the appearance of the characteristically grouped intracellular bodies he terms stegosomes. The tumor studied here is of particular interest, since it represents a sarcomatous evolution of the mouse chondroma originally propagated by transplantation by Ehrlich. The findings appeared with unusual distinctness, and its use is recommended as a test preparation in similar studies.—*H. E. Eggers.*

13396. **MARINESCO, G.** Recherches sur la structure normale et pathologique de la microglie. *Ann. Anat. Path. et Anat. Normale Méd.-Chir.* 7(2): 153-199. 15 fig. 1930.—The results of this work agree with those of Hortega. Microglia occur in all parts of the central nervous system, but are more abundant in the gray than in the white substance. Their form is in close relation with the surrounding structure and varies in the different cortical layers; there is also a variation in amount. In the white substance these cells are more numerous about the blood vessels than among the myelinated fibers. The appearance in different locations is described in detail. Microglia arise from the pia mater and the vascular connective tissue. The cells migrate and change their form as they progress through the nerve tissue. They are mesodermal in origin, and act as macrophages in pathological conditions. Following traumatism, the early appearance of microglia about the focus indicates an emigration from the surrounding normal areas. Recent experiments in poliomyelitis of the monkey indicate that the cells in the sub-pial space, which present all the histochemical and morphological characters of microglia, are without doubt of mesoglial origin. Originality is added to this work by experiments on the dynamics of the morphology of microglia cells. In order to explain the polymorphism consideration is given to the physicochemical factors, as osmotic tension, surface tension and contact electricity. To this end, Ringer's solution of different pH was injected at the level of the fourth ventricle. Modifications of the microglia found in both the alkaline and acid spheres were the same as those found in other conditions. The acid gave increase in the perinuclear protoplasm, with swelling of the processes. Secondary branchings and their spines were lacking. Fol-

lowing injection of alkaline solution (pH 7.70) the lesion was greater, and of different aspect. The cells were more swollen and contained many vacuoles, some presented pseudopods. Treatment with Scharlach demonstrated no fat. To explain this cell swelling, consideration is given not only to the physicochemical factors already mentioned, but also to the digestive ferments found in these cells. Often swelling of the cells and their processes preceded phagocytosis, in which the digestive ferments (especially lipase) of the cells took part. During the globular phase, the microglia contained lipoid droplets made up largely of myelin from degenerated nerve fibers. Protease must also have been present, for some cells contained fragments of axis cylinders as well as red blood corpuscles and bacteria. Change in osmotic tension by injection of distilled water into the cisterna caused, especially in the cerebellum, swelling of the cell processes and reduction in their number. The intensity of the process was variable and included all the different forms of microglia cells. The lesion diminished in severity from the surface downward. Trypan blue was also injected into the cisterna with resulting increase of cytoplasm and swelling of processes. This lesion was somewhat similar to that following repeated injections of acid Ringer's solution (pH 6.10). In all of these injection experiments, alterations were present not only in the microglia, but also in the brain cells.—*A. E. Taft.*

[Messina]* 12(2): 101-124. 1931.—Author presents the clinical, hematological and histopathological findings of a new form of hemolytic anemia.—*N. A. Michels.*

13398. MIGUNOW, B. I. Primäre spontane Neubildungen bei Versuchstieren. *Centralbl. Allg. Path. u. Path. Anat.* 51(11): 417-420. 4 fig. 1931.—The author describes adenocarcinomas, one of the ileo-cecal region, one of the abdominal skin each in a ♂ guinea pig and an endothelioma in a ♂ rabbit. Tumors in guinea pigs are exceedingly rare, more frequent in rabbits.

13399. MONALDI, TULLIO de SANCTIS. La colorazione sopravitale del sangue di cavie inoculate con B.C.G. e con bacilli tubercolari virulenti. [Supravital staining of the blood of guinea pig inoculated with B.C.G. and virulent tubercle bacilli.] *Haematologica 1. Arch. [Messina]* 12(1): 65-76. 1931.—Author gives a modification of the supravital staining technic of Sabin, Cunningham and Doan. In 250 examinations on 50 guinea pigs the normal leucocytic formula was: neutrophils, 38.99%; eosinophils, 2.80%; basophils, 0.13%; monocytes, 8.80%; lymphocytes, 49.28%. The L/M (lymphocyte-monocyte) ratio showed a normal variation of 5.60. In progressive tuberculosis (mortal), polynucleosis and marked monocytosis were accompanied by a diminution of the L/M ratio. The author claims that with the newer technic monocytes may be detected which show a small central rosette and disseminated vacuoles. Important differences were noted anent the mode of infection. If the tubercle bacilli were introduced subcutaneously, the initial neutrophilia and increase of monocytes were followed by a marked lymphocytosis; if per os, the initial monocytosis was followed by a lymphocytosis. Since modifications in the L/M ratio corresponded to the evolutionary stages of the infection, they are to be regarded as having important prognostic value.—*N. A. Michels.*

13400. MUSTAKALLIO, SAKARI. Über das Basalfibroid oder das typische Nasenrachenfibrom. *Acta Soc. Med. Fennicae "Duodecim" [Suomalaisen Lääkäriseuran Duodecim'in]* 13 [Ser. B.] (3): 1-32. [Art. 7.] 2 pl. 1931.—In 6 cases of basal fibroid or typical naso-pharyngeal fibroma, embryonal mesenchymal cells (principally grouped around the blood vessels, but also independently in streaks and islets) and elastic fibers were found in all, fibroblast giant cells (not hitherto mentioned in literature) in 5, non-striated muscular fasciculi independent of the blood vessels in 3, and hyaline degeneration in 4 cases. Hyaline degeneration seemed to begin in blood vessel walls in the same region as the embryonal mesenchymal cells mentioned. Hence the degeneration of these cells is presumed to play an important part in the disappearance of the tumor, which occurs after puberty.

13401. OERTEL, HORST, HERBERT NYE, and BRIAN THOMLINSON. A further contribution to the knowledge of innervation of human tumours. *Jour. Path. and Bact.* 34(5): 661-666. 10 pl. 1931.—The observations here recorded confirm the conclusions previously expressed, that mature and immature human tumor tissues are innervated, and that this innervation applies to blood vessels and also to the stroma and parenchyma of the growing tumor. This conception is based upon close co-ordination of newly-formed nerve fibers with stroma and parenchyma in which they end and to the cells and nuclei of which they are so intimately attached that a resemblance to normal innervation is definitely noticeable.—*M. J. S.*

13402. ROCHLIN, D. G., und G. A. SEDGINIDSE. Der Einfluss konstitutioneller und Rassen-Besonderheiten auf die Entstehung der sogenannten Pyorrhoea alveolaris. *Zeitschr. Ges. Anat. Abt. 2, Zeitschr. Konstitutionsl.* 16(2): 217-226. 26 fig. 1931.—From studies on 53 patients, the author concludes that pyorrhoea alveolaris is caused by constitutional inferiority of the mesodermal derivatives; signs of premature aging occurred in the bones, also a mesodermal derivative. The condition of the sella in these patients pointed to a certain degree of hyperpituitarism; roentgenological indications of pyorrhea were also found in some acromegalia patients.

13403. SABORIDO, J. Reproducção do lymphosarcoma de camondongos mediante inoculação de orgãos de animaes portadores do tumor. [Reproduction of lymphosarcoma of mice through inoculation of organs of animal carriers of tumor.] *Arch. Inst. Biol. Defesa Agric. e Animal* 4: 281-284. 1 pl. 1931.—Ten series of inoculations of organs of mice, having well developed lymphosarcomas, in the subcutaneous tissue of the axilla, were made on 39 normal mice. These resulted in the development of 4 new tumors, 2 of which were observed in a group of 14 mice having received liver, 1 in a group of 12 mice which received spleen, and 1 in a group of 13 which received kidneys. The new tumors were inoculated into normal mice and proved as easily transplantable as the original lymphosarcoma. Based on these positive results, a suggestion is made on the metastatic nature of some atypical, small, round-shaped cells commonly found in the vicinity of a number of vessels in organs of mice carrying the tumor.

13404. SCHLAEPFER, KARL. Beitrag zur pathologischen Anatomie der Lungen nach Unterbindung der Hauptlungenarterie einer Lunge mit und ohne gleichzeitige Phrenicotomie derselben Seite. *Arch. Klin. Chir.* 164: 240-247. 3 fig. 1931.—Ligation of the primary branch of the pulmonary artery of one lung is followed by chronic stasis in that lung. After several mos. the stasis is somewhat relieved through collateral circulation established between the bronchial artery and pulmonary veins. Ligation of the artery with simultaneous phrenicotomy on the same side increases the stasis appreciably; the stasis is permanent, since collateral circulation is not so effective. As a result, after 2 yrs. there occurs a peribronchial fibrosis, which sometimes invades the atria and even the alveolar walls.—*M. Lederer.*

13405. SCHULTZ, ARTHUR. Zur Frage der Beziehungen zwischen Leukämie und Gicht. Zugleich Mitteilung histologischer Darstellungsmethoden der Harnsäure und der Urate. *Virchow's Arch. Path. Anat. u. Physiol.* 280(2): 519-533. 7 fig. (4 col.) 1931.—A 21 yr. old ♀ at autopsy showed typical gout deposits in the joints; the liver and kidneys showed marked enlargement, and lymphocytic infiltration. The clinical course was that of an aleukemic leukemia combined with gout. In the kidneys typical deposits of Na monourate with granuloma-like proliferations were demonstrable. In the uriniferous tubules were uric acid crystals from which

after destruction of the tubules, Na monourate is formed. The deposits are explainable as due to the destruction of nuclear material. The uric acid was stained with a modified glycogen stain (Best-Fraenkel) and the urates with methylene blue and picric acid.—*A. Schultz (transl. by G. L. Rohdenburg).*

13406. **SCHUSTER, NORAH H. Pulmonary asbestosis in a dog.** *Jour. Path. and Bact.* 34(6): 751-757. 1 pl. 1931.—In the lungs, the histology is typical, but naked asbestos fibers are present instead of asbestos bodies usually found, and the case throws no direct light on the mode of formation of these bodies. Asbestos bodies do not alter the course or nature of the disease. The fibrosis is probably a result of the toxic action of the asbestos and not a mechanical effect.—*N. H. Schuster.*

13407. **SELIGMAN, C. G. Acromegaly among the old Northmen.** *Nature [London]* 128(3223): 221. 1931.—Quotations from the Egil Saga are given, indicating the existence of acromegaly among the Norsemen.

13408. **SHAPIRO, PHILLIP F. Fetal adenoma of the hypophysis and dermoid cyst of the hypothalamus.** *Arch. Path.* 11(1): 22-43. 7 fig. 1931.—The first tumor resembled one of the so-called "pars intermedia tumors," but originated from the midportion of the pars anterior, instead of the pars intermedia. It was composed, not of the specific differentiated pars intermedia cells, but of undifferentiated fetal cells. If man has a pars intermedia comparable with that of lower animals, it is rudimentary, variable, and functionless; there is, as yet, no histologic proof of its presence. The dermoid cyst belonged to the group of inclusion tumors of the hypophyseal area. It was derived from embryonal rests of cranial external ectoderm included during the invagination of the brain vesicles, and was related to Erdheim's tumors derived from rests of oral ectoderm invaginated with Rathke's pouch. It involved the hypothalamus, leaving the hypophysis relatively intact, and yet produced the diabetes insipidus and the diabetes mellitus usually ascribed to hypophyseal lesions. The diencephalon rather than the hypophysis is chiefly responsible for these syndromes.—*Author's summary.*

13409. **SMITH, M. C., E. M. LANTZ, and H. V. SMITH. The cause of mottled enamel, a defect of human teeth.** *Arizona Agric. Exp. Sta., Tech. Bull.* 32. 253-282. 7 fig. 1931.—Evidence from a study of an Arizona community, and from experimental work on rats, leads to the conclusion that mottled enamel, a tooth defect first reported in the United States in 1916 and now recognized as endemic in various communities, is caused by the destructive action of fluorine present in the water supplies of the afflicted communities.—*S. L. Smith (courtesy Exp. Sta. Rec.).*

13410. **SOUDAKOFF, P. Fatty degeneration of the anterior segment of the eyeball (Xanthomatosis Bulbi).** *Nation. Med. Jour. China.* 17: 86. 1931.—Whether xanthomatous accumulations in the sclera are developed locally or as a part of a generalized cholesterol diathesis has not yet been determined. The author concluded that "fatty degeneration of the anterior segment of the eyeball is found exclusively in a recently inflamed amaurotic eye in which metabolic processes were disturbed, and circulation was hampered by increasing tension. Fat could no longer be utilized by the cells, it was liberated and phagocytosed by histiocytes. Fat infiltration of the innermost lamellae of the sclera may be explained by a predisposition of this tissue to accumulation of fat and by a hindered outflow in the sclera on account of a glaucomatous condition of the eyeball."—*F. D. Weidman.*

13411. **STOCKMAYER, W. Über Osteodystrophia fibrosa beim Hunde.** *Arch. Wiss. u. Prakt. Tierheilk.* 62 (6): 602-616. 3 fig. 1931.—The external signs of an hypostatic-porotic form of this disease in a dog were softening and atrophy of the bones without the presence of deformities. Histologically, in all parts of the skeleton the giant cells, lacunar resorption, breaking down of bone structure and new growth of fibrous tissue with newly formed trabeculae—changes typical of osteodystrophia fibrosa—were observed. The lesions were subperiosteal, occasionally endosteal, and more advanced on the head. "Appositional" bony tumors, partly lamellar, partly reticular, of osteoblastic origin were rarely encountered. As a rule metaplastic new bone growth took place directly from connective tissue. Increased resorption causes porosity of the skeletal frame.—*W. Stockmayer (transl. by F. Volkmar).*

13412. **STORTI, E. Anemia sperimentale di Botriocefalo. [Experimental anemia with Bothriocephalus.]** *Haematologica 1. Arch. [Messina]* 12(3): 237-264. 4 fig. 1931.—Dogs which had ingested *Diphyllobothrium ranarum* larvae developed a grave anemia, suffering a 50% loss of body weight. The red cell count dropped to 1 million per cmm., the drop being accompanied by intense hemolysis and diminution in hemoglobin. The most striking alterations occurred in the bone marrow, which showed an intense hyperplasia of the erythroblastic series. The process however did not exhibit the slightest deviation from normal erythropoiesis. The leucoblastic mechanism was not involved. The myeloid metaplasia which occurred in the spleen was largely erythroblastic, relatively few myelocytes being present. While splenic follicles were reduced in size, aggregations of plasma cells were conspicuously massive. Nothing is recorded to substantiate the contention that plasma cells represent aborted erythroblasts. The lymph nodes showed extensive hyperplasia of the histiocytic elements, many of which proliferated by mitosis, others differentiated into macrophages. No myeloid metaplasia occurred in lymph nodes, the few erythroblasts encountered being interpreted as having been carried into the organ by the blood stream. Hemolymph nodes showed no modifications. Except for an intense hyperplasia of the stellate Kupffer cells and small foci of plasma cells, the liver was relatively unaltered. After a critical review of the literature comprising 200 cases of anemia due to *Bothriocephalus*, the author concludes (as does Ferrata) that very rarely is the infection a true pernicious anemia.—*N. A. Michels.*

13413. **TROITZKAJA-ANDREEWA, A. M. Zur Kenntnis der Altersveränderungen der Arterien. (Über die Altersfibrose der Arterienwand.)** *Frankfurter Zeitschr. Path.* 41(1): 120-135. 6 fig. 1931.—Specimens were examined from the ascending aortic arch, the thoracic, and abdominal aortas, the common carotid, and the femoral, branchial, lienal, superior mesenteric, and right and left coronary arteries from 21 subjects: 3 aged 9 days; 2 each aged 5, 10, 23, and 40 yrs.; and 1 each of 16, 20, 24, 27, 42, 53, 56, 62, and 83 yrs.; in the older persons only sections without visible lesions were chosen. A constant thickening and increase in collagen and collagen fibers took place at the expense of the reticular fibers, for the precollagen changed into collagen. In arteries of the elastic type numerous coarse collagen fibers were always present. The collagen and precollagen fibers were arranged circularly in the media, anastomosing with each other through the spaces of the elastica as well as with the collagen fibers of the intima and adventitia. Arteries of muscular type contained little collagen or precollagen; muscle fibers divided into irregular groups. Decrease in muscle was not so distinct in arteries of the elastic type, the total muscle sometimes being greater in advanced age; the arrangement of fibers became irregular. With advancing age collagen and precollagen stained more diffusely and contours became indistinct (hyalinosis). The increase also was diffuse, focal accumulations not being observed, though in the media, usually nearer the adventitia were small areas which apparently corresponded to the vasa vasorum where the collagen fibers were particularly developed. The changes appeared to be uniform in the various arteries. The author concludes that the collagen in the media had no relation to atherosclerotic changes in the intima. Thus, while mechanical influences appear to be basic for arterial fibrosis, there is also a primary change of the physicochemical structure of the interstitial substance that increases with age.

13414. URNER, JOHN A. The intra-uterine changes in the pregnant albino rat (Mus norvegicus) deprived of vitamin E. *Anat. Rec.* 50(2): 175-187. 1931.—Ninety-one Wistar albino rats, reared on a diet low in vitamin E (Burr no. 561), composed of casein (crude) 30.0, sucrose 45.0 salts (McCollum no. 185) 4.5, and lard 20.0, with 0.6 gm. of powdered yeast and 3 drops of cod-liver oil daily, exhibited normal growth, oestrous rhythm, and breeding behavior. Pregnancy was followed by embryonic death and resorption. There was no first-litter fertility. From the 10th to the 16th day of pregnancy, body weight increases at a reduced rate, due to the preponderance of mammary development over embryonic and fetal resorption. After the 16th day, it decreases, associated with mammary involution. Gross examination of pregnant uteri after the 10th day revealed abnormal pregnancy by a softening of the enlargements and a blue discoloration, due to blood in the amniotic cavity. Embryos showed apparently normal development until the 10th day, when there appear a rarefaction of the mesenchyme, failure of the blood-forming tissues, and death of the embryo. Abnormality of the ectoplacenta began by the 10th day of gestation, due to failure of the mesodermal elements. Necrosis began by the 13th day and was complete by the 17th or 18th day. The decidua basalis became necrotic by the 15th day. The uterus returned to almost virginal condition by the 21st day.—*Author (courtesy Wistar Bibl. Serv.)*.

13415. WALICHAN, SONA. Zur pathologischen Anatomie der Endophthalmitis. Über Veränderungen der Suprachorioidea und des Suprachorioidealraumes. *Graefe's Arch. Ophthalmol.* 126(4): 561-591. 6 fig. 1931.—Endophthalmitis [24 eyes studied] could be divided into 2 groups according to the histological changes: cases of typical endophthalmitis with marked exudation into the vitreous, polynuclear cells predominating; and cases with exudation and altered suprachoroidal space,—cases in which the character of the cellular elements and participation of the choroid approximated sympathetic inflammation.—*From author's summary (transl.)*.

13416. BARELLI, LUIGI. Sulla temperatura propria dei tessuti neoplastici. [Temperature of neoplastic tissues.] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 741-746. 1930.—The temperature of adenocarcinoma of mice (measured by the thermoelectric method) was in most cases lower than that of muscles of the hind leg of the animal. The temperature of chicken sarcoma was in most cases lower than that of uninjured breast muscles. The temperature of the skin in the area over the neoplasm was in most cases lower than the temperature of the uninjured muscles. The temperature of the skin over a malignant neoplasm in man was higher than that of surrounding parts, while the reverse was observed in benign neoplastic processes. The possible diagnostic value of the thermoelectric temperature measurement is mentioned.—*M. Comel.*

13417. BENEKE, RUDOLF. Der Wasserstoss als gewebeformende Kraft im Organismus. *Beitr. Path. Anat. u. Allg. Path.* 79(1): 166-208. 1 fig. 1927.—The author, disciple of the developmental-mechanics of Roux, develops the idea that constant disturbances of the total water content of the tissues (including intracellular as well as that of the blood), are significant for the growth and the maintenance of the normal tissue structures as well as for the development of pathological growths. They present mechanical stimuli active throughout life. To this water impact all tissues react, most strikingly the connective tissue. Thus Beneke explains, for instance, that the sclera of the eye, as a sphere of connective tissue, is influenced by the water enclosed in the vitreous which during each movement of the eye undergoes a definite expansive impulse. The hard bony cavity of the labyrinth responds to the wave impulses of the endolymph which exert their effects against the walls. The normal structure of the vascular system depends on the continually changing volume of the water content of the blood, also on the firmness or the softness of the stroma of the organs, (for example: liver, kidneys, brain), and on the degree of intake of the water impact through the parenchyma cells, etc. These basic principles repeat themselves in the pathological products in varied manner. The author analyzes according to his new viewpoint the pathological histology of many heart diseases (sclerosis of the valves and others, thrombosis and its relation to the heart-myomata), the connective tissue structures of the auricle walls (especially the left), and the heart-aneurisms. Furthermore, he sees in the water-impact of the edematous fluids the reason for the growth of the elephantine fibroses, for the vicarious intervertebral tissue hypertrophies in the spondylositic growths (under a special accentuation of the water increase of the hypertrophic intervertebral discs). The strength and the growth of the dura and its pathological formations in the brain and cord (meningocele, etc.) are influenced by the water impact of the cerebrospinal fluid, as also the development of the hydrocephalus as well as of the glia-walls from the foci of brain softening (cysts). The latter can go on to become blastomata (gliomata) through chronic water impact; the case is similar for traumatic growths in the cord. Here lies the significance of the chronic water impact for the appearance of certain blastomata. The same applies to cysts in other tissues. The atrophy of the wall of the hydrocele, the changes of the peritoneum in chronic ascites, the thickening of the wall of chronic hydropericardium depend directly on the mechanical action of the enclosed water; increase of water through its impact effect plays a part. In these cases the epithelium and the connective tissue of the sac are both equally influenced. It is the same in ovarian cysts. In all these growths there is the possibility of increase of the growth-force through the impacts of their contents; the author thinks that the development of the blastomata can go on to the stage of malignancy (ovarian cysts to carcinomata).—*R. Beneke (transl. by H. J. John)*.

13418. BERNER, OLE. Über kleine, aber tödlich verlaufende traumatische Gehirnblutungen, die sog. "Duretschen Läsionen." Eine rechtsmedizinische Studie. *Virchow's Arch. Path. Anat. u. Physiol.* 277(2): 386-419. 20 fig. 1930.—In 190,000 necropsies Berner has never seen a single case of primary ventricular hemorrhage of the 4th ventricle of spontaneous origin. He has, however, seen a group of cases in which cerebral hemorrhage seems to be the result of injury elsewhere, and in which the bleeding tends to occur in the 4th ventricle and in the neighborhood of the aqueduct. These he believes to be due to waves of increased pressure in the cerebrospinal fluid in persons with exceptionally fragile blood-vessels.

13419. BERTACCINI, GIUSEPPE. Ricerche sull'equilibrio acido-base e la riserva d'alcali nel sangue in alcune dermopatie. [Acid-base equilibrium and the alkali reserve in the blood in certain dermopathies.] *Gior. Ital. Derm. Sifil.* 69(1): 1-17. 1928.—The author reviews briefly the fundamental principles of acid-base equilibrium. Results of studies on 32 patients of skin diseases are then reported, which include the alkali reserve determination by the Van Slyke method and, as a control, the colorimetric determination of serum pH by the

Michaelis method. In accordance with the findings of other authors it was found that the variations of the blood pH are so slight as to be considered within the limits of technical errors. Considerable variations, however, were found in the alkali reserve, which was always below normal in 22 cases of eczema in various stages and forms of the disease (slight or moderate acidosis); somewhat higher but still below normal in 3 cases of psoriasis; and almost normal in 7 other dermatoses. In young patients the alkali reserve figures were lower than in elderly patients. Interesting relations were found between alkali reserve and glycemia and glycosuria. There is a lowering of the alkali reserve with the increasing of glycemia and appearing glycosuria in a diabetic and vice versa, during dietetic treatment. With insulin, there is a rapid fall of the glycemia while the alkali reserve increases, reaching after 3 or 4 days a value higher than the pre-existing, at least for a number of days. Similar, but less conspicuous effects were obtained by the A. with intravenous introduction of $CaCl_2$ and sodium hyposulphite, and the endomuscular injection of milk. The A. proposes to return to this subject with more numerous data and researches extended to collateral problems.—*M. M. Strumia.*

13420. **BRAUCH, FRITZ.** Über den Blutdruck bei Morbus Basedow. *Zeitschr. Klin. Med.* 114(1/2): 79-95. 1930.—The problem of blood pressure variations in Basedow's disease is considered from the viewpoint that cases with equable variations of blood pressure may be combined, without considering somatic symptoms. It is shown that the blood pressure values in Basedow's disease and pronounced thyrotoxicosis are variable, being increased in 13 of 48 cases. These increased values were found in obese types (of 13 cases with increased pressure, 8 were adipose). The development of the lymphatic ring, the tendency to alimentary hyperglycemia and glycosuria, increased sympathicotonus, and markedly increased true adrenalin sensitiveness appear to be without particular relationship to the increased blood pressure. There is described a Basedow's case with outspoken symptom changes, typically controlled by nitro-glycerine. During the course of Basedow's disease observed over a long period, there are variations in blood pressure. —*Author's summary (transl. by E. H. Boyer).*

13421. **CASPARI, W., und F. OTTENSOOSER.** Über den Einfluss der Kost auf das Wachstum von Impfgeschwülsten. III. Mitteilung. Untersuchungen über das Vitamin D. *Zeitschr. Krebsforsch.* 32(1/2): 74-81. 2 fig. 1930.—Mice on an anti-rachitic diet, achieved by adding to their food either small amounts of a commercial preparation of vitamin D (Merck's vigantol), or irradiated ergosterol, showed marked enhancement of growth of inoculated tumors, although vigantol in therapeutic doses showed this effect only in part. This effect is distinct from the growth-stimulating action of vitamin B.—*H. E. Eggers.*

13422. **CASTELLANI, ALDO.** Metadysentery. *Ann. Internal Med.* 2(2): 155-170. 1928.—Some years ago Castellani introduced a new classification of bacterial dysenteries as follows: (1) Bacterial dysentery, sensu stricto (synonyms Shiga dysentery, Shiga-Kruse dysentery), due to dysentery organisms which do not ferment lactose or mannitol and do not clot milk (Shiga-Kruse bacillus). (2) Paradysentery, due to organisms which do not ferment lactose, ferment mannitol (acid only), do not clot milk (Flexner, Hiss-Russell, etc.). (3) Metadysentery, due to organisms, the metadysenteric bacilli, which, as is the case with the true dysentery bacilli, do not produce gas in any sugar, but either ferment lactose (acid only) and clot milk or ferment lactose (acid only) without clotting milk, or clot milk without fermenting lactose. (Organisms of the genus *Dysenteroides* and *Lankoides*.) To make clear this grouping of bacterial dysenteries and dysentery bacilli, it may be said that the classification of the aerobic (facultative anaerobic) asporogenous, non-capsulated, gram-negative intestinal bacilli which do not liquefy gelatine or serum and do not produce pigment, viz., the tribe Ebertheae of Chalmers and Castellani (bacillaceae growing well on ordinary media, not forming endospores; aerobes and often facultative anaerobes; without fluorescence, pigment formation or gelatine liquefaction; without polar-staining, gram-negative, without a capsule), which may be subdivided into 2 subtribes: (a) The organisms do not produce gas in glucose or any other sugar—Subtribe *Eberthoanaerogeneae.* (b) The organisms produce gas in glucose and usually in other sugars—*Eberthoaerogeneae.* The 1st subtribe contains 6 genera: *Alkaligenes* Castellani and Chalmers, *Vibriothrix. Eberthus* Castellani and Chalmers, *Shigella* Castellani and Chalmers, *Lankoides* Castellani and Chalmers, *Dysenteroides* Castellani and Chalmers. The 2nd subtribe contains 5 genera: *Salmonella* Lignières, *Wesenbergus* Castellani and Chalmers, *Enteroides* Castellani and Chalmers, *Balkanella* Castellani and Chalmers, *Escherichia* Castellani and Chalmers. These 11 genera can be easily differentiated by using 3 media: milk, lactose, and glucose. Castellani discusses differentiation and gives a key for identification of the various organisms.

13423. **DOGLIOTTI, A. MARIO, e MARIO MAIRANO.** Sul meccanismo d'azione e sulle vie di eliminazione del cloruro di sodio nel trattamento dell'occlusione intestinale alta con soluzioni ipertoniche. [The mechanism of action and the avenues of elimination of NaCl in the treatment of high intestinal occlusion with hypertonic solutions.] *Ann. Ital. Chir.* 9(4): 295-312. 1930.—Experiments on high intestinal obstruction in 4 dogs showed that more than ½ the NaCl introduced either hypodermically or intravenously was eliminated in the vomit. Comparison of the H_2O and NaCl content of the organs of a normal dog, a dog in which high occlusion had been produced without treatment and a dog occluded with treatment showed decrease of H_2O in all the organs except the stomach (in which there was an increase) of the dog occluded without treatment; decrease of H_2O, but less marked, in all the organs of the occluded treated dog except the liver, pancreas and stomach (which showed increase of H_2O over normal); decrease of NaCl in all organs of the occluded untreated dog; decrease, generally less, in all the organs of the treated occluded dog except the liver, pancreas and stomach, which showed increase of NaCl over normal. The authors conclude that the gastric mucosa, the liver and the pancreas are the organs chiefly concerned in the detoxication of the organism, that the NaCl stimulates the cellular function of these organisms, and that the H_2O is the vehicle of elimination of the substances elaborated.

13424. **FIGURELLI, GIUSEPPPE.** Ipocloruremia e terapia clorurosodica nelle occlusioni intestinali acute, alte (duodenali). (Ulteriori ricerche sperimentali e studio sintetico.) [Deficiency of blood chlorides and sodium chloride therapy in acute high intestinal (duodenal) obstruction.] *Ann. Ital. Chir.* 9(9): 878-891. 1930.—Of 11 dogs, in 6 high intestinal obstruction was produced by complete occlusion with gauze ligatures; in 5 the intestines were cut and the stumps ligated. In 3 of each group NaCl treatment was given. The deficiency of blood chlorids was less in the cases of obstruction by ligation alone than in those in which the intestine was cut; the benefits of NaCl treatment were likewise less in the former than in the latter groups.

13425. **GIORGIO, A. M. di.** Il contegno di alcuni costituenti minerali del sangue durante lo shock spinale. [Behavior of some mineral constituents of blood during spinal shock.] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 798-800. 1930.—Immediately following transverse section of the spinal cord of dogs (during the stage in which the shock is marked) the Ca content of serum showed a noticeable diminution, whereas the P content did not vary noticeably. A marked diminution of the Ca/P ratio followed. The Ca and Ca/P values reverted to normal after 9 to 12 days.—*M. Comel.*

13426. **HAMMER, H.** Zur experimentellen Hämatoporphyrose der Knochen. *Virchow's Arch. Path. Anat. u. Physiol.* 277(1): 159-173. 5 fig. 1930.—These studies fail to sustain Königsdörfer's assertion that the teeth

and skeleton cannot be colored by experimentally introduced artificial hematoporphyrin. While the attempt was unsuccessful when made on adult animals, repeated injection of artificial hematoporphyrin from cattle blood into animals a few days old (3 rabbits, 2 guinea-pigs, 10 rats and 1 puppy) produced deep coloration of bones and teeth. This effect (unlike that from uroporphyrin reported by other authors) was only gradually produced; the tolerance of the subjects for hematoporphyrin seemed to be lower than that reported by others for uroporphyrin. The deposits of porphyrin disappeared from the teeth of 2 guinea-pigs on suspension of the injections for several weeks. Fränkel's opinion that the disappearance is due to a covering of the colored dentine by fresh uncolored dentine is untenable, since new dentine layers are formed, not on the tooth surface, but on the pulp. In the case of an animal killed 3½ mos. after cessation of injections, no trace of hematoporphyrin pigment could be found in the bones or the teeth.

13427. **HOUSSAY, B. A., y A. BIASOTTI. La diabetes pancreática de los perros hipofisoprivos. [Pancreatic diabetes in hypophysectomised dogs.]** *Rev. Soc. Argentina Biol.* 6(4): 251-296. 1930.—Hypophysectomy previous to or after pancreatectomy diminishes the intensity of the diabetes observed (9 experiments in which no infection occurred and 5 experiments in which infection did occur). Survival is considerably prolonged and may be as long as 6 mos., without injection of insulin. There is a gradual loss of weight, but at times important increases are observed. The blood sugar is usually between 0.13 and 0.323 gm. %, nearly always below 0.3%. In 7 dogs hypoglycemia convulsions were observed; sometimes they were fatal, at others the injection of glucose permitted recovery. Glycosuria was never very marked, on an average 0.059 to 0.89 gm. per Kgm. per day, except in 2 cases in which it was 1.3 and 3.23 gm.; fasting diminishes it considerably or even suppresses it. Ingestion of sugar increases the severity of diabetes but only from 30 to 70% of the amount given is eliminated. The D: N ratio is low, 0.70 to 1.86. The basal caloric output was below the normal in 2 cases and slightly above in 1. Lesions of the tuber cinereum do not modify the course of pancreatic diabetes. In dogs with pituitary and pancreas removed degenerative lesions of the parathyroids were observed. All operations were controlled by post-mortem examination, those on the pituitary and mid-brain by histological sections.—*J. T. Lewis.*

13428. **HOUSSAY, B. A., y A. BIASOTTI. La diabetes floridcínica de los perros hipofisoprivos. [Phlorhizin diabetes in hypophysectomised dogs.]** *Rev. Soc. Argentina Biol.* 6(5/6): 326-340. 1930.—Hypophysectomised dogs were intoxicated with phlorhizin 22 to 65 days following operation. In 3 to 9 days of intoxication 6 out of 8 died. Only 1 out of 6 controls and 1 out of 5 with lesion of the tuber cinereum had toxic symptoms and died. Hypophysectomised dogs lose less weight than the two other groups, they have no polyuria, which was marked in controls, blood sugar fell below 0.07% while only 1 control had a blood sugar as low as this figure. Injection of glucose did not produce complete recovery from toxic symptoms. Glycosuria is less marked, only ⅓ of the amount eliminated per Kgm. per day by controls. Less N is eliminated by the operated dogs and the D: N ratio is lower. Animals with lesions of tuber cinereum intoxicated with phlorhizin show no difference from normal controls.—*J. T. Lewis.*

13429. **INAWASHIRO, ROKURO. Studien über den Gasstoffwechsel bei Beriberi bzw. B-Avitaminose. III. Mitteilung. Spezifisch-dynamische Wirkung des Kohlehydrats bei Beriberi (einschliesslich der Veränderung des RQ und Blutzuckers nach Kohlehydratzufuhr bei Beriberi).** *Tohoku Jour. Exp. Med.* 12(5/6): 555-570. 1929.—In beri-beri the specific dynamic effect of carbohydrates is decreased. The R.Q. increased only slightly after glucose administration. The rise of blood sugar level was insignificant though the hyperglycemia was of long duration. The disturbance of carbohydrate metabolism is attributed to deficiency in vitamin B.—*Author's conclusions (transl. by K. E. Mason).*

13430. **JOHNSTON, CHRISTOPHER. The relationship of blood uric acid content to the state of renal function in nephritis.** *Jour. Clin. Investigation* 9(4): 555-559. 1931.—The concentration of uric acid in the blood of 30 patients with renal disease has been compared with the standard blood urea clearance determined simultaneously. The determination of blood uric acid as an indicator of renal function appears to be of little value. Normal blood uric acid may occur despite 80% loss of urea excreting power. When rise of blood uric acid does occur there is, except in some terminal cases, little correlation between the extent of rise in blood uric acid and the extent of fall in renal function.—*Author's summary and conclusions.*

13431. **LORETO, C. Sul contenuto in calcio dei segmenti ossei sede di frattura sperimentale. (Nota preventiva.) [Ca content of segments of bone containing experimental fractures.]** *Ann. Ital. Chir.* 9(12): 1283-1289. 1930.—In the fractured radii of rabbits [number not stated] the Ca content at various times after the fracture was always above the Ca content of the normal radii. This Loreto attributes not only to the Ca salts set free locally by the necrosis of the bone fragments, but also to a deposit of Ca by the blood stream.—*Author's summary (transl.).*

13432. **MACCHIARULO, O. Varianti glicemiche del periodo mestruale in donne normali, diabetiche e con affezioni morbose diverse interessanti l'apparato genitale, fegato e rene. [Blood sugar variations of the menstrual period in normal and diabetic women and women with various affections of the genital organs, liver and kidneys.]** *Rass. Ostetr. e Ginecol.* 39(4): 195-216. 1930.—In 20 normal women the average intermenstrual blood sugar was 0.092%; premenstrual, 0.105%; menstrual, 0.120%; normal on the 3rd day post menstruum. In cases of salpingo-oöphoritis the intermenstrual figures were normal, the menstrual supernormal. In women with constitutional ovarian hypofunction the intermenstrual blood sugar was low, with slight and irregular increase during the menses. In 3 cases of ovarian cyst the intermenstrual blood sugar value was low (0.08%) and not above 0.11% during the menses, with a rapid postmenstrual fall to an average of 0.075% by the 7th day. In 4 cases of uterine fibroma with metrorrhagia the premenstrual, menstrual and postmenstrual blood sugar figures were respectively 0.109%, 0.160% and 0.140%. In 6 cases of uterine fibroma with menorrhagia these figures were respectively 0.102%, 0.153%, and 0.120%. In 3 cases of hepatitis the blood sugar curve was irregular, with slight menstrual rise. In diabetic patients the blood sugar rose from a premenstrual 0.32% to 0.46% during the menses; but under insulin and dietetic treatment the figures fell to 0.18% and 0.21% respectively.

13433. **MATSUMOTO, Y. Über den gebundenen Zucker im Blute bei Hautkrankheiten.** [In Japanese.] *Japanese Jour. Dermatol. & Urol.* 30(11): 1105-1112. [German summary, 115-117.] 1930.—The bound blood sugar was entirely normal in all cases examined of urticaria, psoriasis, pityriasis rubra pilaris, prurigo, acne rosacea and alopecia areata and in single cases of other diseases. In purpura and erythema it was generally higher, and very high in syphilis, sarcomatosis cutis, in purulent dermatoses and in children.—*From author's summary (transl.).*

13434. **MIYAKE, ISAM, und KENSHIŌ NARAHARA. Zuckerstoffwechsel und ezematöse Hautveränderung. II. Hautzucker und eczematöse Hautveränderung.** [In Japanese.] *Japanese Jour. Dermatol. & Urol.* 30(8): 809-824. [German summary, p. 86.] 1930.—In a previous communication it had been shown that eczematous skin manifestations are the result of inadequate sugar metabolism. In the present paper the skin sugar and blood sugar curves are followed through a sugar dosage during and after an artificially induced dermatitis. The results indicate that under normal conditions the skin

is capable of storing sugar from the blood; this capacity is disturbed in the skin of dermatitis, though healthy skin from subjects with dermatitis functions like the skin from healthy subjects. Sugar intolerance frequently follows the production of artificial dermatitis, but stands in no direct relation to the cutaneous manifestations. The latter frequently cause disturbances of liver function, which is highly significant with relation to sugar intolerance. [See MATSUNOBU, T. Hautkrankheiten resp. eczematöse Hautveränderung und Leberfunktion (Zuckerstoffwechsel und eczematöse Hautveränderung, III.). *Japanese Jour. Dermatol. and Urol.* 30(8): 825-838. 1930.]

13435. OHTA, KOHSHI, und TOMOTAKE IZUMITA. Zur Kenntnis der Funktionsanomalie des Verdauungskanals bei der Säuglings-Beriberi. I. Über die Form und die motorische Funktion des Magens bei der Säuglings-Beriberi. II: Über die Sekretionsanomalie des Magens bei der Säuglings-Beriberi. *Jahrb. Kinderheilk.* 128 (1/2): 10-39; (3/4): 161-198. 1930.—I. This portion of the study is based on about 158 observations on 40 infants affected with beriberi. X-ray study of 32 cases showed no difference between the form of the stomach and the peristalsis in healthy infants and those affected with beriberi. The milk of women with beriberi, however, was found to remain in the stomach about 2 hrs. longer than cow's milk, which in turn was evacuated more slowly than the milk of healthy women. The relation of the vegetative nerves to the motor function of the stomach in infantile beriberi was studied by administration of small doses of pilocarpine, which generally hastened gastric evacuation, atropine, which delayed it, and epinephrine, which had no uniform effect. II. Observations on 48 cases of infantile beriberi showed 4 types of acidity: Type 1, which comprised the majority of cases, subacidity or achlorhydria; Type 2, comprising about ¼ of the total, normal acidity, soon becoming transformed into subacidity; Type 3, rarely encountered, hyperacidity passing through daily variations into subacidity and Type 4, occurring in a few cases, normal acidity throughout. Vomiting, loss of appetite, and type of disease showed no connection with the form of acidity. [Paper III in this series, "The motor function of the intestinal canal in infantile beriberi," is published in issue 3/4 of this volume of Jahrb. Kinderheilk. under authorship of IZUMITA alone.]

13436. PACCHIONI, DANTE. Il ricambio normale e patalogico dei nucleoproteidi nelle diverse età. Il braditrofismo nell'adulto e nel bambino. [Normal and pathologic metabolism of nucleoproteins at different ages. Bradytrophism in adults and children.] *Riv. Clin. Ped.* 26(4): 249-287. 1928.—The fetus synthesizes nucleoproteins which are necessary for the formation of new nuclei and for repair of used up parts of nuclei. The kidneys of the fetus participate in the excretion of uric acid. The congenital uric acid infarcts of the kidneys and those in the new-born are the result of the accumulation in the kidney of uric acid during intra-uterine life and of its abundance in the blood and interstitial fluids. The nursing infant also builds up nucleoproteins synthetically. It is probable that the cytoplasm accomplishes only a partial and preparatory synthesis which the nuclei complete. It seems that uric acid is formed in the nuclei from the nucleoproteins and in the cytoplasm from the purine compounds (purines, nucleosides, nucleotides) which did not enter the nuclei. It is also probable that uric acid originating in the nuclei is more soluble and less stable than that formed in the cytoplasm. The nursing infant eliminates more uric acid than the adult because it produces more and urinates more. In a child which consumes purine food the purine-bodies are mostly utilized by the nuclei for the synthesis of nucleoproteins, the nuclear metabolism being very active. For that reason the child produces an excess of more soluble uric acid which is easily eliminated through the kidneys without marked loss of water. Therefore the state of hyperuric-acidemia can hardly occur in infancy. On the contrary the adult produces less of the nuclear uric acid and more of the less soluble cytoplasmic uric acid. This occurs in a marked degree in gouty bradytrophics. Gout results from an insufficient metabolic activity of the nuclei due to a deficiency of the part of the autonomous endocrine system which controls the catabolic processes, i.e., the excito-catabolic sympathetic endocrine part as compared with the parasympathetic endocrine part which controls the anabolic processes. This anomaly of the harmonic balance is transmitted to descendants and reveals itself in the activity of the neuro-endocrine system; there the metabolism of the nucleoproteins is not so prominent as the fat metabolism. The lowering of the fat metabolism is responsible for the exudative diathesis in infants and for ketosis in childhood. At puberty with the activation of the endocrine function of the genital organs, increased activity of the thyroid gland, and a parallel decrease of the function of the thymus and tonsils there begins to develop a sufficient equilibrium between the two sections of the autonomous endocrine system, which lasts until early middle age. At ages between 40-50 when the action of the excito-catabolic sex glands and of the thyroid decreases, the nuclear changes are again slowing down. This results in hyperuric-acidemia and gout.—*Author's summary (transl. by I. Davidsohn).*

13437. ROBINSON, R. H. O. B. Diagnostic value of the estimation of blood cholesterol in cholelithiasis. *Lancet* 217(5533): 540-543. 1929.—A modification in the technic for estimating the amount of cholesterol in the blood is described. The normal range of value is shown to be greater than is usually realised. Although the average value is raised in subjects suffering from cholelithiasis, estimation on an individual case is useless as a means of diagnosis. The whole blood cholesterol is very markedly raised in the severer degrees of obstructive jaundice, the rise disappearing when the jaundice is relieved by biliary drainage. Ether anesthesia tends to produce a fall in the blood cholesterol, but this can be responsible for only a small part of the fall after biliary drainage. The blood cholesterol tends to maintain a constant level in any normal human subject.—*Author's summary.*

13438. ROGOZIŃSKI, F., et M. STARZEWSKA. Sur le rachitisme expérimental. I. L'influence des rayons ultraviolets sur le métabolisme minéral et sur la composition des os. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (II)* [*Zool.*] 1930(3/4): 157-178. 1 pl. 1930.—Two groups of white rats, 4 litter mates each, aged 6 and 5 weeks respectively, were placed on diets designed to induce rickets, the 1st group on McCollum diet no. 3143, the 2nd on a diet lower in P, with wheat and maize flour in place of wheat and maize. The 1st group were exposed to ordinary room daylight. The 2nd group were kept in the dark except for 1 control. After a preliminary period 1 animal in each group was placed in a special metabolism cage for the determination of Ca, Mg, and P intake, excretion in urine and stool, and balance. X-ray examinations of 2 rats in Group I and 1 in Group II were made. After a period of 3-4 weeks on this regimen, the animals were irradiated twice a day for 10 min. with a mercury vapor lamp. At the conclusion of the experiment the femurs were analysed for dry weight, weight of ash, and Ca and P content. The authors conclude that the balance of Ca and P is always positive in young rats during growth, even when kept on a diet exceedingly poor in P. Ultraviolet irradiation increased the retention of Ca and P by improving absorption. For example the % of ingested P found in the stools fell from 80% in a non-irradiated rat to 28% after irradiation. The weight of the ash in the bones of rachitic animals is increased by irradiation and may equal normal. A remarkable constancy in the % of Ca in the ash of bones from rachitic and normal rats was found. The proportion of P was more variable.—*J. B. Youmans.*

13439. SCARPELLO, A. La riserva alcalina nelle colecistiti. (Ricerche cliniche e sperimentali.) [Alkaline reserve in cholecystitis.] *Ann. Ital. Chir.* 9(8): 780-794.

1930.—On the basis of 13 chemical observations and 7 experiments on dogs, Scarpello concludes that the alkaline reserve is lowered (but almost always compensated) in most cases of acidosis, the degree of acidosis being in direct proportion to the degree, the diffusion and the duration of the infective process of the cholecystitis. The condition is presumably due to a functional change in the liver cell.

13440. **SCHULTZ-BRAUNS, O. Die tödlichen Vergiftungen durch gasförmige Stickoxyde (Nitrose-Gase) beim Arbeiten mit Salpetersäure. (Zugleich ein Beitrag zur Kenntnis der Zenkerschen Degeneration des Herzens sowie der Bronchitis et Bronchiolitis obliterans und der miliaren karnifizierenden Pneumonie.) [Fatal poisoning by the gaseous oxids of nitrogen during work with nitric acid, with discussion of Zenker's degeneration of the heart, bronchitis and bronchiolitis obliterans, etc.]** *Virchow's Arch. Path. Anat. u. Physiol.* 277(1): 174-220. 10 fig. 1930.—Discussion of the chemistry and pathology of the process, with review of cases reported.

13441. **STRIECK, FR., und H. E. CH. WILSON. Untersuchungen über den Stoffwechsel in der Inkubationszeit bei febrilen Infektionen und bei afebrilen Infekten.** *Deutsches Arch. Klin. Med.* 157(3/4): 173-185. 3 fig. 1927.—The authors made metabolism studies of the afebrile incubation period in 3 cases of artificial malaria infection. They conclude that there is a rise in total or protein metabolism in the afebrile prodromal period, apparently produced by a stimulus to specific central nervous centers. A similar rise in metabolism was observed also in 2 cases of afebrile infections of different cause.

13442. **TAKIGAWA, K. Studien über Vitiligo vulgaris. I.** [In Japanese.] *Japanese Jour. Dermatol. & Urol.* 30(10): 1001-1045. [German summary, 105-107.] 1930.—Observations on 706 clinic patients and 52 patients closely studied show a fairly even distribution of cases between the sexes; low percentages in youth, maximum between the 21st and 25th years, gradual fall thereafter, with a distinct rise in ♀♀ at the time of the climacteric. In 42 cases in which the functional state of the vegetative nervous system was pharmacodynamically investigated, abnormal excitability was found. In 19 out of 52 cases in which the blood and cerebrospinal fluid were studied, an antisyphilitic treatment was instituted. In the majority of 71 cases in which blood and urinary sugar were determined, a disturbed sugar metabolism was found. In 6 out of 25 cases x-ray by Takagi's method showed a shallow pituitary fossa. Blood glutathione, studied in 23 patients, was in general somewhat lowered. Adrenaloid substance, determined in 21 patients by Chikano's method, was usually somewhat above normal. Tyrosin in the blood in 20 cases studied by Haas' method was generally within normal limits. Blood phenolase in 23 cases studied was more or less subnormal. The blood picture in 37 patients showed no important changes except a relative increase in leukocytes in 70.3% of the cases, and a slight eosinophilia in 21.7%. In 14 patients out of 17 the sedimentation rate of the erythrocytes (by Westergren's method) was hastened. The blood type of 75.7% of 37 patients was A. The congo red test of the functioning of the reticulo-endothelial system was generally negative in 16 cases. Takigawa concludes that vitiligo vulgaris has no connection whatever with syphilis, but must bear some relation to the functioning of the endocrine organs or the vegetative nervous system.—From *author's summary (transl.)*.

ANIMAL PATHOLOGY

INFECTIOUS AND OTHER DISEASES OF LOWER ANIMALS

F. S. JONES, *Editor*

R. W. GLASER, *Associate Editor*

(See also in this issue the subsection "Lower Animals" in the sections Immunology and Filterable Viruses; and Entries 12165, 13393, 13398, 13403, 13529, 13635, 13646, 13648, 13661, 13673, 13688, 13691, 13695, 13698, 13722, 13748, 13805, 13818, 13943, 13958, 14059, 14424, 14435, 14469, 14927)

13443. **BABONI, NINO. Anabortina e reazioni allergiche nella diagnosi dell'aborto infettivo dei bovini. [Anabortin and allergic reaction in diagnosis of bovine infectious abortion.]** *Profilassi Sieri e Vaccini Patol. Comp.* 3(1): 2-5. 1930.—A review of the literature is given. The author's work was done with anabortin, a suspension of Bang bacillus grown in glycerinated broth with addition of 5% formalin. The intradermal reaction, the 1st series done at the base of the neck and the 2nd on the subcaudal skin, was shown to be of diagnostic value and far superior to either the thermal or ophthalmic reactions. A large number of cows was tested.—*H. L. Gruehl.*

13444. **BERGMANN, MAX, WILLI HAUSAM, und ERICA LIEBSCHER. Dermatophyten als Erreger von Lederschäden. (10 Mitteilung über Häute- u. Lederschäden von M. BERGMANN und Mitarbeitern.)** *Collegium [Frankfurt a. M.]* 1931(733): 248-254. 3 pl. 1931.—Skin diseases produced by pathogenic fungi were demonstrated as the cause of imperfect leather. The authors describe defects 1-3 cm. in diam. in chrome leather; living fungi were demonstrated therein, *Trichophyton* being the apparent organism.—*M. Bergmann (transl. by S. W. Becker)*.

13445. **BIESTER, H. E., and L. H. SCHWARTE. Intestinal adenoma in swine.** *Amer. Jour. Path.* 7(2): 175-186. 3 pl. 1931.—In the studies of the pathology of infectious enteritis in swine, with reference to intestinal adenoma, several facts were recorded. In pigs killed after the acute disease had subsided, it was noted that in the glands of the large intestine the goblet cells had been replaced by a lower type of epithelium; other material indicated that repair had come about by proliferation of flattened elongated epithelial cells with large nuclei. In advanced cases where epithelial destruction had occurred, an adenoma-like formation containing less differentiated types of epithelium, was found.

13446. **BRUHNKE, JOHANNES. Morphologische Untersuchungen des Wandhornes und der Wandlederhaut einiger pathologischer Hufe.** *Deutsch. Tierärztl. Wochenschr.* 39(28): 433-438. 4 fig. 1931.—The investigation covered contracted hoofs, keraphyllocele and laminitis. In order to get a conception of the morphology, microserial sections were made from the wall of the hoof and its sensitive laminae in its entire length from the coronary border to the bearing surface of the toe. The findings of the various sections were compared and described separately for each of the 3 defects named.—*J. Bruhnke (transl. by F. Volkmar)*.

13447. **COMINOTTI, LUIGI. Ausscheidung des B. abortus (Bang) durch das Euter bei Kühen nach Impfung mit lebenden Kulturen desselben Bakteriums.** *Deutsche Tierärztl. Wochenschr.* 39(30): 465-466. 1931.—50-66.5% of heifers double-vaccinated with living cultures of *Bacillus abortus* excreted virulent abortion bacteria in the milk as long as 15-24 mo. after administration. The organisms maintained their biological characteristics which were acquired under artificial cultivation. Guinea pigs injected subcutaneously with such organisms developed agglutinins slowly (34-44 days after administration).—*Author's summary (transl. by F. Volkmar)*.

13448. **ELTON, CHARLES. The study of epidemic diseases among wild animals.** *Jour. Hyg.* 31(4): 435-

456. 1931.—To a summary of available published records of epidemics among wild animals, are appended unpublished records from various sources. Consideration of periodicity in numbers of mice and epidemics among them indicates that study of ecology is needed to solve problems of mammal epidemiology and human disease.

13449. **EMMEL, M. W., and I. FOREST HUDDLESTON. Susceptibility of the fowl to the species of the genus Brucella.** *Proc. 21st Ann. Meet. Poultry Sci. Assoc.* 1929. [In: *Bull. Alabama Polytech. Inst.* 25 (1): 76-77. 1930.]—A series of experiments are reported in which it is demonstrated that organisms of the *Brucella* group are pathogenic for fowls, but the disease produced is not always fatal; the course is 18-96 days. Symptoms are emaciation, and paleness about the head, comb and wattles; diarrhea and paralysis may develop in some cases. Diagnosis on gross pathology is difficult. 4 flocks are described in which natural infection occurred. Decreased egg yield seems to be an important economic factor where infection of this type occurs.—*M. W. Emmel.*

13450. **FELDMAN, WILLIAM H. Susceptibility of the gopher (Citellus tridecemlineatus) to Mycobacterium tuberculosis.** *Amer. Jour. Path.* 7 (2): 139-146. 2 pl. 1931.—Gophers were inoculated with original strains of human, bovine and avian tubercle bacilli, 2 animals being injected intravenously, 2 subcutaneously, and 1 intraperitoneally, with each type. 2 of the 15 animals injected escaped after 2 weeks, and 1 died 3 hrs. after injection. Definite lesions of tuberculosis were observed with each of the 3 forms, degree or extent of infection varying with route of inoculation. The animals were more susceptible to the bovine and human strains than to the avian form.

13451. **FELDMAN, WILLIAM H. The pathological changes following experimental exposure of dogs to Mycobacterium tuberculosis of avian origin.** *Amer. Jour. Path.* 7 (2): 147-156. 2 pl. 1931.—In 6 dogs, bacilli of avian tuberculosis were injected into the brain; later, tuberculous lesions were found in the brain and liver in every instance. In only 1 animal was the spleen involved; and in all, the lungs escaped demonstrable infection. In 4 of 10 dogs intravenously injected, in which the disease resulted, the lesions (mainly nonprogressive) were sharply limited to the liver. No explanation is known for the consistent and extensive infection of the liver in the intracerebrally inoculated animals, as compared to the infrequency of lesions in the liver of dogs inoculated intravenously. Likewise, failure of the disease to become manifest in the lungs is difficult to explain and emphasizes the significance of the susceptibility of organs in the pathogenesis of tuberculosis. The lesions induced were essentially circumscribed or diffuse accumulations of monocytic cells, generally progressive; necrosis was not common. The apparent absence of giant cells would indicate that these structures are not a part of the histological response of dogs toward tuberculous infections. Although the dog's brain offers a vulnerable portal of entry for tuberculosis, the dog apparently possesses an extremely formidable constitutional resistance to this form of the disease.—*From author's summary.*

13452. **FINKELDEY, W. Spontantuberkulose beim Affen. [Spontaneous tuberculosis in a hamadryad monkey.]** *Virchow's Arch. Path. Anat. u. Physiol.* 281 (2): 316-322. 2 fig. 1931.

13453. **[GOLOV, D. A., and A. N. KNIAZEVSKII.]** ГОЛОВ, Д. А., и А. Н. КНЯЗЕВСКИЙ. К вопросу о роли эктопаразитов пустого гнезда суслика Citellus pygmaeus в эпидемиологии чумы. **[Role of ectoparasites of the empty nest of C. pygmaeus in epidemiology of plague.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9 (1): 62-67; French résumé, 130-132. 1930.—*Cer[atophyllus?] tsq., Ct[enopsylla?] breviatus, Neopsylla setosa,* and *Rhipicephalus schulzei* O. were found on 15 marmots caught during a plague epidemic of marmots in 1929, in Kazakstan. Anatomical studies of killed marmots showed that they were not infected, but suspensions of ground fleas found on them, when injected into a house mouse, produced the disease and death on the 4th day. *Bacillus pestis* was isolated from the organs of the mouse. Fleas infected with *B. pestis* were also found in empty nests of marmots dead from plague; evidently they serve as the means of spreading the disease among the migrating young marmots. These results were not obtained with suspensions of *R. schulzei.*—*G. A. Lebedeff.*

13454. **HAYDEN, C. E. The constituents of the blood of animals as evidence of intestinal contribution to the cause of diseases of obscure origin.** *Cornell Vet.* 20 (2): 223-231. 1930.—The constituents of the blood in 1 case of preparturient paresis in a ewe, in 6 stiff lamb cases and 3 normal lambs, in 1 case of icterohematuria in a sheep and in 1 case of azoturia in a horse, together with blood from 5 normal horses for comparison, were studied. Preparturient paresis gave a high total non-protein and urea reading, together with a Ca reading 2 mg. below minimum normal standard. The stiff lamb cases gave a very high total non-protein and urea N reading, and a chloride content slightly below average. There was the same increase in total non-protein and urea N in the icterohematuria case. Other constituents of the blood in preparturient paresis and in stiff lambs would seem to indicate that increase in N is non-renal in origin, whereas the evidence in icterohematuria points toward possible renal and liver disturbance. The case of azoturia showed a higher reading for lactic acid, amino-acid and free phenols at onset, than was indicated during recovery. The author concludes that the level of some of the blood constituents would seem to indicate an etiology due to intestinal contribution in preparturient paresis, stiff lambs, azoturia, and possibly in icterohematuria.—*Lucille Bishop.*

13455. **HORTA, A. AVILA, et A. MENDONÇA MACHADO. Tuberculose du type bovin chez les porcs.** *Arq. Inst. Bact. Camara Pestana* 6 (2): LXXIII-LXXXVIII. 1 fig. 1930.—The authors identified a case of generalized tuberculosis in a pig by inoculation into rabbits, pigeons and guinea pigs. The bacillus isolated was of bovine type. Statistics from the Lisbon Municipal Slaughter-House indicate that incidence of swine tuberculosis was greatest during 1909 (0.332%), its incidence declined with 1926 (0.069%), and since then it has increased slightly. It is noted that the majority of infected pigs was from the northern country where milk products are fed; pigs in southern Spain are bred in the fields.—*A. A. Horta.*

13456. **LEBAILLY, C., et M. BRIENS. Septicémie épidémique à pneumocoques chez les bovins adultes.** *Rev. Vét. et Jour. Méd. Vét. et Zootech.* 83 (Oct.): 543-545. 1931.—A contagious pneumococcus septicemia occurred in 1930 at St. Pierre-la-Vieille. It was extremely deadly, attacking young cattle on pasture. Death occurred within 24 hrs., preceded by intestinal and nasal hemorrhages. A vaccine made of a titrated microbial emulsion stopped the epidemic.—*Authors' summary (transl.).*

13457. **MONTGOMERIE, R. F., and W. T. ROWLANDS. "Pulpy kidney disease" of young lambs in North Wales.** *Vet. Jour.* [*London*] 87 (9): 401-410. 1931.—The condition is believed to be identical with the pulpy kidney disease described by Gill in New Zealand. Field observations indicate that injection of lamb dysentery serum has markedly reduced losses from this disease. In 5 of 11 cases, diluted, filtered, intestinal contents were toxic to rabbits and mice. In one trial no toxicity was shown for a lamb. Antitoxic sera prepared from *Clostridium oedematis, Cl. welchi* and *Cl. novyi* failed to neutralize intestinal filtrate, but exposure to 60° C. for 1 hr. rendered it atoxic.—*I. E. Newsom.*

13458. **OLT, A., und A. STRÖSE. Wildseuchenbekämpfung. Gemeinfässliche Belehrung über die wichtigsten seuchenartigen Krankheiten unseres Wildes. [Control of epidemics among game animals. Most important**

epidemic diseases of game animals in Germany.] 2nd ed. 54p. I. Neumann: Neudamm, 1928.

13459. **PARISH, H. J., and S. CRADDOCK. A ringworm epizootic in mice.** *British Jour. Exp. Path.* 12 (4): 209-212. 1931.—An epizootic is described in which nearly 50% of a breeding stock of 2500 mice were infected with *Trichophyton gypseum asteroides*. The disease spread to 4 laboratory attendants. Epizootics of ringworm in mice are rare, and it is suggested that some unusual predisposing factor may have determined the virulence of this attack.—*J. Bland.*

13460. **RICHTER, JOHANNES. Zur Pathologie des Uterus der Hündin.** *Berliner Tierärztl. Wochenschr.* 46 (40): 721-730. 17 fig. 1930.—The author found 24 cases of endometritis and 40 cases of pyometra among 64 dogs with uterus disease; colon bacillus was the common cause. Clinically, one can differentiate between chronic endometritis and pyometra; histologically it is impossible unless the entire wall of the uterus has atrophied due to the pyometra. In these cases of infection, hysterectomy alone is followed by complete recovery, but symptomatic treatment is unsuccessful.—*J. Richter (transl. by J. E. Lackner & S. S. Schochet).*

13461. **SJOLLEMA, B., und L. SEEKLES. Über Störungen des mineralen Regulationsmechanismus bei Krankheiten des Rindes. (Ein Beitrag zur Tetaniefrage.)** *Biochem. Zeitschr.* 229 (4/6): 358-380. 1930.—Examination of the blood serum of 12 normal cattle and of those affected with parturient paresis and grass staggers (grass tetany) shows noticeable differences in the regulatory mechanism of mineral metabolism in the 2 syndromes, chiefly in Mg content, concentration of Ca-ions and amount of inorganic P. For parturient paresis (25 cases), the average values were, Mg, 2.19; Ca, 0.44; and P, 2.16; for grass tetany (39 cases), Mg, 0.46; Ca, 1.18; and P, 4.33 mgm. %. There were also differences in total Ca content (average, parturient fever, 4.35 mgm. %; grass tetany, 6.65 mgm. %). In normal cattle the average values were: Mg, 1.66; P, 4.57; Ca^{++}, 1.65; Ca, 9.35 mgm. %. In parturient paresis, the Ca:Mg ratio was 2; in narcosis from intravenous injection of Mg salts, the Ca:Mg ratio fell to 0.9. In normal animals the value was 5.6. Against this, the Ca:Mg ratio in grass tetany was as high as 14.6. In this disease there was a connection between Mg content of serum and time of drawing of blood. At the beginning of an attack the content was always low; soon after an attack it became relatively high. Attacks may appear when the Ca:P ratio is moderately high—average 1.5; thus, the condition resembles that seen after parathyroidectomy, when seizures may occur when the ratio is as low as 1. The 2 syndromes show great variability with regard to the % of diffusible Ca. In parturient paresis the diffusible Ca runs 25-100%; in grass tetany, 40-100%; in normal animals, 48-66%. No connection was found between occurrence of attacks and changes in the % of diffusible Ca. Inorganic phosphoric acid is wholly diffusible in normal animals as well as in these 2 diseases. Diffusible Mg fluctuates considerably in all 3 conditions. Results show that, at least in parturient paresis, there is no connection between concentrations of inorganic constituents of the blood serum (Ca^{++}, H^+, HCO_3^-, HPO_4^{--}). The assumed connection between mineral composition of blood and disease symptoms can scarcely be regarded as settled, though better agreement might be possible if we were in a position to determine quantitatively the different forms of each of the blood serum constituents. Apparently, the blood serum gives a false picture of conditions in the tissues (caused, e.g., by altered permeability), unless other portions of the blood are also taken into account.—*Author's summary (transl. by I. E. Newsom).*

13462. **SÖNTGEN, CARL. Antiformin-Anreicherungsmethode nach Machens zur besseren Ausbeute an Tuberkelbacillen bei der mikroskopischen Untersuchung von Rachenschleimbecherproben mit Nachprüfung durch den Tierversuch.** *Arch. Wiss. u. Prakt. Tierheilk.* 63 (2): 181-188. 1 fig. 1931.—The antiformin method of Machens gave 30% more positives than simple microscopic examination, when applied to 365 cases of open pulmonary tuberculosis in cattle. This method made a diagnosis possible in 4.7% more cases than did direct microscopic examination. It is to be recommended for the pharyngeal mucus test but, should occasion require, it is necessary to save enough of the mucus without addition of antiformin, for animal inoculation.—*Author's summary (transl. by I. E. Newsom).*

13463. **STAMMER, HANS-JÜRGEN. Die Bakteriensymbiose der Trypetiden (Diptera).** *Zeitschr. Wiss. Biol. Abt. A, Morph. u. Ökol. Tiere* 15 (3): 481-523. 25 fig. 1929.—A study of 37 species of trypetids showed in all cases the presence of symbiotic bacteria, the manner of distribution of which varied with the genus. In the simplest case, the bacteria are diffuse or in clumps in the intestinal contents of the larvae and young adults. In old adults they are always present in enormous numbers in the lumen of the intestine. A special mechanism for transmission is lacking in this case, except for a short, slit-like connection between intestine and vagina opening in the ovipositor. With the larvae of Tephritini, of the Schistopterini, and of *Dacus oleae*, the 4 digestive caeca are filled with bacteria. In adults, the bacteria are localized in a special zone of the ventriculus. The transmission mechanism here consists of furrows in the hind intestine, which in the older adults are filled with bacteria. In the adult of *D. oleae* the diverticulum of the oesophagus contains the bacteria. The bacteria-filled, finger-like invaginations in the posterior part of the hind intestine function as the transmission mechanism. Freshly laid eggs of *Tephritis heiseri* and *D. oleae* are covered with bacteria which enter the micropyle to infest the larvae shortly before hatching. Experiments by various workers indicate that phytophagous and coprophilous fly larvae can develop only when microorganisms are present. This appears to be true also for the Trypetidae.—*O. A. Johannsen.*

13464. **STEFFAN, HELMUT. Die Beziehungen der Linsenveränderungen zu Alter, Geschlecht, Farbe und Rasse des Pferdes, ohne Berücksichtigung der Berlinschen Ringe.** *Zeitschr. Veterinärk.* 43 (2): 33-69. 1931.—The lens was affected in 34.4% of the horses observed; in 25.4% the affection involved both eyes. The number of lens affections increases with age. The incidence seems to be correlated with the presence of pigment in the skin, white horses being oftener affected than bay, sorrel or black. Geldings contributed 38.2% of the cases; mares, 26.0%. The % was higher in fullblooded than in coldblooded or warmblooded horses. The affections are equally divided between the posterior and anterior capsules and the entire lens substance. It is assumed that most of the diseases of the lens are occasioned by internal causes.—*Author's summary (transl. by F. Volkmar).*

13465. **TRAWIŃSKI, A., und I. MATERNOWSKA. Ein Fall geschwürig-eitriger Endo- und Myokardiumtuberculose beim Rinde.** *Arch. Wiss. u. Prakt. Tierheilk.* 61 (4): 359-361. 1 fig. 1930.—Autopsy of an 8-yr. old cow revealed tuberculosis of the lung, liver and heart. The upper endocardium of the right ventricle presented grayish, thickened areas; the tricuspid valve, characteristic tubercular nodules and numerous irregular, flat ulcers extending into the wartlike muscle. Histologically, the ulcers consisted of coagulation-necrosis surrounded by a zone of cellular infiltration and, on the periphery, inflammatory granulation tissue. Tendency toward calcification was observed. It is assumed that the lesions were of hematogenous origin.—*F. Volkmar.*

13466. **TULLBERG, KJELLÅKE. Diplokockjuverinflammation hos ko. Experimentella studier. [Diplococcus inflammation of the udder in cows. Experimental studies.]** [With English summary.] *Skandinavisk Vet.-Tidskr.* 21 (10): 309-337. 22 fig. 1931.—Injection of bouillon culture of diplococci isolated from an infected udder, into the teat of a healthy milch cow was followed by acute inflammation of the udder restricted to the part infected, and accompanied by changes in the milk,

Necrosis of the epithelium of the milk ducts and acini resulted. In an untreated cow, udder inflammation continued for 1 mo., but with return of health the milk did not attain its original quantity. In another case, total cessation of milk secretion followed the inflammation. In a 3rd cow, infection of one quarter 1 mo. after the 1st quarter had been infected, led to inflammation of long duration. This evidence indicates to the author that vaccines can not be regarded as of prophylactic value against mastitis.

(See also in this issue Entries 12176, 12547, 12590, 12964, 12967, 13326, 13344, 13345, 13361, 13382, 13387, 13425, 13443, 13456, 13457, 13466, 13571, 13634, 13645, 13652, 13655, 13656, 13658, 13661, 13667, 13672, 13687, 13698, 13700, 13702, 13713, 13715, 13766, 13772, 13775, 13791, 13800, 13819, 13831, 13833, 13838, 13942, 13943, 14081, 14351)

GENERAL

13467. **ALEXANDER, H. L. The allergic skin reaction.** *Arch. Dermatol. and Syphilol.* 24(4): 543-545. 1931.—The author had previously reported the presence in normal skin of a then unidentified substance which increases the local allergic edema (size of wheal) induced by subcutaneous injection of histamine. He now reports the isolation of this substance and its identification as Ca; it acts, however, only in very dilute solution (10 parts per million).

13468. **ANDERSEN, T. THUNE. Das Verhältnis zwischen dem F-Antigen und dem A-Antigen in Menschen-Erythrozyten der Gruppen A und AB.** *Zeitschr. Rassenphysiol.* 4(2): 49-86. 1931.—This paper deals in general with, and confirms, the well known relationship of the Forssman substance in tissues of the guinea pig type to that in cells of human group A. In his work, rabbits were immunized with saline extracts of Forssman antigen, sheep blood and human blood of all groups. In addition, some rabbits were injected in accordance with the method described by Landsteiner and Simms, viz., a mixture of alcoholic extract and pig serum. The various sera were tested for action on sheep blood and blood of group A. The author failed to produce anti-A agglutinins by injecting alcoholic extracts of human blood group A and pig serum, but the preparation of such sera was previously described by Witebsky. Peculiar properties were displayed by the sera of rabbits injected with alcoholic extracts of B blood and pig serum. These sera gave complement fixation reactions with extracts of group B blood and, strangely enough, also with guinea pig kidney.—*P. Levine.*

13469. **AOKI, K. Über das Wesen der Mitagglutination.** *Zentralbl. Bakt. I. Abt. Orig.* 105(6/8): 459-462. 1928.—The specific types of a number of *Salmonella* spp. which showed cross agglutination, were agglutinated by their own specific antisera but not by those of the other species. The non-specific types, however, were generally agglutinated by the non-specific antisera of the other species. The writer correlates the occurrence of non-specific variants within a bacterial species, with the phenomenon of cross agglutination.—*J. B. Nelson.*

13470. **BARR, M., A. T. GLENNY, and C. G. POPE. Some observations on the distribution of antitoxins in serum.** *Brit. Jour. Exp. Path.* 12(4): 217-226. 1931.—Use of $(NH_4)_2SO_4$ for fractionating antitoxic sera has advantages over that of saturated solutions. The quantities should be expressed in terms of gms. of salt per liter of serum and not as % saturation. Using this method it is shown that the quantity of $(NH_4)_2SO_4$ necessary to precipitate a given proportion of antitoxin may be altered by addition to the serum of an excess of either of the non-antitoxic proteins—euglobulin or serum albumin. On blending sera which exhibit differences in antitoxin distribution as determined by salting-out methods, some redistribution of antibodies occurs. On blending 2 globulin fractions containing different types of antitoxin, one removed at low and the other at high concentration of precipitating salt, redistribution of the antibodies from both fractions occurs; any quantity of precipitant sufficient to cause separation of protein, precipitates both types of antitoxin, though in different proportions.—*J. Bland.*

13471. **BEDSON, S. P. Immunization with killed herpes virus.** *Brit. Jour. Exp. Path.* 12(4): 254-260. 1931.—Herpes virus treated with low concentrations of formalin is capable of producing a high degree of immunity in guinea pigs. That this immunity is produced by dead virus is shown by the following: (1) Each vaccine was tested by serial passage in the plantar skin of 3 guinea pigs and proved inactive. This procedure was shown capable of reactivating sub-infective doses of live virus. (2) Guinea pigs were inoculated with a dose of virus 10 times greater than that which, though subinfective, could be reactivated by the serial passage method. This dose must therefore have been greater than any living virus which could have been present in the formolized virus. Almost no immunity was produced by this dose of living virus, however, while that produced by formolized virus was good. Herpes virus killed by heating at 60 or 100° C. is devoid of immunizing power. If the virus is treated with formalin before heating at 100°, it is still capable of producing some immunity.—*J. Bland.*

13472. **BELÁK, ALEXANDER, et al. Vegetatives Nervensystem und Immunität. IV. ALEXANDER BELÁK, und JOHANN von SIEGLER. Die Wirkung des Adrenalins auf die Agglutininbildung beim Kaninchen. V. A. BELÁK, und D. SZABÓ. Die Wirkung des Thyroxins auf die Agglutininbildung beim Kaninchen.** *Zeitschr. Ges. Exp. Med.* 75(3/4): 443-448; 449-453. 1931.—The experiments reported were done to test Pfeiffer's theory that antigen does not act directly on the cells but stimulates them through the parasympathetic nervous system. IV. The antigen used was a suspension of paratyphoid bacilli. Each rabbit in a series divided into 3 groups, received 0.1 cc. of bacterial suspension injected intracutaneously into the ear. The rabbits in the 1st group were then injected intravenously with a solution of adrenalin and the antigen depot was removed 2-3 sec. later by cutting off the ear. The 2nd group were not given adrenalin, but the antigen depot was removed by excision of the ear. The animals in the 3rd group received adrenalin intravenously and the antigen depot in the ear was allowed to remain. At intervals up to 16 days after injections, agglutination titers were tested for comparison. The averaged titers were 1-10,800 to 1-14,000 in the group receiving injection of antigen without adrenalin, while the average titers of agglutinin in the serum of those receiving adrenalin and antigen, with immediate removal of the antigen depot, were 1-5200 to 1-9800. On the basis of these differences, the authors conclude that adrenalin depresses agglutinin formation through stimulation of the sympathetic nervous system. They regard this as further evidence that antibody production is a function of the tonus-height of the parasympathetic nervous system. V. The authors report results of the effect of injection of thyroxin on agglutinin production following intravenous injection of a suspension of paratyphoid bacilli. Repeated injections caused a decreased agglutinin production. The data are presented as additional evidence in favor of the theory that immune-body formation

is dependent on the activity of the vegetative parasympathetic nervous system.—*S. Bayne-Jones.*

13473. **BELFANTI, S., et G. DESSY. Nouvelle méthode de vaccination antituberculeuse avec des bacilles vivants et virulents. (Note préliminaire.)** *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(7/8): 325-337. 1931.—Experiments on 695 guinea pigs and 6 goats showed that it is possible to confer immunity to tuberculosis by introducing living and virulent bacteria into the organism, provided they are carried by substances like lysocithine, saponin or cyclamine, which can rapidly excite the formation of a local barrier, the latter prohibiting general diffusion of the bacteria into the organism. Saponin is the best vehicle because it is easily conserved, is most constant in action, and is most easily sterilized. The vaccine must be introduced hypodermically, otherwise it becomes pathogenic.—*From authors' summary (transl.).*

13474. **BERARDI, ANTONIO. L'isoemoagglutinazione nei rapporti fra madre e figlio. [Isohemagglutination in its relation between mother and child.]** *Pediatria Rivista* 36(5): 250-256. 1928.—Although at birth the blood group is not well defined, in the following months it forms gradually; therefore there can be antagonism between serum of newborn and red-cells of mother. Thus, a blood-transfusion from mother to child must be done with the same precautions as for adults.—*E. Ponzi.*

13475. **BESCHE, ARENT de. Eine Untersuchung über antigene Eigenschaften in Pferdeserum und in Pferdehaaren-Pferdeschuppen Extrakt.** *Acta Path. et Microbiol. Scandinavica Suppl.* 3: 53-61. 1930.—Among 53 patients with asthma in etiologic relationship to horses, 21 gave cutaneous reactions for both horse serum and extract of horse hair and dander. The balance reacted with the hair-dander extract, but not with serum. Among the 1st group, 3 had previously received prophylactic doses of diphtheria antitoxin and reacted strongly after injection. Among the 2nd group, 4 had received diphtheria antitoxin, and 2 had dyspnea and collapse symptoms. The skin reaction is therefore of value, as indicating sensitiveness to horse serum. Distinct positive reactions were obtained when an asthmatic patient was injected with horse serum and with the hair-dander extract, although the serum reaction was less serious than the extract reaction. Guinea pigs were sensitized by intraperitoneal injection with horse serum and extract of horse hair and dander. When injected intravenously 11 days later, strong anaphylactic symptoms developed.—*P. G. Heineman.*

13476. **BIANCALANA, L., et S. TENEFF. Comportement de la réserve alcaline et du pH après transfusions de sang compatible et incompatible.** *Soc. Internaz. Microbiol. Boll. Sez. Italiana* 3(9): 609-612. 1931.—In cases of transfusion disturbances from compatible or incompatible bloods, the authors have always found a displacement of the alkaline reserve and pH toward the acid side.—*Authors' conclusions (transl.).*

13477. **BIANCALANA, L., et S. TENEFF. Modifications du pouvoir isoagglutinant des sérums: (1) Dans la préparation des donneurs de sang immune. (2) Après les opérations chirurgicales.** *Soc. Internaz. Microbiol. Boll. Sez. Italiana* 3(9): 613-616. 1931.—The authors conclude from their studies that universal donors are dangerous when they possess isoagglutinins in high titer. Preparation of donors for immuno-transfusion tests sometimes causes increase in isoagglutinating power. Such increase is seen preeminently in individuals in whom immunization is accompanied by a febrile reaction. It is therefore believed preferable in immuno-transfusions, even more than in ordinary transfusions, to choose the donor from the same group as the recipient. Before using universal donors, it is necessary to control the intensity of the reaction provoked by the vaccination, and eventually to base their use on the iso-agglutinin titer. In their researches the authors controlled the isoagglutinin titer after more or less grave surgical operations carried out under local or general anaesthesia; control was carried out 7 days after operation. Results obtained suffice to demonstrate that the isoagglutinin titer diminishes after surgical operations; this parallels the lowering of immunity power observed after such operations.—*Authors' conclusions (transl.).*

13478. **BIGLIERI, ROMIRIO. Ensayos de vacunación por medio de emulsiones de neuro-viruela muertos por el éter, el ácido fénico y formol. [Variola vaccination with emulsions of neuro-virus killed by ether, phenol, and formaldehyde.]** *Rev. Soc. Argentina Biol.* 7(5/6): 399-409. 1931.—Only negative results were obtained.—*J. T. Lewis.*

13479. **BIGLIERI, ROMIRIO, e IDA FISCHER. Contribución al estudio de las propiedades antibacteriofágicas de sueros humanos. [Antibacteriophage activity of human serum.]** *Rev. Soc. Argentina Biol.* 7(5/6): 410-415. 1931.—In 80 specimens examined, antibacteriophage action was found constantly for staphylococci, and in 2.5-3.7% of cases for *B. coli, B. typhosus* and *B. paratyphosus A* and *B.*—*J. T. Lewis.*

13480. **BOAS, HARALD. Untersuchungen über die neue Schnellreaktion von Kahn.** *Acta Path. et Microbiol. Scandinavica Suppl.* 3: 69-74. 1930.—In 3135 cases of syphilis, the Wassermann reaction gave 49% positive results; the Kahn reaction, 57%. In 2% of these cases the Wassermann reaction only was positive; in 10% of the cases the Kahn test was positive while the Wassermann was negative. In 2226 control cases the Kahn reaction was positive once (probably a latent case). Both reactions gave positive results in 1484 cases, and both gave negative reactions in 3481 cases. The author thinks that the Kahn reaction should not replace the Wassermann, but that both tests should be used. His choice would be the Kahn, if only one method is used, because the technique is simpler, it is more sensitive, and it requires less time.—*P. G. Heineman.*

13481. **BORQUIST, MAY, and CHARLOTTE ROWE. The phagocytosis of tubercle bacilli by leucocytes.** *Amer. Rev. Tuberc.* 24(2): 172-181. 1931.—Micromanipulation of monocytes and clasmatocytes shows that they differ in consistency, a monocyte being fragile and easily disintegrated, and a clasmatocyte being distinctly more resistant, more sticky and more elastic. Monocytes and clasmatocytes with ingested tubercle bacilli were studied: (1) on flat preparations both with neutral-red and without stain, kept under continuous observation for periods of from 2-11 hrs., and (2) on fixed and stained smears of mixtures of cells and bacteria which had been incubated in hanging drops. Monocytes, clasmatocytes and epithelioid cells with ingested bacilli were studied in smears of lung tissue and peritoneal exudates obtained from tuberculous animals. There was no evidence that ingested tubercle bacilli (bovine strains, different from those studied by Sabin and Doan) are fragmented by any of the cells studied. Bacilli inside cells neither took up neutral-red nor appeared disintegrated. Epithelioid cells contain many more bacilli than other cells, but no greater number of life-cycle changes were seen within them. These experiments suggest the possibility that the longevity of the epithelioid cell, rather than the multiplication of bacilli within it, may account for its greater content of bacilli as compared with the clasmatocyte.—*Authors' summary.*

13482. **BRAIER, BERNARDO. Influencia de la vacuna coli sobre el metabolismo nitrogenado de los perros hipofisoprivos. [Effect of B. coli vaccine on N metabolism of hypophysectomized dogs.]** *Rev. Soc. Argentina Biol.* 7(3/4): 305-313. 1931.—Hyperthermia after infection of vaccine is the same in fasting operated animals and in controls. Urinary N increases more in controls.—*J. T. Lewis.*

13483. **BRÜDA, B. E., und H. PFEIFFER. Über die Bedeutung der Milz und des Speicherzellensystems (Retikuloendothels) für die Abwehr von bösartigen Impfgeschwülsten der Ratte.** *Zeitschr. Ges. Exp. Med.* 68(1/4): 116-125. 1929.—The effect of the growth of a malignant mouse tumor was tested in splenectomized rats, in parabiotic rats where one partner was splenec-

tomized, and in splenectomized rats blocked with India ink. It is concluded that prevention of growth of malignant tumors in rats is due to secretion by the spleen of a substance, designated "mesenchymin," into the blood and lymph. The spleen is thus brought into line with the rest of the reticulo-endothelial system in having the function of inner secretion.—*R. W. Linton.*

13484. **BURNET, F. M.** The flocculation reaction with staphylococcal toxin. *Jour. Path. and Bact.* 34(6) : 759-769. 1931.—The toxin, which is remarkably heat-resistant, gives good flocculation with its antitoxin. Optimal flocculation bears a constant relation to the neutral point and is always in the zone of antitoxin excess. Both toxin and antitoxin can be recovered from the precipitate.—*A. E. Boycott.*

13485. **CAPPELLINI, ICILIO.** Sul potere isoemoagglutinante delle varie frazioni proteiche del plasma umano. (Nota preventiva.) [Isohemagglutinating power of the various protein fractions of human serum (preliminary note).] *Sperimentale* 85(2/3) : lxxxv-lxxxvi. 1931.

13486. **CARONIA, JOSEPH.** The nature and uses of lysed typhoid vaccines. *Amer. Jour. Dis. Children* 39 (1) : 1-8. 1930.—The author reports favorably on use of typhoid or paratyphoid vaccines lysed with convalescent serum, for treatment of enteric fever.—*F. W. Hachtel.*

13487. **CHANTRIOT.** Syphilis, paludisme et sérologie. *Rev. Prat. Mal. Pays Chauds* 11(6) : 249-261. 1931.—The author concludes that malarial fever modifies the course of syphilis favorably to a condition in which specific chemotherapy is effective. The plasmodium favors reactions between lipids and proteins of the Treponema. The Wassermann reflects this reaction in varying frequently from positive to negative. The action of malaria naturally acquired, as that of provoked malaria, on visceral or latent syphilis, seems to be comparable in most cases to the action of malariatherapy in paresis. Agents other than the hematozoon can bring about this serological modification and ought to be important adjuvants which prepare in some way for chemotherapy. Most of the pyretogenic shocks and heterotherapy are useful in syphilis where the serological reaction is irreducible. In the case of syphilis resistant to the ordinary chemical agents it seems absolutely necessary to practise a heterotherapy appropriate to the case. Autohemotherapy is sometimes sufficient and is apt to be of great value.—*R. E. Jung.*

13488. **COCA, ARTHUR F., MATTHEW WALZER, and AUGUST A. THOMMEN.** Asthma and hay fever in theory and practice. Pt. 1. Hypersensitiveness, anaphylaxis, allergy (COCA); Pt. 2. Asthma (WALZER); Pt. 3. Hay fever (THOMMEN). 851p. 95 fig. Charles C. Thomas: Springfield, Illinois, 1931.—This book is composed of 3 monographs, which together cover the history, theory, and practical aspects (diagnosis, etiology, prevention and therapy) of specific sensitiveness. Part I, in addition to a review of the literature of these subjects, includes chapters in which are discussed the questions of hypersensitiveness to non-antigens, the skin as a shock tissue, and the methods of preparing extracts and solutions for testing and prophylactic treatment of allergic diseases. Part II is a comprehensive and critical review of the literature on etiology, pathology, clinical aspects, diagnosis and treatment of asthma. It also includes an extensive consideration by WALZER and THOMMEN of the methods of testing for hypersensitiveness and a chapter by BOWMAN and WALZER on the excitants of allergy from the points of view of their relative frequency and importance as excitants, the proper testing strength, their chemical nature, indications for treatment with them, the various manufactured articles in which they may occur and through which contact with them by sensitive persons and others may be had. Part III presents a historical review of this subject, an exhaustive consideration of the botanic aspects of the condition, and detailed consideration of the etiology and mechanism, diagnosis and treatment of hay fever.—*A. F. Coca.*

13489. **COLOSI, NATALE.** Bile as an antigen in serum diagnosis of syphilis. *Amer. Jour. Syphilis* 15(2) : 244-246; also in *Med. Times and Long Island Med. Jour.* 59(4) : 148. 1931.—The author performed 125 comparative Wassermann tests with normal, 1+, 2+, 3+, and 4+ human sera and − and 4+ cerebrospinal fluid, using both alcoholic and cholesterinized extracts of beef heart and of ox bile. It is concluded that: (1) Ox bile possesses the antigenic principle common to extracts of normal organs. It can be used, therefore, as antigen in the Wassermann test for syphilis. (2) With normal and luetic sera and cerebrospinal fluid, aqueous solutions, plain alcoholic and cholesterinized extracts of ox bile are as reactive as Wassermann antigens, as are similar extracts of normal organs. (3) Sheep bile is hemolytic to ox and sheep erythrocytes and can not be used, therefore, as antigen in the Wassermann reaction, at least when the anti-sheep hemolytic system is used.—*N. Colosi.*

13490. **CONFALONE, RAFFAELE.** Recherches expérimentales sur l'influence réciproque de la vaccination anti-typhique et de la vaccination de Jenner. *Soc. Internaz. Microbiol. Boll. Sez. Italiana* 3(5) : 170-173. 1931.—Anti-typhoid vaccination, administered simultaneously with Jenner's vaccine, often causes death of experimental animals; administered 3 days after Jenner's vaccine, it gives rise to rapid and intense production of typhoid agglutinins, which dies down in a short time; when administered after the vaccine pustule has disappeared, it produces but few agglutinins, and for a very short time. Jenner's vaccination administered after anti-typhoid vaccination shows that these treatments have no effect on each other.—*Author's résumé (transl.).*

13491. **CUMMINS, S. L., and C. WEATHERALL.** The retardation of lytic processes by colloidal silica solution. *Brit. Jour. Exp. Path.* 12(4) : 239-244. 1931.—Preservation from lysis in human blood or serum by colloidal silica solution extends to other serum-soluble bacteria besides the typhoid bacillus. The solution also preserves type 1 pneumococci from lysis in ox bile and retards both tryptic and peptic digestion of albuminous substances. Addition of colloidal silica solution to a cellular exudate produced by intraperitoneal injection of dust particles, leads to the agglutination of the leucocytes and dust cells and to their preservation intact for 2 mo. or more. The bearing of these observations on pulmonary silicosis is discussed.—*J. Bland.*

13492. **CUMMINS, S. LYLE, and C. WEATHERALL, with an analytical note by E. T. WATERS.** Adsorption of tuberculin by coal dust. *Jour. Hyg.* 31(4) : 464-471. 1931.—The relative exemption of coal miners (as compared to gold miners) from tuberculosis suggested that, if the active principle of tubercle bacilli were adsorbed by C, accumulation of coal dust in the lungs might tend to prevent tuberculous infection. Anthracite coal dust was brought into contact with tuberculin, and samples of coal-treated and untreated tuberculin were tested in 5 experiments on 9-20 patients. Results indicate that anthracite coal dust, especially in an alkaline medium, adsorbs the active principle of tuberculin. Previous saturation with serum protein, while it appears to diminish, does not annul, the power of coal dust to adsorb the active principle.

13493. **DADDI, G.** Études préliminaires sur la sérothérapie polyvalente des Bact. coli. *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(9) : 549-551. 1931.

13494. **EBERSON, FREDERICK, and MARION A. SWEENEY.** Tuberculotoxins and their significance in allergy and neutralization phenomena. *Jour. Immunol.* 20(6) : 395-416. 1931.—Intracutaneous and intraperitoneal studies were made with Berkefeld filtrates of cultures of tubercle bacilli in tuberculous and normal guinea pigs. Comparative studies included filtrates prepared from extracts of focal tuberculous tissues. Neutralization tests were made by intracutaneous and intraperitoneal methods, using immune serum prepared in goats by intracutaneous injections of toxic filtrates over a period of 2 yrs. Intracutaneous tests resulted as follows: Reac-

tions obtained with toxic filtrates were unlike those of tuberculin and confirmed previous observations relating to the production of toxic substances by tubercle bacilli grown in suitable media; the immune goat serum contained antibodies demonstrable in the skin by passive transference to tuberculous animals; combinations of immune goat serum and toxic filtrates in varying proportions exhibited neutralizing properties of the serum under certain conditions; and, when such proportions of material permitted, a simultaneous reaction of passively transferred local allergy. In the normal, non-tuberculous guinea pig controls, these phenomena were not observed, indicating the specificity of these local reactions; filtrates prepared from focal tuberculous tissues in guinea pigs were inactive. Toxic Berkefeld filtrates prepared from 5-18-day-old cultures caused typical immediate or delayed reactions resulting in death or a chain of symptoms followed by recovery. Heating the filtrate to 100°C. for 1-2 hrs. modified or prevented symptoms. These reactions did not occur in normal guinea pigs. Comparison of the behavior of filtrates with ordinary Old Tuberculin under identical conditions showed definitely marked qualitative and quantitative differences. Primarily, irrespective of dosage, injections of diluted O.T. produced no immediate or delayed reactions characteristic or analogous with those elicited by the filtrates. From the quantitative standpoint also, the filtrates were not concentrated before use; the dose injected was proportionately smaller than that of tuberculin; and the cultures from which filtrates were prepared represented 5-18 days' growth, as against 6-8 wks. for tuberculin. Filtrates from 5-day cultures were highly toxic. Immune serum prepared in goats by subcutaneous injections of toxic filtrates over a period of 2 yrs. neutralized completely or lessened the toxic reactions obtained with filtrates alone. Results were considered specific for the following reasons: Normal goat serum failed to protect tuberculous guinea pigs under identical conditions; filtrates were innocuous for normal guinea pigs; immune serum did not neutralize the lethal action of diluted tuberculin, and in this respect did not differ from normal goat serum. Immune goat serum alone caused irregular reactions at times and, rarely, death, depending on dosage, indicating a passively induced allergic response. With normal serum alone the phenomenon was not observed. Toxic filtrates of cultures appeared to contain antigenic and allergenic substances. Filtrates prepared from emulsions of local tubercles in the skin of experimentally infected guinea pigs did not cause local or general reactions. A more accurate interpretation of clinical and immunity phenomena is suggested by the data presented.—*F. Eberson.*

13495. **FELTON, LLOYD D. A study of the neutralizing substance of the pneumococcus.** *Jour. Immunol.* 19 (6): 511-533. 1930.—The author considers the neutralizing characteristic the significant variable in the pneumococcus culture used in the protection test. He draws the following inferences from this experimental work: The protective antibody of antipneumococcus serum can be completely neutralized by killed cultures of pneumococci. This neutralization is type-specific. The law of multiple proportions may operate in the relation of pneumococcus antibody and neutralizing substance. The neutralizing substance of Type I is less stable than that of Type II culture. An 18-hr. culture of pneumococcus killed by 0.4% formalin makes a good neutralizing antigen. Lethal doses of 250,000-10,000,000 may be used as indicators of the endpoint of neutralization. A definite relationship exists between protective power of serum and dilution of serum which is completely neutralized by antigen. The therapeutic activity of pneumococcus-immune serum could be determined by use of a killed culture of pneumococcus as antigen.—*R. W. Jung.*

13496. **FRANZA, ROBERTO. Vaccinazioni triple alternate.** *Boll. Soc. Italiana Biol. Sperim.* 3(5): 637-640. (Also in: *Archivio Sci. Biol.* 11(3/4): 350-359.) 1928.—Rabbits were inoculated alternately with typhoid, cholera, and melitensis organisms; other rabbits, with mixed and single vaccines. They always reacted by production of specific antigens. With single vaccines specific agglutinins resulted; with mixed vaccines, one of the organisms usually produced the predominant antibody. In such cases the typhoid bacillus always showed the highest value. In animals treated alternately with 3 bacteria, no matter in what order, agglutinins were highest for the first organism that sensitized the animal. Successive injections of the other bacteria show an attenuation of their specific action but apparently help to increase the agglutinins toward the first microorganism. This phenomenon is analogous to the action of non-bacterial proteins on cells previously sensitized by a bacterial vaccine, which thereby are stimulated to greater production of specific agglutinins.—*R. Franza (transl. by P. Hillkowitz).*

13497. **FREUCHEN, IB. Einleitende Versuche zur Feststellung des Verhaltens der eosinophilen Zellen bei antistoffbildenden Processen.** *Acta Pathol. et Microbiol. Scandinavica Suppl.* 3: 123-132. 1930.—The number of eosinophils decreases on introduction of diphtheria toxin during the immunization of a horse and is apparently dependent on the previous antitoxin titer of the animal. Variation in number of eosinophils is relatively greater than, and in opposition to, variation in whole number of leucocytes.—*I. Freuchen (transl. by H. C. Sox).*

13498. **FREUND, JULES, and HOWARD J. HENDERSON. Distribution of antibodies in the serum and organs of rabbits. VI. The antibody content of the bile of immunized rabbits.** *Jour. Immunol.* 18(4): 325-330. 1930.—Antibodies are eliminated from the liver in the bile of rabbits actively or passively immunized against typhoid bacilli. The following numerical relation exists between agglutinin titers of the serum, liver-extract, lymph of the liver, and bile—expressed in %, viz.: Serum, 100%; liver-extract, 10%; lymph of liver, 80%; bile, 0.8%. In the bile of passively immunized rabbits, the maximum titer is reached within 2 hrs. after immune serum is injected. Loss of antibodies by elimination with bile explains at least in part why antibodies disappear from the blood of animals after active or passive immunization.—*J. Freund.*

13499. **FRIEDBERGER, E., G. BOCK, und A. FÜRSTENHEIM. Zur Normalantikörperkurve des Menschen durch die verschiedenen Lebensalter und ihre Bedeutung für die Erklärung der Hautteste (Schick, Dick).** *Zeitschr. Immunitätsforsch.* 64(3/4): 294-319. 6 fig. 1929.—The authors studied the occurrence of such normal antibodies as hemolysins against sheep red cells and hemagglutinins against rabbit red cells in over 600 different human sera, representing the whole span of human life and including an approximately equal number of specimens from the newborn, young infants, older children, adults, and senile individuals. Blood from the umbilical cord of the newborn contained no appreciable amount of antibodies. During the first years of life the antibody content increased gradually, reaching its maximum around the 10th yr. From that point on, the antibody curve declined slowly but steadily throughout the following decades. The level in late senility was about at the same height as in earliest infancy. The relation between the 2 antibodies mentioned, in the same sample of serum was variable. The antibody titer bore no relation to blood groups. Up to 40 yrs. of age, females showed consistently a higher antibody content in the serum than males. Similar experiments with rabbits showed an analogous curve. The hemolysin and hemagglutinin curves resembled the known curves of diphtheria and scarlatina antitoxin production in different age groups in all essential respects, excepting the transitory passive transfer of antitoxin from mother to child during the first mo. of life. The authors argue from this parallelism that defensive antibodies are formed and increased in adolescent age as a result of a general maturation law, rather than under the influence of contact with the specific antigen.—*C. W. Jungebluth.*

13500. **FUJIOKA, N. Weitere biologische Studien**

über den BCG-Stamm. Über die Tuberculinreaktion bei mit dem Stamm BCG infizierten Meerschweinchen. *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 58(3/4): 335-342. 1928.—In confirmation of Kraus' observations, it is shown that guinea pigs, injected with large doses of BCG (5, 10, 20 mgm.) by the intraperitoneal, intravenous, intraocular, or intestinal routes, develop macroscopically discernible tuberculous lesions, but most of them survive intraperitoneal injection of 0.25 cc. of human tuberculin, which invariably kills guinea pigs infected with human or bovine strains of tubercle bacillus. BCG-infected guinea pigs which survive intraperitoneal injection of tuberculin, nevertheless give a positive intracutaneous tuberculin reaction. It is thus shown that the degree of sensitization in guinea pigs infected with virulent strains of tubercle bacilli differs from that induced with large doses of BCG.—*A. B. Sabin.*

13501. **GREENWOOD, M., W. W. C. TOPLEY, and J. WILSON.** Contributions to the experimental study of epidemiology. *Jour. Hyg.* 31(2): 257-289. 1931.—9 vaccines were tested on a herd of more than 4000 mice. The efficacy of a *Bact. aertrycke* vaccine, as an immunizing agent, appears to be determined by its content in O-somatic antigen. No indication was obtained that other components have any significant effect. There is a suggestion that the effectiveness of a vaccine containing O-antigen may diminish slightly on storage; but such loss is very slight over a period of 1 yr. There is a suggestion that injection of bacteria unrelated to *Bact. aertrycke* may result in a minor increase in resistance to infection with that organism; but this is trivial in comparison with that which follows injection of specific O-antigen, and is not obtained with all non-specific agents. Vaccinated mice show a significant advantage as compared with the unvaccinated in respect to expectation of life; this advantage is not uniform over the whole period of exposure. As judged by chance of survival over the succeeding 5 days, it is not apparent on the day of entry, or during the 1st week of exposure, probably because the risk of dying of a fatal infection within the first 10 days or so of residence in the cage is in any case slight. The advantage of the vaccinated mice on this test increases to a maximum between the 25th and 30th days of cage life and thereafter declines, so that a vaccinated mouse which has survived exposure for a considerable period (50-60 days in this experiment) enjoys no significant advantage over an unvaccinated mouse which has survived for the same period. The protection afforded is in no sense absolute. Judged from the experience in this herd of mice, it has little if any influence on the ultimate mortality from the specific disease. Vaccinated mice, in presence of infection, are never placed in the same position as normal mice in a non-infected herd. This conclusion does not involve the deduction that vaccination is useless. Under other conditions of exposure, especially where the risk of infection is limited in time, the advantage afforded by vaccination might well make the difference between effective immunity and death.

13502. **HARE, R. Studies on immunity to haemolytic streptococci. III. Observations on the variations in resistance to phagocytosis displayed by broth cultures of strains of high and low virulence.** *Brit. Jour. Exp. Path.* 12(4): 261-271. 1931.—Strains of hemolytic streptococci virulent for animals become resistant to phagocytosis during the active growth phase. Probably this is in reality resistance to opsonization by the opsonins of the serum of the blood in which the tests are done. The resistance to phagocytosis which accompanies the growth phase gradually disappears as the culture grows older, but it does not do so completely for many hrs. Strains of medium virulence are not so resistant during growth, and their resistance quickly disappears altogether. Strains of minimum virulence do not become resistant at any period. The virulent strain is therefore characterized by production of resistant cocci which remain resistant until the culture has gone far into the phase of decline. The avirulent strains do neither of these things. —*J. Bland.*

13504. **HEIDELBERGER, MICHAEL, and FORREST E. KENDALL.** Data on a protein-antibody system. *Science* 72(1862): 252-253. 1930.—By use of a protein dye as antigen, colorimetric determinations of the amount of antigen in the supernatants and precipitates of the precipitin reaction were possible. The reaction can be expressed quantitatively by simple equations that follow the mass law. The prepared antibody solutions were colorless, suggesting that antigen itself does not take part in the building up of the antibody complex.—*R. R. Spencer.*

13505. **HINTZE, K.** Ueber den Komplementgehalt des Meerschweinchenserums nach Untersuchungen an 1000 Meerschweinchen und seine Bedeutung für die Wassermannsche Reaktion. *Zentralbl. Bakt. I. Abt. Orig.* 117 (6): 353-363. 1930.—Guinea-pig serum is an important but labile factor in the Wassermann reaction and is not as consistent as has been supposed. In evaluating the same serum on the same day with the same reagents, definite differences were obtained, and in 4% of over 1000 healthy guinea pigs these differences were considerable. Mainly, the hemolysin power was diminished, but in a few cases the guinea-pig serum hemolyzed without amboceptor. These variations are most frequently found in abnormal animals—infected or pregnant. It is recommended that sera from pathological animals not be used; moreover, each guinea-pig serum should be titrated independently and those deviating markedly from the normal should be discarded, as a mixture of a related series does not give an average result since the abnormal sera hinder the action of the normal.—*H. C. Sox.*

13506. **HIRSZFELD, LUDWIG.** Schutzimpfung und Serumtherapie. Bericht über die Arbeiten betreffend die Scharlachätiologie, Pathogenese und Therapie, ausgeführt im Staatlichen Hygienischen Institut in Warschau. *Seuchenbekämpfung* 6(4): 215-222. 1929.—Experience in Warsaw clearly demonstrated the importance of the Dick reaction for recognizing susceptibility to scarlatina. Individuals recovered from attack did not always show a negative Dick reaction. Possibly such patients did not possess antitoxin, but antitoxin was rapidly produced. The number of pseudo-reactions was reduced when human blood was used for culture. Anatoxin was used in 3385 cases; 29.6% showed completely negative reactions after treatment, 34.8% showed a decreased positive reaction, and 35.6% remained positive. Of 7885 immunized individuals, 0.4% contracted scarlatina; of 63,920 non-immunized individuals, 1.09% contracted the disease; the course was variable and no definite conclusions could be reached. There seems to be competition between affinity of toxin for cells or for antitoxin, the Dick reaction being positive when cell affinity is greater than antitoxin affinity. Antitoxic *Streptococcus* serum has a favorable influence on general condition, intoxication and consciousness of the patient. Complications were not prevented, but were reduced. Pus complications were not affected. Serum treatment is recommended for all cases within 2 days, excepting for light cases. The sera are tested on at least 5 children and it is required that 0.04 cc. of antitoxin should neutralize 10 skin doses. Goats, rabbits and guinea pigs can not be used; 3% of the horses used proved suitable.—*P. G. Heineman.*

13507. **HOEN, E., und L. TSCHERTKOW.** Ueber das Verhältnis der Antikörper zu den Serumproteinen. *Zentralbl. Bakt. I. Abt. Orig.* 117(6): 364-367. 1930.—Acidification of an antigen to pH 2.8-3.0, followed by immersion in a boiling water bath for 10 min., had slight effect on a precipitinogen. Similar treatment of its homologous antibody or even acidification alone, largely destroyed its precipitating activity. The conclusion is

drawn that protein and antibody are not bound inseparably to each other.—*H. C. Sox.*

13508. **HOLFORD, FRANCES E. The placental transmission of foreign proteins in rabbits.** *Jour. Immunol.* 19(2): 177-216. 1930.—Pregnant rabbits were injected subcutaneously with varying quantities of foreign protein less than 1 wk. ante-partum; the young at birth were bled from the heart by a small hypodermic syringe; ring precipitation tests were then performed, the serum of the young being carefully layered over an antiserum of high titer and specific for the antigen in question. Of the antigens employed—crystalline egg albumin, horse or beef serum, pseudoglobulin fraction of beef serum, globulin fraction of horse serum, and horse hemoglobin—all except the last-named were in a number of instances demonstrated in the serum of the newborn. It is suggested that this fact may be of significance in further investigation and explanation of certain phenomena of modified resistance in other species, including man, which are likewise supplied with the hemochorialis type of placenta.—*Frances E. Holford.*

13509. **IMSCHENETZKY, A. Über die Permeabilität der Haut für Trypanblaulösung, unter Berücksichtigung der Hautimmunitätstheorie von Besredka.** *Zeitschr. Ges. Exp. Med.* 69(1/2): 113-125. 2 fig. 1929.—Poultices containing 1% trypan blue solution applied to the skin for 48 hrs. produce an exudative infiltrating inflammation, with necrobiosis of the epithelium and cells of the hair follicles. These points of injured epidermis and alterations in walls of hair follicles serve as points of entrance for the dye into the lymph of the cutis. Histiocytes absorb the dye from the tissue lymph and carry it as granules in their protoplasm. Particles of stain were seen also in the polymorphonuclear leucocytes which were localized especially beneath the epithelium and in the region of the hair follicles. The dye travelled with the lymph through the lymphatic vessels to the regional lymph nodes, where it was collected in certain reticular stroma cells and in the histiocytes of the capsule. External application of the dye solution, without poulticing, produced massing of the dye in the superficial horny layer, without any penetration of the dye into the corium. —*Author's conclusions (transl. by S. Bayne-Jones).*

13510. **ISHIGAMI, J. Experimental studies of percutaneous immunization by eggwhite. I. Appearance of precipitin in rabbit serum and Arthus's phenomenon of local skin by applying eggwhite. II. Appearance of precipitin in rabbit serum and the Arthus phenomenon produced locally in the skin by rubbing in of eggwhite.** [In Japanese, with English summary.] *Acta Dermatol.* 17(3): 167-188; (4): 291-306. 3 fig. 1931.—I. Immunity to eggwhite was produced in rabbits by applying eggwhite to the surface of the ear-flap, precipitin appearing in the serum on the 17th day after 1st application. One group was immunized by injection of eggwhite (A); the other, by applying eggwhite to the surface of the right ear-flap (B). Groups A and B were kept until the precipitin in the blood had completely disappeared. Then, to the surface of right ear-flaps of all, eggwhite was applied for 30 days. The time of first appearance of precipitin in the blood serum and its degree were identical in A with B, indicating that the local skin to which eggwhite has once been applied does not acquire an ability to prevent further entrance of immune substance through repeated application by the same route. The Arthus phenomenon was tested in the part of the skin where eggwhite had been previously applied cutaneously, in comparison with that shown by other spots; but neither anaphylactic nor insignificant dermo-reactions were recognizable. The local region shows only a slight hyperkeratosis, accompanied by no other histological changes. II. Experiments indicated that rabbits can be more intensely immunized by rubbing in eggwhite than by applying it, if the rubbing is continued for 30 days; that the appearance of precipitin in the blood serum is the same, whatever part of the body is rubbed (skin of ear-flap, back, abdomen); that the local skin into which eggwhite has been rubbed acquires no ability to prevent further entrance of immune substance by repeated rubbing by the same route; and that the Arthus phenomenon shows no local differences.—*From author's summary.*

13511. **KESTEN, BEATRICE M., and JENARO SUÁREZ. Observations on skin sensitivity in sprue patients.** *Porto Rico Jour. Publ. Health & Trop. Med.* 5(3): 263-267. 1930.—24 patients with sprue were tested intradermally with food and fungus allergens. Food tests were essentially negative. 8 of 13 patients with acute sprue were positive to an extract of *Monilia psilosis.* A lesser number were also positive to blood-infusion-broth filtrates of *M. psilosis* (2 patients) and to a *Monilia* isolated from erosio interdigitalis (3 patients).—*Authors' summary.*

13512. **KLINE, B. S. Mechanism of the microscopic slide precipitation tests for syphilis. Preliminary report.** *Jour. Lab. and Clin. Med.* 16(12): 1202-1216. 9 fig. 1931.—To avoid clumping (agglutination), emulsions for the microscopic slide precipitation tests for syphilis are made by first precipitating the cholesterol crystals in water and subsequently coating them with antigen lipid. Cholesterol crystals precipitated from alcoholic solution by a small or large amount of warm or cold water or salt solution by slow or rapid mixture, vary but little in size and shape. Upon this fact depends the greater uniformity in particle type of slide test emulsions, and upon it and the fact that the reacting surface of the final particle is composed of antigen lipid only, and not of both antigen lipid and cholesterol, depends the greater specificity and uniformity of sensitivity of slide test emulsions in routine practice.—*From author's summary.*

13513. **KRAUS, R., und FR. WERNER. Giftschlangen und die Serumbehandlung der Schlangenbisse.** 220p. 98 fig. Gustav Fischer: Jena, 1931. Pr. 12 M.—This book is a manual for physicians in Europe and the tropics. Of the sections on topics of immediate practical interest to him, the following deserve mention: tabulation of venomous families and spp. according to geographical distribution; description of individual spp. (not limited to Europe and the tropics); symptomatology of envenimation; properties and uses of all available antitoxic sera, together with a list of the institutions at which they are produced; technique of snake-bite treatment. The book, incidentally, will also serve a more heterogeneous group of readers, i.e., all who are interested in venomous snakes or their venom from any point of view, since the authors appear to have included all reliable information to be had on the subject. The meagerness of our present knowledge is forcibly emphasized, e.g., concerning the composition of venom and the nature and number of its active constituents.—*L. W. Butz.*

13514. **KUMARIS, J. Zur Frage der Geschlechtsgebundenheit bei der Blutgruppenvererbung.** *Zeitschr. Rassenphysiol.* 4(1): 6-7. 1931.—The author presents his own results and those of 2 others, which show a greater incidence of group A in the female than in the male population of Greece. An opposite result was obtained by a 4th worker. No attempt is made to determine whether these differences are statistically significant.—*P. Levine.*

Nancy* 2: 62-80. 1929.—Complement fixation shows that *Monilia cataneii* is more closely related to *M. albicans* (Charrin) and *M.* Jaubert than to *M. albicans* (Vuillemin). *M.* Jaubert and *M. albicans* (Charrin) are closely related. *Monilia* sera can not sensitize *Cryptococcus ruber, Mycoderma lactis* (Baarn), *Saccharomyces etiennei, S. pastorianus, S. ellipsoïdeus, S. pombe, Schizosaccharomyces octosporus* or *Torula colliculosa.*—*W. C. Tobie.*

13519. LATTES, LEONE. Le fonti biochimiche dell'individualità umana. [The biochemical bases of human individual differences.] *Atti Soc. Ital. Prog. Sci. (Riunione 18. Vol. I. Firenze)* 1929: 658-670. 1930.—A biochemical continuity between zygotes and soma, related to a Mendelian characteristic, is shown by the presence in human germ cells of the isoagglutinogens A and B, which pass directly into the embryo. An experimental test to distinguish between 2 kinds of spermatozoa in heterozygous individuals by means of normal group-specific sera was not successful because the sera exerted no spermatoxic activity.—*L. Lattes (transl. by M. Goettsch).*

13520. LEVINSON, L. B. Zur Frage der Atoxizität und des immunisierenden Effektes von Tetanusanatoxin. *Zeitschr. Immunitätsforsch.* 61(3/4): 268-276. 1929.—Mice which had received 3 subcutaneous injections of tetanus anatoxin were tested 1 and 2 mo. after the last injection. The majority died or showed symptoms of tetanus; only a relatively small number were immune and the immunity gradually disappeared after 2 mo. Some of the mice died with symptoms of tetanus following anatoxin injections; consequently the anatoxin can not be considered entirely non-toxic for the more susceptible individuals. The same anatoxin was non-toxic for guinea pigs and produced immunity to subsequent injection of toxin. It is assumed that the high mortality among immunized mice following toxin injection, was not due to absence of antitoxin, but that the antitoxin produced did not neutralize the subsequently injected toxin. The reactions of mice to tetanus anatoxin and toxin differ from those of horses, guinea pigs, and rabbits.—*G. I. Steffen.*

13521. LURJE, M., A. ROSENBLATT, und N. KOSSAREW. Die Dysenterie-Anavakzine Shiga-Kruse und ihre vakzinierenden Eigenschaften. *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 61(1/2): 130-136. 1929.—A Shiga-Kruse dysentery bacillus emulsion, killed at 60° C., was injected intravenously into dogs weighing 1700-2000 gm. Death occurred 5 days after injecting 250 million killed bacilli; 1 billion bacilli caused death in 16 hrs. The latter was taken as the fatal dose. A formula was adopted of 2 billion bacilli in 1 cc. physiological saline with 5% formalin kept at 39° C. for 21 days. Dogs tolerated hyperimmunization with large doses of the formula (4-6-8 and 6-10-10 billion) and gave serum with agglutination titer of 1:3000-4000. Smaller doses (1-214 billion) gave a 1:2000 titer. Immunized dogs survived 8 times the fatal dose of killed emulsion and intravenous infection with living cultures. Large immunizing doses caused 10% wt. reduction and brief fever of 1-2° C. Smaller doses caused 5-6% wt. reduction and no fever. Wt. was regained in 2 wks. 11 human subjects were given 3 doses (1-2-3 billion) of the formula subcutaneously at 5 day intervals, with only a weak local reaction. Sera with titers of 1:75-1:150 were obtained from 5 subjects 7 days after vaccination.—*L. H. Cady.*

13522. MACKIE, T. J., and M. H. FINKELSTEIN. Natural bactericidal antibodies: observations on the bactericidal mechanism of normal serum. *Jour. Hyg.* 31 (1): 35-55. 1931.—A study was made of the mechanism of natural bactericidal action by sera of ox, sheep, horse, rabbit, guinea pig, rat, and man towards *Bacillus typhosus, B. dysenteriae* Shiga, *B. proteus* and *Vibrio cholerae,* which exhibit the maximum reactivity to this effect. Serum-complement has no bactericidal action per se, and an antibody-like agent invariably acts as an intermediary agent, "sensitizing" the particular organism to complement and capable of being "absorbed" by it from serum at 0° C. This sensitizing agent is stable at 55° but labile at 60-65°, in this respect resembling natural hemolysins and agglutinins but contrasting with the more stable immune antibodies and the more labile natural complement-fixing antibodies for bacterial antigens. It is resident mainly in the carbonic-acid-insoluble fraction of the serum, and is present in sera of young animals before certain other natural antibodies have developed. Absorption tests demonstrate the high degree of specificity of these natural bactericidal antibodies for particular bacteria. A non-specific extracellular substance occurs in bacterial cultures, which may neutralize or inhibit these antibodies, and interfere with their sensitizing action even at 0°. This substance is liberated in large amount in cultures heated at 120°. It can be removed by repeated washing of growth in saline solution. It may inactivate a bactericidal antibody in heated serum, though not in fresh unheated serum, and may inactivate a particular antibody in the serum of one animal species but not in another. Strains of bacteria vary in their production of this substance. Results indicate that immune antibodies have their precursors specifically differentiated in sera of normal animals and that, in general, immune antibodies are not substances formed de novo.—*Authors' summary.*

13523. MARTIN, PAUL. Contribution à l'étude de la précipitation et de l'agglutination sériques des champignons. 211p. 5 pl. Doctorate thesis: Univ. (Pharmacie) Nancy. (See also *Bull. Sci. Pharmacol.* 37(7): 416-422. 1930).—With the fungi studied, the precipitation reaction does not permit strict diagnosis of antigen. The agglutination reaction gave better results. However, the coagglutination phenomenon occurs for the species studied: *Monilia albicans, M. cattanei, M.* Jaubert, *Cryptococcus ruber, Mycoderma lactis* Baarn and *Schizosaccharomyces octosporus.* Addition of starches or of solutions of metalic salts ($MnCl_2$, $MgCl_2$) increases the agglutinating titer of the serum. It is the same with addition of alcoholic extracts of heterologous fungi.—*P. Martin (transl. by G. H. Robinson).*

13524. MIURA, MAKOTO. Experimentelle Studien über die sogenannte Depressionsimmunität. *Japanese Jour. Exp. Med.* 7(3): 379-387. 1929.—In 1920, Morgenroth, Biberstein and Schnitzer observed that mice already infected with streptococci are strongly resistant to a 2nd inoculation with large doses; this phenomenon

they termed "depression immunity." This secondary immunity is manifest within 24 hrs. of the 1st infection and continues for 5 days. The observation was later extended to other bacteria and animals and is confirmed by the author. He finds that immunity to the 2nd or super-infection develops not only to living bacteria homologous with those of the 1st or pre-infection, but also to dead homologous bacteria and to living and dead heterologous bacteria. The immunity can also be induced by pre-treatment with bacterial autolysates and nucleo-proteins, but not with bacterial metabolic products, or with proteins, lipoids and metallic colloids. Varying grades of immunity are induced by infection with streptococci, pneumococci, and mouse-typhoid bacilli, dependent on specific properties of the organism employed. Morgenroth et al. ascribed the immunity to a lowering of virulence of the organisms of the super-infection, by pre-treatment; this is not accepted by the author, who ascribes it to a refractoriness of the cells and tissues, induced by pre-infection. This refractory state may be ascribed to using-up of the tissue-cell-receptors by saturation with haptophore groups of the bacteria, etc. A leucocytosis is present in the circulating blood of pre-treated mice, but their serum appears to possess no power of retarding infection or of reducing virulence. Exceptionally, the whole blood of pre-treated mice shows no increase in bactericidal power. The immunity phenomenon can not be ascribed to any active offensive action of the tissues towards organisms of super-infection, or to functional alteration in the reticulo-endothelial system.—*R. T. Hewlett.*

13525. **[NEVLER, A. I.]** НЕВЛЕР, А. И. Реакция связывания комплемента при скарлатине. **[Complement fixation in scarlatina.]** Журнал Микробиологии и Иммунобиологии (*Jour. Microbiol. et Immunobiol.*) 7(2): 175-178; German summary, 235. 1930.—The following antigens were used: Altman and Schultz's laboratory method used in gonorrhea; Hitchcock's emulsion of 1-day-agar culture of scarlatinal and pyogenic streptococci; and Dick's toxin. Altogether, 110 human sera were tested—48 scarlatinous and 52 normal; sera of 4 rabbits immunized intravenously; and sera of 6 immunized horses. Scarlatinous sera gave positive results in 40%; normal in 20%. In rabbits, the reaction was paradoxical: it was positive before immunization with scarlatinous streptococci and toxin, and negative or weakly positive after immunization. In 2 of 6 horses, a positive reaction was noted—those with Dick toxin as antigen. Caronia's antigen gave a negative result in scarlatinous sera.

13526. **NOHLEN, ARNO, und MILIVOJ SARVAN.** **Über ein Verfahren zur Diagnostik der Tuberkulose beim Affen.** *Beitr. Klin. Tuberk.* 77(2): 186-190. 1931.—Tuberculin tests used heretofore were of no use on 6 monkeys, either in local or general effects (ophthalmic test, Mantoux, intracutaneous tests with undiluted and diluted tuberculin). In intramuscular injection of 3-5 cc. of a mixture of undiluted ophthalmotuberculin and old tuberculin, 9 tuberculous monkeys died within 1-3 days, with symptoms of severe general intoxication. In 6 healthy animals, the intramuscular injection of similar amounts of tuberculin provoked no pathological reaction.—*Authors' summary (transl.).*

13527. **OHYAMA, SEIICHI.** **Sur la purification de la toxine diphtérique.** *Jour. Biochem. Tokyo* 13: 255-272. 1931.—Willstätter's method of precipitating enzymes by addition of $ZnCl_2$ to effect adsorption of the enzyme on the resulting hydroxide or phosphate, was employed. Phosphates of Ca, Sr, and Ba and $Sn(OH)_2$ are also excellent adsorbents for the toxin, which may be recovered by eleutriation without loss of toxicity. The pH of the solution must be carefully adjusted. Addition of trypsin to the solution decreases the toxicity of the toxin; purified takadiastase is without effect.—*J. S. Caldwell.*

13528. **OLBRYCHT, J., und S. SNIESZKO.** **Untersuchungen über Präcipitine.** *Deutsche Zeitschr. Ges. Gerichtl. Med.* 12(6): 515-548. 1 fig. 1928.—A reinvestigation of the common methods of immunizing. 237 rabbits were used in production of precipitating antisera against human, horse, beef and pig sera and human and sheep hemoglobins. The strength and specificity of these antisera were studied in relation to amounts and intervals of antigen injections, season of yr., heating of antigen before injection, etc. The method of repeated injection of small amounts of normal serum, with rest periods, gave best results. A new method of immunization comprising the best parts of the old methods is described as follows: (1) Blockade the reticulo-endothelial tissues with 2 intravenous injections of 5-7.5% colloidal India ink on successive days; (2) give a series of 10 intravenous injections of 0.1 cc. normal serum + 0.9 cc. saline, with injections on each 2nd day; (3) pause for several wks. to several mo.; (4) repeat (1); (5) give a series of daily intravenous injections of 1 cc. of normal serum per kgm. body wt. To prevent anaphylactic shock give an intravenous injection of 0.1 cc. of normal serum + 0.9 cc. saline 1 hr. before the 1st injection in (5).—*A. Boyden.*

13529. **OTTO, R.** **Vergleichende Untersuchungen mit Schlangengiftseren und Viperngiften verschiedener Herkunft.** *Zeitschr. Hyg. u. Infektionskrankh.* 109(2): 272-285. 1928.—The antivenins tested were: Serum E R from the Pasteur Institute in Paris (A), Serum antiophidicum Butantan (B), Serum antibothropicum Butantan (C), and Serum from Bandoeng, Java (D). The venoms were: I *Vipera aspis* (France), II *Lachesis lanceolatus* (S. America), III *Crotalus terrificus* (S. America), IV *Ancistrodon rhodostoma* (Java), and V *Lachesis gramineus* (Java). Results: (1) *A* protected only against I, and not against II, III, IV, or V. (2) The polyvalent *B* protected not only against II and III, but likewise against I, IV, and V. (3) *C* protected against II, to a less degree against I, and not at all against III, IV, or V. (4) *D* protected against IV and V, to a less degree (by subcutaneous injection of the venom-antivenin mixture) against I, and not at all against II or III. Accordingly the antivenins *B* and *C* as well as *A* can be used in the treatment of bites by European vipers.—*R. Otto (transl. by Lewis W. Butz).*

13530. **PALDROCK, A.** **Some observations upon leprosy in Estonia and its treatment.** *Amer. Jour. Trop. Med.* 9(6): 445-460. 2 fig., 1 map. 1929.—Of 6 lepers given the combined CO_2-snow and Solganal treatment, 2 appeared completely cured, 1 nearly cured and 3 moderately improved. Active auto-immunization is accomplished by freezing lepromata with CO_2-snow, the broken-down tissues acting as antigens in stimulating antibody formation. Together with absorption of pathological tissue in treated areas, there occurs a reduction in size of untreated lepromata. Treatments are repeated every 3-4 wks. for 4 mo. At each treatment, 10 small lepromata are exposed 3-4 sec. A 4-mo. rest period follows each course of treatment. If, after 2 yrs., a patient no longer responds to this treatment, intravenous injections of Solganal are given. This drug is effective against the already weakened leprosy organisms, considered by the author as trichomyces rather than bacilli. —*A. L. Stoughton.*

13531. **[PETROV, M. N.]** ПЕТРОВ, М. Н. К вопросу об образовании антител при кишечной вакцинации. **[Formation of antibodies after per os vaccination.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(4): 419-423; French résumé, 482-483. 1929.—Of 6 rabbits which after 24-48 hrs. of fasting were given per os vaccine of paratyphoid B (30 milliards), only in 1 were agglutinins (titer 1:100) found in the serum. When these same rabbits were given a live culture (10 milliards in 5 cc. of physiological saline) of paratyphoid B, on the 5th day after treatment agglutinins (titer 1:500, soon increasing to 1:2000) were found in the serum. Thus, introduction of live cultures into animals previously vaccinated per os with paratyphoid B quickly caused the appearance of agglutinins in the serum. 0.2 cc. of blood serum of rabbits previously vaccinated

injected under the skin of mice failed to protect them when the paratyphoid culture (5 lethal doses) was injected on the following day. Serum taken from rabbits on the 5th day after introduction of live culture of paratyphoid, although not preventing death, had some preventive properties. Serum taken on the 10th day had evident preventive properties: 0.2 cc. of the serum prevented mice from dying after intra-abdominal injection of 10 lethal doses of live culture.—*G. A. Lebedeff.*

13532. **PLATONOFF, G. Neutralisation des Tuberkulinshocks durch Lipoide.** *Zeitschr. Ges. Exp. Med.* 70 (1/2): 231-235. 1930.—Experimental and clinical data show the characteristic signs of allergy in some phenomena of tuberculosis. As an approach to the treatment of tuberculosis from this standpoint, through administration of anti-anaphylactic substances like Ca, atropin, etc., the author chose the experiment of checking tuberculin shock by lipoids (Na morrhuate and Na gynocardate), the anti-anaphylactic action of which (when egg-albumin was used) was observed previously. These substances mixed with the tuberculin injected, protected 12 tuberculous guinea pigs (4 controls) against a lethal dose; and, given before tuberculin, protected 5 guinea pigs (5 controls). Clinical injections of tuberculin mixed with Na morrhuate or Na gynocardate occasioned but slight temp. reaction.—*G. Platonoff.*

13533. **RECHE, O. Theoretisches zur Physiologie der Agglutinogene und Agglutinine.** *Zeitschr. Rassenphysiol.* 4(1): 1-5. 1931.—The author discusses the origin of the human blood properties A and B and their corresponding antibodies α and β, and raises the question as to their possible function. He suggests that group "O" in the American Indian may possibly have properties differing from group O of other races containing also factors A and B, and therefore suggests that the blood of any race be examined by reagents derived from the same race only. The author cites experiments which indicate that the blood cells of some lower monkeys react with human sera of group O, but not with sera of groups A and B.—*P. Levine.*

13534. **RECHE, O. Zur Blutgruppenuntersuchung der menschlichen Primitivrassen.** *Zeitschr. Rassenphysiol.* 4(2): 88-90. 1931.—The author calls attention to the numerous primitive races not yet examined as to blood properties, e.g., those of New Guinea, Melanesia, Philippines, South America, Africa, etc.—*P. Levine.*

13535. **ROBERTS, EDWARD F. Extirpation of the antigenic depot and antibody production.** *Jour. Immunol.* 20(4): 291-304. 1931.—The contention that the stimulus to antibody production is the hematogenous-transported antigen is supported by the following evidence derived from experiments on rabbits: antigen circulates from its site of deposition; adequate ligation of the ear base blocks its passage; extirpation diminishes slightly the extent of antibody production; elimination of the nervous pathway by establishing a healed wound of 2 wks. duration as the only connecting link between antigenic depot and the remainder of the animal, fails to prevent antibody production; elimination of the venous drainage by operative procedure prevents antibody production.—*E. F. Roberts.*

13536. **SARVAN, MILIVOJ. Über die Rolle der Milz bei der experimentellen Tuberkulose.** *Beitr. Klin. Tuberk.* 77(2): 182-185. 1931.—Intrapulmonary injection of 0.5 cc. of a 1:10,000 suspension of human type tubercle bacilli was done in 3 splenectomized and in 4 normal *Macacus rhesus.* A control died spontaneously on the 27th day, and a splenectomized monkey on the 35th; the pulmonary conditions were alike, but there was a greater extension of abdominal tuberculosis in the control. The other monkeys were killed; in the non-splenectomized animals the abdominal organs were more affected, particularly by peritoneal dissemination; in the splenectomized animals all but 1 were free of peritoneal tuberculosis. Possibly from splenectomy a compensatory increase in formation of immune bodies in other organs (reticulo-endothelial system?) occurs, and, in contrast to some other causes of infection (vaccine virus, simian piroplasmosis, etc.), mainly against the tubercle bacillus.

13537. **SAVINO, E., J. NEGRETE, y C. ACUÑA. Obtención, purificación y medición del suero antineumocóccico. [Preparation and standardization of antipneumococcic serum.]** *Rev. Soc. Argentina Biol.* 7(2): 127-139. 1931.—An active serum is obtained by immunizing horses with cultures of pneumococcus type I in broth-liver-glucose. Purification, to eliminate substances that provoke chills, is obtained by the following procedure: Citrate plasma is recalcified and precipitated with 22% Na_2SO_4, dialyzed, and adjusted to pH 4.7 by adding acetic acid, thus eliminating inactive lipids, nucleoproteins, etc. After adjusting to pH 6.6-6.8 the active pseudoglobulin is precipitated by dilution with water saturated with CO_2 and then dissolved in 3% saline up to 1/10 the original serum volume. Felton's method of standardisation is followed; 1 unit is the amount of serum that protects a white mouse against the action of 10^6 minimal lethal doses of a strain that kills by the intraperitoneal injection of 10^{-8} cc. of culture. Mice weighing 15 gm. are used; they receive 0.5 cc. of a 1:200 dilution of 6-hr. culture with 0.5 cc. of the diluted serum, 3 mice being used for each dose. The protective dose contains $\frac{1}{4}$ of Felton's unit. In dead mice, presence of pneumococcus was verified. The final dilution of concentrated serum contains 750 units per cc.—*J. T. Lewis.*

13539. **SCHMIDT, S., und K. A. KJAER. Reinigung und Konzentrierung von Diphtherietoxin und Diphtherieanatoxin durch Ausfällung mit Säuren.** *Biochem. Zeitschr.* 228(4/6): 291-299. 1930.—By suitable change of the pH of toxin and anatoxin (preferably to pH 3.5-4.1), the authors precipitated the specific material. When the precipitate is dissolved in alkaline solution they find that 50-60% of the specific material has been recovered and that nearly all the non-specific proteins have been removed. Acidification changes certain specific properties of the toxin; e.g., the immunizing action of the purified anatoxin may be less than that of the corresponding crude anatoxin.—*Author's summary (transl. by M. S. Nichols).*

13540. **SCHWARZ, EUGENIO. Ricerche sperimentali sulle modificazioni immunitarie indotte da ripetute prove di Schick. [Immunity modifications from repeated Schick tests.]** *Pediatria* 37(1): 32-39. 1929.—Intradermic introduction of diphtheria toxin, even in the very small dose used normally in the Schick test, stimulates production of antitoxin.—*E. Ponzi.*

13541. **SIRACUSA, V. La propriété antigène du sperme du groupe A.** *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(9): 594-602. 1931.—Using the serological method, the author confirmed the analogy between antigen A of the blood and antigen A of the sperm. The so-called individual reactions of blood and of sperms to antisperm serum, confirmed only for blood, appear to be only group reactions. The author failed to show in the antiserum obtained with sperms of the A heterozygote (AO), an eventual spermotoxic action capable of distinguishing the 2 types of spermatozoids, genetically diverse, in the individual heterozygotes. Immunization with sperms of heterozygote AO failed to give specific agglutinin for O-erythrocytes, giving it only for A-erythrocytes.—*Author's résumé & conclusions (transl.).*

13542. **SORDELLI, A., y E. MAYER. El agar como antígeno "in vitro." [Agar as antigen in vitro.]** *Rev. Soc. Argentina Biol.* 7(5/6): 416-422. 1931.—Serum of horses immunized against *Bacillus anthracis* or *B. typhosus*, grown in agar-serum media, precipitated in vitro with these bacilli and with agar. All commercial brands of agar have this property, as does also *Laminaria japonica* (Kombu) and *Undaria pinnatifida* (Wakamen). There is apparently no specificity among them. The precipitinogen of agar is water-soluble, precipitates with 4 volumes of alcohol, is destroyed by acids (0.1 *N* HCl) and is not destroyed by alkali. The agar precipitin can be separated from the antianthracis precipitin by adding bacilli to the serum and centrifuging, agar precipitin alone remaining. Both precipitins are

found in the euglobulin when serum is diluted with water saturated with CO_2.—*J. T. Lewis.*

13543. **STRENG, OSW. Immunokonglutinin-Antikomplement.** *Acta Path. et Microbiol. Scandinavica Suppl.* 3: 411-429. 1930.—These studies show that agglutinins can be absorbed by native bacilli; and that with bacteria charged with complement, the immunoconglutinins are absorbed. Any complement may be used, and the new immune bodies act on the complement. By immunization with bacteria charged with complement or blood, flocculation appears as soon as combination with complement has occurred. These immune bodies are anticomplementary, and are analogous to conglutinins in calf serum. The value of these immunoconglutinins for diagnostic purposes is now being studied.—*P. G. Heineman.*

13544. **SUGIURA, KANEMATSU, and STANLEY R. BENEDICT. The effect of the injection of heated tumor tissues on resistance to tumor implantation.** *Amer. Jour. Cancer.* 15(4): 2727-2744. 5 fig. 1931.—Fragments of fresh tumor tissues in Locke-Ringer solution at pH 7 were submitted to different temp. for varying periods. The thermal death points of the Flexner-Jobling rat carcinoma (F.R.C.), Sugiura rat sarcoma (S.R.C.), and Rous chicken sarcoma No. 1 (R.C.S.) are as follows: for F.R.C., 20 min. at 45° C.; for S.R.S., 30 min. at 45°; and for R.C.S., 180 min. at 45°, 15 min. at 55°, 10 min. at 60°, and less than 5 min. at 70°. Inoculation of heat-inactivated F.R.C. cells previous to implantation of fresh, healthy homologous tumor cells failed to prevent growth of the latter. Injection of heat-inactivated S.R.S. cells produced slight but definite protection against subsequent growth of new sarcoma cells in treated animals. Injection of a fragment or emulsion of R.C.S. in which the causative agent had been attenuated at 45-60° with a minimum time of exposure, conferred marked resistance to subsequent implantation of homologous tumor. The immunizing property of the attenuated chicken sarcoma was abolished by prolonged heating or heating the tumor tissue at a much higher temp. Previous injection with heat-inactivated R.C.S prolonged life in the tumor-bearing chickens, subsequently inoculated with viable tumor. Single or repeated subcutaneous or intramuscular inoculations of heat-inactivated F.R.C., S.R.S., or R.C.S. had no effect in checking growth of firmly established tumors in animals.—*Author's summary.*

13545. **SULZBERGER, MARION B., and R. L. MAYER. Sensitizations. Regional, seasonal, dietary and other influences accounting for variations and fluctuations.** *Arch. Dermatol. and Syphilol.* 24(4): 537-542. 1931.—Chance observations showed that guinea pigs react differently when sensitizations with the same brand of neoarsphenamine were attempted in Breslau, Zürich and New York. In Breslau, 98% of the animals became sensitized; in New York, none; Zürich animals were intermediate. These differences remained constant in spite of identical technique. A study in Breslau showed that the diet of the experimental animals is of decided importance, green fodder (alkaline ash) inhibiting and dry fodder favoring sensitization (neoarsphenamine and paraphenylendiamine were employed in the experiments at Breslau). Other influences may also be involved, e.g., lack of genetic homogeneity in the races of experimental animals used. Results may throw some light on hitherto apparently contradictory results reported by different observers, as well as on observations of clinical, epidemiological, endemiological, geographic and seasonal fluctuations.—*From author's summary.*

13546. **[SYCHEV, N. A.]** СЫЧЕВ, Н. А. К вопросу о зоологической близости и серологическом типе верблюдов. **[Zoological affinity and serologic type of camels.]** Журнал Экспериментальной Биологии (*Jour. Biol. Exp.*) 6(1): 49-59. 1930.—2 rabbits were immunized with erythrocytes of a pure-bred 2-hump camel; 30 cc. of fresh erythrocytes were injected into the ear vein of rabbits once a wk. for 3 wks. Serum was taken 9 days after the last injection; the blood of the rabbits showed a typical picture of hemolysis, not only with erythrocytes of the 2-hump camel, but also with those of 1-hump, and hybrid camels. Thus the hemolysogenic antigen properties of the erythrocytes of both types of camels were closely related, or the erythrocytes of the 2-hump camel, besides its generic antigen, also had a homologous heterogenic antigen of the 1-hump camel. This led to the conclusion that the 2 types of camels are related. In confirmation the author found that these 2 types of camels belong to the serological types of the guinea pig. —*G. A. Lebedeff.*

13547. **TENAGLIA, ALFREDO. Absorción de las toxinas diftérica y tetánica por la pulpa dentaria. [Toxin absorption by dental pulp.]** *Rev. Soc. Argentina Biol.* 7(5/6): 370-376. 1931.—Diphtheria toxin was absorbed (1/10 of dose applied); tetanus toxin gave no symptoms.—*J. T. Lewis.*

13548. **THOMSEN, OLUF. Übersicht über die Entwicklung der Blutgruppen beim Menschen.** *Acta Path. et Microbiol. Scandinavica Suppl.* 5: 57-59. 1930.—The agglutinins begin to develop at 6 mo., reach their maximum titer at 5-10 yrs., and then gradually return to the titer at birth, reaching it in old age. The agglutinogens reach maximum sensitivity at 15-20 yrs., and remain unaltered thereafter.—*A. S. Wiener.*

13550. **VANDEBERG-LOMMEL, Mme. Quelques recherches sur les substances extraites des bactéries coliformes, capable de réagir dans l'épreuve de fixation.** *Arch. Internat. Méd. Exp.* 6(4): 463-469. 1931.—While alcoholic extracts of typhoid and paratyphoid bacilli contained undeniable antigens, extracts of *B. coli* were irregular, some exhibiting type-specific reactions, others, prepared under identical conditions, being incapable of complement fixation.

13551. **VELLARD, J., und A. de ASSIS. Immunologische Untersuchungen über das Gift brasilianischer Anurenarten.** *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 63(1/2): 116-138. 1929.—*Phyllomedusa burmeisteri* Blgr. and *Trachycephalus nigromaculatus* Tschudi have skin secretions which hemolyze goat corpuscles. Secretions of *Hyla faber* Wied, *Leptodactylus ocellatus* L., *Bufo marinus* L., *B. rubescens* Lutz, and *B. crucifer* Wied do not. The *nigromaculatus* hemolysin is very unstable, being destroyed in 30 min. at 45°, and even at 4° within a few days. That of *burmeisteri* is thermostable and decreases somewhat in hemolytic power only after 30 min. boiling. Slow poisoning of dogs with the composite venom of *B. marinus* causes formation of complement-fixing substance in the serum. These antibodies are strictly specific and exert their action only in presence of *marinus* antigen. The antigenic properties of this venom depend on the presence of small quantities of protein, which escape chemical detection and are probably atoxic. These complement-binding properties of the immune sera are weakened considerably by boiling. The toxin of the *marinus* parotid gland secretion, which is thermolabile and alcohol-soluble, has no power to stimulate formation of complement-binding substance. The same is true of anura toxin, both with regard to homologous antigens and to those of other species.—*L. W. Butz.*

13552. **WADSWORTH, AUGUSTUS, and RACHEL BROWN. Chemical and immunological studies of the pneumococcus. II. The ether-soluble fraction of type-I pneumococcus.** *Jour. Immunol.* 21(4): 255-260. 1931.—The ether-soluble fraction of type-I pneumococcus was obtained by extracting dried cells with ether at room temp. The extractive appeared to be a mixture of substances which failed to give the usual protein, sterol, glycerol, or carbohydrate reactions. N and P content were very low. The extractive was obtained in 1.2% yield from virulent, and in 2.15% from avirulent organisms. Extraction of autolyzed cultures with ether failed to give the same product. In vitro, the extractive behaved as antigen in complement-fixation reactions with the 3 types of anti-pneumococcus sera. In vivo, no antigenic activity was demonstrated. The sera of inoculated rabbits, however, protected mice against pneumococcus infection. Ether extraction of dried pneumococci did not impair

the antigenic activities of the cells in fixing complement and in immunizing mice.—*R. Brown.*

13553. WADSWORTH, AUGUSTUS, ELIZABETH MALTANER, and FRANK MALTANER. The quantitative determination of the fixation of complement by immune serum and antigen. *Jour. Immunol.* 21(4) : 313-340. 1931.—The conditions essential to quantitative measurement of changes in hemolytic activity of complement, which take place in complement-fixation tests with immune serum, were investigated, also the relations between these changes and concentration of immune serum. The observation of Morse that the point of 50% hemolysis is the most exact index of the hemolytic unit of complement, was applied; also the findings of Brooks that changes in complement activity must be measured at points of equal degree of hemolysis. The limits of concentration of reagents and the conditions under which quantitative determinations of changes in hemolytic activity could be made, were established, using tubercle antigens and their specific antisera. Variations in fixability of different complements rendered impossible the direct measurement of the immune reaction by use of a hemolytic unit of complement. However, a constant relation was discovered between extent of changes in hemolytic activity of complement and quantities of immune serum present, which made possible the use of a "fixability unit" in determining the specific activity of serum, instead of the hemolytic unit,—thus eliminating the error due to differences in fixability of different complements. The observations suggest that by use of "fixability units," determined with an immune serum selected as standard, it may be possible to measure quantitatively with different complements the activity of various other sera by comparison. Development of a quantitative method based on comparison with standard immune serum should be an important step toward standardization of the complement-fixation test, since it would permit adoption of a specific serum as a universal standard of comparison in evaluating reactions, just as such standards have been adopted in other fields, e.g., in comparing toxins and antitoxins.—*E. Maltaner.*

13554. WEINERT, H. Blutgruppenuntersuchungen an Menschenaffen und ihre stammesgeschichtliche Bewertung. *Zeitschr. Rassenphysiol.* 4(1) : 8-23. 1931.—The author examined the blood cells of 3 gorillas, 1 orang-outang, and 1 chimpanzee with human serum of groups A and B. In some instances the sera of the apes were tested with human cells of groups A and B. He concludes that the 5 higher apes belong to group A. Neither property A nor B could be demonstrated in the blood cells of some lower monkeys.—*P. Levine.*

13555. WEINZIRL, JOHN, and J. DURWARD THAYER. Desensitisation in tuberculous guinea-pigs as measured by the systemic test. *Tubercle* 12(11) : 488-505. 1931. —14 protocols were carried through, involving 238 tuberculous test guinea pigs, 55 tuberculous controls and 15 normal controls. Of the total, 125 test animals, 40 tuberculous controls and 15 normals remained to receive the systemic test; tuberculosis, intercurrent infections and antigens accounted for the loss. Antigens employed in desensitizing test animals were: (a) heat-killed, (b) iodine-killed, and (c) ether-killed virulent tubercle bacilli; (d) ether-killed avirulent tubercle bacilli; (e) ether-killed *Mycobacterium smegmatis;* (f) tuberculins; and (g) tuberculo-proteins. As indicated by the systemic test, considerable desensitization was secured in tuberculous guinea pigs treated with certain antigens. Desensitization spared the lives of the animals to a considerable extent against administration of a 25 mg. dose of old tuberculin. Heat-killed and iodine-killed tubercle bacilli, and old tuberculin are unsuitable antigens for desensitization of tuberculous guinea pigs. Ether-killed and treated antigens of both virulent and non-virulent tubercle bacilli and of *M. smegmatis* caused desensitization to about the same degree in tuberculous guinea pigs when injected in suitable doses. Tuberculo-proteins are promising antigens for desensitization of tuberculous guinea pigs. A dose of 1 mg. of bacillary antigen generally gave greater desensitization than smaller doses; larger doses tended to kill the animals. The systemic test, as here used, was unsatisfactory, due to the toxic properties of old tuberculin. Theoretically, the value of the systemic test is not altered; only the reagent is found deficient. It is hoped that purified tuberculin, S.M.T., will prove more satisfactory.—*Author's summary.*

13556. WOLFF, L. K. Ueber die Bakterizidie von Blut und Serum gegenüber Staphylokokken. *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 50(5/6) : 543-558. 1927. —Usual bactericidal tests are unsatisfactory because there are so many sources of error. Agglutination of bacteria may simulate a great reduction in number. Some sera may be bactericidal in presence of air and not so under anaerobic conditions. Dilution of a serum to extinction does not necessarily measure its bactericidal power, as the undiluted serum may be inactive. What we wish to know is the bactericidal power of the whole blood in the vessels, but no practical method of making such a test has been devised. The author, using Wright's method, determined that the bactericidal power developed after injection of staphylococci into a rabbit is due to the leucocytes which kill the bacteria, but not by phagocytosis. Addition of antistaphylococcic serum does not increase the bactericidal power, either in vitro or in vivo. The bactericidal power of a blood is lessened or entirely extinguished by adding staphylococci.—*E. C. L. Miller.*

13557. YOSIDA, KAN-ITI. Über die gruppenspezifischen Unterschiede der Transsudate, Exsudate, Sekrete, Exkrete, Organextrakte, und Organzellen des Menschen und ihre rechtsmedizinischen Anwendungen. *Zeitschr. Ges. Exp. Med.* 63(3/4) : 331-339. 1928.—The author found in all physiological and pathological body fluids except cerebrospinal fluid, constant as well as group-specific isohemagglutinins and also heteroagglutinins equal to those of the serum. They were demonstrable in many secretions and excretions such as tears, saliva, sperms, sweat and urine, but in urine only after concentration. In these transudates, secretions, and excreta, and in various organ extracts (thyroid, thymus, lungs, liver, spleen, kidneys, ovary, lymph nodes, pancreas, intestine, muscle, etc.), group-specific antiagglutinins were also found, which antagonized agglutination of erythrocytes of the same group; they could be clearly demonstrated in exceedingly small amounts of material in which isohemagglutinins could not be found. The group-specific absorption capacity of the organ cells for isohemagglutinins was shown in various organs, especially glandular (e.g., thymus, thyroid, lungs, liver, spleen, kidneys, pancreas, ovaries, and lymph-nodes),—also in all mucous epithelia and in spermatozoa. Hence, specimens of blood are not absolutely necessary to determine blood groups, but merely a specimen of organ cells or body fluids.—*From author's summary (transl.).*

LOWER ANIMALS

13558. ANDRIEVSKY, PETRO. Les manipulations techniques dans la production du sérum antipestique à Bamako. [Technical manipulations in production of anti-rinderpest serum at Bamako.] *Rec. Méd. Vét. Exotique École Alfort* 4(3) : 129-136. 7 fig. 1931.

13559. BERGEON, P., et J. CÈBE. Au sujet de la vaccination antipestique. Expériences faites au laboratoire de l'école vétérinaire de l'Indochine à Hanoi en 1929. *Bull. Écon. Indochine Agric., Élev., Forêts, Sect. B* 33(May) : 434-445. 1930.—Use of glycerinized anti-rinderpest vaccine has not given convincing results. Buffaloes failed to withstand a severe test dose of virulent blood 15 days after vaccination. Calves so treated survived, but were very sick with the disease. Buffaloes and calves treated with vaccine prepared according to the "Jacotot" technique resisted the test dose of virus given 15 days and also 4-5 mo. after vaccination. It appears that the activity of the "Jacotot" vaccine deteriorates rapidly. The hyperactive serum of "Jacotot" exerts a good influence on the course of rinderpest in calves, but has no effect in buffaloes. In contaminated areas,

it appears that serovaccination should limit the loss of animals.—*L. A. Barnes.*

13560. **CLARK, C. F. Correlation of blood reactions with the breeding records over a period of years in an abortion-infected herd of cattle.** *Jour. Amer. Vet. Med. Assoc.* 32(3): 290-331. 1931.—Positive (+) animals had 2½ times more abortions than negative (−) animals. Sterility was 4 times more frequent in suspicious animals, and 8 times more frequent in + animals, than in those with a − history. Retention of the fetal membranes occurred with almost equal frequency in −, suspicious and + groups. A majority of + animals (62%) and an appreciable number of suspicious animals (11%) had *Brucella abortus*-infected udders. Of animals + at 1:50, 38% became −, 33% became suspicious, and 28% became +. Of animals + at 1:100, 11% became −, 22% became suspicious and 67% became +. Of animals + at 1:50 or 1:100 for 5-10 mo., only 2% became −. Animals + at 1:50 or 1:100 for more than 10 mo. did not become permanently −.—*Author's summary.*

13561. **HUHTALA, E. Havaintoja luomistaudin vastustamisessa. [Observations on the campaign against infectious abortion.]** *Suomen Eläinlääkärilehti (Finsk Veterinärtidskr.)* 37(2): 27-38; (3): 53-64; (4): 92-102. 1931.—The author made his observations in heavily infected regions in which about 25-35% of all cattle were infected with *Bacillus abortus* Bang. Individual farms had 15-40 cows. These properties were exclusively devoted to milk production; since in these circumstances, destruction of the infection was practically impossible, methods were chiefly directed towards maintaining production. It appeared that introduction of the plague into healthy herds was principally by indirect ways; therefore it seems that the epidemic in the early stages is insidious. With this in mind, diagnosis was established in this stage and campaign measures begun. Strict accomplishment of systematic hygienic measures is of greatest value. Immunization with killed cultures has not given satisfactory results. The author believes that this method of attack has no economic value. On the contrary, inoculation of living cultures subcutaneously gave very good results. The author describes in detail his method of dealing with control of infectious abortion in dairy herds. In Finland there is compulsory notification and pasteurization for *B. abortus* infections.—*E. Huhtala (transl. by G. H. Robinson).*

13562. **MAZZUCCHI, M. Le nouveau vaccin anticharbonneaux "Carbozoo" dans sa constitution et dans ses applications pratiques.** *Soc. Internaz. Microbiol. Boll. Sez. Italiana* 3(6): 193-196. 1931.—The vaccine here proposed differs entirely from the anti-anthrax vaccine proposed by Pasteur; it contains, not attenuated bacilli, but living, virulent organisms in a strongly hemolytic menstruum—saponin. This vaccine, "Carbozoo," can be injected into animals without danger. A single injection is sufficient to produce, after 12 days, an immunity such that vaccinated animals withstand a dose of anthrax which kills control animals in 40-60 hrs. In comparative tests, "Carbozoo" has always been superior to other vaccines; it has been used in practice for 2 yrs., and 800,000 animals have been vaccinated, with excellent results.—*M. Mazzucchi (transl. by L. C. Havens).*

13563. **SCHERMER, S. Untersuchungen über die Blutgruppen des Pferdes.** *Zeitschr. Immunitätsforsch.* 58 (1/2): 130-142. 1928.—On the basis of investigations of 50 horses for occurrence of isagglutinins, the author finds 2 factors, X and Y, and 2 corresponding agglutinins, x and y,—thus giving 4 groups in a manner similar to man. However, 16% of the horses gave reactions not corresponding to those of any of the 4 groups. The isoagglutinins in horse sera are very weak and frequently are entirely lacking. It is consequently not always possible to determine the group of any individual horse by use of a few grouping sera. There are significant differences in incidence of the groups in various races of horses.—*P. Levine.*

13564. **VALENTINI, ISIDRO ITALO M. Trabajos clínicos y experimentales sobre la vacunoterapia de las afecciones bronquiopulmonares de los equinos. [Clinical and experimental studies of vaccine therapy of bronchopulmonary diseases of horses.]** *Bol. Min. Agric. Nacion. [Buenos Aires]* 29(4): 463-474. 1931.—The disease discussed occurred in poorly nourished animals and resembled bronchopneumonia. There was apparently no single etiologic agent. An autopyo-vaccine made from the nasal discharges, a stock vaccine, and sero-vaccine therapy were used. Digitalis was frequently administered. A stock vaccine and antistreptococcus serum were given as a prophylactic. No statistics are given as to incidence, mortality or effectiveness of treatment.—*G. H. Robinson.*

13565. **WALKER, J. Rinderpest research in Kenya.** *Communic. to Pan-African Agric. & Vet. Conf. Pretoria, August, 1929. Bull.* 8A. 21p. 1929; also in: *Union So. Africa Dept. Agric. Pan-African Agric. & Vet. Conf. Pretoria Papers Vet. Sect.* p. 39-57. 1929(1930).—In Kenya, active immunization against rinderpest consists in subcutaneous inoculation of 2 cc. of citrated virulent blood and, simultaneously, a dose of antiserum of 20 cc. per 100 kgm. body weight, for cattle of average susceptibility. Pending active immunization, outbreaks are sometimes dealt with by the serum method alone, when the herd is threatened by disease in the vicinity or when rinderpest has already appeared in the herd. With a view to perfecting the method of active immunization, the writer investigated the following problems: (1) Conferring of immunity—It was found that use of fresh blood is of fundamental importance in producing rinderpest in simultaneously inoculated cattle. (2) Supply of virulent blood for field use—Experiments showed that results with iced blood despatched to the field in insulated boxes were unsatisfactory, and use of virus-makers infected at the laboratory and despatched to the desired center by rail or lorry was substituted. (3) Production of virus free of redwater and anaplasmosis for the simultaneous inoculation of dipped stock—On account of dipping for East Coast fever, a % of cattle submitted for immunization are now susceptible to redwater and anaplasmosis and accordingly avenues were exploited with a view to production of "clean blood" or "clean virus." After various experiments, it was decided to adopt the method of breeding and rearing virus-makers free of tick-borne diseases. (4) Immunization with tissue extract—The author describes a method of immunization with tissue extract and concludes that further investigations are necessary to confirm the duration of immunity conferred. In the meantime this method of immunization is utilized for inoculation of dairy cattle, cows heavy in calf, pure-bred cattle and calves. Redwater infection is not transmissible by inactivated spleen prepared from an animal reacting to redwater.—*J. Walker.*

ANIMAL IMMUNOLOGY

PARASITOLOGICAL

(See also in this issue 13585, 13588, 13630, 14507)

13566. **ADAMS, PAUL. Über das Wesen der trypanoziden Wirkung menschlichen Normalserums.** *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 58(5/6): 459-482. 1928.—The trypanocidal effect of parenteral administration of normal human serum in mice infected with pathogenic trypanosomes, does not depend on antibody-

provoking substances. Trypanosomes could not be eliminated from the blood of mice by administration of bile, urea, emetin, iodine, weak acids, etc. Sera from rabbits, guinea pigs, calves, horses, hogs and some lower monkeys likewise had no effect. *Macacus* monkeys succumb after infection with nagana trypanosomes. The trypanocidal action of human serum was distinctly reduced by heating at 56-60°, and completely destroyed at 62°. The action also decreases with age of serum. Serum, inactivated by heat, is not reactivated by complement (guinea pig serum). Wassermann-positive serum is more active than normal serum.—*P. G. Heineman.*

13567. CERRUTI, CARLO G. Reazioni allergiche (intrapalpebre) nella cisticercosi del coniglie. [Intrapalpebral allergic reactions of rabbits in cysticercosis.] *Nuova Vet.* 6(10): 229-234. 1 fig. 1928.—Infection of rabbits with *Cysticercus pisiformis* creates a particular allergic state demonstrable, on injection of an extract of whole worms into the lower eyelid, by a copious edema persisting for 72-90 hrs. and accompanied by a general reaction. The extreme sensitivity and specificity of the intrapalpebral reaction permits detection of rabbits infected with cysticerci. It seemed impossible to confer a passive anaphylactic state on normal guinea pigs by injection of serum from rabbits severely infected with cysticerci.—*C. G. Cerruti (transl. by H. L. Gruehl).*

13568. ESSEX, HIRAM E., J. MARKOWITZ, and FRANK C. MANN. Physiologic responses and immune reactions to extracts of certain intestinal parasites. *Amer. Jour. Physiol.* 98(1): 18-24. 1931.—Most of the experiments were performed with the dog tapeworm, *Taenia pisiformis,* up to 5 times the standard dose of its extract being injected into 4 heavily infected dogs with no depressor response; though in dogs (no. not stated) which had never been infected it produced decided fall in blood pressure. Extract of *Toxocara canis* gave similar depressor action, but the toxic principle was evidently distinct, for the depressor reaction was developed when a dose of *Toxocara canis* extract was given after either a previous dose of the same extract or one of *Taenia pisiformis* extract. The reaction in either case is evidently not anaphylactic.

13569. REGENDANZ, P., und E. REICHENOW. Über Zeckengift und Zeckenparalysis. *Arch. Schiffs- u. Tropen-Hyg.* 35(5): 255-273. 1931.—After considering pertinent literature references, the authors take up the biology and anatomy of the dog tick, *Rhipicephalus sanguineus,* with special reference to head and salivary glands. Eggs of this sp. and also of *Dermacentor reticulatus* were ground up in 0.6% Ringer's or 0.9% physiological saline and introduced intraperitoneally, subcutaneously or intravenously into dogs, rabbits, guinea pigs, rats and mice. Results showed the presence of a toxin which, if sufficient in amount, induced motor paralysis and death. The venom resists drying, is not destroyed by alcohol, and is still potent after exposure to 75° C. for 45 min., but is destroyed at 85° for 15 min. and at 100° for 1 min. Oxidation does not render it innocuous; it passes Berkefeld-N filters; and has a weak hemolyzing effect on sheep erythrocytes. Resistance to the venom apparently can not be developed. Larvae and unengorged nymphs are free of venom, which is elaborated only after feeding by the female imago; it is primarily associated with development of eggs in the ovaries. It does not occur in head or salivary glands, or in Malpighian tubules.—*E. C. Faust.*

13570. SARKAR, SARASI LAL. Some peculiarities in the malarial temperature charts of Chittagong Hill Tracts. *Indian Jour. Med. Res.* 18(2): 367-375. 1930.—A comparison of charts of children from a hyperendemic with those from a subendemic region showed that the fever in the former (1) remained at constant levels for some hrs. and did not rise to the sharp high peaks characteristic of ordinary malarial fevers, and (2) the acuteness of fever tended to diminish with advancing age. These facts are taken to support Christophers' conclusion that under hyperendemic conditions a form of immunity is produced by an acute infestation starting shortly after birth and lasting about 2 yrs.—*W. Trager.*

13571. VASSILIADIS, P. La fonction antiparasitaire de la rate décelée par la splénectomie. *Arch. Internat. Méd. Exp.* 6(1): 89-119. 1931.—In animals with rat-bite fever, splenectomy increased the number of spirilla in the blood; in rats infected with *Tr[ypanosoma] lewisi,* it rendered the infection pathogenic, which it had not been previously; in mice infected with *T. rhodesiense* and *T. pecandi,* it had no effect. Of 25 splenectomized rodents, 12 (6 species) were immune to *T. lewisi* before and after operation; of the 13 others (*Mus minutus*), 5 became infected; the remaining 9, with 4 controls, remained immune. Rabbits, normally immune to *Eperythrozoon coccoides,* after splenectomy were successfully inoculated, though after 3-5 days the parasite disappeared from the blood and the animals were refractory to fresh inoculations. In other experiments, latent infections of rodents, particularly with *Bartonella muris* and Eperythrozoa, were rendered patent by splenectomy.

13572. ALESSANDRINI, GIULIO. Parassitologia dell'uomo e degli animali domestici. [Parasites of man and of domestic animals.] 573p. 413 fig. Unione Tipografico-Editrice Torinese: Torino, 1929.—This book, taking up the whole field of zooparasitology, with emphasis on the parasites of man, and bringing out some of the recent advances in this field, is divided into 4 sections: (1) A discussion of parasites in general. Here are discussed the scope of parasitology, host parasite relationships, habitat of parasites, propagation and defense of parasites against destructive influences, origin of diseases due to parasites, deleterious mechanical influences of parasites in the host, diagnosis and prophylaxis of parasitic diseases. (2) Morphology and biology of protozoan and metazoan parasites. The author considers the four classes of Protozoa; and for the Metazoa he discusses the various parasites in the Platyhelminthes, Nemathelminthes, Annelida and Arthropoda. Each group is considered first as a whole, and then the individual species are in many cases discussed in detail. For each important parasite the synonyms are listed; many forms are figured, and differentiating tables are given for the various species of spirochaetes, amebae, malaria parasites and trypanosomes. (3) Discussion of diseases caused by zooparasites. It covers those produced by Protozoa, Trematoda, Cestoda, Nematoda, Acanthocephala, Acarina, and Insecta. For most of the diseases discussed, the author gives a general consideration of each disease caused by a specific parasite, followed by a definition of the disease, historical résumé, geographic distribution, etiology, mode of transmission, symptomology, pathology, diagnosis, prognosis, epidemiology, treatment and prophylaxis. A table gives methods of diagnosing cestodes found in man with reference to the scolices, mature

proglottids and eggs. The author discusses the Acari as possible transmitters of diseases. (4) Parasitological technic, consideration being given to methods of collecting, fixing and preserving ectoparasites and endoparasites. Directions are given in methods of collecting and examining feces for animal parasites, and in methods of killing, fixing and mounting helminths.—*J. E. Alicata.*

Предварительные данные по паразитологии малярии Армении. **[Reports of the Permanent Commission for the Study of Malaria Mosquitoes and other Ectoparasites at the Zoological Museum of the Academy of Sciences, USSR. Preliminary data on parasitology of malaria in Armenia.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9 (2) : 231-235. [French résumé p. 285-286.] 1930.—35,854 primary blood examinations among the population of the region of the Arax and the Koura rivers during 1924-26 showed that intermittent forms of malaria predominate in Armenia. *Plasmodium vivax* was found in 50% of the cases, mainly in the lowlands, especially from April to June; *P. malariae* was found in 20-45% of the cases, also in the lowlands, but mainly from Nov. to April; and *P. praecox* in 10-15% of the cases, mainly in the hilly regions from Sept. to Nov. Out of 6 spp. of mosquitoes found, *Anopheles maculipennis* Mg. predominated; less often, mainly in the lowlands, *A. pseudopictus* G.; and in the hilly regions *A. superpictus* G., *A. bifurcatus,* and very rarely *A. plumbeus. A. superpictus* in 80% of the cases was infected with *P. immaculatum.*—*G. A. Lebedeff.*

13574. **BEVAN, E. W. List of internal parasites of sheep in Rhodesia.** *Rept. Dir. Vet. Res. So. Rhodesia* 1930: 8-12. 1931.

13575. **BRUG, S. L. Dracunculus medinensis in the Dutch East Indies.** *Mededeel. Dienst Volksgezondheid, Ned.-Indië* 19 (1) : 153-157. 3 pl. 1930.—*Cyclops leuckarti* from Java was infected with *Dracunculus* larvae from an imported case of dracontiasis. The life cycle of the larvae in the crustacean was completed, for, out of a monkey fed with the *Cyclops,* a full grown ♀ *Dracunculus* was obtained about 1 yr. after the infective meal. The fact that no epidemic of this disease has occurred in the Dutch East Indies, although a suitable vector and imported cases of dracontiasis have been present for hundreds of yrs., can be explained by the abundance of running water, the natives rarely, if ever, drinking stagnant water.—*S. L. Brug.*

13576. **CABRAS, A. L'echinococcosi in Sardegna. Studio storico-statistico compilato nel 1920 e stampato nel 1930.** 75p. Giovanni Ledda: Cagliari, 1930. Price 8 L.—Data on *Echinococcus* infestation in Sardinia—historical, clinical manifestations, incidence, morbidity, and mortality in relation to sex, vocation, etc. *Echinococcus* is quite common on the island, particularly where running water and pasture lands make it favorable for cattle. Infestation occurs in persons of all ages.—*G. Tegoni (transl. by A. S. Pearse).*

13577. **CALCAR, R. P. van. Die Ursache des Carcinoms. [Cause of carcinoma.]** 66p. 25 pl. S. C. Van Doesburgh: Leiden, 1926.—The author presents evidence for a theory of protozoan etiology. He maintains (1) that the nature of the cancer cell indicates a symbiosis with the epithelial cell on the basis of which cancer flourishes, and (2) that no experimental method of producing cancer excludes the possibility of protozoan action. He cites illustrative experiments by which he claims to have produced precancerous growth in a curetted Thiry intestinal loop of a dog by introducing protozoan cultures. He also declares that he has obtained protozoan cultures from cancer tissue previously dried under heat (80° F.) so as to destroy all life except that in the protozoan cysts and spores.

13578. **CAMERON, A. E. Parasites of horses.** *Canada Dept. Agric. Bull.* 152. 1-22. 24 fig. 1931.—A handbook.

13579. **CAWSTON, F. G. Some results of original research into the treatment of chronic haematuria caused by Schistosoma haematobium (Bilharz) and its associated trematode parasitic worms.** *Jour. Roy. Army Med. Corps* 1929 (1-12) : 1929.—Although *S. haematobium* infection has been known in South Africa since 1864, it was not specifically treated until 1919, when intravenous tartar emetic was administered. Antimony therapy has made curable an intractable condition previously unhelped by physicians. The disease, contracted by natives and whites alike, when bathing in the "infected waters" of brickkilns and slow-running rivers of Natal, has become increasingly prevalent within recent years. Mass therapy will not become popular until oral administration of some bilharziacidal drug is possible. Education regarding the specific snails as the cause of the infection, the sources from which the disease is contracted, the cleaning up of insanitary pools and the need for specific treatment,—all these should be in the program of the public health authorities for eradicating the infection. —*E. C. Faust.*

13580. **CLEVELAND, L. R., and JANE COLLIER. Various improvements in the cultivation of Entamoeba histolytica.** *Amer. Jour. Hyg.* 12 (3) : 606-613. 1930.—When liver infusion agar slants are covered with serum-saline (1-6) and a small amount of sterile rice flour is added, a culture of *E. histolytica* may be started from a single organism. This medium, so far as the amoebae of man are concerned, is virtually specific for *E. histolytica.* The amoebae become practically as numerous as blood cells in the blood stream, and encystation, excystation, and metacystic development occur simultaneously with rapid multiplication of trophozoites. This medium also permitted isolation of the amoebae from almost 100% of the stools and liver abscesses examined. The percentages of successful isolations with other media were approximately as follows: Craig, 10; Boeck-Drbohlav, 25; Dobell-Laidlaw, 70. Loeffler's dehydrated beef serum slants covered with serum-saline (1-6) was found an excellent medium; in it, the various stages in the life-cycle of *E. histolytica* did not occur in such rapid succession as when liver infusion agar slants were used. The amoebae also grew well in an autoclaved liquid medium composed of hydrolyzed Hb. Results with many other kinds of media are given.—*From authors' summary.*

13581. **DANIEL, GEORGE E. The respiratory quotient of Balantidium coli.** *Amer. Jour. Hyg.* 14 (2) : 411-420. 1931.—The respiratory quotient under the given experimental conditions is 0.84, indicating that under aerobic conditions the carbohydrate of the medium is not the chief source of energy for the balantidia.

13582. **[ELPAT'EVSKIĬ, V. S., and B. V. VOSKRESENSKIĬ.]** ЕЛПАТЬЕВСКИЙ, В. С., и Б. В. ВОСКРЕСЕНСКИЙ. Глистная зараженность детей детдома N°. 8 в Баку. **[Worm invasion among children of children's home No. 8 in Baku.]** [German summary.] Известия Азербайджанского Государственного Университета имени Ленина, Отдел Естествознание и Медицина (*Ann. V. I. Lenin State Univ. Azerbaijan, Sect. Nat. Hist. & Med.*) 6: 177-179. 1927.—Of 76 children examined only 2 were negative for worms. Distribution of species was as follows: *Trichuris trichiura,* 80.15%; *Ascaris lumbricoides,* 9.21%; *Hymenolepis nana,* 5.26%; *Taenia saginata,* 3.94%; *Enterobius vermicularis,* 3.94%; *Ancylostoma duodenale,* 1.31%; *Trichostrongylus* sp., 1.31%; *Dipylidium caninum,* 1.31%.

13583. **[ELPAT'EVSKIĬ, V. S.]** ЕЛПАТЬЕВСКИЙ, В. С. Necator americanus (Stiles) у населения Азербайджана. **[Necator americanus among the inhabitants of Azerbaijan.]** [German summary.] Известия Азербайджанского Государственного Университета имени Ленина, Отдел Естествознание и Медицина (*Ann. V. I. Lenin State Univ. Azerbaijan, Sect. Nat. Hist. & Med.*) 6: 181-184. 1927.—The author describes 2 cases, one of *N. americanus* only, and one in which both *N. americanus* and *Ancylostoma duodenale* were present.

13584. **EMELIN, V., und H. ZEISS. Die Bekämpfung**

der Kameltrypanosomiase in Russland. Доклады Академии Наук СССР., Сер. A. (*Compt. Rend. Acad. Sci. URSS., Sér. A*) 1928(20/21): 417-420. 1928.—A report on the investigations and control measures carried out by S. Ilovajskij (1922-1924) and his successors, V. Emelin and S. Dračinskij. Camel trypanosomiasis is prevalent and very destructive around Uralsk. It is caused by *Trypanosoma su-auru* Ilov., and transmitted (mechanically) by biting insects (e.g., *Tabanus, Chrysops*, and *Haemalopota*) and by contact, especially coitus. Treatment with Bayer 205 (Naganol, or Germanin) or with Antimosan proved effective; the latter gave only a temporary cure, the former immunizes also. Together they proved very effective.

13585. **FAIRLEY, N. HAMILTON, F. P. MACKIE, and F. JASUDASAN. Studies in Schistosoma spindale. Part V. The guinea-pig as a host for male schistosomes.** *Indian Med. Res. Mem.* 17. 61-68. 4 pl. 1930.—Applications to the shaved skins of guinea-pigs of cercariae of *S. spindale* showed penetration and subsequent unisexual infection with ♂♂. Since di-sexual infections result in rabbits and buffaloes using the same technique, it is suggested that some host factor is antagonistic to the development of ♀♀. This view is supported by the frequency with which mal-formed ♂♂ occur at autopsy. The pathology showed definite hepatic lesions attributable directly to the ♂♂. This pathogenicity of ♂♂ makes it advisable to use serological tests to determine unisexual infections in man; no other clinical means being available to determine the presence of this type of schistosomiasis in endemic regions.—*R. O. Christenson.*

13586. **FAUST, ERNEST CARROLL. Human strongyloidiasis in Panama.** *Amer. Jour. Hyg.* 14(1): 203-211. 1931.—Of 1662 persons of pure or mixed negro blood, 348 harbored *Strongyloides;* 2 came to autopsy; 25 were treated with gentian violet. The results confirm Darling's work in refutation of Leichtenstern's hypothesis that the tropical strain of *Strongyloides* has necessarily an indirect development and the temperate strain a direct. A third strain, the hyperinfective type, has been differentiated in many cases in this series, most of which were heavily infected showing clinical symptoms. Symptoms may develop, due to heavy infestations, as a result of (1) the hyperinfective type, (2) the gradual building up by the skin route of a heavy infestation over a long period. The specificity of gentian violet as a strongyloidicide and its tissue-staining potency were demonstrated. The effect of this dye on altering the indirect and hyperinfective strains of *Strongyloides* to the direct type has a most important bearing on the fundamental biological conception of the life cycle of *Strongyloides* and its relatives.

13587. **FISH, FREDERIC. The effect of physical and chemical agents on the oocysts of Eimeria tenella.** *Science* 73(1889): 292-293. 1931.—The prepatent period of coccidiosis produced by *E. tenella* in chicks is 160-165 hrs. Both segmented and unsegmented oocysts are killed in 10 min. at 55°C. moist heat. The thermal death time of unsegmented oocysts is inversely proportional to the degree of heat used (24 hrs. at 45°C.—5 sec. at 80°C.). One zinc sulphide unit of ultra-violet kills unsegmented oocysts. Of 8 disinfectants used, colloidal iodine, cresol, and phenol produced 100% mortality of unsegmented oocysts in less than 48 hrs.—*F. Fish.*

13588. **FOSTER, A. O., and W. W. CORT. The effect of diet on Hookworm infestation in dogs.** *Science* 73 (1903): 681-683. 1931.—Experiments on 13 dogs indicate a definite correlation between undernourishment and susceptibility to *Ancylostoma caninum.* In dogs previously demonstrated to be resistant, a deficient diet results in lowered resistance, increased rate of development of worms, and increased egg production per worm. Transfer to an adequate diet results in spontaneous loss of worms and recovery of resistance.—*A. O. Foster.*

13589. **[FREINKMAN, E. Z.]** ФРЕЙНКМАН, Э. З. Сравнительная оценка методов копрологического исследования на глистоношение. **[Comparative evaluation of methods of fecal examination in helminthiasis.]** [German summary.] Одеський Медичний Журнал (*Odessaer Med. Zeitschr.*) 5(1/2): 147-154. 1930.—Method of plain smear, although simple, does not give very exact results. Methods of concentration are preferable for certain species of intestinal parasites. Of these, Fülleborn's method is much simpler than that of Telemann, requires no complicated apparatus, is more exact, and yields a greater quantity of parasite eggs. In comparative experiments Fülleborn's method gave 75% positive results, as against 52% by Telemann's method, and 8% by plain smear. In Telemann's method, eggs when passing through gauze are often retained, and the whole preparation is less satisfactory than in Fülleborn's method.

13590. **[FRIEDMAN, S. M.]** ФРИДМАН, С. М. Результаты обследования учащихся сельской школы на глистоношение. **[Helminthiasis among country school children.]** [German summary.] Одеський Медичний Журнал (*Odessaer Med. Zeitschr.*) 5(1/2): 81-88. 1930.—Home and school conditions in the village Baranovka, district of Volyn, are highly insanitary and conducive to infections. Out of 170 children, aged 8-15, helminthiasis was found in 92.3%. *Ascaris lumbricoides* in 140 cases, *Trichuris trichiura* in 116, *Enterobius vermicularis* in 23, *Hymenolepis nana* in 23, *Taenia solium* in 1. Combination of 2 species (mostly *A. lumbricoides* with *T. trichiura*) was found in 88 cases; combination of 3 species, in 19. Boys are comparatively more infected than girls, due, probably, to their earlier participation in land work. *A. lumbricoides* and *H. nana* are more frequent among boys, *T. trichiura* and *E. vermicularis* among girls.

13591. **FROBISHER, MARTIN Jr., NELSON C. DAVIS, and RAYMOND C. SHANNON. On the failure of yellow fever virus to persist in a colony of Aëdes aegypti.** *Amer. Jour. Hyg.* 14(1): 142-146. 1931.—To test the theory that yellow fever infection may be transmitted from mosquito to mosquito, 300 mosquitoes which had fed on infected monkeys were released in a cage in which a fresh monkey was placed every fortnight for 6 mos., 100 batches of fresh mosquitoes reared from eggs laid in the cage being added in the intervals. The 1st 6 monkeys became infected and 4 died of yellow fever. The last 5 monkeys developed no fever and subsequent tests proved that they had no immunity. The authors believe that the relation in time between the disappearance of infectivity and the usual life span of fed mosquitoes suggests that the original stock of infected insects had died. It seems practically certain that in nature yellow fever is not self-propagated among *Stegomyia* mosquitoes and that these insects could not maintain infective quantities of yellow fever virus among themselves without some suitable intermediate host.

13592. **GILDOW, E. M., and C. W. HICKMAN. A new treatment for Oestrus ovis larvae in the head of sheep.** *Jour. Amer. Vet. Med. Assoc.* 32(2): 210-216. 1 pl., 1 fig. 1931.—Experiments proved that a large portion of 1 cc. of CS_2 can be introduced into the frontal sinuses through the middle nasal meatus. 3 cc. of a solution composed of equal parts of CS_2 and light mineral oil, introduced into each nostril of sheep, is of decided value in killing *Oestrus ovis* larvae in the sinuses. The success of this treatment depends entirely upon getting some of the medication into the infected sinuses.

13593. **GROSS, ALFRED O. Progress report of the New England Ruffed Grouse Investigation Committee.** p. 1-8. 1 fig. Massachusetts Fish and Game Assoc.: Boston, 1926.—Includes a brief report on parasites and diseases in *Bonasa umbellus* found by E. E. Tyzzer. Of 5 spp. of nematodes, *Ascaridia lineata* and *Dispharynx spiralis* were by far the most numerous. A few cestodes (*Davainea tetragena*) and many Protozoa were found. Infectious diseases were not common.

13594. **GRZIMEK, BERNHART. Jodmilch gegen Kückenkokzidiose.** *Arch. Geflügelk.* 5(9): 287-291. 1931.—The use of iodized milk as recommended by Kerr is not adapted to control coccidiosis in chickens. The favorable results reported are due to other circum-

stances (aging of animals, dry weather) or to the hygienic measures which Kerr recommended at the same time.

13595. **HALL, MAURICE C. Parasites of dogs and cats.** *Vet. Alumni Quart. [Columbus, Ohio]* 19(2): 47-57. 1931.—Ascarids, hookworms, whipworms, and tapeworms are discussed.

13596. **HALL, MAURICE C., and W. E. COTTON. Copper sulphate sprays on pastures for the control of worm parasites of livestock.** *North. Amer. Vet.* 12(8): 31-35. 1931.—Experiments with a limited number of animals showed that a 1% $CuSO_4$ solution is not injurious to horses, cattle, or sheep, even when spraying is repeated 4 times a month; grass also was uninjured. The solution was applied at different rates, depending on size of plot and height of grass, one example being 80 liters for 6,450 sq. ft. where the grass was 6 in. high.

13597. **HOARE, CECIL A. The peritrophic membrane of Glossina and its bearing upon the life-cycle of Trypanosoma grayi.** *Trans. Roy. Soc. Trop. Med. and Hyg.* 25(1): 57-64. 2 fig. 1931.—This membrane of the tsetse-fly is a thin chitinous sheath arising at the proventriculus and extending throughout the entire alimentary canal. Each fresh meal stimulates the production of a new portion of the membrane at the proventriculus, the older part being propelled further back, towards the rectum, whence fragments of it are gradually discharged with the faeces. The propulsion of the membrane is aided by the peristalsis, and also by the spines in the hind-gut. These spines are directed posteriorly and prevent the membrane from being drawn forwards. A revised description of the hind-gut is given. The localization of *T. grayi* in the course of its development in the tsetse-fly is determined by the presence of the peritrophic membrane and involves 3 successive waves of migration in opposite directions: (1) the flagellates first develop inside the lumen of the membrane migrating backwards, towards the rectum; then (2) they leave the peritrophic membrane and migrate forwards, outside the peritrophic membrane, up to and including the mid-gut; and finally (3) they again migrate backwards to the hind-gut.—*C. A. Hoare.*

13598. **HOFFMAN, FREDERICK L. Present-day trends in the malaria death rate.** 47p. Prudential Press: Newark, New Jersey, 1931.—This is an extended discussion, amplified by detailed statistics, of malaria mortality throughout the South and in many foreign countries. It is probably the most complete statement of its kind available. The paper discusses in detail certain excessive malaria death rates in European and non-European countries with particular attention to malaria in Panama, Africa, Asia, West Indies, and in the United Fruit Company's experience. It includes a reference to the original investigations of Sir Ronald Ross and the work of the Ross Institute. It includes the Resolutions of the Far Eastern Medical Association Congress at Algiers. Of special importance are detailed statistics of heavily infected counties of southeastern Missouri. The paper should prove of value to all students of malaria not having access to the original foreign reports.—*F. L. Hoffman.*

13599. **JELKS, JOHN L. The spread of intestinal protozoan infections.** *Jour. Tennessee Acad. Sci.* 4(2): 53-55. 1929.—Notes on the prevalence of such infections in Tennessee, and on the necessity for better sanitary control of vegetable production, to eliminate use of fecal materials, sewage, etc., on vegetables.

13600. **KHAW, O. K. Experimental infection of guinea pigs with Clonorchis cysts in fishes.** *Peking Soc. Nat. Hist. Bull.* 4(4): 19-25. 1 pl. 1930.—The lesions of clonorchiasis in the liver of guinea pigs experimentally infected with *Clonorchis sinensis* may be described as cirrhosis originating from the portal region and involving the liver lobules from the circumference inwards, and is unlike other types of cirrhosis in that it shows periportal adenoma-like hyperplasia of bile-ducts; hyperplasia of lining epithelium of intrahepatic branches of bile-ducts with projection into the lumen; and it seldom gives rise to jaundice and ascites.

13601. **KNOWLES, R. The Kala-azar transmission problem and the factor of resistance.** *Trans. 7th Congress Far East. Assoc. Trop. Med.* 3: 1-11. 1927[1928].—The author discusses the environmental conditions under which kala-azar spreads. The discovery at the Calcutta School of Trop. Med.—subsequently confirmed by the Kala-Azar Commission in Assam—that *Leishmania donovani* develops in *Phlebotomus argentipes,* is described. All attempts at actual transmission of the disease from man to man by this sandfly, however, have failed. This the author attributes to natural resistance to the disease. The epidemiological, clinical and experimental evidence in favor of this view is discussed. In the endemic areas man may become infected wholesale with *L. donovani,* but the parasite does not give rise to the symptoms of kala-azar until the patient's resistance is lowered by intercurrent disease or endocrine deficiency.—*R. Knowles.*

13602. **LÉGER, L. Sur la "Sanguinicolose," maladie parasitaire de la carpe d'élevage.** *Ann. Univ. Grenoble, Sci.-Med.* 6(1): 97-102. 2 fig. 1929.—The trematode *Sanguinicola inermis* is reported from the blood of carp in certain rearing ponds in France. The eggs and embryos of the parasite give rise to cysts in the kidney and liver, which if numerous are serious. Drainage and liming the ponds periodically and destroying the intermediate mollusk hosts (Lymnaea) are recommended.—*L. Léger (transl. by R. H. M'Gonigle).*

13603. **LINKE, OTTO. Die Ophthalmomyasis.** *Graefe's Arch. Ophthalmol.* 126(4): 644-651. 2 fig. 1931.—A fly larva, stated to be probably an Oestrid, was removed from the conjunctiva of a patient.

13604. **MANALANG, C. Malaria transmission in the Philippines. I: The natural vector.** *Philippine Jour. Sci.* 45(2): 241-249. 1 pl., 1 map. 1931.—Two years of dissection of anophelines caught in 10 places shows that of the 12 species,—*Anopheles funestus (mimimus), A. aco, A. tesselatus, A. sinensis, A. barbirostris, A. rossii, A. karwari, A. philippinensis, A. fuliginosus, A. ludlowi, A. kochi, A. maculatus,*—numerically well represented in about 65,000 mosquitoes, *A. funestus,* the same vector found in 1927, is the natural vector of malaria in the Philippines. Possibly other anopheline spp. may transmit malaria under natural conditions, but the topography and mosquito fauna of the places studied are so typical of the many known malarious regions that such would be exceptional.—*Author's summary.*

13605. **NIESCHULZ, O. Zoologische Beiträge zum Surraproblem. XXIV. Einige weitere Übertragungsversuche mit Mücken.** *Zentralbl. Bakt. I. Abt. Orig.* 111(6/8): 456-460. 1929.—Surra was transferred from horse to horse using *Armigeres obturbans* (Walk.). Out of 5 attempts 1 was positive. All attempts to transfer from horse to rabbit were negative as well as from rat to rat. Many mosquitoes were used in each experiment. The small animals were most difficult to infect. Attempts with *Culex whitmorei* (Gil.) and *Stegomyia fasciata* (Fabr.) failed. The author concludes that the mosquito is of slight importance as a vector of surra.—*M. E. Larson.*

13606. **NIESCHULZ, O., und A. BOS. Ueber den Infektionsverlauf der Mausekokzidiosis.** *Zeitschr. Infektionskr. u. Hyg. Haustiere* 39(1/2): 160-168. 1931.—Experiments were conducted with *Eimeria falciformis* (Eimer). With this parasite the merozoites appear in the feces a day after infection. The oocysts sporulate in 3 days at 25°C. The oocysts appear in the feces on the 5th day after infection, and a spontaneous disappearance begins a week later and the animals become free of the parasites in 26 days, when prevented from acquiring a reinfection. The chronic condition seen in field cases is probably due to reinfection.—*L. D. Bushnell.*

13607. **OTTO, G. F., W. W. CORT, and A. E. KELLER. Environmental studies of families in Tennessee infested with Ascaris, Trichuris and hookworm.** *Amer. Jour. Hyg.* 14(1): 156-193. 1931.—Environmental studies were made

of 329 families in the mountain regions and 202 families living in the central basin and western plains and lowlands. The ascaris and trichuris infestations were confined largely to the mountain areas, though considerable infestation was found in the rugged foothill type of country around the central basin. The incidence of ascaris was less than 10% in practically all of the central basin and area west of it. While trichuris infestation was much lower than ascaris, the two were roughly parallel. Families with heavy trichuris were almost invariably ascaris families, in which the dooryard where soil pollution occurred was kept quite damp either by shade, poor drainage, or a combination of both. The more resistant eggs of ascaris, however, seemed to maintain heavy sources of reinfection in unshaded and seemingly dry areas. The hookworm infestation was definitely correlated with the sandy soil provinces of the state, particularly of the Cumberland Plateau. The source of the infection was usually some moist sandy area.—*From authors' summary.*

13608. **PACHECO, GENESIO.** Sur la fréquence des kystes d'amibes et d'autres protozoaires dans des fèces, apparement normales, provenant des zones suburbaines et rurales de Rio-de-Janeiro. *Compt. Rend. Soc. Biol.* 98(17): 1560-1561. 1928.—16 specimens in 220 showed amoebic cysts, 13 specimens other protozoan cysts. Incidence of infection was high in the years 8-15, as well as 4-7.

13609. **PATIÑO, FLAVIO PATIÑO.** Tratamiento de la babesiellosis por la tripaflavina. [Treatment of Texas cattle fever with trypaflavine.] *Rev. Med. Vet.* [*Bogotá*] 3(17): 54-60. 1931.—Trypaflavine injected intravenously into cattle was efficacious in the treatment of Texas cattle fever. Whether it kills the parasite or merely hinders its multiplication has not been determined.

13610. **PAVÉ, SALOMÓN, y FRANCISCO A. ROSSI.** Eustrongylus visceralis; sintomas y lesiones en el perro. [E. visceralis, symptoms and lesions in the dog.] *Rev. Med. Vet.* [*Buenos Aires*] 13(4): 127-137. 4 pl. 1931.

13611. **PAYNE, GEORGE C., and FLORENCE K. PAYNE.** Observations on rate of loss of Necator americanus. *Amer. Jour. Hyg.* 14(1): 149-155. 1931.—Observations on 3 heavily infested patients indicated a rate of hookworm loss in feces very much slower than that estimated by Chandler.

13612. **RATCLIFFE, HERBERT L.** A comparative study of amoebiasis in man, monkeys, and cats, with special reference to the formation of the early lesions. *Amer. Jour. Hyg.* 14(2): 337-352. 4 pl. 1931.—In 6 *Ateles* and 2 *Lagothrix* monkeys the first lesions were superficial erosions of the mucosa, followed by undermining ulcers originating in the solitary lymph follicles of the wall of the large bowel. In tissue fixed immediately after death, amoebae were seen in the mucosal lesions but not in the submucosa. The lesions in human intestinal amoebiasis are similar and probably originate in much the same way. The lesions in the cat, unlike those in primates, are produced by direct invasion and destruction of the gut wall by the amoebae.

13613. **REITSMA, K.** Hoe staat het met de cysticercosis (inermis) in Nederland? [Occurrence of cysticercosis in Holland.] *Tijdschr. Diergeneesk.* 58(19): 1026-1046. 1931.—In the abattoir of Rheden in the last few yrs. the % of cysticercosis has not decreased (in 1929, 3.3% in 1930, 5.6%). The pastures along the great rivers, often flooded, seem to be an important source of infection. Rigorous meat inspection is not sufficient for combating cysticercosis in cattle (and taeniasis in man, *T. saginata*) unless supported by vigorous eradication of *T. saginata* in man by the general practitioner.—*From author's summary.*

13614. **REYNOLDS, FRANCOIS H. K., JAMES STEVENS SIMMONS, and JOE H. St. JOHN.** Experimental studies of the treatment of surra. *Philippine Jour. Sci.* 43(4): 627-653. 1930.—It was shown that rats infected with *Trypanosoma evansi* may be cured by alternating injections of tartar emetic and etharsanol in doses smaller than the amount required when the latter drug is used alone. Larger amounts of these drugs in infected horses and mules gave results warranting further study. Five animals, each weighing less than 1,000 pounds, died during treatment, probably due to poisoning by tartar emetic; none had trypanosomes in the blood at any time after the first treatment; and the organisms were not demonstrable in the spinal fluid, or in certain organs extracts of which were inoculated into susceptible white rats. In one experiment the blood remained free from trypanosomes for 60 days, after which a relapse occurred. However, following additional treatment the blood again became negative and remained so for 20 days, after which the animal was killed. Suspensions of the spinal fluid and spleen injected into susceptible rats failed to produce infection. In 3 experiments the animals were apparently cured of surra, as indicated by (*a*) immediate disappearance and permanent absence of trypanosomes from the blood, (*b*) the fact that symptoms disappeared and the temp. remained normal, (*c*) complement-fixation test became negative and remained so, and (*d*) suspensions of the spinal fluid and spleen injected into susceptible rats failed to cause infection. Since a relapse occurred in one animal after 60 days, further studies are advised.—*From authors' summary.*

13615. **ROBERTSON, ANDREW.** Coccidiosis in calves. *Vet. Jour.* [*London*] 87(7): 312-325; (8): 351-385. 1931.—The study is based upon outbreaks observed in Honduras and material selected from slaughtered calves in London. The review of literature is extensive (bibliography of 162 titles). The disease, largely confined to young animals, occurs most frequently in spring and summer and has a mortality of 1-50%. Immunity in older animals is dependent upon the carrier condition. Infection is from the older animals, a large percentage of which are carriers. Pneumonia and nephritis are given as complicating diseases. The characteristic symptom is the presence of blood and mucus in the bowel discharge. The validity of species described in cattle other than *Eimeria zürnii* is questioned. Five days is required for the formation of the sporocyst within the oocyst. The large intestine is most frequently infected but the lesser one to a smaller extent. The parasites develop at the base of the glands of Lieberkühn. Of the drugs used for treatment, tannic acid is most frequently mentioned, but no drug has been found very satisfactory. The most effective control is avoidance of close herding.—*I. E. Newsom.*

13616. **ROLLE, M.** Strongyliosis der Pferde. *Miessnerfestschrift* p. 155-166. 11 fig. Fritz Eberlein: Hannover, 1930.—The heads of the larvae were observed to penetrate into the lumen of the bloodvessels. When horses are thought to have infectious anemia, the intestinal arteries should be examined for these parasites.

13617. **SCHILLING, VIKTOR.** Interessante Fälle von Eosinophilie durch Würmer. 1. Glossitis, Allergie und hohe Eosinophilie durch abgestorbenen Bandwurm. 2. Biologische Kurve der Leukocyten bei Echinokokkenperitonitis. *Hamburg. Univ. Abhandl. Gebiet Auslandsk.* 26: 481-492. 1927.—1. Glossitis, with swelling and lack of taste, in a 64-year old woman of the better class, with an eosinophilia of 53.5%, was attributed to a dead *Taenia solium*. 2. Following the rupture of an Echinococcus cyst in the abdomen the eosinophil count rose to 43%.—*E. C. Faust.*

13618. **SCHLOTTHAUER, CARL F., and HIRAM E. ESSEX.** Control of enterohepatitis in turkeys. *Cornell Vet.* 21(3): 252-255. 1931.—Experiments with 3 groups of turkeys led the authors to believe that transmission must be through the egg. Turkeys died of blackhead within 5-7 days after hatching, regardless of the precautions taken to prevent infection.

13619. **SCHWARTZ, BENJAMIN.** Nodular worm infestation of domestic swine. *Vet. Medicine* 26(10): 411-415. 2 fig. 1931.—*Oesophagostomum dentatum, O. longicaudum, O. brevicaudum, O. georgianum,* and *O.* maplestoni (*O. conicum* Maplestone, preoc.) (p. 411)

are known to be parasitic in the large intestine of domestic pigs; *O. maplestoni* is not as yet known from the U. S. A. The larval stages occur in cysts of varying size in the wall of the large intestine, including the cecum. In southern U. S. A. ulcerated nodules are common in the large intestine, the largest and most conspicuously ulcerated ones usually being free from worms; evidently the nodules continue to increase in size and ulcerate after the larvae have migrated to the lumen of the intestine. "Chitterlings" showing inflamed or ulcerated nodules are objectionable as food and are condemned under meat inspection procedure. Hexylresorcinol in minimum doses of 4 gm. appears to be a promising treatment.

13620. **SEDDON, H. R., and T. T. McGRATH. Observations upon the conditions requisite for the transmission of gastro-intestinal nematodes of the sheep.** *N. S. Wales Dept. Agric. Vet. Res. Rept.* 6(1/2) : 40-57. 3 pl. 1931. —While continued grazing on infected grass land gives the heavy infestation with gastro-intestinal nematodes, slight infestation with *Haemonchus, Ostertagia* and *Nematodirus* may occur in sheep in contact with infested sheep and kept on bare ground. Slight infestation by *Haemonchus* and *Ostertagia* is possible from contamination of the water supply. While low-lying ground is most favorable, a heavy infestation with *Haemonchus, Ostertagia* and *Nematodirus* may be contracted from sloping grass land pasture continuously grazed. *Oesophagostomum* is transmitted under such conditions, but the infestation is not so heavy. Grazing on sloping grass land only when there is no moisture on the grass leads to infestation with *Haemonchus, Ostertagia* and *Nematodirus,* but much less heavily than with continuous grazing on such an area. *Oesophagostomum* was not contracted under such circumstances; there is evidence that this nematode is stricter in its requirements than the others mentioned. Certain evidence is adduced bearing upon the length of the parasitic stage of the above parasites up to egg-laying. This is consistent with figures recorded by others, but, apparently, the minimal period for *Oesophagostomum* may be as low as 35 days. —*Author's conclusions.*

13621. **[SHMELEVA, A. A.]** ШМЕЛЕВА, А. А. Влияние концентрации водородных ионов среды на развитие яиц аскарид. **[Effect of pH of the medium on the development of the eggs of Ascarids.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(3) : 319-324. [German summary, 360-361.] 3 fig. 1929.—The rate of development of the eggs of *Ascaris lumbricoides, A. suum, Toxascaris limbata, Parascaris equorum* does not depend on changes in pH of the medium. When 2 basic factors are supplied—favorable temp. and minimal bacterial contamination—the eggs of *A. lumbricoides* develop to the larval stage within 9-10 days, *A. suum* within 8 days, *P. equorum* within 4 days, *T. limbata* within 2 days. The "seasonal factor" in the development of Ascarid eggs described by some authors is due to not having the same experimental conditions as regards temp. and sufficient oxygen supply. The albuminous membrane of the eggs of *A. lumbricoides* and *A. suum* varies in thickness and form depending upon the pH of the medium, dissolving on the 6-8th day in solution with pH 3.0-4.0 and remaining intact until the end of the experiment at pH 5.0-8.0. The membrane of *P. equorum* dissolves within 24 hrs. at all pH values.—*G. A. Lebedeff.*

13622. **SIMMS, B. T., and J. N. SHAW. Studies of the fish-borne tapeworm, Dibothrium cordiceps Leidy.** *Jour. Amer. Vet. Med. Assoc.* 32(2) : 199-205. 1931.—Two new fish hosts, brook trout and silver salmon, were established for the larval forms of *D. cordiceps.* Examination of many dead or sick fish showed 1-50 tapeworm larvae present, some embedded in the walls of the stomach and pyloric ceca, others crawling on the peritoneal surface. Peritonitis was observed in every fish examined. Although living larvae were fed to a dog, 3 ducks, 2 raccoons, 3 gulls and a house cat, only the gull has been established as a new host for the adult parasite.

13623. **[SMIRNOV, G. G.]** СМИРНОВ, Г. Г. К вопросу о патологических изменениях при миграции аскаридных личинок в теле хозяина. Экспериментальное исследование. II. **[Pathological changes due to migration of Ascaridae larvae in the body of the host. 2.]** Известия Академии Наук СССР., Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS., Cl. Sci. Phys.-Math.*) 1928(1) : 31-44. 1928.—Experiments on guinea pigs showed that migration of *Ascaris* larvae within the host caused patho-anatomical changes in the organs such as liver or lungs, frequently leading to death. Intensity and character depended on the degree of invasion and the histological structure of the organ; thus, dense liver tissue reacted more weakly than and differently from the porous and highly vascularized lung tissue. Larvae of *Ascaris suilla* or *A. lumbricoides* having invaded the liver, abandoned the blood stream and became imbedded in the liver. If within the next few days the larvae did not reenter the blood stream, they lost their penetrating power and remained in the liver, which reacted by formation of a connective tissue capsule around the parasite. Impregnation of the fibrous capsule with Ca salts and possible development of concretions are probably among the later results of changes in the liver. Larvae in the bile ducts arrived from the blood vessels and from the liver. Changes in the lungs might be characterized as "ascaridal extravasation" with the predominance of mesenchymal reaction and with considerable participation of eosinophilic elements. Invasion of other inner organs via the greater circulation was met but rarely. Staining of the guinea pigs in vivo with trypan blue possibly increased the resistance of the organism to the invasion.

13624. **SMIT, H. J., en R. NOTOSOEDIRO. Arduenna strongylina (Rudolphi 1819).** [With German and English summaries.] *Ned.-Indische Blad. Diergeneesk.* 43 (4) : 323-327. 1 fig. 1931.—A detailed description is given of a small worm from the stomach of a 4-mo. old pig and regarded as *A. strongylina.* The worm is reported from the Dutch E. Indies.

13625. **SMIT, H. J., en R. NOTOSOEDIRO. Thelazia callipaeda.** [With German and English summaries.] *Ned.-Indische Blad. Diergeneesk.* 43(4) : 328-332. 1 fig. 1931.—In the eye-sack of a Java born Airedale terrier was found *T. callipaeda,* the ♂ of which was previously found only once and described by Faust. The authors counted 10 pairs of pre-anal and 2 pairs of post-anal papillae whereas Faust mentions 5 pairs of pre-anal, 2 pairs of post-anal papillae, and one pre-anal papilla in the median line.

13626. **SOUZA, MOACYR ALVES de. Coccidiose em cobaya. (Coccidiosis in guinea pigs.)** [With English abstract.] *Rev. Zootech. e Vet.* [*Rio de Janeiro*] 17(1) : 11-14. 1931.—In a wild guinea pig (*Cavia aperia*), marked ileitis, thyphlitis and colitis were observed. Numerous oocysts of *Eimeria cavia* (Sheatherp) were found in feces. Coccidia were also found in cover glass preparations of kidneys and in groups of 10, 20 or more between the urinary tubes in sections. This is thought to be the first report of kidney localisation of coccidia in guinea pig. Infection was reproduced in tame guinea pigs and chickens.—*Author's abstract.*

13627. **STEHLE, M. Ueber Trichinose bei wilden Tieren und ihre Übertragung auf den Menschen.** *Zeitschr. Infektionskr. u. Hyg. Haustiere* 39(4) : 320-329. 1931.—The article discusses the distribution of trichinosis in wild animals and its relation to the human disease. A review of the literature indicates that the disease is found in a variety of wild animals including grizzly bear, polar bear, brown bear, wild hog, fox, badger, marten, polecat, hedgehog, and mouse. The disease has been reported in man following the eating of flesh of bear and hog. Some of the animals in zoological gardens were found infested with the parasite which was believed to be disseminated by rats. A report is made of 69 cases in man (43 ♂♂, 26 ♀♀), with a fatality of 17.4%. The death

rate was 6.5 times as high in ♂♂ as ♀♀, perhaps due to the greater consumption of the infected flesh by the former. From the fact that the flesh of bears is commonly invaded by the trichinella in such large numbers that many persons become diseased following its use as food, it is recommended that all such flesh be carefully inspected before being marketed.—*L. D. Bushnell.*

13628. **TARAMELLI, N., et A. DUBOIS. Un cas de coenurose chez l'homme.** *Ann. Soc. Belge Méd. Tropic* 11(2): 151-154. 1 fig. 1931.—Report of a case of human infection with a taenia of the genus *Multiceps* (*Coenurus*), the 3rd case in the literature definitely determined for man.

13629. [TARNOGRADSKIĬ, D. A.] ТАРНОГРАДСКИЙ, Д. А. Водоемы курорта Теберды в малярийном отношении. **[The waters of the resort Teberda in relation to malaria.]** [German rendering.] Работы Северо-Кавказской Гидробиологической Станции (*Trav. Sta. Biol. Caucase du Nord*) 2(2/3): 127-166. 1 pl. 1928.—Teberda is a resort on the northern slope of the Caucasus 100 km. from Batalpaschinsk, 43° 26″ N., 41° 40″ E., altitude 1322-1424 m. It is 6 km. long, in a valley on both banks of the Teberda river, surrounded by heavily wooded hills. The predominant forest trees are pine, aspen and alder. The climate is mild with little temp. change, cool summers and warm winters. During the summer of 1927 there were 91 days with precipitation. In 1925 and 1927 all of the water sources of the area were examined as possible breeding places of anopheles mosquitoes. No larvae were found in the rapidly flowing mountain streams. Slow flowing brooks in heavily wooded areas were negative but *Anopheles* and *Culex* larvae were frequently in such brooks in lightly wooded areas where sufficient sunlight penetrated to encourage algae and other green plants. Marshy spring areas if unshaded contained many larvae. Periodically forming puddles, as leaks along water lines, served as accidental retreats for *Anopheles*, but the principal breeding places were the marshy areas in light woods and meadows. *Anopheles* larvae have frequently been found at considerably higher altitudes in the Caucasus area. A complete tabulation of all water flora and microscopic fauna found in the region surveyed is given. —*H. F. Smyth.*

13630. **TIMON-DAVID, J. Contribution à l'étude de la spécificité biochimique des parasites. Huile d'Exeristes roborator Fab.** *Compt. Rend. Soc. Biol.* 106(10): 829-831. 1931.—Following the same technique for the extraction of the reserve fat in the larvae of *E. roborator* and in its host, *Pyrausta nubilalis* Hübn., the oils obtained showed only negligible differences in their physical and chemical properties. The parasite, therefore, utilises the fatty reserve of its host without changing any of its characteristics.—*E. Weiner.*

13631. **TUBANGUI, MARCOS A. Eimeria bukidnonensis, a new coccidium from cattle, and other coccidial parasites of domesticated animals.** *Philippine Jour. Sci.* 44 (3): 253-271. 2 pl. 1931.—Cases of coccidiosis in cow and carabao calves and in pups are reported; also in 2 adult cats which were apparently only carriers but which came down with acute symptoms of coccidiosis when infected experimentally with surra trypanosomes (*Trypanosoma evansi*). Assuming that young animals are infected from their infected mothers and other adult animal carriers, a survey was made among domesticated animals and the oöcysts of the following coccidial parasites encountered: *Eimeria zürnii**, *E. smithi**, and *E. bukidnonensis** (p. 259) in cattle; *E. zürnii* and *E. smithi* in carabaos; *E. faurei** in sheep and goats; *E. debliecki* in swine; *E. canis** and *Isospora rivolta** in dogs; *Isospora* sp. in cats; *E. tenella* in chickens. These coccidia appear to be morphologically distinct; differentiation of their oöcysts is facilitated by means of a table.—*Author's summary.*

13632. **TUBANGUI, MARCOS A., and LOPE M. YUTUC. The resistance and the blood sugar of animals infected with the Trypanosoma evansi.** *Philippine Jour. Sci.* 45(1): 93-107. 1931.—The resistance (method of Taliaferro and Taliaferro) and the blood sugar (micro method of Folin) of rats, guinea pigs, cats, dogs and horses infected with surra were studied. In agreement with Knowles and Das Gupta, varying degrees of resistance were exhibited by the different animals, as indicated by their ability to keep in abeyance for a shorter or a longer period the rapid and permanent proliferation of the surra organism. The rat possesses a low resistance, the infection running an acute progressive course and the parasites undergoing constant increase in number, with death occurring when the number of parasites in the blood has reached a maximum. The guinea pig has a high resistance, the infection following a chronic relapsing course and death usually occurring when the parasites are scanty in the circulation. The resistance of cats, dogs, and possibly horses is intermediate, the infections being chronic and relapsing but death occurring when the parasites are most numerous in the peripheral circulation. No evidence was obtained that resistance depends on maintenance of a normal blood-sugar content. In most cases, irrespective of the kind of animal, no appreciable changes in blood sugar were observed during infection, except at the very end when a terminal or agonal hypoglycaemia was usually detected.—*From authors' summary.*

13633. **UAMASAKI, SHIGERU. Über eine zweigeisselige Flagellatenart im Darm von Lucilia sp. (jedenis?).** *Hamburg Univ. Abhandl. Gebiet Auslandsk.* 26: 605-607. 1927.—Examination of *Lucilia* sp. (?) showed 11.5% infection with a 2-lashed flagellate which agrees in many respects with the *Herpetomonas* obtained by v. Prowazek from the house fly. A detailed description is given. Since Becker has shown that *H. muscae domesticae* is infectious for flies of various genera, no new name is here proposed.—*M. W. Kamm.*

13634. **VASSILIADIS, P., et J. JARDIN. Influence de l'hibernation sur le trypanosome rhodesiense.** *Ann. Soc. Belge Méd. Trop.* 10(2): 129-131. 1930.—The experiments show that hibernation in the dormouse diminishes an infection of *Trypanosoma rhodesiense*, and that if it is continued long enough the inoculated trypanosomes disappear. The cure of trypanosomiasis by cold brings about an immunity which, although not sufficient to prevent a new infection, renders it slower and lighter. —*C. W. Dawley.*

13635. **VASSILIADIS, P., et J. JARDIN. Influence du spirochète hispanicum sur l'infection à trypanosome rhodesiense.** *Ann. Soc. Belge Méd. Tropic.* 10(2): 133-136. 1930.—The action of *Spirochaeta hispanicum* on *Trypanosoma rhodesiense* is much less marked than that of *S. duttoni* on *T. pecaude* as reported by Bruynoghe and Dubois. In the mouse, survival was never more than 48 hrs. To observe the effect of a simultaneous infection of 2 trypanosomes differing in pathogenic character and morphology, 4 rats were inoculated with the same amount of *T. rhodesiense*. The blood of 2 of these rats contained *T. lewisi*, the other 2 were free from all parasites. No difference in the development of *T. rhodesiense* was observed. The 4 rats died at almost the same time. In the ultramicroscopic examination, as in the preparations stained with Giemsa, *T. lewisi* were always very numerous, but they did not hinder the development of *T. rhodesiense*.—*C. W. Dawley.*

13636. **WEHRMANN, O. Beitrag zur pathologischen Anatomie der Trichinose des Menschen.** *Virchow's Arch. Path. Anat. u. Physiol.* 263(2): 584-589. 1927.—Five cases are briefly reported. In addition to the previously known changes, one of the author's cases showed the rare interstitial myocarditis described by Simmonds. By analogy one may speak of a thrombophlebitis and a thromboendocarditis due to trichina toxins. Furthermore, a hyperplasia of the bone marrow, and an increase in myeloblasts and eosinophils, with tremendous production of these latter, have been observed in 2 cases; in one instance small aggregates of these cells were demonstrated in the spleen. In addition, there is the reaction of the lymphatic tissue. The irritation produced by different animal parasites on the blood and

hematopoietic tissue is similar in kind, but varies quantitatively with different parasites: there is no reaction or very little; they produce a severe anemia (for example in *Ancylostoma duodenale* infection) or, in the highest degree of intoxication, lead to pernicious anemia (many cases of *Diphyllobothrium latum* infection).—*E. C. Faust.*

13637. **WETZEL, RUDOLF. Zur Ernährungsweise und pathogenen Wirkung der kleinen Strongyliden der Pferde.** Miessner-Festschrift p. 219-233. 8 fig. Fritz Eberlein: Hannover, 1930.—*Craterostomum mucronatum, Trichonema coronatum, T. goldi, T. catinatum, T. elongatum, T. insigne, T. nassatum, T. calicatum, T. minutum, T. longibursatum, T. poculatum, T. bicoronatum, T. ultrajectinum; Poteriostomum imparidentatum, P. rátzii,* and *Gyalocephalus capitatus* attach themselves by the mouth end to the mucous membrane of the large intestine of the horse and feed on the living substance of these hosts. The glandular surface which is repeatedly sucked in by the parasite is destroyed by this mechanical action and the dissolved cell elements and tissue liquids serve the worms as nutrients. The occasional opening of capillaries leads only in a few cases (*T. insigne, T. elongatum,* and *Poteriostomum* spp. to taking up of appreciable amounts of blood.—*Author's summary (transl.).*

13638. **YAKIMOFF, W. L., A. M. POLUEKTOFF, und E. F. RASTEGAÏEFF. Zur Frage der Hasenkokzidiose in Russland.** *Zeitschr. Infektionskr. u. Hyg. Haustiere* 39(4): 311-319. 1931.—The breeders of hares and rabbits recognize certain years as good, others as bad, for the rearing of these animals. The latter are usually cold and wet and the losses are especially associated with coccidiosis. From a study of the cause of death of hares in Russia, it is concluded that the same types of coccidia are present in hares in Russia as in Germany and Holland. *Eimeria stiedae* Lindem. and *E. magna* (Pérard) are described from the cases examined.—*L. D. Bushnell.*

13639. **[ZASUKHIN, D. N.]** ЗАСУХИН, Д. Н. Кокцидиоз и анаплазмоз овец в Уральском округе. **(Coccidiosis and anaplasmosis in sheep in the Uralsk district.)** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(2): 244-249. [English summary p. 287.] 1 pl. 1930.—A case of infection of sheep with intestinal coccidiosis and anaplasmosis, and its symptoms, is described. *Anaplasma ovis* was found in the blood of 41.5% of the sheep, and coccidia (*Eimeria* sp.) in the feces of 87%. Examination showed enlarged lymphatic glands, clay colored liver, hemorrhage of the small intestines. *Anaplasma ovis* and *Eimera* sp. were found in all of the dead sheep. From clinical and patho-anatomical picture it is concluded that anaplasmosis was important in the death of sheep but that coccidiosis also is fatal.—*G. A. Lebedeff.*

13640. **[ZAVADOVSKIĬ, M. M., and L. G. SHALIMOV.]** ЗАВАДОВСКИЙ, М. М., и Л. Г. ШАЛИМОВ. Возможна ли аутоинвазия при оксиуриазисе? **[Is autoinvasion in oxyuriasis possible?]** [English summary.] Труды Лаборатории Экспериментальной Биологии Московского Зоопарка (*Trans. Lab. Exp. Biol. Zoopark, Moscow*) 5: 9-42. 17 fig. 1929.—Eggs of worms from the appendix did not develop in vitro; those of worms freely passing from the rectum did; eggs of some worms extracted from the rectum did not develop in vitro, eggs of others did. Closer analysis showed this capacity to depend on the stage of development of the embryo—the "pre-tadpole" stage being incapable of development in vitro. Temperature limits for such development were 20°-40° C., rapidity of development increasing with increase of temp. From the "tadpole" stage on, eggs required O for their development; up to that stage the author believes them to utilize the O from the blood and tissues of the host. The eggs of *Enterobius* were covered with a shell of 4 membranes, A, B, C, and D, starting with the outer membrane. D was soluble in alcohol, chloroform, ether, and acetic acid, being apparently of lipoid nature. A, B, and C membranes serve as a mechanical protection, D as one against chemical reagents. All 4 membranes were formed on the surface of the undivided egg, and showed no morphologic changes during further development of the embryo. Reaching the "tadpole" stage, D changed its physico-chemical properties, becoming almost impermeable for water and salts, thus isolating the egg and allowing it to develop in water and in physiological solution. Since *Enterobius* eggs on reaching "tadpole" stage require free O, which is absent in the intestine, possibility of autoinvasion must be excluded.

13641. **[ZAVADOVSKIĬ, M. M., with participation of S. IVANOVA, E. VOROB'EVA, and O. STRELKOVA.]** ЗАВАДОВСКИЙ, М. М., с участием С. ИВАНОВОЙ, Е. ВОРОБЬЕВОЙ и О. СТРЕЛКОВОЙ. Биология Trichostrongylidae, паразитирующих у копытных животных. **[Biology of Trichostrongylidae parasitic in ungulates.]** [English summary.] Труды Лаборатории Экспериментальной Биологии Московского Зоопарка (*Trans. Lab. Exp. Biol. Zoopark, Moscow*) 5: 43-83. 6 fig. 1929.—The author studied the egg morphology and embryo development of *Trichostrongylus instabilis*, Ostertagia mentulata, Cooperia pectinata*, Tr. probolurus,* and *Tr. extenuatus,* taken from roe, reindeer, and other ungulates. Findings were similar for all 5 species. Eggs of *O. mentulata* and *C. pectinata* left the host intestine at the stage of 8-12 blastomeres; those of *T. instabilis* at 16-24 and more blastomeres. Eggs of all 5 spp. were very resistant, due to their shell of 3-4 membranes. The 2 outer membranes were permeable to salts and water; the inner almost solely to water, being soluble in lipoid-dissolving substances. Structure of the shell was the same as in Ascaridae and *Enterobius.* Eggs of Trichostrongylidae could not stand drying; they developed well in feces, in water, and in physiological solution; rapidity of development was in direct ratio to temp. increase, the limits being 4-39° C. Upon leaving the intestines, eggs could develop only in presence of O, their development being temporarily arrested in O-free media. At 25° C., larvae left the shell in about 24 hrs. Feeding on manure, they grew rapidly; no growth was shown in water. Young larvae (1-2 days) could not stand drying. Larvae of *Tr. instabilis* were fed to guinea-pigs, and in 1 case eggs were found in feces; they did not develop in the intestines. Apparently, the first stages of development are completed in the maternal gonad, utilizing the O from the host tissues; since O is required for the development of the eggs, autoinvasion with Trichostrongylidae is impossible.

13642. **[ZELENSKIĬ, V. D.]** ЗЕЛЕНСКИЙ, В. Д. Некоторые вопросы биологии трихины и этиологии трихиноза. **[The biology of trichina and the etiology of trichinosis.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(4): 365-393. [German summary.] 6 fig. 1929.—Critical review of literature.

13643. **ZOZAYA, CARLOS. Das Blutbild bei der experimentellen Hamster-Leishmaniosis.** *Hamburg Univ. Abhandl. Gebiet Auslandsk.* 26: 628-630. 1927.—Observations were made on 7 animals. During the course of infection there is a relative increase of lymphocytes with a simultaneous decrease in the total leucocyte count (6 mos.). As the infection progresses the plasma cell count increases (9 mos.). There is no rise in mononuclears, even in heavily infected animals. The change in the blood picture of experimentally infected hamsters is not nearly so marked as in that of human cases.—*D. Koch.*

FILTERABLE VIRUSES, BACTERIOPHAGE, ETC.

(See also in this issue the subsection "Infectious Chloroses" in the section Phytopathology; and Entries 13479, 13486, 13544, 13662, 13693, 13764, 13779, 13784, 13850)

GENERAL

13644. **CARMICHAEL, E. ARNOLD. The aetiology of disseminate sclerosis: Some criticisms of recent work, especially with regard to the "spherula insularis."** *Proc. Roy. Soc. Med.* 24(5): 591-606. 1931.—Experiments on several series of cases, employing the Lange gold-sol curve, levulose tolerance test, variation in pH of cultures and microscopic appearance of cultures, failed to substantiate the work from the Westminster Hospital, as claiming the presence of a virus, so-called "spherula insularis," in cultures of cerebrospinal fluid from cases of disseminate sclerosis.

13645. **GANTT, W. HORSLEY, und A. W. PONOMAREW. Über den Mechanismus der Verbreitung des Tollwutvirus (Virus fixe) im Organismus.** *Zeitschr. Ges. Exp. Med.* 66(5/6): 582-595. 1929.—Fixed rabies virus (Leningrad strain) does not infect dogs when injected subcutaneously, intramuscularly, or intravenously, nor is it possible to find active virus in the brains, even when large doses of the brain of infected rabbits are used. Dogs injected subcutaneously or intravenously with passage virus and then subjected to withdrawal of cerebrospinal fluid did not contract rabies, nor did the brains of these dogs contain active virus. When fixed virus was injected into muscles, especially into those muscle groups having a short nerve connection with the brain, and when subsequently cerebrospinal fluid was removed, the dogs developed typical passage-rabies. The brains of these dogs were shown by tests in rabbits to contain the same fixed virus. Rabies virus reaches the central nervous system from the site of infection by travelling along the nerves. The centripetal spread of the virus is aided passively by the lymph flow in the nerve trunk and actively by proliferation of the virus. Fixed virus may be distributed through the connective tissue of the nerve, but it seems to be chiefly, if not exclusively, distributed along the axis cylinder. These experiments of the passage of virus along nerve sheaths under the influence of a flow of lymph consequent upon a withdrawal of spinal fluid, suggest by analogy that a similar mechanism might be usefully applied in antirabic treatment. Studies of the fate of fixed virus in the immunized animal will have a bearing on this point.—*Author's summary (transl. by S. Bayne-Jones).*

13646. **GOODPASTURE, ERNEST W., and C. EUGENE WOODRUFF. A comparison of the inclusion bodies of fowl-pox and molluscum contagiosum.** *Amer. Jour. Path.* 7(1): 1-8. 1 pl. 1931.—The inclusion bodies of molluscum contagiosum may be freed from surrounding cellular material by tryptic digestion. Unlike fowl-pox inclusions, the molluscum bodies are sticky and gelatinous after digestion, and, therefore, can not be manipulated readily with the Chambers microdissection apparatus. The gelatinous matrix of the molluscum bodies has a markedly granular appearance, due to the presence of myriads of Lipschütz granules—minute coccoid structures 0.25 μ in diam. These granules are identical in size, shape and staining reaction with the Borrel bodies of fowl-pox; they are resistant to trypsin. The molluscum bodies show little or no swelling in distilled water; the fowl-pox inclusions swell markedly, due, probably, to their lipoid material acting as a semi-permeable membrane. Trituration of the molluscum inclusions readily breaks them up into the component Lipschütz granules; fowl-pox inclusions, similarly treated, fail to break up so readily into Borrel bodies. This difference may afford an explanation for the relatively greater filterability of the former. Fowl-pox and molluscum contagiosum are apparently specific for fowls and man, respectively, cross-inoculation experiments having proved unsuccessful. Attempts to transfer molluscum to monkeys and other laboratory animals were also unsuccessful.—*Author's summary.*

13647. **McKINLEY, E. B. Filterable virus and Rickettsia diseases in the tropics. VIII. Intracellular inclusions in filterable virus diseases.** *Porto Rico Journ. Publ. Health & Trop. Med.* 5(2): 114-133. 1929.

Gedanken zur Vererbungswissenschaft auf Grund von Studien an der Lahmkrankheit (renquera) der Haustiere in Perú. [Filterable pathogenes and new data on tuberculosis. Thoughts on genetics based on researches on lameness in domestic animals in Peru.]** 208p. 6 col. pl., 108 fig. Johann Ambrosius Barth: Leipzig. 1931.

13649. **PINNER, MAX, and MARIE VOLDRICH. The disease caused by filtrates of tubercle-bacillus cultures. Its alleged relation to filterable forms of tubercle bacilli.** *Amer. Rev. Tuberc.* 24(2): 73-94. 1931.—Filtrates from pure cultures of tubercle bacilli were injected into 115 guinea pigs: 81 received filtrates from broth cultures; 34, filtrates from saline suspensions of bacilli grown on solid media. In 6 of the 115, acid-fast elements, non-characteristic in appearance except for tinctorial behavior, were seen; animal passage was unsuccessful. No growth was obtained from lymphoid organs of injected animals, or from filtrates. All 34 animals injected with filtrates from saline suspensions remained well; 71.6% of the 81 animals injected with broth culture filtrates developed a disease, fatal in 41% of those affected, characterized by rapid loss of weight, dehydration and loss of tissue tone, and not associated with localized lesions. Its etiological agent is present only in the filtrate from the broth culture of tubercle bacilli, not in the uncultured broth or in bacilli grown on solid media; it is thermostable and not transmissible by animal passage. Incidence of acid-fast elements shows no correlation with incidence of the "filtrate disease."—*From author's abstract.*

13650. **SMITH, WILSON. The effect of testicular passage on the virus of herpes.** *Jour. Path. and Bact.* 34(6): 747-750. 1931.—Herpes virus is not qualitatively altered by testicular passage in rabbits, but the testis provides a better culture medium than the brain, even for intensely neurotropic strains. This accounts for the fact that testicular-passage strains cause skin reactions in high dilution when inoculated intradermally and herpetic lesions of the adrenal glands when inoculated intravenously.—*W. Smith.*

13651. **SOBERNHEIM, G. Variola und Alastrim.** *Zentralbl. Bakt. I. Abt. Orig.* 110(6/8): 97-115. 1929.—The occurrence of an unusual epidemic of smallpox in Switzerland during 1921/1926, led to experimental and epidemiological studies. The death rate was low—15 deaths among 5560 cases. Experimental studies on rabbits and epidemiological studies indicated that the disease was a mild form of smallpox. The reasons for the attenuation of the virus remain unrevealed. It is recommended that epidemics of alastrim be handled in the same manner as epidemics of smallpox, since it is possible, for unknown reasons, that the virus in mild epidemics may assume the full virulence of smallpox.—*D. H. Bergey.*

13652. **STUART, G., and K. S. KRIKORIAN. Further studies in anti-rabies immunisation. Rabies virus—exalted and classical strains compared.** *Jour. Hyg.* 31 (4): 523-542. 1931.—Cross immunity experiments on 20 rabbits showed the identity of exalted virus with the classical strain.

13653. **THOMAS, MARIE. Erzeugung von Bakteriophagen? Auftreten von Bakteriophagen in Gemischen von Bakterien und Pankreaspräparaten.** *Zeitschr. Im-*

munitätsforsch. 63(5/6): 521-536. 1929.—Of 5 preparations of pancreas tested—Pankreon-Rhenania, Pankrophorin-Kahlbaum, Pankreas Dispert-Krause Medico, Intestinol-Henning, and Pankreatin absolut-Merck—filtered solutions in normal saline or broth produced no lysis of the typhoid-paratyphoid-dysentery-coli group. Bacteriophages were occasionally obtained with one preparation only, viz., Pankreatin absolut, if the solution was mixed with broth cultures of certain strains of dysentery bacilli (Flexner, Shiga, Y) and coli. The cultures alone never gave rise to bacteriophages. With greater quantities of pancreatin, bacteriophage formation set in earlier. The bacteriophages appeared sooner if the mixtures of pancreatin and bacteria were incubated at 45°, than at 37° or 22°C. Bacteriophages were also obtained if unheated bacteria were added to pancreatin solution that had been heated to 40, 50, 55, 57.5, 65 or 67.5°, but not with 60 or 62.5°. Flexner bacilli, heated to 80°, still contained viable bacilli; such emulsions, if added to unheated pancreatin, gave rise to weak bacteriophages. No details are given as to technique or duration of heating. No bacteriophage was obtained in mixtures of boiled pancreatin and unheated bacilli. While admitting that a pre-existence of bacteriophage, either in the pancreatin or the bacterial cultures, has not been definitely proved, the author is in favor of this view.—*C. Prausnitz.*

13654. TSCHESCHKOW, A. M. Über die Bedingungen des Eindringens von Tollwutvirus in die Tränendrüsen. *Zeitschr. Ges. Exp. Med.* 78(1/2): 142-146. 1931.—Rabies virus was found in the lacrimal glands in 9 of 10 dogs infected with street virus, in 4 of 10 rabbits infected with fixed virus, and in 3 of 4 cases of human rabies. Hence, it appears that affection of gland centers in the brain does not betoken a specific predisposition of these centers, but that rabies virus settles in the entire brain-stem, and spreads thence, perhaps passively, owing to the circulatory conditions of the cerebrospinal fluid in the brain and its submeningeal spaces.

LOWER ANIMALS

13655. BROWN, HAROLD D. Rinderpest. *Peking Soc. Nat. Hist. Bull.* 4(2): 87-94. 1929.—A general summary of more recent methods of controlling rinderpest, together with some experiences in successful immunization with the aid of bile, of animals succumbing to the disease.—*W. A. Hagan.*

13656. EDWARDS, J. T. Rinderpest: Some properties of the virus and further indications for its employment in the serum-simultaneous method of protective inoculation. *Far East Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 699-706. 1927[1928].—The author describes a method of preserving the virus of rinderpest for as long as 8 days. This permits it to be shipped long distances for immunization of cattle by the virus-serum simultaneous method. The virus is passed first through goats, which filters out the bovine-specific piroplasmic infections.—*R. R. Spencer.*

13657. HAAGEN, E. Untersuchungen über die übertragbare Myxomatose beim Kaninchen. Mit besonderer Berücksichtigung der Züchtung des Myxomvirus in der Gewebekultur. *Zentralbl. Bakt. I. Abt. Orig.* 121(1/2): 1-9. 6 fig. 1931.—Rabbits were inoculated intracutaneously with 1 cc. of whole blood, serum, plasma, or suspensions of erythrocytes, leucocytes, lung, kidney, lymph-nodes, spleen, testis, liver, or ocular secretion from a myxomatous rabbit at height of infection. Lung lymph-nodes and blood cells induced the most marked infection; but with the exception of 1 unsuccessful testicular inoculation, all rabbits died in 10-12 days. Suspensions of various organs, serum, plasma, erythrocytes, and mucous conjunctival secretion (0.1 cc.) were injected intracutaneously into 10 mice, 6 rats, and 8 guinea pigs; no tumor was induced nor did necropsy show pathological changes. The virus passed through a Berkefeld V but not an N filter; results were not uniform, although the original material was highly virulent, possibly because of varying size in the virus elements or because they could not be separated from the accompanying protein at a certain stage of electronegative charge. Myxomatous rabbit tissue was extracted in physiological saline, fragments of testis were submerged for 15 min. in the supernatant fluid, then placed in a drop of normal plasma-spleen extract with a piece of fresh testis; after a week's cultivation the cell zone was excised and the primary culture placed in fresh, normal plasma extract together with fresh testicular tissue; 30 weekly passages were so made. The cell zone was inoculated intracutaneously and found virulent. With increasing passage, a considerable increase in virulence occurred; at the 30th, the inoculation was 3+ on the 3rd day at a dilution of 1:1 milliard, and fatal on 6th (1st passage 3+ on the 5th day with no dilution, fatal on 11th). As in variola-vaccine virus, the virus retained its biological properties. Both testicular tissue and leucocytes proved sources of initial virus material, but because of the difficulty of growing leucocytes in hanging drop, that method had to be abandoned. Lymph-nodes, lung and kidney, as well as testis and leucocytes, were suitable for maintaining the culture. Cell changes appeared not only in the myxomatous tissue, but elsewhere, and were not uniform, varying in size, structure and staining; they were products of the cell reaction to the virus.

13658. JACOTOT, H. Existe-t-il en Indo-Chine plusieurs virus pestiques? *Bull. Soc. Path. Exotique* 24(7): 521-526. 1931.—Experiments showed that strains of the virus of bovine plague from Tonkin, from Laos, from Cochin-China, and from Nhatrang were identical in antigenic action.

13659. SATHE, R. G. Pox in sheep. *Indian Vet. Jour.* 8(2): 118-121. 1 fig. 1931.—Sheep-pox is rare in India and apparently not contagious.

13660. WOODRUFF, ALICE MILES, and ERNEST W. GOODPASTURE. The susceptibility of the chorio-allantoic membrane of chick embryos to infection with the fowl-pox virus. *Amer. Jour. Path.* 7(3): 209-222. 13 fig. 1931.—Ectodermal and entodermal cells of the chorio-allantoic membrane of the chick, as well as embryonic chick skin, are susceptible to infection with the virus at an early stage in embryogenesis. Whether this specific susceptibility is acquired as a result of cellular differentiation has not been determined. Of 4 methods described for isolation of uncontaminated fowl-pox virus, in 2 the virus is developed in tissue that has never been contaminated by extraneous microorganisms. Fowl-pox infection in the trachea of the adult hen was induced by inoculation with uncontaminated virus.—*Author's summary.*

BACTERIOLOGY AND OTHER MICROBIOLOGY

MEDICAL

JAMES S. SIMMONS, *Editor*

(See also in this issue Entries 12886, 12895, 13345, 13364, 13399, 13453, 13459, 13481, 13487, 13506, 13511, 13530, 13571, 13635, 13647, 13648, 13649, 13714, 13748, 13803, 13840, 13902, 13903, 14063, 14066, 14078)

13661. BRUYNOGHE, R. Le sodoku. [Sodoku or rat-bite fever.] *Rev. Méd. Louvain* 1929(20): 305-312. 1929.—"Sodoku" is the Japanese name of a non-fatal intermittent fever produced in man by the bite of rats or meadow-mice. The organism responsible is *Spirillum minus;* infection produces no symptoms in rats and mice, but may be fatal to guinea pigs and rabbits. Specific lysins are formed in the blood of convalescents, and are

even found after the 1st or 2nd attack. Recurrences are explained by the formation and survival of resistant strains. The author used the infection with benefit in general paralysis (pyretotherapy).

13662. **CAROL, W. L. L., and A. CHARLOTTE RUYS.** On aphthosis and ulcus vulvae acutum. *Acta Dermat.-Venereol.* 9(2): 123-141. 8 fig. 1928.—Although the lesions of aphthosis and ulcus vulvae acutum are very similar, identical etiology does not necessarily follow. Ulcus vulvae acutum is well-differentiated from other venereal ulcers. It is suggested that aphthosis may be cased by a virus which usually infects the inner surface of the mouth, rarely the genitals, and exceptionally also the skin. The diagnosis of similar ulcers on the genitals is uncertain. A smear from the lesions usually shows *B. crassus* in almost pure culture. While the presence of the organisms in such ulcers probably warrants a positive diagnosis, the etiology is doubtful. The bacteria may be present as secondary invaders or in symbiosis with other organisms. The authors classify the ulcers into the gangrenous and venereal forms. Healing is usually rapidly spontaneous or follows simple treatment. Several cases are reported. It is concluded that ulcus vulvae acutum may occur in combination with aphthosis and that it is a clinically and bacteriologically well-defined disease. The etiology has not been established.—*L. A. Barnes.*

13663. **CASTRO, A. MARTINS de.** Tinhas dos animaes domesticos em São Paulo. 2. Tricophycia: Tricophyton cerebriforme Sabouraud, 1893. Tricophyton granulosum Sabouraud, 1908. Tricophyton gypseum asteroides Sabouraud, 1893. Tricophyton lacticolor Sabouraud, 1910. Tricophyton rosaceum Sabouraud, 1893. [Trichophytoses of domestic animals at São Paulo.] *Arch. Inst. Biol.* [*São Paulo*] 2: 163-178. 13 pl. 1929.—Of 198 cases of trichophytosis, 127 were caused by microsporia; 71, by trichophyta. The *Trichophyton* spp. of animal origin were *T. granulosum, T. asteroides* and *T. lacticolor.* Cases of *T. granulosum* and *T. asteroides* could be verified as coming from animals—cattle and horses—as the same lesions were found on the animals. Trichophytic tinea is more common in São Paulo than microsporic infections. Among 320 cases, microsporias were found in 127, tinea in 71; tinea favosa was encountered 53 times, and epidermophytosis 69 times.—*B. Bickel.*

13664. **EDDY, M. W., and E. S. KRONENBERG, Jr.** Pathological study of a commercial yeast in the lungs of white rats. *Proc. Pennsylvania Acad. Sci.* 4: 12-17. 1930.—18 *Mus norvegicus albinus* were inoculated through incisions into the trachea, with suspensions of yeast from commercial yeast cakes. All inoculated rats developed cough, and gave indications of difficulty in breathing. When the animals were killed or died of respiratory infection, gray nodules were found in the lungs and trachea, and in all cases yeast cells were detected in these lesions. In 1 series of such artificial infections, 3 successful attempts were made to re-isolate yeast from the lesions. 7 control rats inoculated by the same method with sterile distilled water remained healthy.

13665. **EPSTEIN, STEPHAN.** Untersuchungen über die Pilzarten der Dermatomykosen Schlesiens. *Arch. Dermatol. u. Syph.* 163(1): 126-134. 1931.—The investigations of the university skin clinic in Breslau, 1918-1929, showed a complete change in the etiological significance ascribed to separate species. In 1918, *Trichophyton cerebriforme* was found in almost 90% of all cases; in 1929, in only 16.2%. In its place in recent years *T. rosaceum* and *T. gypseum* appeared; *T. violaceum* was also noticed oftener, as the cause of tinea tonsurans in children. These changes were seen still more clearly in separate observations of trichophytosis capitis, barbae, and corporis. In 1918, almost 90% of the trichophytosis barbae cases were caused by *T. cerebriforme;* since 1927, there was a steady increase of *T. rosaceum,* so that in 1929 over 70% of the cases were caused by it. *T. cerebriforme,* in 1919 equal to *T. gypseum,* was usually absent in trichophytosis corporis after 1921, giving place to fungi of the *T. gypseum* group.—*Author's summary* (*transl.*).

13666. **FICHERA, SALVATORE.** Dissenteria da bacillo ceylonensis. [Dysentery due to Bacillus ceylonensis.] *Policlinico* (*Sez. Prat.*) 36(16): 550-552. 1929.—The author reports a case of chronic metadysentery due to *B. ceylonensis A,* the first found in Italy, and diagnosed by seroagglutination at 1: 900.—*F. Garofalo.*

13667. **GRABOW, C., und F. STRUWE.** Beitrag zum Vorkommen des Erregers der Rattenbisskrankheit (Spirillum morsus muris) und zu seinem Verhalten im Tierversuch. *Zentralbl. Bakt. I. Abt. Orig.* 113(5/6): 418-425. 1929.—2 strains of *Spirillum morsus muris* isolated from 6 wild rats, fall of 1926, were observed to be relatively plump, with 3-6 crowded spirals, with terminal flagella, and with unusually rapid motility. Guinea pigs inoculated intratesticularly and intraperitoneally developed typical, progressive disease with fever, swelling of the eyelids, and alopecia. The organisms were found in the regional glands 30 min. after intratesticular inoculation. Of 41 guinea pigs, 40 died between the 7th and 34th days; only 1 recovered. A primary focus was formed in 1-5 days in rabbits receiving subcutaneous injections. Secondary symptoms, such as swelling of eyelids, conjunctivitis, ulcer on the genitalia, and alopecia followed in 15-57 days. Spirochaetes were found in the blood between the 7th and 21st days; they disappeared as soon as antibodies could be demonstrated, and had no affinity for the central nervous system. The spinal fluid and brain of the rabbit remained sterile after 6 suboccipital injections; the blood and other organs became infected. Rabbits, in contrast to guinea pigs, did not die from the disease, but usually recovered spontaneously.—*C. Grabow* (*transl. by A. F. Reith*).

13668. **HERZBERG, HEDWIG.** Über Streptokokkenbefunde im Rachen von Kindern. *Monatsschr. Kinderheilk.* 43(4): 328-336. 1929.—The author studied 2200 throat swabs, taken at monthly intervals from 170 children in a children's hospital and tuberculosis clinic, for presence of hemolytic streptococci. Average findings were: for children 2-15 yrs. old, 40%+; for those in the tuberculosis clinic, 60-70%+; for infants, 10-15%+. Single swabs from 150 inmates of a tuberculosis sanitarium, taken in January, gave 75%+; from 100 children in a school taken in July, 17%+. The + findings increased as a rule in the damp and cold months from September to December, but this was not constant. 26 cases of scarlatina in the children's hospital comprised 8 cases 2-15 yrs. old, 17 from the tuberculosis clinic, and 1 infant. No relationship was found between rise of hemolytic streptococcus incidence and occurrence of cases of scarlatina, since from January to April, with falling incidence, there were 11 cases, while from October to December, with rising incidence, there were only 3 cases of scarlatina among those in the tuberculosis clinic; other irregular relationships were noted.—*W. L. Holman.*

13669. **KANNO, S., und K. FUJITA.** Über die Untersuchung des Vorkommens von Ohara-Bazillen bei an der Ruhr erkrankten Kindern. *Kitasato Arch. Exp. Med.* 7(3): 302-309. 1930.—Stools of 194 dysenteric children showed the Ohara bacillus in 10; all Ohara cases had weak clinical symptoms. 9 cases were diagnosed by the accompanying physician as "ekiri," and 1 as dysentery; 4 cases terminated in death. The biological and serological constitution of the 10 strains of Ohara bacillus corresponded with the authors' earlier studies. The investigation shows that a part of the "ekiri" cases are caused by the Ohara bacillus.

13670. **KNORR, M.** Eigenartige Formen pathogener Aktinomyceten im Gewebe. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 249-251. 7 fig. 1931.—A communication in regard to peculiar spheres, 3 μ in diam., found in great numbers in the original culture from a case of human actinomycosis. The spheres were capable of developing *Actinomyces.* Growth of *Actinomyces* also was successful on Pyro-plates, after preliminary culture in liver broth. Other morphologic peculiarities in human *Actino-*

myces not previously known, are mentioned.—*M. Knorr (transl. by G. H. Robinson).*

13671. **KODAMA, TAKESHI.** Bacteriological studies of measles. Part 2. Further studies of Kusama's bacillus and cultivation of a diplococcus from measles patients. *Kitasato Arch. Exp. Med.* 7(3): 226-234. 1930.—Kusama's measles bacillus, which has been isolated from the kidney of a monkey infected with measles, is identical with the diplococcus obtained from measles patients and agrees very closely with that described by Tunnicliff. The diplococcus produced slight febrile response and leucopenia when injected subcutaneously or intravenously into Japanese monkeys. However, it was impossible to develop typical measles in monkeys, using this organism. Measles-convalescent serum was found to agglutinate it at a low dilution. Results indicate that it is not necessarily of etiological significance, but that it seems to bear an important relation to measles.—*T. Kodama.*

13672. **KUDO, YUZO.** Experimentelle Forschungen über die Pathogenese des Botulismus. *Japanese Jour. Exp. Med.* 9(4): 373-384. 1931.—The author, using a Type A strain of *B. botulinus,* found that a liver broth at pH 7.0 and incubation at 37°C. for 7-14 days produced maximum toxin. The toxin is destroyed by heating at 70° for 30 min.; it is not destroyed by the amount of HCl in the stomach and it withstands trypsin. Guinea pigs succumbed with symptoms of botulism when toxin or living bacteria or spores were injected or given by mouth. A filtrate of a culture which had not yet developed toxin induced no symptoms. The author produced antitoxic and antibacterial sera in rabbits. The antitoxic serum failed to protect guinea pigs against botulism if the bacilli or spores were injected or given by mouth. Similarly, the antibacterial serum failed to protect against toxin. Therefore, the author concludes that efficient serotherapy against botulism should include use of both antitoxic and antibacterial sera.—*G. H. Robinson.*

13673. **LEIPOLD, W.** Eine Blasenerkrankung der Hände und des männlichen Gliedes, wahrscheinlich durch Pferdedruse vermittelt. *Dermatol. Wochenschr.* 93(40): 1533-1540. 1 fig. 1931.—Pus from a horse with strangles produced a vesicular inflammation on one hand of the patient; by contact, infection was transferred to the other hand and to the penis. Microscopic examination and growth on gelatine-glycerine and blood agar plates, and on agar stabs showed strangles streptococci. Attempts to inoculate a healthy person from the culture were unsuccessful. The disease resembled streptodermia bulbosa, and, on the hands, that of one described case of foot-and-mouth disease. The author suggests that cultures be made from persons with "streptodermia bulbosa," if handling horses with strangles, and inoculated into animals, to prove transmission to man.

13674. **LINDNER, K.** Ist das Bacterium granulosis Noguchi der Erreger des Trachoms? *Graefe's Arch. Ophthalmol.* 122(2/3): 391-414. 1929.—The author saw at the Rockefeller institute, New York, monkeys infected with *Bacterium granulosis,* Noguchi (July, 1928) and declares that they did not have true trachoma, but rather "Follikulosis." The latter is often taken for trachoma. Careful examination of the trachomatous Indians in Albuquerque, where Noguchi did his research, showed that they had typical Prowazek inclusions and Lindner's free initial bodies. Noguchi found no inclusions in these cases. Of the 5 cases from which Noguchi cultivated his bacillus, the author examined 4; 2 of them had a normal conjunctiva, 2 advanced trachoma. In the last 2 cases inclusions could be found. It is concluded that Noguchi examined mixed cases (trachoma with folliculosis) and folliculosis cases. The author believes that *Bact. granulosis* is the cause, or one of the causes, of folliculosis, but not of true trachoma; and he enumerates the points in favor of his conviction. —*K. Lindner.*

13675. **LUSTIG, ALESSANDRO.** Über die zwischen dem Erreger des Undulansfiebers (Maltafieber) und dem des Abortus epizooticus bovinus (Bac. Bang) bestehenden Analogien. Zusammenfassende Übersicht neuerer Forschungen, wie sie im Institut für Allgemeine Pathologie und Bakteriologie der Universität Florenz ausgeführt worden sind. [Analogies between the undulant fever bacillus and Bang's bacillus. Comprehensive survey of new experiments carried on at the University of Florence.] *Zentralbl. Bakt. I. Abt. Orig.* 115(3/4): 219-222. 1929.

13676. **MATSCHAN, W. J.** Über den Pseudoanthrax beim Menschen. [Pseudoanthrax in Man.] *Arch. Klin. Chir.* 155(1): 151-165. 1929.—A review.

13677. **MAZZA, SALVADOR, FLAVIO L. NIÑO, y RAUL NICOLINI.** Blastomicosis de la mucosa labiogeniana. [Mucous blastomycosis of the lips.] *Quinta Reunión Soc. Argentina Patol. Reg. Norte* 1: 231-239. 10 fig. 1930.—Report of a case of Gilchrist-Stokes's blastomycosis of the mucous surface of lips and jaw, etiological diagnosis having been established from microscopical appearances of lesions and positive cultures on human serum.—*A. de Assis.*

13678. **MRONGOVIUS, W.** Zur Frage über den Erreger der diphtheroiden Hautgeschwüre. *Zentralbl. Bakt. I. Abt. Orig.* 112(1/2): 49-54. 1929.—A diphtheroid microorganism, *Corynebacterium diphtheriae* var. **ulcerogenes cutaneum** (p. 51), was recovered from the skin lesions of a man who, within the last 3 yrs., had had 186 flat sores which left smooth scars. The organism was Gram-positive and had rather typical metachromatic granules, both terminal and central. On subcutaneous injection of a pure culture back into the patient, a typical pustule and ulcer were produced. However, similar injections into 50 normal persons produced no lesions.—*E. C. L. Miller.*

13679. **MÜNSTERER, H. O.** Beitrag zur Kenntnis der Dermatomykosen Südbayerns und zur Kasuistik der Sporothrichose. *Arch. Dermatol. u. Syph.* 163(1): 97-113. 2 fig. 1931.—In the Munich district, before as well as after the war, mycoses constituted 3-4% of the dermatoses; trichophytia alone, about 1.5%. In 1918-1921, the mycoses increased almost to 22%; in 1929-1930, the author observed 166 cases. *Microsporon audouini* and *Trichophyton gypseum* were seen most often, while other fungi occurred in isolated cases only; human trichophyton was found only twice. *T. cerebriforme,* frequent in northern Germany, thus far has not been cultured in southern Bavaria. Favus is an indigenous, though rare, disease in Old Bavaria, almost always associated with *Achorion schoenleinii;* actinomycoses were infrequent. In one case with deep softening of the buttocks and ending, after 9 yrs., in death due to sepsis, the clinical diagnosis was that of sporotrichosis and a specific fungus resembling *Mastigocladium* was cultivated. The mycotic flora of Munich shows greatest resemblance to that of Giessen and Tübingen, which also resemble it from the standpoint of economic geography.—*Author's summary (transl.).*

13680. **NÈGRE, L., A. BOUQUET, et J. VALTIS.** Sur les propriétés biologiques des voiles jeunes de Bacilles tuberculeux. [Biological properties of young cultures of B. tuberculosis.] *Compt. Rend. Soc. Biol.* 99(19): 45-46. 1928.—Young cultures (4 days or less) have less virulence and greater antigenic properties than older cultures.

13681. **NICOLLE, CHARLES, et CHARLES ANDERSON.** Indifférence des Spirochètes récurrents pour leurs hôtes du genre Ornithodore. *Acta Med. Scandinavica* 70(5/6): 392-395. 1929.—The spirochaetes of the tick fevers are transmitted to man and susceptible mammals by *Ornithodorus.* As a rule each species of spirochaete is associated with a certain species tick. In cross experiments with the 4 spp. *O. moubata, O. savignyi, O. marocanus,* and *O. normandi,* and the 5 spp. *Spirochaeta duttoni, S. hispanicum, S. marocanum, C. sogdianum,* and *S. crocidurae,* the authors demonstrated that the relation between spirochaete and host is merely a geographical one. Whenever a spirochaete encroaches on the geographical distribution of an *Ornithodorus* with

which it has never been in contact, or vice versa, the 2 will become adapted to each other.—*J. A. Gammel.*

13682. **NIÑO, FLAVIO L., y JORGE HARVEY SILVA.** Favus recidivante del cuero cabelludo. (Estudio micológico.) [Mycological studies on recidivant favus of the scalp.] *Quinta Reunión Soc. Argentina Patol. Reg. Norte* 1: 192-212. 6 pl. 1930.—Very detailed report of a case of recidivant tinea. From the lesions a strain of *Achorion* was recovered that seemingly differed from all other classical strains of *A. schönleini* under certain cultural aspects, sometimes nearly approaching *A. gallinae* Megnin. It was named *A. schönleini* var. tesseriformis.—*A. de Assis.*

13683. **NIÑO, FLAVIO L.** Ulceración blastomicética cutâneomucosa del labio inferior. (Consideraciones acerca de su diagnóstico etiológico.) [Cutaneous-mucous blastomycosis of the lower lip.] *Quinta Reunión Soc. Argentina Patol. Reg. Norte* 1: 213-225. 9 fig. 1930.—Clinical and parasitological description of a case.—*A. de Assis.*

13686. **PERGOLA, M.** Nuovo metodo per la ricerca e la dimostrazione del bacillo difterico. [New method for detection and demonstration of Bacillus diphtheriae.] 182p. 22 fig. Min. Interno, Direz. Gen. Sanita Pubblica: Roma, 1926.—The author makes a detailed survey of the cultural and staining methods for *B. diphtheriae.* Its biological characteristics are discussed at length and extensive, comparative studies of Loeffler's and the author's media for its culture are related. The author's medium (serum-egg-K-telurite) has several advantages over other media so far used or proposed, including the rapidity of development of *B. diphtheriae,* which overgrows other organisms present. The organism, which is subject to known variations of size and shape, retains, when grown on this medium, very distinct morphological characteristics; on staining by suitable methods, the polar granules are typical, evident and abundant.—*N. Colosi.*

13687. **[PIKUL', I. N.]** ПИКУЛЬ, И. Н. Средне-Азиатский клещевой тиф в городе Фергане и его возбудитель. [Centro-Asiatic relapsing fever in Ferghan, and its incitant.] [With French summary.] Русский Журнал Тропической Медицины [*Russian Jour. Trop. Med.*] 6(10): 612-618. 2 fig. 1928.—The author observed 44 cases of Centro-Asiatic relapsing fever in Ferghan (an endemic center). Vectors were ticks (*Ornithodorus*), found in the houses; larvae and 1st stage nymphs were always found on the floor, later stages of nymphs on the walls, and imagos under and on the ceiling. Primary and secondary bites of ticks differ sharply. 180 ticks were fed on patients whose blood contained spirochaetes, and, used for further experiments, successfully infected man, mice and guinea pigs. Virus from man was successfully passed to mice, guinea pigs and rats. Blood of an infected guinea pig, placed on the scarified skin of man, caused typical infection. The spirochaete found does not differ morphologically from *S. duttoni* and *S. obermeieri.* In man it was found in small numbers, not only during attacks but also in apyrexial periods. In mice and rats the reaction was likewise weak and the spirochaetes few; but in guinea pigs the spirochaetes were very numerous, attacks long, and 40% of the animals died. In human blood, after the 1st attack, there were found spirochaetolysins. Cross-immunization and cross-infection experiments with this spirochaete, 2 strains of *S. duttoni,* and 1 of *S. obermeieri* indicated that it is new, it is provisionally named *S.* usbekistanica. The author declares that the infection must be recognized as a distinct nosological entity, under the name of "Central-Asiatic tick relapsing fever."—*B. Van Rosen.*

13688. **RAIZISS, GEORGE W., and M. SEVERAC.** Testicular lesions in rabbits following intraspinal syphilitic infection. *Proc. Soc. Exp. Biol. & Med.* 24: 756-759. 1927.—Spirochaetes disappear from the spinal fluid within a few days after introduction into the 4th ventricle of rabbits, and they travel from the cerebrospinal system to the superficial tissues, particularly the testicles. For this reason, criterion of cure after intraspinal inoculation can not be the disappearance of the organisms from this fluid. Cure must be confirmed by general observation over a period of 6-8 mo.—*Helen M. Dyer.*

13690. **SAYERS, R. R., and F. V. MERIWETHER.** Miliary lung disease due to unknown cause. *U. S. A. Treas. Dept. Publ. Health Repts.* 45(49): 2994-3009. 2 pl. 1930.—A summary of 125 histories of cases found during physical and x-ray examinations of 18,285 individuals. A majority of the cases did not have sufficient symptoms to cause them to stop work or to seek medical aid. The most characteristic finding was a large number of discrete, dense, shot-like spots scattered over the lung areas. Tubercle bacilli were present in only 2 of the 88 cases in which the sputum was examined. Unstained smears of 31 cases (all those examined) were positive for fungi; 2 types were identified—*Aspergillus fumigatus fisheri* and *A. niger.* 10 cases tested with antigen of *A. fumigatus fisheri* gave a negative reaction; 6 cases tested with *A. niger* all gave a positive reaction. 38 cases reported by Sutherland as "miliary calcification of the lungs" are probably the same condition. These miliary calcifications may be due primarily to fungous infection.—*R. R. Sayers.*

Gynäkol.* 135(3): 599-611. 1929.—The antagonistic action of the vaginal bacillus towards foreign bacteria in the vagina consists in the capacity of this organism to split the sugar of the vaginal secretion with formation of considerable quantities of acid. Should the source of the vaginal carbohydrate fail in conditions of disease, this protective acid barrier is no longer present, and foreign bacteria invade the vagina, and with their toxins increase the injury. This suggests that introduction of a culture of the vaginal bacillus into the vagina on tampons soaked in a nutrient liquid (e.g., glucose-liver-broth), together with irrigation with lactic acid of appropriate strength, would restore normal function. Adopting this procedure, it was found that the vaginal bacillus multiplies, so that by the action of 1-3 tampons during a period of 24-36 hrs., all the extraneous bacterial flora is expelled and the acidity of the secretion is markedly increased. In comparison with other procedures proposed for a like purpose, e.g., sugar, yeast, irrigation with weak lactic acid, saline, or antiseptics, the biologic method outlined acts better, for the microflora of the vagina is stabilized and the normal vital activity of the vaginal wall is restored.—*R. T. Hewlett.*

Orig.* 120(1/2): 52-58. 1931.—On intraduodenal introduction of *B. paratyphosus* Schöttmuller, *B. typhosus* and *B. enteritidis* Breslau, varying degrees of diffuse enteritis, hyperplasia of Peyer's patches with necrosis and swelling of the mesenteric lymph nodes, were found. *B. enteritidis* was most pathogenic. *B. typhosus* was least toxic, and with bouillon cultures of even 1: 100 dilution produced only mild lesions.—*Maud L. Menten.*

13702. **WALY, AHMED. Aktinomykose der Lunge.** 30p. Dissertation: Universität Berlin, 1929.—The pulmonary form, comprising 15% of all cases of actinomycosis, is of 2 types: primary, following aspiration of infected dust, and secondary, resulting from direct extension from neighboring organs or blood-stream metastasis. The physical findings are (1) broncho-pulmonary, (2) pleural-thoracic, and (3) fistulo-thoracic, depending on the progress of the disease. Onset and course resemble chronic pulmonary tuberculosis; symptoms are detailed. The disease must be differentiated from tuberculosis, chronic pleurisy, bronchitis, syphilis, gangrene, bronchiectasis and lung tumors. Diagnosis is made by the finding of sulphur granules in the purulent sputum. Young colonies of the actinomycete do not possess clubs and are of soft consistency. Treatment consists in surgical removal of fistulous tracts wherever possible, administration of NaI, vaccine, salvarsan, x-ray therapy, intravenous injection of gentian violet, or bronchoscopic injection of Iodol. Friedmann reports beneficial results in bovine actinomycosis, following administration of his serum, and advises its use in human cases. Actinomycosis is rare in children under 14 yrs. old, since only 0.6% of the cases occur in this age group. A case of primary pulmonary actinomycosis occurring in a boy 9 yrs. old forms the basis of the author's report. Onset suggested tuberculous pleurisy and x-ray showed involvement of the left lower lobe. Temporary clinical and physical improvement followed administration of iodides, horse serum and blood transfusions, but during the 11th mo. of the disease, the pulmonary lesion extended directly through the diaphragm to the left hypogastrium; 1 mo. thereafter it metastasized to the right side of brain, with marked signs of cerebral irritation. The patient died 14 mo. after onset, the usual termination of all cases of pulmonary actinomycosis.—*L. D. Michelson.*

13705. BUTTERFIELD, C. T., W. C. PURDY, and E. J. THERIAULT. Experimental studies of natural purification in polluted waters. IV. The influence of the plankton on the biochemical oxidation of organic matter. *U. S. [A.] Treas. Dept. Publ. Health Repts.* 46(8): 393-426. 1931.—Based on results of an extensive series of experiments on the interrelationship of bacteria and plankton to rate of oxidation of organic matter in polluted water as studied by bacteriological, limnological and chemical tests, it is shown that, under the conditions: (1) No appreciable O depletions were observed in absence of all living organisms. (2) In presence of bacteria, in pure or in mixed culture but free from plankton, O depletions were marked during the first 2 days of incubation at 20° C. and thereafter oxidation practically ceased, although numbers of living bacteria remained quite high. (3) When plankton was present in bacteria-free culture, O depletions occurred, but their extent was very limited. E.g., when *Colpidium* in pure culture had been growing for 27 days and had reached maximum number, the O depletion observed was less than 0.1 that produced by bacteria in pure culture in a similar medium. However, when bacteria were later introduced into the same medium in which *Colpidium* had been growing for 27 days, the O depletion increased over 20 times during the next 5 days. (4) When both bacteria and plankton were present in mixed culture, O depletions during the 1st day or 2 were practically the same as when bacteria only were present, and thereafter oxidation did not cease, as stated in (2), but proceeded to completion. (5) In general, the extent of oxidation observed varied with complexity of biological factors present; i.e., the greater the variety of organisms acting in the medium, the more extensive was the O depletion. Based on results presented, the theory is advanced that the chief function of certain plankton in the biochemical oxidation process is to keep the bacterial population reduced below the saturation point and thus to provide conditions suitable for continuous bacterial multiplication, this in turn resulting in more complete oxidation. Support is given to this theory of the function of the plankton by results obtained in a series of experiments where the limiting populations of bacteria, free from plankton, were reduced by physical and by chemical means.—*C. T. Butterfield.*

13707. CARRIÓN, A. L. Third report on a rat-flea survey of the city of San Juan, Porto Rico. *Porto Rico Jour. Publ. Health & Trop. Med.* 5(2): 158-166. 1929.—249 live rats were trapped in San Juan. Concentration has been moderately higher toward the residential and commercial zones. The Norwegian rat has practically predominated in all sections of the city. Fleas were found in 68% of the rodents captured, their concentration appearing highest at the docks. The index reached 7.9 fleas per rat, and the *Xenopsylla cheopis* index was 7.7. A few specimens of *Echidnophaga gallinacea*, *Ctenocephalus canis* or *felis*, and *Pulex irritans* were encountered. Flea prevalence and atmospheric humidity curves showed marked dissociation during the 2nd half of the yr.—*Author's summary.*

13708. CAVEL, LUCIEN. Sur l'adsorption des matières colloïdales par les "Boues activées." *Rev. Hyg. et Méd. Prévent.* 53(3): 179-181. 1931.—There is disagreement among investigators regarding the mechanism of adsorption of colloidal matter by activated sludge. The author tested the adsorption by such sludge, of a large number of dyes, the electric charge of which was known, and found all positively charged granules to show a relatively high coefficient of adsorption, and negatively charged dyes not to be adsorbed at all. He concludes, obviously, that activated sludge is negatively charged and that organic matter which is fixed is positively charged. Differences in degree of adsorption are explained by amount and kind of bacterial decomposition.—*C. M. Hilliard.*

13709. CHURA, ALOJZ J. Die Diphtherie in Bratislava (Pressburg) seit Beginn des XIX. Jahrhunderts. (Epidemiologische Studie.) *Jahrb. Kinderheilk.* 130(1/2): 79-112. 2 maps. 1930.—An increasing number of cases of diphtheria in recent yrs. with a higher epidemic peak than formerly stimulated renewed studies. Isolation of infected cases has been in effect since 1872. Serum therapy was first tried in 1894, became general by 1896, and in 1898 a plan was formulated for general immunization of children. 7000 children of preschool age have been immunized with Ramon anatoxin at the time of a fully developed epidemic. Diphtheria is endemic in Pressburg. Records are incomplete up to the 2nd half of the 19th century. Records of infectious diseases generally are fair from 1856 to 1906. Diphtheria records are nearly complete from 1881 to date, and these are given as tables and in graphs. Epidemic waves appear at regular intervals, with high peaks in recent yrs. at 14-yr. intervals, and lower peaks at intervening 7-yr. periods. The 2 high peaks of 1914 and 1928 followed measles epidemics (last in 1925), which in turn followed epidemics of scarlatina (last in 1924). Each of these epidemics started in the northeastern corner of the city and spread towards the southwest in the direction of prevailing air currents and traffic. In the northeastern area there is much crowding, and a similar area around the barracks served as a secondary focus. The monthly incidence curves show a peak in November, and low points in May-July, with rapid rise and comparatively slow decline. In epidemic yrs., diphtheria rise begins in July-August, and is ended by June. The study shows the importance of the preschool age group as starters of epidemics which spread through school groups. The highest grade of immunity, with highest incidence of healthy carriers, occurs in the lowest social grade; a lower immunity, in the well-to-do city dwellers; and lowest, in the country dwellers. These factors are discussed at length, as is the effect of individual susceptibility and associated infections. Family infections are rare in Pressburg, but 2.56% of families with 2 or more

children had 2nd cases in the last epidemic. Climatic conditions are also considered.—*H. F. Smyth.*

13710. **CLARK, H. W., and GEORGE O. ADAMS. Sludge digestion and pH control.** *Industr. and Engineer. Chem.* 21(3): 258-260. 1929.—When sludge from the sewage of different municipalities is digested under identical conditions, the pH for optimum digestion of each sludge may vary, due to differences in chemical composition. Raising the pH by addition of $CaCO_3$ accelerates digestion in certain instances; but the sludge of other municipalities has an available alkalinity that makes such addition unnecessary and there is practically always a slow accumulation of lime in the sludge, for organic materials are destroyed by bacterial digestion but the lime remains. Organic acids resulting from decomposition of sludge may, while causing low pH, be beneficial to digestion.—*Authors' summary.*

13711. **COLLINS, SELWYN D. Age and sex incidence of influenza and pneumonia morbidity and mortality in the epidemic of 1928-29 with comparative data for the epidemic of 1918-19. Based on surveys of families in certain localities in the United States following the epidemics.** *U. S. [A.] Treas. Dept. Publ. Health Repts.* 46(33): 1909-1937. 1931.—This study summarizes the age and sex variation in influenza and pneumonia morbidity and mortality during the 1928-1929 and the 1918-1919 epidemics. It is based on canvasses, following each epidemic, of families including nearly 150,000 persons in about 12 localities in the U. S. A. While there are some similarities in the 1928-1929 and 1918-1919 age curves, the differences are more striking than the similarities. The young adult peak in pneumonia incidence and in mortality in 1918-1919 was absent in 1928-1929. Pneumonia incidence and death rate were both much higher in 1918-1919 than in 1928-1929 but the % of fatal pneumonia cases were not greatly different in the 2 epidemics. There was a very large difference in the % of cases complicated by pneumonia in the 2 epidemics; but once pneumonia existed, the chance of fatal outcome was nearly the same in both yrs. Statistical data of this kind give no clue as to the reason for the striking difference in age incidence in the 2 epidemics, and any attempt at explanation would be only conjecture.—*S. D. Collins.*

13712. **ELDER, A. L., and A. M. BUSWELL. Changes of sulfur compounds during sewage treatment.** *Industr. and Engineer. Chem.* 21(6): 560-562. 1929.—Human excreta account for but a small % of the S found in sewage. Reduction of the S during sewage purification is small. Absence of obnoxious odors during treatment of sewage in nidus tanks was noted. Anaerobic sludge digestion produces disagreeable odors unless the pH is kept above 7.0. Reduction of sulphates in raw sewage is very rapid at 37°, fairly rapid at 22°, and slow at 10° C. The biochemical O demand of several S compounds was determined, and methods for determining various forms of S were adapted for use in sewage investigations.—*Courtesy Ind. and Eng. Chem.*

13713. **GREENWOOD, M., W. W. C. TOPLEY, and J. WILSON. Contributions to the experimental study of epidemiology. Further observations on the effect of vaccination on herd mortality.** *Jour. Hyg.* 31(4): 484-492. 1931.—An experiment to study the course of herd mortality in immunized as compared with non-immunized mice in an infected herd (over 1000 mice) showed a difference in favor of the immunized, of about 50%; but even when all immigrants had been previously immunized, the rate of mortality was high and quite different from that of an uninfected herd. Another experiment (over 800 mice) showed that oral inoculation confers immunity to *B. aertrycke* infection in less degree than that given by intraperitoneal inoculation, but superior to normal.

13714. **GÜNDEL, M., und H. LINDEN. Experimentelle und epidemiologische Studien zum Influenzaproblem.** *Arch. Hyg. u. Bakt.* 105(3): 133-167. 1931.—In investigations of the pneumonia problem the authors carried out systematic studies of the pathological significance of influenza bacilli as well as of the epidemiology of diseases produced by them. Influenza bacilli have, previously, been found only infrequently in colds, grippe or bronchopneumonias; doubt has therefore often been cast on their pathologic significance. It was found possible to materially increase the positive findings by aid of culture methods and inoculation of white mice, as described. Influenza bacilli have been found in several thousand examinations on several hundred healthy and sick individuals, and in nearly 400 autopsied lungs. From these and other examinations the following conclusions may be derived: Influenza bacilli are frequent in acute disease of the respiratory passages, even in epidemic-free periods, and not infrequently in pure culture. Occurrence of an angina produced by influenza bacilli can be demonstrated. Even in epidemic-free periods, influenza bacilli may be found in postmortem lungs. As the recognized pathologic-anatomic changes in the lungs of those dying from grippe differ more quantitatively than qualitatively, it is concluded that the influenza bacilli are not without etiologic significance. No evidence for their specificity may be developed by agglutination tests. They were always found in varying numbers in over 1000 examinations of school children, made at regular intervals during 1 yr. In November, 1929, a marked increase of influenza bacilli in school children was recognized. A difference in influenza frequency was observed between older and younger children, as the former were sooner rid of the bacilli. A migration of influenza bacilli in children in school classes was recognized. Observations indicate that the relatively immune older classes of school children may constitute an influenza reservoir. Healthy adults show a similar behavior to older scholars, only more pronounced. Either the influenza bacilli disappear quickly or there develops (rarely) a carrier state. In invalids, on the contrary, there develops a longer retention of influenza bacilli. Thus is to be explained the frequent finding of influenza bacilli in chronic diseases of the respiratory passages. Living saprophytically on the mucous membrane they may, with lowered resistance, become pathogenic. Increase in virulence of influenza bacilli is responsible for the occurrence of house infections, epidemics and pandemics; mixed infections play only a secondary part in the pathogenesis of influenza. Pfeiffer's bacillus is the cause of influenza.—*M. Gündel (transl. by H. F. Smyth).*

13715. **HILL, H. W. "Insusceptible strains" in the epidemiology of human tuberculosis.** *Amer. Rev. Tuberc.* 24(3): 340-345. 1931.—The author contrasts tuberculosis, which infects practically the whole population but produces disease in comparatively few, with measles, likewise a practically universal infection, which produces disease in at least 95% of those infected. If measles killed all susceptibles, the insusceptible survivors alone would reproduce the race. The non-fatality of measles causes its perpetuation. The author's hypothesis is that the comparatively high mortality from tuberculosis tends to weed out susceptibles and to produce insusceptible human strains, thus temporarily limiting the spread of the disease, which then flares up again as susceptible strains increase.

13716. **HOEK, HEINZ. Ein einfacher Apparat, um vereinzelte Colikeime im Wasser schnell festzustellen.** *Zeitschr. Hyg. u. Infektionskr.* 112(4): 715-718. 2 fig. 1931.—A filter plate of Berkefeld filter material was covered with infusorial earth, the solution containing microorganisms filtered with or without suction and the bacteria cultivated on Endo plates; about 67% of the known content was recovered.

13717. **HOLWERDA, KORNELIS. Over de contrôle en de mate van betrouwbaarheid van het chloreerings-proces voor drinkwater, speciaal voor de tropen. [Control and degree of reliability of the chlorinating process of purifying drinking water, especially in the tropics.]** (Thesis: Technische Hoogeschool te Delft) 186 p. Zuid-Hollandsche Boek- en Handelsdrukkerij: 's-Gravenhage, 1929.—The principle and importance of chemical control

of the chlorination process is discussed. Chemical disinfection processes in general progress according to a monomolecular reaction. A possible physico-chemical interpretation is given. The most important factors in experiments on chlorination of drinking water are discussed, and attention is paid to the inadequacy of the conception of the usual term "active Cl." Some new methods to distinguish the best concentration of "active Cl" in drinking water, are given, especially a quantitative method with methyl-orange to distinguish hypochlorite-Cl from other forms. It is demonstrated that the disinfecting power of hypochlorite is very much greater than that of most other Cl compounds, which are not indicated by methyl-orange but may be indicated by iodine, benzidine or ortho-toluidine. The influence of pH on disinfecting power of hypochlorite is demonstrated; a good correlation is found between disinfecting power and ratio between HOCl- and OCl-ions, which depends on the pH of the water. A comparison is made between disinfection with hypochlorite and Cl gas; here also the pH of the water is the predominant factor. The influence of temp. on disinfection by Cl proved to be of the same order as on a chemical reaction. The influence of the same factors was demonstrated in experiments on disinfection with NH_2Cl; its disinfecting power proved to be very much smaller than that of HOCl; in special cases, however, a smaller dosage of NH_2Cl may suffice in practice. Indications for testing the reliability of disinfection with Cl or chloramine are given, especially for the tropics. The influence of NH_3 in drinking water is discussed, and it is demonstrated that the best concentration of "active Cl" may be in the form of HOCl or in the form of other Cl compounds, especially as NH_2Cl. Also $NHCl_2$ and NCl_3 can be formed, which proved to have also a greater disinfecting power than NH_2Cl. The result of the disinfection can be determined in the same way with methyl-orange and ortho-toluidine. The influence of other eventually disturbing substances in drinking water on the chemical control of the chlorination process in the tropics was determined or discussed.—*K. Holwerda.*

13718. HOPKINS, EDWARD S. Latest practice in control of tastes and odors. *Proc. Ann. Conf. Maryland-Delaware Water and Sewerage Assoc.* 5: 87-93. 1931.—From his experimental work and a review of the literature, the author concludes that certain tastes can only be modified or partially prevented by pre-ammoniation. Intermittent change of the Cl: NH_3 ratio for given periods was practiced. No appreciable reduction in odor or elimination of algal growth in clear water reservoirs was noted, even with a 4:1 ratio. It was decided to maintain the original ratio of chlor-amines, as only taste elimination in cold water was accomplished by any given dosage. In planning for future use of this treatment, a reduction in contact period between the NH_3 and Cl is contemplated. This will, it is believed, make possible a reduction in quantity of chemicals used and permit use of a 4:1 ratio without excessive equivalent Cl residual in the water supplied to the city. A residual Cl equivalent above 0.10 p.p.m. is unnecessary for sterilization. The possible efficiency of this treatment may depend on a 4:1 ratio, as indicated by the chemical equations; review of the published data shows that it is being used more or less successfully in other proportions.—*Author's conclusions.*

13720. KING, W. W. Venereal disease among coast guard enlisted personnel during the fiscal year 1929. *U. S.* [*A.*] *Treas. Dept. Publ. Health Repts.* 45 (49): 2979-2993. 1930.—In 1927, in planning greater efforts against venereal diseases, the lack of knowledge of existing conditions among Coast Guard enlisted personnel was found to be a serious handicap. Annual recording of cases and tabulation of data were therefore undertaken. Data for 1927, 1928 and 1929 show a progressive reduction in total number and in number of new cases. The rate per 1000 for all cases fell from 105.64 to 82.12; for new cases, from 98.77 to 70.98. The number of men affected fell from 10.1% to 7.7%. Gonorrhea showed greatest reduction in incidence. That of syphilis remained practically stationary; chancroid showed marked variation. Hospital patients fell from 714 to 581 in number, but the number of days in hospital increased from 18,506 to 22,150; the average number of days per patient increased from 25.92 to 38.12. About 66% of the cases were hospitalized. A very high % of the cases occurred during the 1st yr. of enlistment. Southern ports as a rule showed higher incidence than northern ports. An important fact noted was the high % of cases among food handlers, cooks and mess attendants.—*W. W. King.*

13721. KLARMANN, EMIL, LOUIS W. GATYAS, and VLADIMIR A. SHTERNOV. Bactericidal properties of monoethers of dihydric phenols. I. The monoethers of resorcinol. *Jour. Amer. Chem. Soc.* 53 (9): 3397-3407. 1931.—The ethers, normal saturated aliphatic up to the nonyl ether, some secondary and cycloaliphatic and a few aromatic, were prepared. *Staphylococcus aureus* and *Bacillus typhosus* were used in the experiments. Results are presented both in minimum germicidal dilutions and in phenol coefficients. There is a distinct relation between bactericidal effect and chemical constitution, as well as a difference in behavior toward the 2 bacteria used. While resorcinol alone has a very low germicidal effect, the ethers have phenol coefficients of 1.2-650 for *Staph. aureus.* The efficacy increases with molecular wt. of saturated normal chain for *Staph. aureus* up to the nonyl ether, while a maximum is reached for *B. typhosus* with the n-hexyl compound; iso-compounds are less effective than corresponding normal chain ethers. Aromatic and alphylaromatic ethers have lower coefficients than aliphatic ethers with C_6 and above. The phenyl ether is more effective than the benzyl derivative, but in the alphylaromatic series the germicidal effect increases with length of side chain (compounds only up to phenyl propyl examined). While the bactericidal effects of the first 5 members (up to amyl) are approximately equal for *B. typhosus* and *Staph. aureus,* there is a sudden increase from 36 to 330, 580 and 650, respectively, for *Staph. aureus,* while *B. typhosus* shows a relatively moderate increase (from 38 to 46) for the hexyl ether, with a subsequent rapid decrease. A comparison with results obtained by others on nucleus substituted resorcinol derivatives shows that there is a distinct similarity between the 2 series of compounds. It is concluded that an alkyl group has approximately the same effect on bactericidal effects of resorcinol whether it is introduced into the nucleus or attached to one of the OH groups, and that one open OH group is sufficient to bring about the bactericidal effect.—*E. Klarmann.*

13722. [KONOVALOVA, S. F.] КОНОВАЛОВА, С. Ф. Блохи-обитатели сусликого гнезда как носители и хранители чумной инфекции. **[Fleas inhabiting gopher burrows as plague carriers.]** Вестник Микробиологии и Эпидемиологии (*Rev. Microbiol. et Épidémiol.*) 6 (1): 39-40. English summary, 128. 1927.—Near the village of Zavetnoe 2.5% of the gophers were infected with plague. Of 17 burrows examined, in 1 were found 17 *Neopsylla setosa* and 26 *Ceratophyllus tesquorum;* emulsion of these fleas was injected into a healthy gopher, which died in 7 days; and sown on agar on which typical plague colonies developed 24 hrs. later.

13723. LLOYD, BLODWEN. Bacteria of the Clyde Sea area: A quantitative investigation. *Jour. Marine Biol. Assoc. Unit. Kingdom* 16 (3): 879-907. 2 fig. 1930.—Water samples were taken for 1 yr.,—monthly at 3 stations, less frequently at other places. The surface waters had the highest bacterial content. With increased depth until near the bottom, there was a progressive decrease. At the bottom there was usually a slight increase. Throughout the yr. the numbers were remarkably constant for all layers except the surface, with only slight evidence of rhythmic seasonal variation. At the surface,

the bacterial content fluctuated widely, apparently in relation to factors which are not seasonal but irregular. At the surface the bacterial content is irregular throughout the day; at lower levels, there is a slight increase during hrs. of darkness, the maximum occurring in the evening hrs. in Dec., and at 3-6 a. m. in March, July and Oct. The waters of Lochs Striven and Long were remarkably free from pollution. In Cumbrae Deep, however, and in the estuary off Greenlock, the numbers of bacteria were high and a large proportion were presumptive coliform organisms.—*Author's summary.*

13724. **MAZZETTI, GIUSEPPE. Sul potere battericida dell'olio di lino cotto. Nota I. [Bactericidal power of boiled linseed oil.]** *Boll. Soc. Italiana Biol. Sper.* 3(6): 747-749. 1928; also in *Ann. Igiene* 37(10): (3-9). 1927.—Following the observations of Jacobitz and Bitter, the author found that bricks treated with commercial boiled linseed oil have a strong bactericidal action (due entirely to the oil and only in the commercial product) on *B. typhosus, Staphylococcus aureus,* anthrax spores, *B. diphthcriae* and tubercle bacilli. Pure linseed oil extracted in the laboratory by the Soxhlet apparatus acquires bactericidal power only when heated to a high temp. for a long time.—*G. Mazzetti (transl. by P. Hillkowitz).*

13725. **MAZZETTI, GIUSEPPE. Ulteriori osservazioni sul potere battericida dell'olio di lino cotto e di altri olii vegetali. Nota III. [Further observations on the bactericidal power of boiled linseed oil and other vegetable oils.]** *Boll. Soc. Italiana Biol. Sper.* 3(6): 754-758. 1928.—Continuing his previous experiments, the author found that bricks treated with commercial boiled linseed oil, although losing in time their bactericidal power, nevertheless still showed it after a rather long period (10 mo.). It is impossible with present technique to utilize the bactericidal power of boiled linseed oil for disinfection of anthrax-bearing hides. Other vegetable oils, non-desiccated (castor oil, olive oil, soy bean oil, etc.), acquire, after being heated to 280°, bactericidal power, which normally can not be demonstrated. Heating of crude commercial linseed oil increased the weak bactericidal power which it has normally. The author thinks that his experiments further explain why heated olive oil, at a high temp., is the best means of sterilization and conservation of foods.—*G. Mazzetti (transl. by P. Hillkowitz).*

13726. **ORTIZ, PEDRO N. Underlying principles of public health administration.** *Porto Rico Jour. Publ. Health & Trop. Med.* 5(4): 433-437. 1930.

13727. **ROUBAUD, E. Prédominance de Synosternus pallidus Taschenb. (Xenopsylla pallida) comme puce domestique, dans certaines régions pesteuses du Sénégal.** *Bull. Soc. Path. Exotique* 24(7): 551-554. 3 fig. 1931.—The predominance of *Synosternus pallidus* Taschenb. (*Xenopsylla pallida*) as a domestic flea in certain plague-infested regions of Senegal suggests the probability that it acts as a vector. Differential characters distinguishing *S. pallidus* from *X. cheopis* are given.

13728. **RUDOLFS, WILLEM. Chemical and biological correlations in a polluted stream.** *Industr. and Engineer. Chem.* 21(3): 256-258. 1929.—The water of the Raritan River system in New Jersey is in its natural condition admirable for potable and industrial purposes. The lower section of the river is heavily polluted. The studies conducted show an apparent direct relation between amounts of ammonia present and biochemical O demand of the river water. O depletion was far greater in summer than in winter. The effect of 2 small dams on the self-purification of the river is considerable. There was a direct relation between biochemical O demand, bacteria and plankton. The highest number of *B. coli* recorded was 11,000 per cc.—found opposite a bathing beach. During the summer mo. the average number of *B. coli* at this point was 3240 per cc. The relation between rainfall and O saturation is discussed.—*Author's summary.*

13729. **RUDOLFS, WILLEM, and H. HEUKELEKIAN. Thermophilic digestion of sewage solids. IV. Fresh solids and activated sludge.** *Industr. and Engineer. Chem.* 23 (1): 67-69. 1931.—Daily additions of sewage solids, both fresh and activated, have been digested at thermophilic temp. (50° C.) in as short a time as 2.1 days. This digestion time can probably be reduced to 24 hrs., since 92.2% of the total gas produced by activated sludge was obtained in 24 hrs. or less, and 88.5% of the gas evolved from the fresh solids in this time. The sludge produced was black, had no odor other than the tarry odor of ripe sludge, and had a biochemical O demand corresponding to ripe sludge. Gentle shaking, to bring the raw solids into contact with the seed material, proved beneficial. For best results, charging of raw material into tanks should be continuous. Preheating of the sludge is probably best, and the ripe sludge can be dewatered continuously.—*Courtesy Ind. and Eng. Chem.*

13730. **SMILLIE, W. G. Field studies of acute respiratory disease.** *Porto Rico Jour. Publ. Health and Trop. Med.* 5(1): 3-7. 1929.

13731. **THIRY, URBAIN. Nouvelles recherches sur les Leptospires aquicoles.** *Arch. Internat. Méd. Exp.* 6(4): 471-546. 23 fig. 1931.—Typical leptospiras were obtained from 69 of 124 samples of water (mostly alkaline) from various parts of Belgium. Among 324 mice from Antwerp, Ghent, Louvain and Germany, 74 showed leptospiras in the urine, attributed by the author to contamination of the conduit water. One strain proved temporarily pathogenic for white mice. A definite lysis (not agglutination) proved it to possess a close specificity, and proved *Leptospira icterohaemorrhagiae* to be distinct from all other leptospiras, either from water or from mice.

13732. **WAAL, J. W. de. Atypische colibacterien en drinkwateronderzoek. [Atypical Bacillus coli in drinking water.]** *Nederlandsch Tijdschr. Hyg., Microbiol. en Serol.* 6(1): 1-18. 1931.—Following up investigations by Clemesha and Eijkman, Smit determines the age of pollution of water by feces from the different quantities of water by which lactose at 37° and glucose at 45° C., respectively, can be made to ferment. In recent pollutions, these quantities are alleged to be equal; in older pollutions, the quantity of water necessary for the 2nd fermentation is alleged to be greater than for the 1st. Smit assumes that colon bacilli in water polluted by feces lose their power to ferment glucose at 45° C. sooner than for lactose at 37°. This assumption is incorrect; the writer found in river water, colon bacilli that could ferment glucose at 45° but not lactose at 37°. The age of a pollution by feces can not be determined in the manner prescribed by Smit. The writer suggests replacing glucose by lactose in the Eijkman-test, since fermentation of lactose at 45° is more characteristic for colon bacilli than that of glucose at the same temp.—*J. W. de Waal.*

13733. **WELDERT, R., und G. JORDAN. Vom sauren zum alkalischen Faulraum.** *Kleine Mitteil. Mitglieder Ver. Wasser-, Boden- u. Lufthyg.* 7(1/4): 34-43. 1931.—Change of the Nordhausen putrefaction chambers from acid to alkaline fermentation was accomplished. In acid fermentation it is possible to arrive at a normal alkaline condition of the sludge, so long as this depends on organic ferments, if the amount of the daily additions does not exceed 10%. The desired conditions are further insured by heating the septic tank. An emptying of the tank in such cases will hardly have been completed. The interior structure of the heating contrivance brings a preservation and improvement of the alkaline fermentation, increased yield of gas and greater reduction in the volume of the sewage; thus, it is possible to assist considerably in maintaining the desired conditions.—*Authors' summary (transl. by W. G. Sackett).*

Chem.* 21(11): 1039-1042. 1929.—Commercial mill sawdust (fir, spruce, and pine) was hydrolyzed with dilute H_2SO_4 and the resulting sugar liquors were fermented with a lactic acid organism which ferments both pentoses and hexoses. Malt sprouts (5%) as a source of N and excess $CaCO_3$ as a neutralizing agent must be added to the sugar liquor for satisfactory fermentation. 7-10% concentration of sugar may be fermented in 5-7 days with a destruction of 82-88% of the total sugars. A yield of acid equivalent to 95-100% of the sugar destroyed is obtained. This acid consists of 90-95% lactic and 5-10% acetic acids. Sugar obtained by the Bergius process fermented equally as well as the sugar liquor obtained by the H_2SO_4 process, and gave approximately the same yield of products.—*Courtesy Industr. & Engineer. Chem.*

Forhandl.* 3(paper 21): 82-85. 1930 (1931).—Examination of gas generated in samples of meat and fish in tins 30-66 yrs. old showed that H was generated by chemical action. In cans with a thick coat of pure tin and with no soldering seams or bare iron spots, tin may begin to dissolve during the first months, and in proportion to the O of the air in the can, with consequent H generation. Afterwards, as the O is consumed as "depolariser," H generation takes place, but the rapidity of this H generation in cans with neutral and sterile content is so small that it can not be detected for decenniums, if the cans are kept at room temp. However, if the contents are of bad quality, high H-ion concentration or non-sterile, local corrosion of the tin coat takes place and bare Fe spots (and consequently H generation) will be found after 1-2 yrs.—*F. A. Rotondaro.*

13741. **THAYSEN, A. C., and L. D. GALLOWAY. The microbiology of starch and sugars.** viii+336p. Oxford University Press: London, 1930. Price $8.50.—This is a companion volume to "The microbiology of cellulose, hemicellulose, pectin and gums," by A. C. Thaysen and H. J. Bunker (1927). The 2 volumes endeavor to review the microbiology of the carbohydrates. This volume presents in Pt. I a review of the chemical constitution of starch, glycogen, inulin, di-, tri- and tetrasaccharides, and glucosides, and of the action of microorganisms on them or on their decomposition products. In Pt. II the fermentation of the pentose and hexose sugars is discussed, including the action of yeasts and of other fungi, as well as of aerobic and anaerobic bacteria. Pt. III is devoted to the synthetic activities of microorganisms; Pt. IV, to the microbiology of cereals and cereal products, including grain and its milled products, starch, bread, and the bread-baking process; and Pt. V deals with transformations brought about in sugar cane, sugar beet, in raw sugar juices and in sugar-house products, during and following manufacturing operations. Each of the 23 chapters is followed by a list of literature citations, 912 in all, which include most of the essential and important references in the field. The world literature, including the American, is reviewed. The authors have synthesized this mass of literature drawn from the fields of biology, organic chemistry, and industrial technology into an organized whole.—*R. A. Gortner.*

Cornell Univ.* 1928/1929: 126-134. 1930.—The electrical conductivity method of treating milk effectively destroyed tubercle bacilli with which milk had been artificially inoculated.—*Author's summary.*

13744. **DAHLBERG, A. C.** Cooling as a factor in sanitary milk production. *Agric. Engineering* 11(12): 409-412. 1 fig. 1930.—The essentials shown by the study are: The cooling tank should be large enough so that when filled with milk cans there will be twice as much ice and water as milk. Insulation with 3 in. of cork, or its equivalent, protected against wetness, saved more than its cost, in refrigeration in 1 summer. Milk can be satisfactorily cooled by placing it immediately in water at 40°, if the tank is of ample size, well insulated, and a large enough source of refrigeration is available. Stirring or surface cooling is unnecessary. For milk of bad flavor, e.g., absorbed feed flavor, aeration may be desirable. Ice has not been given a real opportunity as a refrigerant on dairy farms because of lack of insulation in cooling tanks; it will maintain temp. below 40° in insulated tanks of ample capacity. Electrical cooling of milk appears to be practical.—*From author's conclusions.*

13745. **GRIMES, M., and A. J. HENNERTY.** A study of bacteria belonging to the sub-genus Aerobacter. *Sci. Proc. Roy. Dublin Soc.* 20(8/12): 89-97. 1931.—Cultures of butter yielded several organisms which ferment litmus milk and lactose broth at 21° but not at 37° C. Of these, *Aerobacter* hibernicum (p. 92) and *A.* liquefaciens (p. 93) are described.

13746. **HANSEN, POUL ARNE.** Thermophilic bacteria in milk pasteurized by the holding method. *Internat. Dairy Congr. Eng. Ed.* 1931(Sect. 2): 10-19. 1931.—Pin point colonies may be produced by thermophilic bacteria on plates from pasteurized milk. A bacteriological study of a milk plant by Breed smears or by plating samples of milk on sugar agar, usually reveals the source of these organisms. Thermophilic bacteria can be controlled by correct plant practices and by avoiding longer than necessary heating of the milk. Continued growth of thermophilic bacteria in milk may produce acid or proteolysis; feeding experiments with rabbits and guinea pigs indicate that they are harmless saprophytes, and their occasional appearance in milk pasteurized by the holding process is not a valid argument against the holding method.—*P. A. Hansen.*

13747. **HARDING, H. A.** Report of committee on milk plant practice. *Ann. Rept. Internat. Assoc. Dairy & Milk Inspect.* 19: 94-99. 1930.—Includes brief reference to developments during the yr., in milk plant practice. Subdivisions of the report deal with thermophilic bacteria and with metals and flavors in pasteurized milk, protection of pasteurized milk from contamination, and milk-bottle washing machines.—*H. A. Harding.*

13748. **HERGESELL, WERNER.** Vergleichende Untersuchungen über die in der Milch vorkommenden Streptokokken einschliesslich des Streptococcus epidemicus (Davis). *Arch. Wiss. u. Prakt. Tierheilk.* 63(6): 543-560. 1931.—*Strep. lacticus* is easily distinguished by bleaching of litmus and methylene blue milk, by reduction of Janus green and ammonium molybdate, and by growth at 10°. *Strep. agalactiae* reddens litmus milk under coagulation; does not reduce methylene blue milk, Janus green, or ammonium molybdate; does not grow at 10°; and is α, α_1 or γ-hemolytic in the sense of Brown. The hemolytic streptococci of human and animal origin (*Strep. pyogenes haemolyticus*) are nearest to *Strep. agalactiae*, but are distinguishable through their small acid forming capacity, hemolytic power, and capacity to destroy hemoglobin. *Strep. epidemicus* can not be distinguished by bacteriological methods from *Strep. pyogenes haemolyticus hominis.* Also, the hemolytic streptococci of Diernhofer and Seelemann, which cause a mastitis not distinguishable from "Gelber Galt," agree in biological characters with *Strep. pyogenes haemolyticus.* This entitles them to be classified with *Strep. epidemicus.* There are 2 forms of *Streptococcus* udder inflammations in cattle; the *agalactiae*-streptococcus-mastitis, and the more dangerous *epidemicus*-steptococcus-mastitis.—*Author's summary (transl.).*

13749. **KLINE, EDMUND K.** The colon group of bacteria in milk. *Ann. Rept. Internat. Assoc. Dairy & Milk Inspect.* 19: 68-85. 1930.—Primary isolation and enumeration on Endo plates followed by differential tests and sugar fermentations showed that colon-aerogenes bacteria of milk correspond exactly to types isolated from bovine feces and from hay and grain cultures. Excluding atypical and intermediate cultures, about $\frac{1}{3}$ of the milk strains correspond to bovine fecal, and about $\frac{1}{2}$ to hay and grain, strains. Endo-plate counts in low-count raw milk (under 50,000 total count) show no correlation with total agar-plate counts, but are correlated to the sanitary requirements met by the dairy. They detect unclean milk held to low counts through proper cooling or other measures, and can be used as an index of cleanliness and care in control of dairy farms producing better grades of milk.—*E. K. Kline.*

13752. **ALLAM, FATHALLA. Vom Energieverbrauch der Knöllchenbakterien bei der Bindung des Luftstickstoffes.** *Zeitschr. Pflanzenernähr. Düng. u. Bodenk., A. Wiss. Teil* 20(5/6): 270-301. 1931.—One series of pot cultures of soybeans was inoculated with soybean nodule organism. A sterile series was treated with varying amounts of NH_4NO_3. A portion of each received a limited amount of normal sunlight. The data taken included green wt., dry wt., ash wt., total N, leaf surface area, and chlorophyll content. Results were taken to indicate that the energy consumed by nodule bacteria may be fairly large under certain conditions. It was calculated in 2 experiments, that for fixation of 1 gm. of N. the bacteria required 104 and 50.4 calories, respectively. The partial removal of light resulted in a decrease in total dry wt. in both sterile and inoculated series; this was especially pronounced in the inoculated series. The % of total N was higher in the series receiving only a part of the sunlight but more grams of total N were produced in the series receiving normal sunlight. The author concluded that partial removal of light had a disturbing influence on symbiosis between nodule bacteria and host.—*T. C. Peele.*

13753. **JACOBS, STANLEY EDWARD. The influence of antiseptics on the bacterial and protozoan population of greenhouse soils. Part I. Naphthalene.** *Ann. Appl. Biol.* 18(1): 98-136. 1931.—Greenhouse soils were treated with naphthalene at the rate of 0.1 gm.-molecule per kgm. of air-dry soil. There was an immediate and rapid increase in bacterial numbers, at once followed by a sharp decline. Subsequently, the fall in numbers became more gradual, occurring in steps at irregular intervals. The initial rise corresponded with the rapid disappearance of naphthalene from the soil, and the sharp decrease occurred soon after the major portion had gone. By adding successive quantities of naphthalene, the bacterial numbers were maintained at a high level for considerable periods. Bacteria capable of making good growth with naphthalene as their sole source of C were readily isolated from these treated soils. All this evidence indicates that at least part of the increased bacterial population was composed of naphthalene-decomposing bacteria. By making parallel counts on Thornton's agar and on a medium containing naphthalene as sole source of C, it was shown that only a portion of the increased bacterial population was due to naphthalene-decomposing bacteria. This was borne out by showing that the level reached by the bacterial population was not raised by increasing the amount of naphthalene. Presence or absence of an initial lag in naphthalene decomposition depended on temp. of incubation of treated soil. Development of protozoa was suppressed until the bulk of the naphthalene had disappeared. At this stage there was a sudden increase in numbers of active amoebae and flagellates, followed by a decrease. Thereafter, there were bursts of activity at irregular intervals, those of the amoebae coinciding with decreases in bacterial numbers. In a soil abnormally rich in organic matter, an initial decrease in ammoniacal N was followed by an increase after the naphthalene had all disappeared. This increase was prevented by adding successive amounts of naphthalene. One of the strains of naphthalene-decomposing bacteria was capable of growth in a medium containing phthalate as sole source of C, and traces of phthalic acid were found in a culture on the naphthalene medium.—*S. E. Jacobs.*

13754. **NORMAN, A. GEOFFREY. The biological decomposition of plant materials. Part IV. The biochemical activities on straws of some cellulose-decomposing fungi.** *Ann. Appl. Biol.* 18(2): 244-259. 1931.—A number of common soil fungi [*Trichoderma* sp., *Phoma* sp., *Aspergillus flavipes, A. fumigatus, A. nidulans, A. niger, A. terreus, A. versicolor. Actinomyces* sp.] isolated from rotting straw were inoculated into sterile straw, with addition of available N. Amount of decomposition effected, losses of various straw constituents, and immobilization of N which took place, were all determined, and compared with mixed flora decompositions at various temp. Though none of the organisms develop appreciably on a cellulose-agar plate, all decomposed cellulose to a considerable extent. Certain minor differences in ability to utilize carbohydrate constituents were noted, but in general all substances but lignin were attacked to a degree relatively proportional to the apparent total loss of organic matter. The "N factor" or N immobilized by 100 gm. straw rotting with a particular organism, was determined in each case. There is no correlation between "N factor" and loss of organic matter or of any particular straw constituent; differences appear to be varietal. Some indication of the relative efficiencies of the organisms was obtained from a factor for which the name "N equivalent" is proposed. This represents the N immobilized as microbial protein in the course of removal of 100 gm. organic matter from any given plant material. Attention is drawn to difficulties which restrict the absolute value of the "N equivalent" as a measure of efficiency in decomposition. The value of single factor studies as a preliminary to the synthetic method of investigation of such a process as biological decomposition, is discussed.—*Author's summary.*

13755. **SMITH, F. B., and P. E. BROWN. The effect of manures and crop residues on nitrogen changes and microorganisms in the soil.** *Iowa State Coll. Jour. Sci.* 5(3): 155-166. 1931.—The purpose was to correlate the nitrate-assimilating power of soils variously treated with manures and crop residues and the types of organisms developing in greater numbers with the treatments, with the nitrifying power of the soil and the accumulation of nitrates. Dry virgin Carrington loam was treated with 1% dry wt. of various artificial farm manures, ordinary farmyard manure and certain residues, such as oat straw, corn stalks, and sweet clover tops and roots, in 4-gal.-pots in the greenhouse. Materials were finely ground and thoroughly mixed with the soil. The soil moisture content was adjusted to approximately 50% of saturation and maintained by frequent additions of distilled water. Samples for analysis were taken of each soil after 1, 4, 9 and 13 wks. The nitrate content of the soils, their nitrate-assimilating and nitrifying powers, and the number and genera of molds were determined at each sampling. Results showed that nitrate accumulation in the soil is prevented both by a depression in nitrate production and by a stimulation in nitrate assimilation when various organic materials are applied to the soil. Sweet clover tops and roots stimulated the nitrate-assimilating power of the soil to a greater extent than did straw and corn stalks, yet more nitrates accumulated in the soils treated with these residues than in the soils treated with straw and corn stalks. Undoubtedly this, in part, is caused by the higher N content of the leguminous residues and to their more rapid nitrification. It is also due, however, to stimulation in development of large numbers of *Mucor* and *Rhizopus* soon after treatment. These organisms do not decompose cellulose or assimilate nitrates, but are large producers of ammonia, thus increasing nitrate production and accumulation. Straw and corn stalks, rich in cellulose and pentosans, stimulated development of *Aspergillus, Trichoderma, Alternaria* and other cellulose-decomposers. These organisms are also heavy feeders on ammonia and nitrates, thus depressing nitrate production, stimulating nitrate assimilation and preventing accumu-

lation in the soil. These results would also seem to indicate the occurrence of a nitrate-assimilating flora in the soil, and that the cellulose-decomposers may be the principal nitrate-consumers.—*F. B. Smith.*

13756. **TETRAULT, P. A. The decomposition of cellulose in nature.** *Proc. Indiana Acad. Sci.* 39: 137-151. 1929 (1930).—A review of the literature of cellulose decomposition. The point is made that the breaking down of cellulose in nature is apparently a function of the lower forms of life, protozoa, fungi and bacteria being most active in this respect. The more highly developed organisms, when cellulose is used for food, seem to be dependent on some bacteria or protozoa for the digestion of this material.—*P. A. Tetrault.*

13757. **WAKSMAN, SELMAN A. Decomposition of the various chemical constituents, etc., of complex plant materials by pure cultures of fungi and bacteria.** *Arch. Mikrobiol.* 2(1): 136-154. 2 fig. 1931.—In the decomposition of plant residues by microorganisms, it was found that different organisms attack different chemical constituents. Some prefer water-soluble substances, hemi-celluloses and nitrogenous complexes; others attack cellulose; and a few are capable of decomposing lignin. Decomposition is accompanied by synthetic processes, new complexes being built up side by side with those that are being decomposed. Loss in weight as a result of decomposition is usually not a true index of the amount of decomposition that has taken place. Only an analysis of the various organic constituents will help to visualize the nature of the changes produced in decomposition of plant material by microorganisms.—*S. A. Waksman.*

I.]** [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 21(1): 79-102. 2 pl. 1929.—A review of the work on testing for available phosphate by means of *Azotobacter.*

13759. **ZIEMIĘCKA, J. Znaczenie fosforu przy asymilacji wolnego azotu. Studja nad mikrobiologja gleby. Część II. [Rôle of P in N-fixation. Soil microbiology. II.]** [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest Ann.)* 21(2): 231-246. 1 fig. 1929.—Experiments showed that there was no definite relation between amount of P_2O_5 absorbed by *Azotobacter* from easily soluble phosphates and amount of N fixed. As the quantity of P diminishes, its utilization in fixation seems to become more and more economical. In presence of 26.0 mgm. of P_2O_5 in form of KH_2PO_4, less than 1 mgm. of free N was fixed per mgm. of P_2O_5 absorbed; in presence of 10.5 mgm. of P_2O_5, 2 mgm. of N were fixed for each mgm. of P_2O_5 absorbed; and in presence of 1 mgm. of soluble P_2O_5, 7 mgm. of N were fixed. The difficultly soluble phosphates such as $Ca_3(PO_4)_2$ and also those in Thomas slag, can be used to a certain extent by *Azotobacter* in N fixation.—*From author's summary (transl.).*

13760. **ZIEMIĘCKA, J. O wpływie gelu krzemionkowego na pobieranie fosforu przez Azotobaktera. [Influence of silica-gel on assimilation of P by N fixers.]** [With French summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 22: 343-350. 1929.—Experiments here described show that colloidal Si favors growth of *Azotobacter.* Cultures on silica-gel plates with mannite and on soil molds, have shown that this organism can use PO_4 ions contained in difficultly soluble phosphates, only in presence of silica-gel. Development is not stimulated by silica-gel if the soil is well supplied with soluble P_2O_5. On the contrary, the Al-silicic acid in the clay added to the molds had no influence on absorption of insoluble phosphates by *Azotobacter.* Thus, silica-gel has a specific action in absorption of P. The gel used, saturated with bases, had a pH of 7.5-7.8. Why the gel did not have a favorable action in all the soils studied remains to be determined.—*Author's summary (transl.).*

GENERAL BACTERIOLOGY

13761. **[BEZSONOVA, A. A.] БЕЗСОНОВА, А. А. Голодный кислый агар, как дифференциальная среда для B. pestis и B. pseudotuberculosis rod. Pfeiffer'a. [Nutrient-deficient acid agar as a differential medium for B. pestis and B. pseudotuberculosis rod. Pfeiffer.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(3): 264-269; English summary, 353-354. 2 fig. 1929.—Both *Bacillus pseudotuberculosis rodentium* and *B. pestis* grow on a nutrient-deficient agar; also, they behave alike toward the reaction of the deficient agar (pH 5.9-7.0), except that not every strain of *B. pestis* grows at pH 6.4 or lower H-ion concentration; and at pH 5.9-6.1 a definite concentration of agar (2%) is required as well. Differentiation of the 2 is possible only by combining the 4 factors—nutrient-deficient agar, acid reaction, definite concentration of agar, and a small amount of inoculum. On transferring both in 1 loop of emulsion (made from 1 loop of agar culture of each in 5 cc. of sterile physiological saline) into 3% agar prepared with physiological saline at pH 5.9-6.1, the 150 strains of *B. pestis* produced no growth, while the 11 strains of *B. pseudotuberculosis rodentium* produced growth.—*G. A. Lebedeff.*

13762. **[BEZSONOVA, A. A., and G. N. LENSKAĬA.] БЕЗСОНОВА, А. А., и Г. Н. ЛЕНСКАЯ. Бульон мутящие варианты B. pestis. (Материалы по диссоциации B. pestis.) [Broth-clouding variants of B. pestis: Data on dissociation.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(3): 270-279; English summary, 354-356. 7 fig. 1929.—One of the characteristic features of the plague bacillus—its clear growth in broth—can not be considered stable. It sometimes acquires the broth-clouding property, and in some cases retains it for a long time. This mutation is considered as a dissociation. Sometimes such variants yield avirulent colonies of peculiar appearance, a fact of great practical importance in diagnosis. These variations are evidently not infrequent; during 5 mo. of observation they were found in 4 of 150 strains. The authors believe that the broth-clouding variants, producing pale, soft colonies without laced border, can be referred to the smooth (S) type. They are avirulent; thus—like the smooth colonies of *B. anthracis*—they are exceptions to the general rule that S forms are virulent.—*From authors' summary (G. A. Lebedeff).*

13763. **[BEZSONOVA, A. A.] БЕЗСОНОВА, А. А. Пептонная вода с рамнозой, как дифференциальная среда для B. pestis и B. pseudotuberculosis rod. Pfeiffer'a. (Peptonized rhamnose-containing water as a differentiating medium for B. pestis and B. pseudotuberculosis rod. Pfeiffer.)** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(4): 458-461; English summary, 486-487. 1929.—The fact that rhamnose (methyl-pentose, $C_6H_{12}O_5$) reacts differently to *B. pestis* and to *B. pseudotuberculosis rodentium* enabled the author to construct a new differential medium consisting of 1% rhamnose, 0.5% peptone, and 0.5% NaCl (pH 7.2). The medium is colored

with litmus and sterilized 3 times at 100°C. All of the 10 strains of *B. pseudotuberculosis rod.* tested, after 24 hrs. turned the blue color to bright red, due to decomposition of rhamnose and formation of acid; none of the 160 strains of *B. pestis* tested, effected this change.—*G. A. Lebedeff.*

13764. **BOGETTI, M. Expériences de disassociation bactérique sur le groupe Castellanus-Cerruti 1930.** *Soc. Internaz. Microbiol. Boll. Sez. Italiana* 3(6): 310-312. 1931.—The author studied a group of 20 dysentery strains isolated in Ceylon and designated as the genus *Castellanus* by Cerruti. Dissociation was accomplished by prolonged incubation and by action of anti-Shiga bacteriophages. Differentiation into typical "R" and "S" forms was confirmed, though no differentiation was obtained by cross agglutination tests performed with 4 different antisera.—*L. Baumgartner.*

13765. **BOYD, ELDON M., and GUILFORD B. REED. Oxidation-reduction potentials in cultures of Es. coli.** *Canadian Jour. Res.* 4(6): 605-613. 1931.—Following evidences advanced in a previous paper, that metabolic gases are concerned in production of growth-oxidation-reduction potentials observed in cultures of bacteria, experiments were arranged to test the effects of such gases in comparison with other factors. Growth and oxidation-reduction potentials were determined simultaneously in anaërobic buffered broth cultures of *Escherichia coli.* It is shown that in sugar-free broth there is a sudden fall in potential at the beginning of the logarithmic growth period. Addition of glucose to the medium induced an earlier and more precipitous fall in potential, coincident with the first evolution of gas. At the same time, evidence was found of a non-gaseous electromotively active system in these cultures.—*Authors' abstract.*

13766. **CERRUTI, CARLO G. L'azione della bile sul Bac. gallinarum.** *Ann. Igiene* 39(4): 274-284. 1929.—The author shows that *B. gallinarum* grows abundantly in broth containing a variable quantity of ox bile and in bile alone, without change in morphological characteristics. Cultures in 25% bile broth lose their virulence towards chickens but have marked vaccinating qualities. The attenuating and vaccinating action of bile on typhoid cultures is seen even when it has been added up to 25%. The organisms quickly resume their pathogenic and morphologic characters when transplanted to plain broth.—*C. G. Cerruti (transl. by P. Hillkowitz).*

13767. **CERRUTI, CARLO G. Su di nuovo metodo di differenziazione tra Pasteurelle e germi tifo-coli.** *Profilassi* 4(2): 40-43. 1931.—The author proposes culture in broth and agar, with addition of 4% NaCl. On these media *Pasteurella* does not develop, while the typhoid-colon group grows abundantly. Similar results are obtained by taking directly from infected pathologic material.—*C. G. Cerruti (transl. by P. Hillkowitz).*

13768. **COULTER, CALVIN B., and FLORENCE M. STONE. The occurrence of porphyrins in cultures of C. diphtheriae.** *Jour. Gen. Physiol.* 14(5): 583-596. 1 pl. 1931.—Toxic filtrates of *Corynebacterium diphtheriae* contain a complex porphyrin, not heretofore described, which has a characteristic absorption spectrum in the visible, of 2 bands, at 573 and 537 mm. This complex is unstable and has not been obtained as crystals; it breaks down to yield coproporphyrin and the Cu compound of coproporphyrin. The ash gives the reaction for Fe. It appears to represent a compound of coproporphyrin with both Cu and Fe. The content of a toxic filtrate in porphyrin is proportional to its content of toxin, so that the toxic principle may conceivably originate from the cytochrome of the bacilli, which yields the complex porphyrin.—*C. B. Coulter.*

13769. **CRUICKSHANK, ROBERT. Döderlein's vaginal bacillus: A contribution to the study of the lacto-bacilli.** *Jour. Hyg.* 31(3): 375-381. 1 fig. 1931.—A study of morphological and cultural characters of 60 strains indicates that the organism belongs to the lactobacillus group; 3 morphological types are recognized, all biologically similar. Primary culture of Döderlein's lactobacillus may be readily obtained on lactose blood agar incubated aerobically, provided the vaginal flora is of "Grade A" type, but its subsequent propagation on artificial media is less likely to succeed. There is no serological homogeneity among the strains, although there was some evidence of a serological relationship among the members of the commonest morphological type. The same serological type tends to persist in the vagina throughout pregnancy. Döderlein's lactobacillus and lactobacilli derived from other sources are not serologically identical.—*Author's summary.*

13771. **DAVID, ROBERT. Contribution à l'étude numérique de la multiplication du bacille pyocyanique dans différents milieux de cultures liquides. Influence de la teneur des milieux en certains éléments nutritifs.** 198p. Imprimerie Durand: Chartres, 1931.—4 chapters are devoted to discussion of techniques employed for quantitative study of bacterial multiplication, of growth phases in bacterial cultures, and of multiplication of *Bacillus pyocyaneus* in different liquid media, both non-synthetic and synthetic. No lag phase was evident when cells were enumerated by direct microscopic count, but it was marked when plating technique was used. The plate count was always smaller than the microscopic count. The proportion of cells capable of development on agar plates increased during the logarithmic growth period. The average length of cells increased during this phase. The lag phase is longer in synthetic media; the generation term in synthetic media is of the order of 100 min.; on ordinary media, 30-35 min. Various studies were made of media in which the bacteria had grown for 48 hrs. Surface tension is increased. The pH rises from 7.0 to 8.0-8.4. In general the rotation of light as measured by the polarimeter is decreased. Total N decreases slowly. Amino-N decreases, and disappears almost completely in 9 hrs. Ammoniacal N increases. Total C decreases. The S fixed is irregular and small in amount; P is utilized. Cl (chloride-ion) is not significant in its effect. Inhibition of bacterial growth in older cultures is not due to exhaustion of food. There is a bibliography of 198 titles.—*R. E. Buchanan.*

13772. **DOWNIE, A. M., L. STENT, and S. M. WHITE. The bile solubility of pneumococcus, with special reference to chemical structure of various bile salts.** *British Jour. Exp. Path.* 12: 1-9. 1931.—Preparation of various derivatives of bile-acids is described, and tests are made of their lytic action on strains of pneumococci from various sources and of different serological types. All normal strains of pneumococci tested, irrespective of type, were equally susceptible to lytic action of the various bile salts. Of 6 R strains tested, 5 were equally soluble, while the 6th was almost completely resistant; the latter was also resistant to normal autolysis in culture. Comparative tests with various bile salts and Na oleate indicate that there is no parallelism between lytic activity and surface tension of the solutions. Saponin and the Na salts of all the bile acids tested, except dehydrocholic and dehydrodeoxycholic acid, brought about lysis. Na salts of the various choleic acids were similar to the deoxycholic acid fraction in activity. There seems to be some correlation between chemical structure and power to form addition compounds, and lytic activity of the various salts tested. The conditions under which lysis by bile salts and normal autolysis take place are similar. The experiments suggest that the bile acids combine with the pneumococcal cell and so alter it that lysis is readily produced by the autolytic enzyme of the cell.—*J. Bland.*

13774. **[FEL'DMAN, M.]** ФЕЛЬДМАН, М. **Bacterium paracoli из воды р. Дона и его диссоциация. [Bact. paracoli from Don waters and its dissociation.]** Журнал Микробиологии и Иммунобиологии (*Jour. Microbiol. et Immunobiol.*) 7(2): 189-196; German summary, 237. 1930.—Of 47 *Bact. paracoli* strains isolated from water, 9 formed indol and 38 did not. Lactose was decomposed by 38 strains (5 of them indol formers). Repeated sowing heightened fermentative activity of the strain in respect to lactose, thus bringing it closer to *B. coli*. Similarity of receptors of *B. paracoli* in water did not parallel biochemical and cultural similarities. Dissociation of its water strains gave 3 widely different varieties: S, O, and R.

13775. **GARDNER, GÉRARD. Recherches sur les Spirochétidés dans le district de Montréal.** 85p. Editions Médicales: Paris, 1930.—This book on spirochaetes is divided into 10 chapters which treat of their nomenclature; characteristics; occurrence in surface waters, in feces of cows, in sea water, in decaying vegetation, and in animals; and the influence of cold on them. The author records the results of his own studies of the Spirochaetaceae in water, in decaying vegetation, and in the alimentary canal of cows, rabbits and rats. He discusses the occurrence of *S. icterohemorrhagiae* in nature, and results of testing the serum of different individuals for presence of agglutinins for this organism. Low temp. (−15°C.) influences rate of development and morphology, in slowing multiplication and in changing spiral into globular forms.—*D. H. Bergey.*

13776. **GERARD, R. W., and I. S. FALK. Observations on the metabolism of Sarcina lutea. I.** *Biol. Bull. Marine Biol. Lab.* 60(3): 213-226. 1931.—The respiration of a strain of *S. lutea*, growing as individual cocci of uniform size and of relatively high viability, was studied by the Warburg technique. Suspensions of thoroughly washed bacteria in water or in glucose solution were enumerated by direct and by plate counts, and pH determinations were made before and after manipulation in the manometer. A simple method is described for obtaining accurate gas mixtures with a low concentration of O. The O consumption of various suspensions of the washed cocci was fairly constant in water suspension at about 2.6 cmm. O per mgm. dry wt. per hr., or approximately 7 μ^3 O per single cell per hr.: that is, over 3 times its volume of O was consumed per hr. by each micrococcus. This value is for the nearly constant level attained some hours after the start of the experiment. O consumption is considerably more rapid at first and falls along a roughly arithlogarithmic curve towards an asymptote. This early excess appears to represent an O debt due to partial asphyxia produced in the course of preparation of the suspensions. In 0.2-0.5% glucose, the rate of O consumption falls along a similar curve, but the rates are 100-300% greater than for suspensions of cocci in water. The respiratory quotient in water is constant at about 0.67; in glucose it falls from 0.95 to 0.71 in 7 hrs. (1 experiment each). The O consumed by a suspension in water is independent of O concentration when this is above 1%. For glucose suspensions 2.5% O or more is required for maximal consumption. Below the critical values of O tension, O consumption becomes less with diminishing concentration. When air is admitted to the suspension after a period of complete anoxia, there is observed a high initial rate of consumption followed by progressively declining rates during several hours until a relatively constant rate is approached. When 0.5% or less of O are admitted after anoxia, consumption is greater at first and then falls as when air is admitted; but the maximal rate is low, usually less than normal for air. The O debt developed is not apparently associated with production of detectable acid metabolites (in water suspensions, at least), nor with formation of CO_2 during asphyxia. It may result from accumulation of non-acid metabolites, or of amounts of acid metabolites that do not equal or exceed the buffering capacities of the cells. The oxidation quotient, even in glucose solution, in contrast to the data for most cells that have been studied, is not over 0.6.—*Authors' summary.*

13777. **GERARD, R. W. Observations on the metabolism of Sarcina lutea. II.** *Biol. Bull. Marine Biol. Lab.* 60(3): 227-241. 1931.—The Q_{O_2} of washed *S. lutea* in water suspension at 22° C. in the relatively steady state, averages 2.5. There is no untoward effect of crowding in heavy suspensions. NaCl does not modify the Q_{O_2} until $M/5$ concentrations are reached, when a slight depression may result. The Q_{O_2} is also unaffected by pH, at least between 7 and 8, or by presence of phosphate buffers. Glucose causes a marked increase in Q_{O_2}, the maximum being largely independent of glucose concentration. The extra O used under the influence of glucose may be more than that required to fully oxidize it, which, with other evidence, suggests a "specific dynamic action." Sodium lactate may increase the Q_{O_2} in water suspension over 20-fold. Its addition is always followed by a great rise in respiratory rate, the maximum reached being independent of lactate concentration, at least between 0.05 and 2.0%. Respiration falls rapidly back to normal after addition of small amounts, and the extra O consumed accounts for full oxidation of the added lactate, both *d* and *l* forms. With larger concentrations of lactate, the increased respiration also falls after the initial maximum, but more slowly. This fall is not primarily due to removal of lactate or accumulation of end products. Methylene blue added to a suspension in water, doubles respiration at first, later depresses it. Added to one in glucose solution, the same sequence appears. The Q_{O_2} in glucose is increased only 50% by the dye, but this is an absolute increase over twice that in water; so that glucose and methylene blue added together to a water suspension cause a greater increase in respiration than the sum of their separate effects. The dye added to lactate solutions seems to be depressant from the start. Thioglycollic acid doubles the respiration of a buffered water suspension. NaCN causes no inhibition of respiration up to concentrations of $M/100$ or somewhat stronger. This is true for the low respiration of suspensions in water, saline, or phosphate buffer, and for the increases evoked by methylene blue, lactate and glucose. Extremely strong cyanide concentrations do depress, but even $M/10$ NaCN does not abolish more than $\frac{2}{3}$ to $\frac{3}{4}$ of the total respiration. CO containing 5% O has no effect on the respiration of a water suspension, but somewhat inhibits the increase in glucose and largely that in lactate. Light has little if any effect on the inhibition. The metabolism of *S. lutea* is compared with that of other cell types.—*Author's summary.*

13779. **GLASER, R. W. The "Rickettsiae" and the intracellular "symbionts."** *Science* 74(1914): 243. 1931.—Note on a criticism by Kligler and Aschner, of the author's interpretation of the intracellular bacteria which he found in the American and German roaches, in which he states that in his paper both terms "rickettsia" and "symbionts" were printed in quotes, and that much trouble was taken to demonstrate that the microorganisms discussed were indeed bacteria.

13780. **GRÉGOIRE, CH. Procédé d'isolement de l'entérocoque par les milieux dits "cyanoferrique" et "électif" de L. Muller.** *Arch. Internat. Méd. Exp.* 6(3): 319-325. 2 fig. 1931.—Addition of 0.5-0.6 cc. of iodine-KI solution to 10 cc. of a mixture of bouillon 9 parts, Na hyposulphite 1 part with 5% $CaCO_3$, produces a medium which supports life in enterococci but usually in no other bacteria.

13781. **GORDON, J., and K. E. COOPER. A study of phosphorus distribution in bacterial cultures. Part II.** *Brit. Jour. Exp. Path.* 12(4): 234-238. 1931.—The organic P in *Bacillus coli* (grown in a synthetic medium containing no detectable organic P) consists of 86% of organic P other than lipin and 14% of lipin P. There is no direct

proof that lipin P was synthesized from inorganic P but the evidence suggests that it was. On the other hand, some of the other organic P must have been so synthesized.—*J. Bland.*

13782. **GORINI, COSTANTINO.** Milk as nutritive medium for microorganisms. *Internat. Dairy Congr. Eng. Ed.* 1931 (Sect. 2) : 95. 1931.—A summary.

13783. **HÄMÄLÄINEN, R.** Über die oligodynamische Einwirkung der Silbersalze auf den Staphylococcus aureus. *Acta Soc. Med. Fennicae "Duodecim"* [*Suomalaisen Lääkäriseuran Duodecim'in*] 13[Series A] (2) : 1-7. [Art. 4] 1930.—The effect of 42 Ag compounds on a culture of *Staph. aureus* spread out uniformly on an agar-disc, was not proportional to the chemical disinfecting action of the metal salt (dependent on its solubility), but on the oligodynamic effect of the Ag. Thus Bechold's observations are made intelligible by Murto's explanation of the oligodynamic effect on the basis of the electron theory.

13784. **HAUDUROY, PAUL.** Le cycle évolutif du bacille d'Eberth et des bacilles paratyphiques. *Presse Méd.* 38(55) : 924-927. 1930.—Typhoid bacilli, paratyphoid bacilli, and any other bacilli for which there is an active bacteriophage, can, under the influence of bacteriophage, undergo a change from a visible, nonfilterable form to an invisible, filterable form. With the typhoid bacillus, experiments show that this can take place not only in vitro but also in vivo. Evidence has been obtained that the filterable form is present in the blood of typhoid fever patients at onset of infection, and in the feces at the end of the disease. Certain septicemias are considered to be caused by the filterable form of typhoid bacillus, although the clinical signs of typhoid fever are not present. These invisible, filterable forms may play an important rôle in the etiology of typhoid fever.—*A. M. Woodruff.*

13785. **HIBBERT, HAROLD, and FRITZ BRAUNS.** Studies on reactions relating to carbohydrates and polysaccharides. XXXVI. Structure of the levan synthesized by the action of Bacillus subtilis on sucrose. *Canadian Jour. Res.* 4(6) : 596-604. 1931.—The action of *B. subtilis* on a sucrose nutrient medium gave a 2 : 6 anhydro fructofuranose polysaccharide, levan, identical in structure with that synthesized by *B. mesentericus.* The yield of levan (calculated on the fructose portion of the sucrose taken) was 60-65%. The pure, ash-free, snow-white, powdery levan, on hydrolysis with oxalic acid, was converted into fructose, the yield of the pure, crystalline hexose amounting to 99%. On methylation the levan was converted into trimethyl levan, the yield of partially purified product amounting to 88.5%. The trimethyl levan on hydrolysis was converted into 1 : 3 : 4 trimethyl fructofuranose identical with that obtained from the levan synthesized by *B. mesentericus* from the same sucrose nutrient medium. The pure, snow-white, crystalline 1 : 3 : 4 trimethyl fructofuranose was obtained in a yield of 98.5%. Attention is drawn to the marked influence exerted on the course of the methylation by small amounts of inorganic impurities present in the levan and to the necessity for using only highly purified, ash-free products for physico-chemical investigations on the properties and structure of polysaccharides. Apparently, insufficient purification of many of the products, such as starch and inulin, used previously by investigators, renders somewhat uncertain various conclusions drawn regarding the structure of these substances.—*Authors' abstract.*

13786. **[HIMMEL'FARB, Ya. K.]** ГИММЕЛЬФАРБ, Я. К. К вопросу о дифференциальном диагнозе между **B. pestis** и **B. pseudotuberculosis rodentium** на питательных средах с углеводами. **[Differential diagnosis between B. pestis and B. pseudotuberculosis rodentium on carbohydrate media.]** Вестник Микробиологии и Эпидемиологии (*Rev. Microbiol. et Epidemiol.*) 6(1) : 82-85; German summary, 133. 1927.—The author experimented with 3 virulent and 2 avirulent strains of *B. pestis,* and with 3 strains of *B. pseudotuberculosis rodentium.* The medium contained 0.5% peptone water (pH 7-7.2), with addition of different concentrations of maltose (1, 0.5, 0.25, 0.1, and 0.05%). From 48-hr. agar cultures of these bacteria an emulsion was prepared in physiological saline, containing up to 50 millions of bacteria per cc. This was sown on the medium and kept at 28-30° C. After 24, 48, and 72 hrs., the pH was tested with methyl-red solution. After 72 hrs. (sometimes earlier) the yellow color of *B. pestis* cultures turns yellowish-pinkish-red.

13787. **HODER, FRIEDRICH.** Ein verbessertes Filtrierverfahren. *Zentralbl. Bakt. I. Abt. Orig.* 121(1/2) : 111-112. 2 fig. 1931.—By insertion of a right-angled glass tube through a 2nd hole in the rubber cork plugging the vessel into which material is filtering, a water suction pump may be attached, yet all danger of contamination and additional pipetting obviated.

13788. **HORELLI, VÄINÖ.** Über die Oligodynamie der Elemente bei Mykobakterien; mit besonderer Berücksichtigung der Theorie von J. A. Murto. *Acta Soc. Med. Fennicae "Duodecim"* [*Suomalaisen Lääkäriseuran Duodecim'in*] 13[Series A] (2) : 1-152. [Art. 5.] 5 pl. 1930.—The author examined 23 strains of mycobacteria. Growth was most effectively retarded by As, Sb, Tl; effectively by Cd, Hg, Zn, Ge; slightly but quite obviously by Co, Rd, Ir, Cu, Ag, Bi, In, Te, (Mo). Growth was promoted by Di (=Ne+Pr), W, U, Mn, Ni, Er, Y, Fe, (Mo); slightly and occasionally by La, Ce, Th, Ta, Al, (Se), V, (Pb), (Sn), (Au), B, Ti. Mycobacteria were not influenced in any way by Mg, C, Si, Zr, Nb, Cr, Pd, or Pt. A marginal elevation was formed by As, Sb, Cd, Hg, Zn, Co, Rd, Cu, Ag, Bi, Ge, (Mo); a double elevation, by Sb, Cd, Zn, (Mo). [Apparently elements in ( ) either promoted growth in some organisms and inhibited it in others, or affected only certain organisms.] There was a specific proportion between the mycobacteria and the elements. These observations are more intelligible after study of Murto's theory regarding the oligodynamic phenomena.—*Author's summary.*

13789. **ITANO, ARAO, and SATIYO ARAKAWA.** Studies on Bacillus thermofibrincolus n. sp. II. Physiological studies. *Ber. Ōhara Inst. Landw. Forsch.* 4(3) : 357-363. 2 fig. 1929.—The optimum temp. (65°C.), lower limit (30°), and maximum limit (80°) for growth, are noted. The optimum quantity of cellulose is 1.50-2.25%. As N source, albumin is better than peptone, and while $(NH_4)_2SO_4$ can be utilized, no $NaNO_3$ is used. Optimum pH is 8.0-8.4, and the limiting values are pH 4.6 and 10.2, respectively, for fermentation; for growth, pH 4.5 and 11.0. In the course of fermentation of sugars, so much organic acid is produced that only ½ the sugar (1%) is fermented in 5 days, but addition of $CaCO_3$ enables the organism to ferment the sugars completely, with exception of galactose and lactose. An alteration of pH occurred in course of fermentation.—*A. Itano.*

13790. **ITANO, ARAO, and SATIYO ARAKAWA.** Studies on Bacillus thermofibrincolus. III. Physiological studies (continued). *Ber. Ōhara Inst. Landw. Forsch.* 4(4/5) : 457-469. 4 fig. 1930.—The influence of ecological conditions and the N metabolism of the organism are investigated. When 1.5-3.0% cellulose was supplied, about 60-88% was fermented within 3-7 days; and 24-33% volatile acids (as acetic acid) and 3-12% alcohol (as ethyl) were produced, relative to the fermented cellulose. Culturing by Buchner's anaerobic method, less cellulose was fermented than under aerobic condition, but double quantity of alcohol and equal amount of volatile acids were produced; 0.5% peptone was best, and on the whole the less peptone the better the cellulose fermentation. Different nitrogenous compounds had different degrees of influence on fermentation. The organism has proteolytic action and the amino-N production is governed by the source of energy supplied.—*A. Itano.*

13791. **[IUDENICH, V. A.]** ЮДЕНИЧ, В. А. К вопросу о биологических свойствах бацилла риносклеромы **Fritsch'a.** **[Biological properties of the Fritsch rhinoscleroma bacillus.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épi-*

démiol. et Parasitol.) 8(3): 248-260; German summary, 352-353. 1929.—In determining spp. of capsulated microorganisms, fermentations of sugars, due to their instability, must be considered as secondary rather than primary indicators. Ox bile retards growth of the rhinoscleroma bacillus, and differs in effect on Friedländer's diplobacillus and on the ozena bacillus. Complement fixation is specific, and is considered as a definite method for differential diagnosis of membranous smears and also as dependable for early serodiagnosis of scleroma. Sera from immunized animals or from human cases of scleroma, agglutinate only the non-capsulated form of Fritsch's bacillus. Membranous capsules interfere with the agglutination test, but it may be considered as important for serodiagnosis and may be clinically useful. Infection of rabbits with rhinoscleroma through the nasal membrane failed to produce typical local infection. —*From author's summary (G. A. Lebedeff).*

13792. [IVANOVSKIĬ, N., and T. SASYKINA.] ИВАНОВСКИЙ, Н., и Т. САСЫКИНА. Реакция Schardinger'a в применении к дифференциальной диагностике B. pestis и B. pseudotuberculosis rod. Pfeifferi. [The Schardinger reaction in differential diagnosis of B. pestis and B. pseudotuberculosis rod. Pfeifferi.] Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(1): 72-76; German summary, 132-133. 1930.—2-day-old agar cultures of *Bacillus pestis* and *B. pseudotuberculosis rodentium* were washed with physiological saline and diluted with it to 3.5×10^9 bacteria per cc. 3 cc. of these cultures were mixed with 0.5 cc. of Schardinger's solution, covered with paraffin and placed in a thermostat at 30° C. With *B. pseudotuberculosis rodentium*, discoloration of methylene blue occurs within 1 hr.; with *B. pestis*, discoloration in most cases did not occur, but only white precipitation; in only 3 of 60 cases did *B. pestis* discolor methylene blue (2-3 hrs.). Thus, the reducing properties differentiate the 2 organisms.—*G. A. Lebedeff.*

13793. **JORDAN, EDWIN O.** A text-book of general bacteriology. 10th ed. 819p. 200 fig. W. B. Saunders: Philadelphia, 1931.

13794. **KNUTTI, RALPH E., PETER K. OLITSKY, and JOSEPH R. TYLER.** Differential filtration as a means of isolating Bacterium granulosis. *Science* 73 (1904): 709-710. 1931.—A suspension of the contaminated material is diluted in normal saline and passed through filters selected to allow passage of *B. prodigiosus* but not staphylococci or other large forms. The filtrate is either spread on plates or inoculated into Leptospira medium, and *Bact. granulosis* recovered.

13795. [KOROBKOVA, E. I.] КОРОБКОВА, Е. И. К изучению B. pestis и B. pseudotuberculosis rodentium Pfeiffer. [Study of B. pestis and B. pseudotuberculosis rodentium.] Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 8(4): 435-457; French résumé, 484-486. 1929.—On Martin's bouillon at pH 6.4, in almost all of 158 *B. pestis* and in 11 *B. pseudotuberculosis rodentium* cultures tested, the pH decreased within the first 4-5 days, with marked variations for different cultures of both bacilli. When *B. pestis* was grown on bouillon at pH 5.8, the pH decreased to 5.6 on the 3rd day, and only on the 6th day increased to 5.7-5.9. When *B. pseudotuberculosis* was grown on the same medium, the pH increased to 6.8 on the 3rd day. This confirms Nikanotov's conclusion that Martin's bouillon at pH 5.8 is suitable for differentiating the 2 organisms. The other method for differential diagnosis is Martin's bouillon (pH 6.2-6.4) stained with thionin, indigo disulphonate, malachite green, litmus, etc. It was found that *B. pseudotuberculosis rodentium* reduces these stains more rapidly and completely than *B. pestis;* the rate of reduction increased with increase of Eō (water electrode) and rH (negative logarithm of hypothetical H tension) of the stains, also with the number of bacteria.—*G. A. Lebedeff.*

13797. **KUŽELA, J.** O jaderné povaze bakterií. Studie na podkladě nukleální reakce Feulgen-Rossenbeckovy. [Nuclear character of bacteria. Application of the nuclear reaction of Feulgen-Rossenbeck.] *Zákonitosti života.* Memorial Volume in Honor of the 60th Birthday of Prof. Dr. Vl. Růžička. P. 199-212. Aventinum: Praha, 1930.—These studies demonstrated by means of this nuclear reaction, the chromatic nature of the stainable granules and of the structures in *Bacillus anthracis,* and confirmed the nuclear nature of the following organisms: *B. mesentericus, B. proteus, B. fluorescens liquefaciens, Encapsulatus rhinoscleromatis,* bacilli of hay infusions, and some of the cocci. This study confirms the observations of Růžička who, in his cytological studies (1902, 1904, 1906), demonstrated an analogy between the bacterial cell and the nucleus of the ordinary cell.—*J. Kužela (transl. by B. F. Lutman).*

13798. **LASSEUR, PH., et R. FRIBOURG.** Transport électrique des bactéries. Description d'un appareil utilisé dans le transport macroscopique. *Trav. Lab. Microbiol. Fac. Pharm. Nancy* 2: 81-83. 1 fig. 1929.—This is a modified Kopaczewski apparatus using filters of porous glass to prevent diffusion, instead of agar plugs. The bacterial suspension is placed in an inverted U-tube with openings immersed in a larger, upright U-tube, each arm of which has an electrode, and an inlet tube through which a solution washes products of electrolysis through an outlet at the bottom.—*W. C. Tobie.*

13799. **LAVES, W.** Gepufferte Methylenblaulösungen zur Bakterienfärbung in Schnittpräparaten fauler Organe. *Deutsche Zeitschr. Ges. Gerichtl. Med.* 17(1): 44-47. 1 fig. 1931.—Using methylene blue solution buffered to pH 3.5 at a time when the bacteria were still electronegative (i.e., alkaline) but the tissue positive, the author obtained an elective staining of putrefactive bacteria (in putrefaction there is a gradual shift in tissue reaction from acid to alkaline).

13800. **LESLIE, P. H., and A. D. GARDNER.** The phases of Haemophilus pertussis. *Jour. Hyg.* 31(3): 423-434. 1 fig. 1931.—Analysis of 32 strains indicates that *H. pertussis* is a uniform species, without fixed varieties or "types." After isolation from human subjects, it tends to pass through a series of antigenically distinct phases, of which the first 2 are toxic to guinea pigs, the last 2 relatively harmless. The former probably correspond to the S, the latter to the R, phases of other bacteria. The phase-changes are, up to a point, reversible. Experiments on guinea pigs produced some evidence that the toxic phase I is the best, and perhaps the only, antigen for production of active immunity in guinea pigs.

13801. **LI, BANG DSCHENG.** Vergleichende Untersuchungen über den Wert der Eier-Nährböden. *Beitr. Klin. Tuberk.* 75(3/4): 367-377. 1930.—A comparison of the advantages of Lubenau-Hohn's, Petragnani's, and Sweany-Evanoff's nutrient media for propagation of *B. tuberculosis,* showed them to be of value in the order named. On Sweany-Evanoff's medium, growth from mixed cultures of H_2SO_4-treated infectious material, for diagnosis, was less abundant, very slow and difficult to differentiate. It was hard to pick colonies from it. Its preparation was most complicated. Petragnani's medium without malachite green gave much better results, but not equal to Lubenau-Hohn's. Preparation of the latter was most simple. Petragnani's medium had favorable water of condensation, thus eliminating the necessity of adding broth with the inoculum, while Lubenau-Hohn's gave the best growth. Either is recommended for diagnostic work.—*C. E. ZoBell.*

13802. **LIPMAN, CHAS. B.** "The possible rôle of micro-organisms in the precipitation of calcium carbonate in tropical seas." *Science* 74(1910): 150-151.

1931.—Critical comments on a paper dealing with this subject, by Werner Bavendamm.

13803. **MAZZETTI, GIUSEPPE. Osservazioni su di un ceppo asporigeno di bacillo del carbonchio. [A non-sporulating strain of anthrax bacillus.]** *Boll. Soc. Italiana Biol. Sper.* 3(8): 1193-1194. 1928.—The author obtained a stable non-sporulating strain by culturing in Loeffler's broth to which was added K bichromate 1:2000. This strain forms bodies resembling spores, but which will not resist 65° for 15 min. In broth it produces uniform turbidity, but this characteristic changes with variation in virulence. In agar it forms atypical colonies which only after a variable period take on the appearance of the ordinary anthrax colonies. The strain has less resistance than the vegetative form of the original strain from which it originated. This strain is virulent for guinea pigs and rabbits. It lends itself to various serological tests—agglutination, precipitation, complement deviation. Small laboratory animals can be immunized by successive inoculations by this strain, as well as by the normal virulent anthrax bacillus.—*G. Mazzetti (transl. by P. Hillkowitz).*

13804. **MEYN, A. Zur Morphologie und Biologie des Rauschbrandbazillus.** *Miessner-Festschrift* P. 143-154. 1 pl. Publ. by Fritz Eberlein: Hannover, 1930.—This bacillus of symptomatic anthrax is decidedly pleomorphic and can be anything between a sphere and a slender rod. In cultures on the surface of Zeissler plates, it occasionally forms colonies. Reproduction takes place by fission, budding, and gonidia (from peripheral swellings that form daughter cells). It can sporulate in young anaerobic cultures and under favorable nutrient conditions. Cells which show no inclination to form spores do not sporulate when air is admitted or when nutrient conditions are unfavorable.—*Author's summary (transl.).*

13805. **MINETT, F. C., A. W. STABLEFORTH, and S. J. EDWARDS. The biology of Streptococcus agalactiae.** *Zentralbl. Bakt. I. Abt. Orig.* 122: 466-469. 1 pl. 1931.—A note in reply to criticism by H. Haupt. It is concluded that: (1) streptococci of the *Strep. agalactiae* group do not uniformly show hemolysis of the alpha or alpha-prime type, in the sense of J. H. Brown. On the contrary, when growing in blood agar plates, some strains are clearly beta-hemolytic (illustrated by photographs). (2) Mastitis may be caused at times by streptococci other than *Strep. agalactiae.*—*F. C. Minett.*

13806. **MONTI, ACHILLE. Contributo alla biologia dei ferrobacteri. [Studies on the biology of iron bacteria.]** *Boll. Soc. Ital. Biol. Sperim.* 5(3): 420-423. 1930.—According to the author, the term "iron bacteria" should be reserved for those organisms capable of retaining in their protoplasm and tissue, Fe dissolved in water,—a group essentially physiological in nature. Other organisms causing oxidation of ferruginous compounds outside their own bodies, by means of a precipitation of hydroxide of Fe due to a product of their metabolism, should not be included. The author isolated and cultivated in citrate solutions the thermophilic *Spirophyllum* **thermale** (p. 423), from the thermal waters of Prè-St.-Didier (near Aosta); it lives at 36° C.—*M. Comel.*

13807. **MÜLLER, D. Untersuchungen über Oxydasen in getöteten Essigbakterien. I.** *Biochem. Zeitschr.* 238 (4/6): 253-267. 1931.—When a suspension of *Bacterium pasteurianum* was dropped into 10 times the volume of acetone, stirring constantly, a preparation with few living bacteria was obtained. After addition of water it absorbed some O. Absorption was increased when various mono-, di-, and polyvalent alcohols were added: most by ethyl- and n-propylalcohol; less by isopropyl- and methyl alcohol, and ethylene glycol; still less by glucose; and little if at all by glycerol. O absorption was not increased by Ca gluconate. Living *Bact. pasteurianum* oxidized isopropyl alcohol to acetone; about 75% of the amount estimated from O absorbed was found. Acetone preparations from *Bact. pasteurianum* oxidized isopropyl alcohol to acetone; about 100% of the amount estimated from O absorption was found. Dead bacteria showed 3-6% of the oxidative ability of the living. Isopropyl alcohol oxidation ceased when a suspension of dead bacteria was heated to 95° for ½ hr.—*Author's summary (transl.).*

13808. **MUZZARELLI, G. La méthode de Muzzarelli pour la coloration des spores des microorganismes. [Method for staining of spores of microorganisms.]** *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(7/8): 469-471. 1931.—On a slide to which the material has been fixed by a flame, spread a solution of boracic methylene blue. Heat gently until vapor forms (20-30 sec.). Wash and decolorise for an instant, using 10% HNO_3. Wash again; then, to bring out the contrast, use 1% eosin or orange G (saturated) for a few sec. Wash again and dry.

13809. **NEUMANN, HARRY. Die Isolierung und die Entwicklung von Anaerobiersporen.** *Zentralbl. Bakt. I. Abt. Orig.* 115(1/2): 100-108. 1 pl., 4 fig. 1929.—Favorable conditions for germination of anerobe spores were found in the Fortner plate containing horse blood agar. Micro-capillary methods were used to isolate, count and seed the spores. A high % of the spores germinated. Photo-micrographs show the stages in germination, bringing out new details.—*W. N. Berg.*

13810. **NYBERG, CARL. Zur Biologie des Bacillus mycoides. III. Über einige fermentähnliche Sekretionsprodukte des Bacillus mycoides.** *Acta Soc. Med. Fennicae "Duodecim." [Suomalaisen Lääkäriseuran Duodecim'in.]* 13[Ser. A.] (3): 1-18. [Art. 9]. 1931.—*Bacillus mycoides* always produces a hemolytic substance, various types and strains producing different quantities. It is best produced in broth at pH 7.0-7.5; it may be separated from the bacteria by asbestos filter. If left standing, it rapidly decomposes; it withstands moderate heat only. Rabbit serum usually rather strongly inhibits its hemolytic effect. No antibodies seem to appear in rabbits on immunization. Production of a bacteriolytic ferment was not demonstrated. Liquefaction of gelatin is caused by a soluble ferment, best produced in broth at about pH 6 and separable from the bacteria by asbestos filter. It is not so easily decomposed as the hemolytic substance and is more thermostable. Rabbit serum strongly inhibits this ferment, which, used as antigen, does not seem to provoke antibodies.—*From author's summary.*

13811. **OIJEN, C. F. van, en B. H. MOLANUS. Colorimetrische bepaling der pH van vleesch-extracten. [Colorimetric determination of pH in meat extracts.]** [With English, German and French summaries.] *Tijdschr. Diergeneesk.* 58(16): 849-855. 1931.—A quick and reliable method, using the apparatus of Michaelis-Walpole, is described. The disk-comparator of Hellige is not suitable. Cold distilled water, boiled shortly before, is used as solvent. To about 10 gm. of meat, cut up fine, 100 cc. of water are added; ½ hr. afterward the mixture is filtered and the determination carried out.

13812. **OZOLS, P. Untersuchungen über die paratyphusähnlichen Bakterien.** *Deutsche Tierärztl. Wochenschr.* 39(42): 649-655. 4 fig. 1931.—From researches on this group in laboratory and literature, it is concluded that paratyphoid-like bacteria occur very frequently in nature. The indol-negative strains are divided into 2 main groups—motile and non-motile. Methods of culture for identification are outlined. Agglutination tests are unsuitable for identifying these forms. The arabinose and rhamnose-peptone solution with brom-thymol-blue and the so-called arabinose and rhamnose whey are of equal value. The ordinary methyl red test is unreliable. —*From author's summary (transl.).*

13813. **PERGOLA, M. Préparation des solutions de tellurite de potasse pour le "S.U.T." [Preparation of solutions of K-tellurite for "serum-egg-tellurite."]** *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(7/8): 337-342. 1931.—Precise directions for addition of the tellurite to this culture medium.

13814. **PERRY, C. A. Further adjustment of Havens' brilliant-green bile medium.** *Amer. Jour. Hyg.* 14(2): 461-469. 1931.—Addition of peptone and meat-extract to bile was found to have an adverse effect on the selective bacteriostatic properties of brilliant-green. The re-

action of brilliant-green bile medium was found an important factor influencing the selective bacteriostatic properties of the dye. *Bacillus typhosus* grew in bile at room temp. at pH 5.2 but not at pH 5.0. Brilliant-green was active in bile at pH 5.1-6.0; the optimum appears to be about pH 5.6. Treatment of 1 lot of brilliant-green with HCl did not improve its selective bacteriostatic property when the reaction of the medium was satisfactory. An outfit is described for collection of stool specimens, which has been found to control satisfactorily the amount of feces added under field conditions.—*Author's summary.*

13815. **PIETSCHMANN, KÄTHE. Die Zellkernfrage bei den Bakterien.** *Archiv Mikrobiol.* 2(2): 310-332. 1931.—A review of the literature on the problem of bacterial nuclei.

13816. **RAHN, OTTO. The formula for the fermenting capacity of a single cell.** *Jour. Bacteriol.* 19(6): 383-387. 1930.—A modification of the manner of stating the formula suggested by Rahn (1912) and improved by Buchanan and Fulmer (1918), which makes it clear that the short time intervals taken must be computed separately and not from zero time, is as follows:

$$x = \Delta S(\log b_2 - \log b_1)/\Delta t(b_2 - b_1)0.434$$

where x = the amount of the fermentation product formed; ΔS and Δt are increased during a short time interval; and b_2 and b_1, the corresponding bacterial counts. This applies only while the rate of cell multiplication is increasing or constant. It applies to heat production as well as to the other products.

13817. **RAMCHANDANI, J. C. Saltations in bacteria. II. Bacillus prodigiosus.** *Ann. Bot.* [*London*] 43(171): 579-586. 1 pl. 1929.—The author reports dissociation of *Serratia marcescens* into a color-free strain which was further dissociated into a more transparent strain. The color-free cultures were morphologically, physiologically and serologically identical with the parent red strain. The color-free characteristic remained constant for 9 mo. under varied conditions. The transparent dissociant lost pathogenicity for mice, a characteristic of the parent strain.—*W. L. Kulp.*

13818. **REED, GUILFORD B., and CHRISTINE E. RICE. Studies in the variability of tubercle bacilli. I. A rapid-growing bovine type.** *Canadian Jour. Res.* 4(4): 389-398. 3 pl. 1931.—Variability studies were carried out on a considerable series of cultures of tubercle bacilli and related acid-fast bacteria. This paper deals with a rapid-growing strain of bovine tubercle bacillus. Results conform to claims recently made by Petroff, that certain types of tubercle bacilli undergo dissociation. It is shown that this avirulent, rapid-growing strain consists of R types which appear to be stable in acid fluid media and more or less stable on solid media. Rapid transfers through strongly alkaline fluids or growth in large volumes of similar media result in appreciable dissociation into S types. The S types were unstable, particularly in acid fluid media, and readily reverted to the R form.—*G. B. Reed.*

13819. **REED, GUILFORD B., and CHRISTINE E. RICE. Studies in the variability of tubercle bacilli. II. Correlation of colony structure, acid agglutination and virulence.** *Canadian Jour. Res.* 5(7): 111-121. 3 pl. 1931.—28 cultures of tubercle bacilli (including human, bovine and avian forms from widely differing sources) were compared as to colony structure, habit of growth in fluid media, acid agglutination, and virulence for animals. The recently isolated, highly virulent cultures and all those with a long history of high virulence grew on solid media in S colony form; on fluid media, in bovine and human types, as a continuous veil-like pellicle; in avian types, as a diffuse suspension. All were agglutinated only at a high acidity. All the avirulent or low virulent cultures or those with a history of loss of virulence now grow on solid media in R colonies; in fluid media, as a heavy pellicle tending to separate into discrete islands; and they are agglutinated at a relatively low acidity.—*G. B. Reed.*

13820. **REIS, JOSÉ, e ANNITA SWENSSON. Hydrolyse do hippurato de sodio por bacterias e especialmente pelas do genero Streptococcus. [Hydrolysis of Na hippurate by bacteria, especially Streptococcus spp.]** *Arch. Inst. Biol. Defesa Agric. e Animal* 4: 237-242. 1931.—The writers find hydrolysis of Na hippurate rare outside of *Streptococcus*. In this genus it is not peculiar to the hemolytic bovine samples, but also appears in *Streptococcus equi.*

13821. **RICE, CHRISTINE E., and GUILFORD B. REED. Studies in the variability of tubercle bacilli. III. Influence of X-rays upon dissociation.** *Canadian Jour. Res.* 5(7): 122-129. 1931.—X-ray treatment of cultures of a rapid-growing strain of bovine tubercle bacillus, showing a tendency to change from R to S, promoted the change to a considerable degree. Stable R cultures of the same species are unaffected. Larger doses produce a lethal effect. Protective colloids such as gelatine or blood serum, added to the suspension, reduced the effect of the irradiation. Non-acid-fast bacteria were much less sensitive to x-rays, as no change in rate of dissociation was observed in actively dissociating cultures, with twice the dosage to which tubercle bacilli were exposed. —*G. B. Reed.*

Catalogue of the national collection of type cultures maintained by the council at the Lister Institute of preventive Medicine, Chelsea Bridge Road, London, S. W. 3rd ed.** *Great Brit. Privy Counc. Med. Res. Counc., Spec. Rept. Ser.* 64. 1-112. 1931.—Part 1. Alphabetical list of bacteria and fungi, with details of strains maintained. Part 2. List of subjects, with references to the related organisms, as, e.g., anaerobes, apple, food-poisoning, etc.

13825. **SCHANG, PEDRO J. Acción del extracto fluido de ajo sobre el bacilo de Koch y en los bovinos y cobayos tuberculosos. [Action of garlic extract on Koch's bacillus and on tuberculous cattle and guinea pigs.]** *Rev. Med. Vet.* [*Buenos Aires*] 13(4): 138-147. 1931.—This extract seems to attenuate the bacteria but not to kill them.

13826. **SCHIEBLICH, MARTIN. Über die Bildung von Vitamin B durch Bac. ellenbachensis Stutzer und Bact. prodigiosum (Ehrenberg) Lehm. und Neum.** *Biochem. Zeitschr.* 233(4/6): 371-374. 1931.—After vitamine B deficiency appeared, following vitamine B-free diet, 3 rats each (averaging 52 gm.) were given *Bacillus ellenbachensis* or *Bacterium prodigiosum* exclusively. In 30 days there was an average gain in wt. of 56.3 gm. on the former and of 29.7 gm. on the latter diet. The bacteria were grown on a medium composed of a vitamine B-free rat diet cooked with 10 volumes of water. No signs of toxicity appeared from feeding *B. prodigiosum.*

13827. **SEGRE, S. B. coli hémolytique et chlorure de lithium.** *Soc. Internaz. Microbiol. Boll. Sez. Ital.* 3(9): 569-570. 1931.—Lithium chloride in the medium on which *Bacillus coli* was grown, acted like a poison which penetrates into the bacterial cell, altering the organism morphologically and physiologically.

13828. **SEIFERT, E. Über den Infektionsweg bei postoperativer Parotitis. III. Der Einfluss der Mucilaginosa auf das Wachstum von Staphylokokken.** *Deutsche*

Zeitschr. Chir. 231(7): 503-506. 1931.—Plant mucin formed by salep (1:50), flax seed (macerate 1:5), carrageen (1.5:120), althaea (macerate 4:18), gelatina alba (10%) and 4% oat solution failed to exert the physical, inhibitory action on staphylococci caused by animal mucus (saliva, pseudomucin of ovarian cystomata). Tragacanth appeared to have no nutritive value, and in 1:100 solution no culture appeared (no nutritive element was added). Whether this was true for species pectorales (60:250), Iceland moss or gum arabic, the author leaves undecided; perhaps a bactericidal agent was also present, as arabin in gum arabic.

13829. SMIT, JAN, en L. H. LOUWE KOOIJMANS. Onderzoekingen over Lactococcus dextranicus. [Investigations on L. dextranicus.] *Nederl. Tijdschr. Hyg., Microbiol. en Serol.* 5(4): 215-226. 1 pl. 1931.—Description of isolation and properties of *L. dextranicus* (*Strep. mesenterioides* or "Froschlaichpilz"). Among 30 strains isolated from sewage and other samples of contaminated water, 16 proved to have the property of hemodigestion, while 20 were inactive on blood-agar plates. Only this 2nd group showed the capsules characteristic for this species when cultivated on sucrose media. Most species of this group were inactive against raffinose, which is fermented by all strains of the blood-positive group. Fermentation products from glucose (89% lactic acid, 4% acetic acid, 6% carbonic acid) and production of mannitol from levulose and sucrose, were the same for both groups (while sewage streptococci do not produce carbonic acid or mannitol), but the viability of strains of both groups in sterile filtered water showed a marked difference. The blood-negative group is killed in a much shorter time (10 days) than the blood-positive (24 days). The same proved to be the case with ordinary sewage-streptococci, which also can be differentiated by the property of hemodigestion.—*J. Smit.*

13830. SMITH, MURIEL M. Observations on Bacillus (Haemophilus) influenzae with special reference to morphology and colonial characters. *Jour. Hyg.* 31(3): 321-335. 2 pl. 1931.—Several strains were grown under varying conditions for many months. A modification in morphology occurred in all strains studied. Typical coccobacillary forms were changed to atypical, long-curved forms; the reverse change was less frequent and constant. The change took place most readily after growth in Fildes' broth for several weeks or months at 37° C. The typical strains produced smooth colonies; the atypical gave rough colonies or colonies very much smaller than those produced by the typical strains. The change in colony form occurred at the same time as the change in morphology. The biochemical characters, on the whole, remained unchanged. Fermentation reactions of 140 strains were examined. The sugars most frequently fermented were dextrose, maltose and sucrose, the atypicals being the more active fermenters. Of the typicals 63.9%, and of the atypicals, 18%, gave a positive indol reaction. Although the ability to grow on *X* or *V* alone affords an important differential criterion within this group, great care is necessary in interpreting results, especially in strains which grow on *V* in absence of *X*. Different yeast preparations may give very different results in this respect. All strains tested were non-hemolytic.—*From author's summary.*

13831. SMITH, THEOBALD. The agglutinating action of agar on bacteria. *Science* 74(1905): 21. 1931.—The author observed clumping of *Brucella* and *Streptococcus* strains and of other bacteria in the condensation water of a culture medium consisting of a neutral 2% agar only.

13832. [STIEBEN, V.] ШТИБЕН, В. R и S-формы паратифа С. **[R and S forms of paratyphoid C.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(1): 83-89; German summary, 133-134. 2 fig. 1930.—Of 6 cultures of paratyphoid C-44, one, after growth for 1½ mo. in Merezckovsky albumin water and also in bouillon with 8% NaCl, disassociated into R and S forms. The R form differed from the original and S forms morphologically (short, thick, slowly moving rods), by type of colony (dry, flat, granular, with rough margins) and by type of bouillon culture (transparent with precipitate at bottom). The S form differed from the original by type of colony (moist, elevated and round). There was no biochemical difference between S and R forms and the original culture. Serologically, the S form differed from the original and R forms by its specific agglutination. Cross absorption of agglutinins of the original culture, and of R and S forms showed that one antigen was characteristic for the S form and another for the R form; the original culture had both. The original culture had thermolabile and 2 kinds of thermostabile antigens, of which one is common to S and the other to R. The S and R forms had thermolabile and thermostabile antigens. Thermostabile antigen caused granular type of agglutination. The specific S form made it possible to differentiate the paratyphoid C from other paratyphoid rods and also showed certain differences in construction of receptors of the Glasser and Valdagsen types, which are considered as being identical.—*G. A. Lebedeff.*

13833. [STIEBEN, V.] ШТИБЕН, В. S и R-формы Bact. paratyphi N. **[S and R forms of Bact. paratyphi N.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(2): 186-192; German summary, 281. 6 fig. 1930.—As a result of a study of S and R variants, including their serological reactions, the author confirms his former conclusions that the paratyphoid $N(N_2=C_1)$ is a distinct member of the Gärtner group.—*From abstract by G. A. Lebedeff.*

13834. TARR, H. L. A., and HAROLD HIBBERT. Studies on reactions relating to carbohydrates and polysaccharides. XXXV. Polysaccharide synthesis by the action of Acetobacter xylinus on carbohydrates and related compounds. *Canadian Jour. Res.* 4(4): 372-388. 1931.—The action of *Acetobacter xylinum*, when cultivated in nutrient solutions containing certain carbohydrates or polyhydric alcohols, in forming surface polysaccharide membranes has been confirmed. The nutrient substrate necessary for effective synthesis of N and ash-free polysaccharides from such C compounds was determined, and the necessity for the presence of a small amount of ethyl alcohol proved. This type of synthesis appears to be specific for this organism, in that only the hexoses, their anhydrides and compounds which presumably yield hexoses as a result of bacterial action, give rise to polysaccharide formation. When the C compound used is not a free hexose, or one apparently capable of conversion into a hexose, as in the case of pentoses such as arabinose and xylose, glycols, polyglycols and erythritol, no membrane formation takes place. On the other hand, mannitol, known to undergo oxidation with formation of fructose under the experimental conditions, gives rise to a high yield of a synthetic polysaccharide. Glycerol behaves similarly, due presumably to a primary oxidation to dihydroxy acetone and conversion of this to fructose, the latter then yielding the polysaccharide membrane. The introduction of a methyl group into glycerol and glucose, with formation of α-methyl glycerol and α-methyl glucoside, respectively, inhibits polysaccharide formation. The product obtained from glucose was very closely related, if not identical, to cellulose. Galactose is much less reactive than glucose, while mannose appears to be relatively inactive with the strain of *A. xylinum* employed. The highest yield of the polysaccharide was obtained from fructose, a result presumably connected with the recognized fact that this bacterium forms little or no acid from this sugar.—*Authors' abstract.*

13835. TEMPEL, ERNA. Untersuchungen über die Variabilität der Actinomyceten. *Arch. Mikrobiol.* 2(1): 40-71. 1931.—5 actinomycete strains did not change in morphologic or physiologic characters under the influence of changed outside conditions, nor did aerobic forms adjust themselves to anaerobic conditions. Formation of aerial spores depends on presence of O, and forma-

tion of aromatic substances is bound to that of aerial spores. Animal inoculation gave no results.—*M. Roberg (transl. by G. Knaysi).*

13836. **THOMPSON, RANDALL L. Electrophoresis of organisms belonging to the diphtheria group.** *Amer. Jour. Hyg.* 14(2): 235-243. 1931.—Both the Abramson and Mudd electrophoresis assemblies gave reliable results with diphtheria bacilli. A study of 173 cultures of the diphtheria group indicates that toxigenic cultures may generally be separated by electrophoresis, toxigenic forms migrating more slowly than the non-toxigenic.—*Author's summary.*

13837. **THOMPSON, RANDALL L. Electrophoresis of organisms belonging to the pneumococcus group.** *Amer. Jour. Hyg.* 14(2): 244-267. 1931.—Of 77 strains of pneumococcus used, 71 are represented in the data. No relationship was found between virulence of a strain for white mice and its electrophoretic rate of migration; the latter, in the 3 pneumococcal types, decreases in the order: III > I > II. Most strains of the group may be included in 1 of 3 large electrophoretic groups. The existence of 2 other such groups has been suggested; one of these has not been shown to be definitely distinct from one of the 1st groups and the other contains an insufficient number of members to be significant. All typical strains of any one serological type probably belong to the same electrophoretic group. However, one electrophoretic group may include strains not classified in the same serological category. Rough strains may or may not migrate more slowly in the electrical field than their parent or other strains of the same type as the one from which they were derived.—*Author's summary.*

13838. **VANDEBERG-LOMMEL, Mme. Recherche sur la stabilité des modifications biochimiques et antigéniques obtenues artificiellement chez le B. coli.** *Arch. Internat. Méd. Exp.* 6(4): 455-461. 1931.—Of 32 strains of *B. coli* grown on bouillon with 0.025% safranin, 3 strains after 60 passages and 4 strains after 100 passages no longer fermented lactose; 2 strains after 60 and 3 strains after 100 passages failed to produce indol in peptonated water. The modified strains, replanted in ordinary agar, retained their acquired characters through 50 passages. Grown on agar bouillon with crystal violet, at first 0.005%, later 0.01%, after 40-100 passages, several strains failed to attack lactose or indol; transplanted to ordinary agar, after 40 passages, 4 of 5 strains resumed the lactose-fermenting property but not the property of producing indol in peptonized water. Picric acid and methyl green produced modifications in fewer strains, and these quickly resumed their usual properties on transplantation to ordinary media.

13846. **SWEZEY, O. H., et al. [Short notes on Hawaiian insects.]** *Proc. Hawaiian Ent. Soc.* 7(3): 337-394. 1931.—O. H. SWEZEY reported *Metromenus fraternus* (Blkb.) as a new host of *Laboulbenia;* and 2 *Polistes aurifer* from Molokai, parasitized by *Xenos auriferi* Pierce. D. T. FULLAWAY exhibited specimens of *Nonachrostichus citricola* found in limes [*Citrus* sp.] taken in baggage of steerage passengers from the Philippines, and of *Lepidosaphes uniloba* (Kuwana) found on *Alyxia olivaeformis.* O. H. SWEZEY reported *Thrips panicus* Moulton, a Cuban insect, from sugar cane in quarantine on Molokai, and also on *Echinochloa crusgalli crus-*

pavonis at Kailua; also, the rearing of *Thecla echion* (L.) from *Datura arborea;* and he exhibited an *Agromyza* sp. bred from a *Zinnia* stem, which is apparently a new immigrant. L. A. WHITNEY reported a heavy infestation of *Anaphothrips orchidii* (Moulton) in an orchid house in Kaimuki. It has evidently been present several yrs. In a letter R. A. CUSHMAN identified a parasite of *Stagmatophora incertulella* (Walk.) as *Idechthis* sp. very close to *I. canescens* (Grav.). In a letter J. M. ALDRICH identified the fly reported by Swezey from *Zinnia,* and bred by J. F. ILLINGWORTH from *Centaurea,* as *Agromyza virens* Loew. O. H. SWEZEY recorded *Megacerus alternatus* Bridwell as infesting the seeds of *Ipomoea pes-caprae* in the Hawaiian Islands; he also reported the first Hawaiian record of *Trichodectes latus* Nitzsch from the dog. W. W. YOTHERS and A. C. MASON reported the fruit of *Wikstroemia phillyreaefolia* as a new host of *Ceratitis capitata.* J. F. ILLINGWORTH reported finding the eggs of *Nysius coenosulus* White in the flowers of *Erigeron canadensis* and *Amarantus spinosus;* and *Pleurophorus parvulus* Chevrolat destroying a bed of snapdragons by girdling the stems. D. T. FULLAWAY reported that *Dioctes chilonis,* introduced from China as a parasite of the rice borer [*Chilo simplex*] in July 1929, has become established. O. H. SWEZEY reported *Lophocateres pusillus* (Klug), the Siamese grain beetle, from popcorn in Honolulu. He exhibited a new sp. of *Deinocossonus* from dead twigs of *Pteralyxia;* the rare *Mysticomenus tibialis* Sharp captured in a dead frond of *Cibotium chamissoi; Plagithmysus giffardi* Perkins, reared for the first time, from *Smilax; P. vitticollis* Sharp, reared for the first time, from the stem of *Rubus hawaiiensis; Plagithmysus solitarius* Sharp, reared from a fallen *Elaeocarpus* tree; a specimen of the alfalfa seed-chalcis, *Bruchophagus funebris* (Howard), the first record from Hawaiian Islands; and he reported *Trichogramma minutum* Riley as parasitizing the eggs of *Bactra truculenta, Spodoptera mauritia,* and *Lycaenia boetica.* F. X. WILLIAMS reported that *Phaenobremia meridionalis* (Felt) was reared from the sugar cane aphis in Hawaii. O. H. SWEZEY reported *Agromyza virens* from *Gnaphalium.* J. F. ILLINGWORTH reported that *Coluocera maderae* Wollaston is found in numbers in the nests of *Prenolepis longicornis* Latr. on Oahu. O. H. SWEZEY reported *Agromyza virens* breeding in stems of *Bidens pilosa* and *Ageratum conyzoides; Neoclytarlus filipes* (Sharp) as reared from dead *Maba sandwicensis; Ceratitis capitata* from fruit of *Scaevola gaudichaudiana* [Goodeniaceae]; and *Systole geniculata* Förster from seeds of fennel, together with a sp. of *Tetrastichus* near *T. bruchophagi* probably parasitic on the *Systole.* R. H. VAN ZWALUWENBURG exhibited specimens of *Derolathrus atomus* Sharp taken beneath the bark of a dead *Elaeocarpus* tree. O. H. SWEZEY exhibited *Nesamiptis plagiota* Meyr., reared on *Eragrostris.* H. R. HAGAN reported *Pyroderces rileyi* larvae damaging pineapple seeds. R. H. ZWALUWENBURG reported the determination of *Scolopendrella neotropica, S. simplex, Polyxenus* (probably) *fasciculatus* Say, and a *Pauropus* near *P. huxleyi;* also *Onychiurus fimetarius, Folsomia fimetaria,* and *Isotoma palustris* var. *balteata* from Hawaiian cane soils, and *Lepidocyrtus cyaneus* from pineapple soils.

13847. **ANDREWARTHA, H. G. The apple curculio.** *Jour. Dept. Agric. Western Australia* 8(1): 106-114. 4 pl. 1931.—Description, life history and habits of *Otiorrhynchus cribricollis,* introduced into W. Australia over 30 yrs. ago, are given as applying to local conditions. From tests of various methods of control, the following are recommended: For young trees or trees not bearing fruit, arsenate of lead, 1 lb. paste or ½ lb. powder to 8 gal. water, applied the first week in Dec. and repeated 10 days later if necessary; baiting with ground dried apple 9 lbs. and NaF 1 lb., for all trees whether bearing fruit or not; running poultry in the orchard.

13848. **BONGINI, VIRGINIA. Osservazioni biologiche sulla mosca delle ciliegie in Piemonte. (Nota preliminare 1930-31.) [Biological observations on cherry fruit fly, Rhagoletis cerasi L. (Loew), in Piedmont.]** *Boll. Lab. Sperim. Fitopatol.* [*Torino*] 8(3): 4-9. 1931.

13849. **COTTERELL, G. S. Report on the occurrence of Sahlbergella spp. and other insect pests of cacao in Fernando Póo, San Thomé and the Belgian Congo.** *Dept. Agric. Gold Coast* [*Year-book 1929*] *Bull.* 22. 112-133. 2 pl., 2 maps. 1930.—Report on a visit to these 3 countries in the latter part of 1928 and in Jan. 1929. The author discusses the distribution of and injuries caused by *Sahlbergella* spp. in each country visited, with notes on other insect pests.

13850. **COTTERELL, G. S. The hispid leaf-miner (Coelaenomenodera elaeidis, Maul.) of oil-palms (Elaeis guineensis, Jacq.) on the Gold Coast.** *Dept. Agric. Gold Coast* [*Year-book 1929*] *Bull.* 22. 254-260. 3 pl., 1 map. 1930.—This article treats of the distribution, habits, life history and migration of this pest. Hymenopterous parasites, entomogenous fungi and heavy rainfall help to keep it in check.

13851. **CUTRIGHT, C. R. Experimental work with codling moth in Ohio.** *Proc. Ohio State Hort. Soc.* 64. 19-28. 1931.—Biological studies showed that usually 10-30% of all mature larvae may be trapped under bands, but it is not deemed best to advise the general use of bands of any sort in Ohio, except as a supplementary control. When treated with β-naphthol, they gave the best kills of larvae. All common fungicides, when added to arsenate of lead, reduce its toxicity. Additions of lime slightly reduce toxicity but lessen the burning of fruit and foliage. Two applications of an oil spray in midsummer were not as efficient as 1 spray of arsenate of lead and lime sulfur. Oil caused severe burning. Two applications of an arsenical dust in midsummer were less efficient than 1 of arsenical spray.—*Author's summary.*

13852. **De ONG, E. R., and M. HUNTOON. Sulphur as an insecticide.** *Jour. Econ. Ent.* 22(6): 866-873. 1929. —Finely divided sulphur dust gave good control of thrips (*Scirtothrips citri*) on navel oranges in northern California. Toxicity is closely associated with high field temp. as S does not volatilize or sublime readily under 70° F. 2-3 applications of the dust are made by airplane or by a power duster operating from the ground. The larval stage of the scale (*Coccus citricola*) was very susceptible to such applications. In the dusted blocks, mortality among the newly hatched scales ranged from 94.8 to 98.5%, as against 65.8-75.0% in the untreated plots. The higher figure was attained only at maximum ranges of 102-107° F.—*E. R. de Ong.*

13853. **DOWNES, W. The strawberry root weevil with notes on other insects affecting strawberries.** 2nd rev. ed. *Canada Dept. Agric. Pamphlet* 5. 5-19. 8 fig. 1931.—*Brachyrhinus ovatus* L. (strawberry root weevil), *Aristotelia fragariae* Busck (strawberry crown miner), *Polyphylla ruficollis* Csy. (western June beetle), and *Synathedon bibionipennis* Bdv. (strawberry crown moth), *Brachyrhinus sulcatus* Fab. (black vine weevil).

13854. **GARNIER, JEAN. Emploi de l'arsénite et de l'arséniate de soude contre la pyrale de la vigne.** *Pomol.*

Française 1930 (4/5): 58-60. 1930.—A comparison of commercial Na arsenite (80%) and Na arsenate (95-98%) (2.5 kgm. per 100 liters of water) with the hot water treatment, was made in 3 vineyards in Beaujolais which had been reinfested by *Tortrix pilleriana* Schiff. after the district had been kept free from this pest for a number of yrs. by the hot water treatment. In all 3 cases the toxicity of the salts to the insect was practically the same but Na arsenite was the more toxic to the plants, a fact confirmed in a test with *Mercurialis annua* planted in pots and treated with 4% solutions of the 2 salts. A 2.5% arsenical solution gave good results, but owing to the greater toxicity of arsenite to the plants, the use of Na arsenate is preferred.—*C. Zeimet.*

13855. **HOUGH, W. S. The life of a codling moth: at what point in its life can we take advantage of its weak position?** *Rept. Maryland Agric. Soc.* 15: 196-202. 1931.—Of the larvae [of *Carpocapsa pomonella*] found on 8 apple trees, 43.7% made their cocoons on the limbs and 56.3% beneath the bark on the trunks. Observations indicated that the moths settled within 500 ft. of their place of emergence in an orchard. About 90% of the eggs were found on the foliage. Larvae hatching from eggs on the foliage wandered about before they finally settled; the average length of the period of wandering was 131.5 min., minimum 28, and maximum 525 min. Period of wandering of larvae from eggs deposited on the fruit averaged 80 min., minimum 6, and maximum 357 min. Loss of weight of newly hatched larvae was more marked when the temp. was above 80° F. Loss in weight stimulates the young larvae to action which appears to be the reason why the percentage of successful entrants in apples is considerably higher in warm, dry weather. The weakest point in the life of the insect is during the period of wandering of the newly hatched larvae on the fruit and foliage.—*W. S. Hough.*

13856. **JAMES, H. C. Repellent banding to control the ants attending the common coffee mealy-bug.** 14p. 3 fig. Colony and Protect. of Kenya Dept. of Agric.: Nairobi, 1930.—Three types of repellents for the control of ants that attend mealy-bugs are given: High boiling point tar oils, castor oils with poison, and adhesive preparations such as Bandite, TCN6 and tanglefoot. Descriptions of bands and application discussed, together with the cost of materials and labor. The writer considers biological methods the most feasible for controlling mealy-bugs, followed by the "clean-up" method to insure the rearing and spread of predators and parasitic enemies.—*C. R. Jones.*

13857. **JARY, S. G. Some observations on winter moth caterpillar attack on fruit trees in 1929-30.** *Jour. So.-Eastern Agric. Coll. Wye, Kent* 28. 137-146. 1931. —*Cheimatobia brumata* emerged from about Oct. 24 to Jan. 30. *Hybernia defoliaria* emerged over almost exactly the same period, but in very much smaller numbers. Over 99% of the ♀♀ taken were *C. brumata. H. defoliaria* accounted for most of the others; the March Moth, *Anisopteryx aescularia,* was not recorded. An occasional ♀ of *Phigalia pilosaria* was taken. The eggs of *C. brumata,* when laid on unbanded trees, were mostly on the smaller wood and fruit spurs; about ½ were superficial and not in any way concealed, ¼ completely concealed (beneath bud-scales, dead bark, etc.). Many eggs may be laid on stakes, etc., supporting the trees. Even the most careful attention to greasebands did not entirely prevent attack, although the banded trees were as free from caterpillar damage as the best of the sprayed trees. Under commercial conditions, and especially if large numbers of moths are emerging, greasebands do not prevent considerable numbers of ♀♀ from ascending. There is considerable evidence to disprove the theory that ♀♀ may be carried up by the ♂♂, in copula. A tar oil wash of the Long Ashton type gave no better or scarcely as good control of Winter Moth caterpillars as an old type Tar Oil wash used at the same strength (10%). At 6% the control from the Long Ashton type wash was not sufficient to be of commercial value, and had to be followed by lead arsenate. Concealed eggs do not seem to hatch in any greater proportions than eggs laid superficially, when the trees on which they occur have all been subjected to the same treatment.—*From author's conclusions.*

13858. **NEISWANDER, R. B., and M. A. VOGEL. Some new phases on the oriental fruit moth [Laspeyresia molesta] situation.** *Proc. Ohio State Hor. Soc.* 64. 29-43. 6 fig. 1931.—From experimental work in Ohio, it is concluded that storage houses and used baskets provide optimum hibernating quarters for fruit moth larvae. These larvae are protected from sudden weather changes and constitute a source of reinfestation from yr. to yr. Late varieties of peaches, especially when fruits are not all harvested, carry more larvae over winter than earlier varieties and form a more abundant source of reinfestation. Bait traps may be useful in determining when sprays should be applied. Four definite broods of eggs and larvae appeared in northern Ohio in 1930. The summer oils appear safe and practical on peaches when not used in an excessive number of applications; when used in late season sprays, they seem to be the most effective of the materials yet used in Ohio. No undesirable residue was obtained in 1930 with oil used within 10 days of peach harvest.—*Authors' summary.*

13859. **SHERMAN, FRANKLIN. Recent experimental work on codling moth.** *Michigan State Hort. Soc. Ann. Rept.* 60: 48-50. 1931.—Two applications of arsenate of lead for summer brood larvae gave 10% better control than 1 application. A single application, for the summer brood larvae, of arsenate of lead, 2 pounds to 100 gallons, does not necessarily insure freedom from an excessive arsenical residue. One application of oil and nicotine on Strawberry apples for summer brood larvae gave better control than a single application of arsenate of lead. Apples treated with arsenate of lead had an excessive arsenical residue, while those treated with oil and nicotine showed less than the world's tolerance. Oil-nicotine is not effective on late varieties when applied as a substitute for arsenate of lead at the times indicated in the spray calendar for spraying with arsenate of lead. Sunoco oil used at rate of 1 gallon with ¾ pt. nicotine sulphate to 100 gallons of water is unsafe on apples. Paris green and white oil with an extract of pyrethrum proved ineffective.—*Author's summary.*

13860. **SMITH, RALPH H. Investigations on the control of the red scale. [Chrysomphalus aurantii Mask.]** *California Citrograph* 16: 310, 344, 345. Illus. 1931.—Tests with all other suggested remedies lead to the conclusion that nothing of immediate promise can be expected from measures other than oil sprays and fumigation with HCN.—*C. S. Pomeroy.*

13861. **SMITH, RALPH H., and WALTER EBELING. Experiments with oil sprays in control of red scale.** *California Citrograph* 16: 410, 448. Illus. 1931.—Wide variation is obtained in degree of clean-up and even under favorable conditions oil sprays alone appear to be limited in their effectiveness. Combination treatment (spray and fumigation) affords the most dependable means of control of resistant red scale on lemon trees. —*C. S. Pomeroy.*

13862. **SMITH, RALPH H., and WALTER EBELING. Additional report on experiments with oil spray for red scale.** *California Citrograph* 16: 451, 496. Illus. 1931.

13863. **STANILAND, L. N., and C. L. WALTON. A note on the control of woolly Aphis on dormant nursery stock.** *Jour. Bath. & West & Southern Counties Soc.* 5: 181-183. 1930/1931[1931].—In 1 experiment, woolly aphis on young apple trees was eradicated by immersion for a few minutes in, or spraying with, a 10% solution of tar oil wash. The 32 infested trees so treated all remained free until June 7 the following summer. Fumigation with HCN proved almost a complete failure, and a nicotine and soft soap solution was only partially successful.

13864. **VOÛTE, A. D. De bestrijding van door mieren bezochte schildluizen op djeroek. (Combating scales visited by ants.)** [With English summary.] *Landbouw*

[*Buitenzorg*] 6(6): 713-715. 1930.—Citrus trees heavily attacked by *Lecanium* and other scales, which are frequently visited by ants, were banded with tanglefoot; and after 1 month the scales had almost vanished.

13865. **WEDDELL, J. A. Experiments with the heat treatment of fly-infested fruit.** *Queensland Agric. Jour.* 36(2): 141-147. 1931.—A temp. of 110-115° F. at approximately 100% relative humidity for 8 hrs. killed the larvae of the Queensland fruit fly (*Chaetodacus tryoni* Frogg.) infesting apples, oranges, peaches, pears, and persimmons; codling moth larvae were also killed by these conditions. Ability to kill the eggs of the fruit fly in oranges and grape fruit was not proved since the eggs laid in the control fruit did not hatch. A number of the apples became peculiarly soft, watery, and loose skinned, presenting a "cooked" appearance some 5 days or more after treatment, and this symptom appeared distinct from various storage rots and bruises. Only fruit-fly-infested fruits of peach, pear, and persimmon were used, so the keeping qualities of treated fruits could not be ascertained. The flavor of citrus fruit was unaffected.—*From author's summary.*

ECONOMIC ENTOMOLOGY

CEREAL, FORAGE, AND OTHER FIELD CROPS

(See also in this issue Entries 14554, 14839)

13866. **BOX, HAROLD E. Observaciones sobre Taladradores de la caña azúcar. Una plaga nueva de la caña de azúcar: El gorgojo taladrador (Coleóptera; Curculionidae). [Sugar cane borers: the weevil-borer, a new pest of sugar cane.]** *Rev. Industr. y Agric. Tucumán* 19(11/12): 319-322. 2 fig. 1929.—The species is undetermined; only larvae have been found. It was injurious at plantations at Ledesma, near Jujuy, Argentine. It attacked mainly the side sprouts of 2-3 yr. old cane of the strain P.O.J. 36, but did little injury to plant cane. *Diatraea saccharalis* was injurious to corn (maize) at Jujuy, and *Pennisetum latifolium* Spreng. is reported as a new host. Both spp. of *Diatraea* showed light infestations in cane at Ledesma.—*W. T. M. Forbes.*

13867. **CAMERON, W. P. L. Cotton thrips (Heliothrips indicus Bagnall.) in the Gezira in 1929.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 55-63. 1930.—This thrips has a succession of hosts from July to Oct., including *Medicago sativa, Cymbopogon, Sorghum, Echinochloa colona, Crotalaria, Tephrosia, Sesbania, Seliotropium, Dolichos lablab, Lubia afinis, Leucas urticaefolia,* and in Oct. and Nov. it migrates to the cotton. These two months are the period of greatest damage. Flooding to kill the pupae in the ground is a valuable measure when applied at the proper time. The life cycle of the 6 generations from Aug. to Dec. is shown in tabular form, and requires 16-25 days.

13868. **CHIAROMONTE, A. Una particolare circonstanza favorevole allo sviluppo della cotonicoltura a Tessenei: l'assenza di Platyedra gossypiella Saund. [A particularly favorable circumstance to the development of the cultivation of cotton at Tessenei: the absence of P. gossypiella.]** *Agric. Coloniale* 24(4): 185-188. 1930.—The author, finding the cotton at Tessenei (Eritrea) free from any infestation by *P. gossypiella,* warns his countrymen of the danger of importing this cotton pest into Eritrea, owing to its proximity to the cotton growing section of Egypt.—*C. Zeimet.*

13869. **CRUMB, S. E. Tobacco cutworms.** *U. S. Dept. Agric., Tech. Bull.* 88. 180p. 9 pl., 19 fig. 1929.—This publication gives a large amount of information on the habits and control of the generally injurious spp. of cutworms. The first part deals with the general distribution of cutworms, their importance as tobacco pests, the factors influencing spread and importance. General characteristics for identifying larvae, pupae and adults; something on the technique of rearing; a general consideration of natural control of cutworms considering the factors of parasites, diseases and the influence of birds and climatic factors. Nearly 100 pp. are devoted to a consideration of the more common and important spp. found attacking tobacco, taking up the spp. by groups and discussing habits, life history, distribution, importance and natural enemies. The latter fourth of the bulletin is devoted to a consideration of control measures, giving a very comprehensive review of methods which have been tried and the relative efficiency of each.—*W. P. Flint.*

13870. **GIFFARD, W. E. The Sudan bollworm (Diparopsis castanea Hamp.) in the Sudan.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 27. 1-17. Map, 2 col. pl. [1929 or 1930.]—*Diparopsis castanea* is known from many parts of Africa. Its only known host in the Sudan is cotton, although in So. Africa it breeds on other Malvaceae. The egg*, larva*, pupa*, and adult* are described, and the color variations of the latter are illustrated. Data are presented on ecological conditions, seasonal history, duration of stages, depth of pupation. The total developmental period is 40-60 days. When first known in the Sudan it was only one-brooded, but is now a continuous breeder with 4-5 broods a year. This species causes more damage than the pink bollworm (*Platyedra gossypiella*) where the two are present. No satisfactory means of control has been found, although light traps and tractor plowing are useful in reducing the numbers.

13871. **KING, H. H., and H. W. BEDFORD. An account of the locust season [in Anglo-Egyptian Sudan].** 1929. *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 7-14. 1930.

13872. **KIRKPATRICK, T. W. Pink bollworm (Platyedra gossypiella Saund.) in the Gezira [Anglo-Egyptian Sudan] during 1929.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 48-54. 1930.—No living larvae have been found in numerous samples of seed which have been sunned, showing the efficacy of this treatment. It is thought that the climatic differences partly explain the lesser damage in the Gezira than in Egypt.

13873. **MAHOUX, J. Un ennemi du blé. Le cèphe pygmée.** *Progr. Agric. et Vit.* 94(29): 64-66. 1930.—The biology of the wheat stem sawfly (*Cephus pigmaeus*) is described, and there is a short review and description of the common wheat diseases (rust, foot rot and "scald"). The feeding habits of the larvae, as the causative agents of a premature dying of the infested wheat stalks, are described. The insect hibernates in its larval stage and pupates only a short time before its emergence. Crushing with heavy rollers and the use of weed killing chemical solutions (10% sulphuric acid) are suggested as methods of control. *Pachymerus calcitrator* is a natural enemy of the larva of this sawfly; it might perhaps be used to keep the sawfly in check.—*C. Zeimet.*

13874. **MAXWELL-DARLING, R. C. The winter breeding of locusts in the Sudan. Season 1929-30.** *Wellcome Trop. Res. Lab., Ent. Soc. Bull.* 31. 19-21. 1930.

13875. **MICHELMORE, A. P. G. Observations on leafhoppers (Homoptera Fam.—Jassidae) in the Gezira in 1929.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 64-66. 1930.—A preliminary note on *Empoasca fascialis* which has been found on cotton, *Hibiscus, Abutilon,* and other Malvaceae, *Ricinus communis, Solanum dubium, Rhyncosis memnonia,* and *Momordica cymbalaria.*

13876. **NELSON, ALEXANDER. Pasture production in areas liable to infection by Oncopera intricata (Walker) in Tasmania.** *Ann. Appl. Biol.* 18(1): 54-59. 1931.—The replies to a questionnaire sent out to a large class of sheep owners and pastoralists in Tasmania indicate: (1) that *O. intricata* is a pest of first-class economic importance in *Tasmania,* precluding successful pasture production over large areas; (2) that grasses with a mechanism for natural vegetative propagation, *e.g.,*

stolons, etc., are likely to persist through a severe attack and by their recovery after the pupation of the grass-attacking larvae provide some return rather than allow the ground to go out of production or be covered by unprofitable weeds; (3) the replies plus external evidence show that a sward of creeping grasses and clovers is likely to be most useful.—*Author's summary.*

13877. **OGLOBLIN, ALEJANDRO. Informe preliminar sobre un nuevo parásito del trigo. [Preliminary data on a new wheat parasite.]** *Bol. Min. Agric. Nacion [Buenos Aires]* 29(4): 451-455. 9 fig. 1931.—Larvae of a weevil, probably *Prosalidus rufus* Hust., attack the wheat in the province of Buenos Aires. The infestation from 1 to 4% was recorded in different localities of the province. Short account of life-history and the external morphology of larvae are given.—*A. A. Ogloblin.*

13878. **POPE, JAMES B. El "Arrebiatado" del Algodón en Piura (Dysdercus ruficollis L.). [The cotton stainer in Piura.]** *Estac. Exp. Agric. Soc. Nation. Agrar. Lima-Peru, Bol.* 3. 1-14. 2 pl. 1929.—The cotton stainer is a major cotton pest in the coastal valleys of Peru. More damage is done by this insect in the Northern than in the Southern valleys. Data collected from the oldest planters indicate that since 1916 the damage has continued to increase. Since 1916 the area devoted to cotton has increased along with changes in varieties and cultivation methods, which in all probability has made conditions more favorable for this cotton pest. The average time required from egg to adult stage is about 45 days, varying with temp. and food supply. The average life of an adult is about 30 days. The average number of eggs laid during the life of a ♀ is about 200. From 60 to 80 eggs are deposited at a time in the soil under the cotton plants. The damage results from the introducing of fungi by the insect at the time of feeding on the cotton bolls before they open. Bolls less than 30 days old are completely spoiled. The damage to bolls over 30 days old varies, depending on the number of punctures and climatic conditions. The amount of damage varies, depending on the number of stainers and the stage of development of the bolls when they are attacked. In some cases in late planted fields the total crop is lost. Early plantings usually escape heavy damage. Control recommendations are: Early planting over a short period of time; destruction of all cotton plants at the earliest date possible after the crop is harvested; and closed season of at least 60 days between cotton crops.—*J. B. Pope.*

13879. **RUTTLEDGE, W. A note on the control measures used against locusts in northern Kordofan [Anglo-Egyptian Sudan].** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 15-18. 1930.

13880. **RUTTLEDGE, W. Survey of the pests affecting cotton and other crops in Mongalla Province.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 79-82. 1930.—The cotton stainers *Dysdercus superstitiosus, D. nigrofasciatus,* and *D. cardinalis* were found on *Sterculia, Hibiscus esculentus, H. sabdariffa,* and *Wissadula rostrata.* Other cotton pests were *Heliothis obsoleta, Platyedra gossypiella, Oxycarenus* spp., *Empoasca fascialis,* and *Earias insulana. E. insulana* was bred from fruit of *Dombeya kirkii.* A coffee plantation was infested by *Hemileia vastatrix.*

13881. **SPRINGER, R. E. Some factors affecting the hatching of the eggs of the European corn borer.** *Proc. Pennsylvania Acad. Sci.* 4: 99-102. 1 fig. 1930.—Direct exposure of the eggs of the European corn borer [*Pyrausta nubilalis*] to sunlight is fatal. The effect of time of exposure at 90° F. and of exposure to ultra-violet light for various periods is shown in tables and chart.

13882. **ULLYETT, G. C. The life-history, bionomics and control of cotton stainers (Dysdercus spp.) in South Africa.** *Union of So. Africa Dept. Agric. Sci. Bull.* 94. 3-9. 1930.—*Dysdercus fasciatus, D. nigrofasciatus,* and *D. superstitiosus* attack cotton in So. Africa. The present report deals mainly with *D. nigrofasciatus,* of which the developmental periods, generations, and life cycle are discussed. It breeds on cotton, *Sterculia platanifolia, S. murex, Pappea fulva, Hibiscus calycinus, H. lumarufolius, Datura, Abutilon* and *Sida.* The only predator found was *Rhinocoris segmentarius.* No satisfactory means of control have been found.

13883. **VAYSSIÈRE, P. La lutte contre les sauterelles nuisibles en France et en Afrique du Nord.** 52p. 6 pl., 10 fig. Soc. Anonyme de l'Imprimerie Maulde et Renou: Paris, 1929.—Grasshoppers are occasionally injurious to agriculture in southern France and are considered serious in Algeria, Tunisia and Morocco. Eleven spp. of grasshoppers and 4 spp. of grouse locusts attack crops. *Schistocera gregaria, Dociostaurus maroccanus,* and *Calliptamus italicus* are the most important. Description, habits, distribution, noxiousness of each sp. are given as well as a table for identification. Of the various means of control used, poison bait is the most effective. White arsenic is the poison used; it is mixed with bran and molasses, and a strong coloring material (black, green or blue) is added to avoid any fatal error. Special legislation against grasshoppers is provided for in France and Algeria, enabling the authorities to organize departmental syndicates for the compulsory destruction of the pest. Samples of such decrees are given in appendix. —*G. Maheux.*

13884. **WHITFIELD, F. G. S. Report on the entomological work of the Talodi Field Laboratory [Anglo-Egyptian Sudan] for the year 1929.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 31. 76-78. 1930.—The cotton leaf roller, *Sylepta derogata,* was one of the principal pests, but was heavily parasitized. The most serious pests of cotton in the Province are *Dysdercus fasciatus* and *D. superstitiosus.* The only other food plant of the latter is *Adansonia digitata.* Other pests of cotton are *Earias insulana, Podagrica puncticollis,* and *Sphenoptera gossypii.*

13885. **WILKE, S. Der Stand der Maiszünslerfrage.** *Arch. Naturgesch. Abt. A* 91(9): 31-72. 3 maps, 11 fig. 1925(1927?).—Maps and data on the distribution of *Pyrausta nubilalis,* by countries in Europe, Asia, Africa, and America; list of host plants; the damage in various countries is reviewed; the life history, seasonal history, parasitic control and artificial control are discussed.

ECONOMIC ENTOMOLOGY

FOREST AND SHADE TREES

(See also in this issue Entries 12360, 12406, 13922, 13926, 13929, 14029, 14871)

13886. **BRAMMAN, L. Priežu dārznieku (Myelophilus) kaitīgās darbības piemēri un vinu nozīme celmu mizošanas jautājumā. [Damage caused by the pine beetle and its relation to the peeling of stumps.]** *Mežsaimniecības rakstu krājums [Riga]* 6: 10-25. [German summary, 127-128.] 3 fig. 1928.—The large pine beetle (*Myelophilus piniperda*), which does considerable damage in Latvian pine forests, breeds in large numbers under the bark of stumps and of logs left in or near the forest. Cutting low stumps is almost as effective as peeling the stumps in reducing infestations, and is much cheaper. —*W. N. Sparhawk.*

13887. **DENGLER. Ein auffälliges Auftreten des grossen Waldgärtners bei Eberswalde.** *Zeitschr. Forst- u. Jagdw.* 62(2): 122-126. 3 pl. 1930.—The first evidence of the dying of young shoots in the tips of thrifty 130-140-yr.-old pines near the Möller Institute was noted toward the end of July, 1929. Inspection of broken shoots

revealed the presence of *Myelophilus piniperda*, which alone was responsible. It has been generally believed that shoots attacked by this beetle remain green even until broken off in the fall storms. The unusually dry summer of 1929 is considered responsible for the drying up of infested shoots. The occurrence of this particular attack in a stand remote from any felled timber or area containing suitable brood trees indicates that the life history of the beetle needs further study. —*J. Roeser, Jr.*

13888. FELT, E. P., and S. W. BROMLEY. Shade tree insects in 1929. *Jour. Econ. Ent.* 23(1): 137-142. 1930.—The Norway maple leaf stem miner, *Nepticula sericopeza* Zell., is generally distributed in southeastern New York and southwestern New England. Spraying with a nicotine molasses soap combination in May apparently gives excellent control. The red cedar aphis, *Lachnus sabinae* Gill., provided an excellent outdoor demonstration of injuries earlier associated provisionally with this sp. The hackberry nipple gall, *Pachypsylla mamma* Riley, and the hackberry bud gall, *Pachypsylla gemma* Riley, are common on hackberry. The former is readily controlled with a nicotine molasses spray applied about the middle of May and the latter with the same materials applied about June 10th. The insecticide kills many adults and apparently destroys the eggs. The knotty oak galls, *Andricus punctatus* Bass, *A. cornigerus* O. S., and *A. clavigerus* Ashm. are common on the red oak, pin oak and willow oak respectively, in some instances causing serious injury. The alternate generation of the former 2 develops in a small blister leaf gall. The hackberry leaf aphid, *Myzocallis fumipennellus* Fitch, is responsible for a very general yellowish spotting and browning of hickory leaves in early fall, in some cases, most of the leaves being killed. The bronze birch borer, *Agrilus anxius* Gory, and the 2-lined chestnut borer, *Agrilus bilineatus* Weber, are generally distributed. Available data show that feeding of birches frequently enables the trees to outgrow somewhat serious infestations. Work by the 2-lined chestnut borer is frequent on trees indirectly injured by grading or building operations. The filbert bud mite, *Eriophyes avellanae* Nal., produces greatly enlarged buds on European filberts and has been associated with some severe injury. A paste of $Ca(CN)_2$ and castor oil applied to areas infested by the linden borer, *Saperda vestita* Say, has given encouraging results.—*Authors' abstract.*

13889. LÉPINEY, JACQUES de. Les insectes nuisibles du chêne liège dans les forêts du Maroc. (Deuxième étude.) [Injurious insects of cork oak in the forests of Morocco. 2.] *Ann. Épiphyties* 14(4): 313-321. Map. 1928.—Details of the rearing, multiplication and release of an introduced parasite of the destructive Lepidopteron, *Lymantria dispar*, are given and the successful establishment of the parasite, *Schedius kuwanae*, at a number of points in the field is noted. A few notes on the following insects, which were found to be injurious to cork, are also included. Foliage insects: *Phalera bucephala* v. *bucephalina, Drymonia chaonia, Marumba quercus, Boarmia ilicaria, Carcina quercana, Gracilaria sulphurella, Orthacanthacris aegyptia, Chrysomphalus dictyospermi*, and *Chaitophorus*. Insects of the twigs, branches and the trunk: *Dryaphis, Chionaspis lepineyi, Kermes vermilio*. Wood-boring insects: *Xyleborus monographus*.—*H. L. Person.*

13890. SAUNT, J. W. Some American immigrants. *Ent. Record* 43(1): 11-12. 1931.—Notes on the damage to American Ash by *Neoclytus erythrocephala, N. capraea* and others.

13891. SCHWERDTFEGER, F. Beobachtungen und Untersuchungen zur Biologie und Bekämpfung des Kiefernspanners während des Frassjahres 1929 in der Letzlinger Heide. [Biology and methods of control of the pine looper-moth (Geometra piniaria L.) during the outbreak of 1929 on the Letzlinger heath.] *Zeitschr. Forst- u. Jagdw.* 62(2/3): 65-93, 133-166. 2 pl., 26 fig. 1930. —The 5 chapters treat of: general consideration of the area affected; review of the history of the outbreak; observations and investigations of the biology of the insect; comparative experiments to study the effect of various control measures; and recommendations for the future handling of control operations. Scatological observations constituted the principal method of study, and are highly recommended as a means for procuring valuable information in the life habits and control measure possibilities under epidemic conditions. Meteorological conditions (precipitation and temp. fluctuations) had no effect on emergence of the moths, and only partially affected the feeding intensity of the caterpillars. During the 3 feeding months, 10% of the total consumption occurs in August, 30% in September and 60% in October. The favorable results claimed for control spraying in recent times have not been entirely substantiated. Various experiments with arsenic compounds, including Ca arsenate, applied with a power duster, were made under favorable conditions during this outbreak, but with only minor success. This is due not to biological reasons, but to physical causes, such as the character of air movement about the needles, and the electrical charge of the poison dust particles. The failure of motor dusting (not airplane) is attributed to the lack of penetration to all parts of the tree crowns. In future control operations, the employment of airplanes and the use of stronger As compounds are recommended. Control measures must be instituted at the beginning of an attack and not delayed until its height. A fairly extensive bibliography is included.—*J. Roeser, Jr.*

13892. SCHWERDTFEGER, F. Kritische Bemerkungen zu der Abhandlung von Dr. Borchers und Dr. May. Erfahrungen bei der Arsenbekämpfung des Kiefernspanners in biologischer und technischer Hinsicht. [Criticism of Borchers' and May's paper on use of arsenic for killing the pine looper (Bupalus piniarius).] *Forstwiss. Centralbl.* 53(2): 68-73. 1931.—The writer criticises Borchers and May for drawing general conclusions from inadequate experiments, and for misquoting his own views. Other investigations do not show that dusted foliage is too dry for the caterpillars to eat. Borchers failed to consider the influence of wind on the caterpillars' activity.—*W. N. Sparhawk.*

13893. SIMMEL, R. Die Splintkäfer an Hopfenbuche: Eccoptogaster intricatus Ratz.- und E. carpini Ratz.-Sippe. [The ambrosia beetles of hop-hornbeam: the intricatus-carpini-group of Eccoptogaster.] *Ent. Blätter* 24(4): 154-171. 4 pl., 2 fig. 1928.—Biological studies on *E. intricatus* Ratz., *E. simmeli* Eggers, *E. carpini* Ratz., *E. balcanicus* Eggers.—*M. H. Hatch.*

13894. SPENCER, G. J. Insects emerging from prepared timber in buildings. *Proc. Ent. Soc. British Columbia* 27: 6-10. 1930.—Records are given of *Buprestis aurulenta* emerging from buildings as much as 20 yrs. old. There is 1 record of the Longicorn, *Phymatodes dimidiatus*, emerging from split fir rafters in a house 6 yrs. old. Adults of *B. fasciata langi* (and presumably *B. aurulenta*), apparently oviposited in cracks in newly-laid veranda boards and in a seasoned flag pole 2 yrs. old. These beetles may be capable of developing from eggs laid in cracks in prepared lumber, even of heartwood, without feeding first on bark, bast, cambium or sap-wood.

13895. SWEZEY, O. H. Some observations on the insect faunas of native forest trees in the Olinda forest on Maui. *Proc. Hawaiian Ent. Soc.* 7(3): 493-504. 1931. —Results are given of observations on the insects inhabiting certain spp. of native Hawaiian trees in a forest region at 3500-4500 feet elevation on the slope of Mt. Haleakala on the island of Maui. Most attention was given to *Acacia koa* and its insect fauna. This tree is one of the most characteristic of the region, and the fact that nearly all of this species of tree were mostly defoliated early in 1926 by the caterpillars of a native moth, *Scotorythra paludicola* (Butl.), led to these studies. New foliage did not appear on these trees for some months and considerable dying of branches and even of entire trees occurred; but there was fair recovery eventually and no recurrence of the caterpillar outbreak

followed. All the other insects found living on *Acacia koa* are listed, and also the insects found on about a dozen of the other trees characteristic of the region.—*O. H. Swezey.*

13896. **TUBEUF, von. Diplosis pini (DeGeer) (Cecidomyiden-Studien).** [Gall midge studies.] *Zeitschr. Pflanzenkrank. (Pflanzenpath.) u. Pflanzenschutz* 40(8): 375-390. 2 pl., 18 fig. 1930.—In this report is included the French, Danish and German literature on the peculiar life cycle of *Diplosis pini* on *Pinus silvestris* and its pathological status on *Picea excelsa.*—*v. Tubeuf* (*transl. by G. A. Bicherdorf*).

13897. **WICHMAND, HANS. Hylotrupes bajulus L. in Dänemark.** *Anz. Schädlingsk.* 7(2): 13-16. 2 fig. 1931. —*Hylotrupes* is more important than formerly. The increase is apparently correlated with the increased use of slate roofs. The damage is done under the roof. The attack to the main supports is slight. The sprays used in control are Bujerlin, Cuprinal and Goreal; Cyanogas and heat seem to give total kills.—*H. Wichmand* (*transl. by G. A. Bicherdorf*).

13898. **WOLFF. Fünf Jahre Arsenkampf gegen Forstschädlinge.** *Zeitschr. Forst- u. Jagdw.* 62(7/8): 465-497. 5 pl. 1930.—A chronological review of the systematic arsenical-poisoning campaign undertaken in Prussia, 1925-1929, against pine noctua (*Noctua piniperda* Panz.), pine sawfly (*Lophyrus pini* L.), nun-moth (*Liparis monacha* L.), pine looper (*Geometra piniaria* L.), and oak leaf-roller (*Tortrix viridana* L.), including operations with airplanes and with ground dusting apparatus. Of 71 operations, 41 were entirely successful. In 4 cases the result was not completely satisfactory, and 1 failure was due to unfavorable weather, 4 to late application, and 1 to undetermined causes. Success does not require complete destruction of the pest, but only destruction to the point where the endemic balance can be maintained naturally. No loss of birds or game animals resulted from the dissemination of vast quantities of As poisons. Objections based on the decimation of useful parasitic insects in such operations are without foundation. Both airplanes and ground machines find a useful field, the latter being preferable where the area does not exceed 100 ha. The Junker-type W33 airplane, poison dusting model 1929, is said to be the best for overhead operations, and Borchers' "Hercynia" motor duster to be the most effective apparatus for ground use. To be effective, poison dusting must be done in season, and not employed as a last resort.—*J. Roeser, Jr.*

13899. **ANONYMOUS. Mitteilungen des Pressedienstes des Preussischen Ministeriums für Landwirtschaft, Domänen und Forsten.—Forstschäden und ihre Bekämpfung.** *Zeitschr. Forst- u. Jagdw.* 61(10): 633-636. 1929. —The most destructive insect outbreak in forest history occurred in 1924 and 1925 when *Noctua piniperda* killed 5,423,950 cu. m. of timber on 23,623 ha. Following this insect, bark-beetles killed 3,272,260 cu. m. and necessitated the clear-cutting of 10,400 ha. in 1926 and 1927. The sudden removal of the forests has resulted in serious disturbance of ground water conditions over wide areas. The likelihood of future catastrophes of this kind is minimized by the recent progress in combating insects by scattering calcium arsenate from airplanes. The danger of destroying useful insects is apparently obviated by the employment of a new non-arsenic compound, Forestit, which was first prepared in 1928.—A hurricane on November 6-7, 1921, on the Bohemian frontier, was followed by winter damage and an attack by *Tomicus typographus*, which together resulted in the destruction of 690,000 cu. m. and clear cutting of 2,750 ha.—Only 1 large fire, about 1000 acres, is recorded for the last 10 yr. period. Progress is being made in the improvement of portable fire extinguishers.—*J. Roeser, Jr.*

(See also in this issue Entries 13453, 13569, 13573, 13578, 13591, 13592, 13601, 13603, 13604, 13629, 13681, 13687, 13707, 13722, 13727, 13939, 14677, 14691, 14693, 14706, 14771, 14785, 14796, 14839, 15009)

13900. **AYRES, SAMUEL, Jr. Pityriasis folliculorum (Demodex).** *Arch. Dermatol. and Syphilol.* 21(1): 19-24. 1930.—*Demodex folliculorum* was reported from 11 patients who had suffered from various degrees of dermatosis accompanied by itching and burning. In some cases there was pronounced scaling of the skin.

13901. **BECKETT, H. E. Colored glass as a deterrent to house flies.** *Nature* [*London*] 125(3160): 780. 1930.—Blue-green glass was effective.

13902. **CHORLEY, J. K. The bionomics of Glossina morsitans in the Umniati fly belt, southern Rhodesia, 1922-23.** *Bull. Ent. Res.* [*London*] 20(3): 279-301. 5 fig. 1929.—The pupal period is between 3 and 4 times as long in winter as in summer. Breeding continues all year, but greatest density and activity is in September, i.e., towards the end of the dry season. During a period of heavy rains, long grass and full forest foliage, puparia were fairly abundant. Density counts did not indicate lack of nourishment, although the grass in these mopane belts never grows long. All types of forest were used for breeding except the heavy river forest. In the mopane a heavy reduction in density occurred after leaf-fall. The puparia are attacked by at least 7 spp. of insect parasites. Of these *Mutilla glossinae* and possibly 2 spp. of bombyliids are the most important. These parasites show definite seasonal acitivity. At the end of the dry season, 84% of all emergences were parasites. The % of collected puparia which failed to yield either flies or parasites increased from 23% in March to 60% in November. Half an hour's exposure to the sun (118° F.), killed the puparia, even when covered with about 1 in. of sand. Parasitism and the hot summer sun on puparia no doubt contributes to the great fall in density throughout the mopane forest at the end of the late dry season. This fly belt has spread and game has increased despite free shooting since 1905. Between 1924 and 1925 the spread eastward has been rapid, and new settlement areas have been endangered. —*From author's summary.*

13903. **CHORLEY, J. K. Experiments in grass fires against Glossina morsitans in southern Rhodesia.** *Bull. Ent. Res.* [*London*] 20(4): 377-390. 1929.—An account is given of two organized grass fires in the Lomagundi fly-belt of Southern Rhodesia during 1927 and 1928, to control *G. morsitans*. The effect on the flora and game is described. The effect on the adults was to concentrate them along the shady watercourses; on the puparia, no immediate effect was noticeable. The dead puparia collected increased during Oct. and Nov., due probably to the sun, not the fire. The pupal period of the fly decreases from 82 days for puparia collected in June, to 21 days in Nov. Greatest activity of the fly appears to occur in September. A short account is given of the trypanosome infection and food of the fly. On the average 11% of the flies are infected with pathological trypanosomes in the proportion of 10 *congolense* group to 7 *vivax* group. Only 1 infection of the gland was found out of 1,523 dissections. Infection of flies tends to increase during the late dry season, coincident with the increased visibility of the game. Examination of the fat content indicated no starvation amongst the flies. Their food consists almost entirely of mammalian blood, only 1 case of avian blood being found. A decision has

not yet been reached as to the efficacy of grass fires as a means of control.—*From author's summary.*

13904. **COHN, WILLI M. Über eine Form der Malariabekämpfung in Palästina (Folgen eines Spleen).** *Bericht Senckenbergische Naturforschende Gesellschaft* 59(2): 123-124. 1929.—Thousands of *Lebistes reticulatus* [Cyprinodontidae] have been introduced into pools and cisterns in Palestine, where they destroy the larvae of *Anopheles* [Culicidae] and *Culex* [Culicidae].

13905. **[DRENSKI, P., and K. DRENSKI.]** ДРЪНСКИ, П., и К. ДРЪНСКИ. Приносъ къмъ изучване родъ **Phlebotomus (Dipt.)** и тридневната треска въ България. **[Phlebotomus and 3-day fever in Bulgaria.]** [German summary.] Известия на Българското Ентомологично Д-во (*Mitteil. Bulgar. Ent. Ges.*) 4: 31-56. 4 fig. 1927.—Studies were made of *Phlebotomus* from several places in southern and one in northern Bulgaria. Results are divided into 4 headings: morphology and biology of the genus, spp. and their distribution, epidemiology and clinical picture of "Papataci-fever," and prophylaxis and control of the disease. Under the 2nd heading the authors describe *P. papatassi* Scop., *P. minutus* Rond., *P. sergeti* Par., and *P. perniciosus* Serg., and give keys.—*F. M. Wadley.*

13906. **GAUT, R. C., and C. L. WALTON. Report on ox warble flies and their control.** *Ann. Rept. Agric. & Hort. Res. Sta. Univ. Bristol* 1929: 220-225. [1930].—A report on field experiments with treatments to kill the insects in the backs of the animals; also a study of infestation. Oily liquids or oily ointments were not effective, because they dispersed too quickly into the surrounding tissues. A proprietary ointment containing Derris root constituents and a mixture of Derris root with soap were effective and reasonable in cost, application being made 4 times during spring and early summer. —*W. H. Chandler.*

13907. **IYENGAR, M. O. T. Dissolved oxygen in relation to Anopheles breeding.** *Indian Jour. Med. Res.* 17(4): 1171-1188. 1 fig. 1930.—The dissolved O content of 332 ponds and ditches at Sonarpur, Bengal, India, varied from 0 to 6.5 mgm. per liter of water. *Anopheles* breeding was found over the entire range. Of the 6 spp. observed, no relation was shown to the concentration of O except possibly in the case of *A. pseudojamesi* and *hyrcanus* (var. *nigerrimus*) which decreased in prevalence with increase in O, but this may have been a coincidence and actually due to their association with the aquatic plant *Pistia.* The variation in O content of the surface water of the same ponds varied greatly during 24 hrs., reaching the lowest level at 6 A.M. and the highest point between 3 and 4 P.M. One pond examined frequently for 4 days showed a minimum of 3.57 mgm. per liter and a maximum of 6.94. Algae, particularly the very small forms of Volvacaceae and Pleurococcaceae, were thought to be mainly responsible for the enormous output of O during the day. The estimation of dissolved O was made by Winkler's method with slight modifications. For the comparative study the samples of water were all taken between 8 and 10 A. M. Details of the technique used are given.—*W. V. King.*

13909. **JOHNSON, CHARLES W. A bot fly from the White-footed mouse.** *Psyche* [*Boston*] 37(3): 283-284. 1930.—First definite record of *Cuterebra fontinella* Clark from *Peromyscus leucopus noveboracensis* in Massachusetts. A skin of *Rangifer caribou* from Labrador had over 1000 perforations by bot flies (probably *Oedemagena tarandi* L.).

13910. **KOBAYASHI, HARUJIRO. Study on the seasonal prevalence of house flies in Chosen (Korea).** *Far East. Assoc. Trop. Med. Trans. 7th Congr. Brit. India* 3: 186-195. 1927[1928].—Laboratory experiments show that the flies survive longer and produce more eggs in dry and hot weather, and adverse results are obtained in lower temp. and wet conditions. Counting of adult flies in nature shows that the flies are abundant twice in the year, late spring and early autumn; they are not rare in winter. Generally the climate in Keijo is dry, except July and August. Hot and dry air in the Korean homes during winter favors the overwintering of adult flies, which results in early prevalence in spring.

13911. **McINTYRE, G. Scabies in poultry.** *Jour. S. African Vet. Med. Assoc.* 1(3): 69-70. 2 fig. 1929.—Due to *Cnemidocoptes laevis gallinae.*

13912. **MOUTIA, ANDRÉ. Flies injurious to domestic animals in Mauritius.** *Mauritius Dept. Agric. Sci. Ser. Bull.* 15. 1-8. 2 pl. 1930.—Local data, symptoms, and control of flies causing myiasis (*Chrysomia putoria* and *Sarcophaga haemorrhoidalis*) and keratitis (*Stomoxys nigra*) of cattle.

13913. **PETERS, HAROLD S. Ectoparasites and bird-banding.** *Bird-Banding* 1(2): 51-60. 6 fig. 1930.—An account of lice, mites, ticks, fleas, and hippoboscids that infest birds, with some details of their appearance, life histories, habits, abundance, and importance, and with suggestions for coöperation between bird-banders and entomologists in solving problems relating to ectoparasites.

13914. **POTTS, W. H. A contribution to the study of numbers of tsetse fly (Glossina morsitans Westw.) by quantitative methods.** *So. African Jour. Sci.* 27: 491-497. 1930.—A critical account of the methods of counting the tsetse fly population of a given area. Data taken from a few collections on man or on cattle are of little significance, as such data do not allow for varying activity of the fly, or for rapid mass movements of the fly. "Fly rounds" (i.e., collection of flies at 3-5 half-hr. intervals, in the same locality, daily, the collection being done by natives) proved unsatisfactory. Extended reconnaissance fly rounds, covering large stretches of country, in which the collector followed regular beats which corresponded with definite vegetational or topographic areas, gave valuable results. The method preferred, and treated at length in this paper, is the method of "ecological fly catches." A party of definite size (4 catchers, 2 markers, 1 recorder) made 5-min. catches daily, the flies being marked and released. The party follows regular beats, on a "grid" system, whereby each catch is carried out along the same stretch once in 6 days.

13915. **SHORTT, H. E. Note on the feeding habits of Phlebotomus minutus.** *Indian Jour. Med. Res.* 18(3): 1047-1049. 1931.—Disagreeing with the statements made by Lloyd and Napier (See B. A. 5(11): Entry 28477), the author reports experiments in which sandflies (339 in all, *Phlebotomus minutus* group) placed on man (3 hrs.) and on geckos, fed on the latter sp. only. He suggests that either Lloyd and Napier were mistaken as to the identity of the insects they studied, or they may have used an unsatisfactory precipitin technique.

13916. **SIEVERS, HUGO K. Aparición de la larva de Hypoderma bovis en Chile. [Larva of H. bovis in Chile.]** *Rev. Chilena Hist. Nat. Pura y Aplicada* 32: 81-82. 1 fig. 1928(1929).—Larvae of this fly have been found in cattle imported into Chile from the U. S. A., and into Argentina from Germany. The hosts arrive in Chile at a season unfavorable for the development of the larvae, which consequently die without emerging.

13917. **SMITH, A. D. BUCHANAN. Colored glass as a deterrent to house flies.** *Nature* [*London*] 125(3160): 780. 1930.—Blue glass was effective.

13918. **TORRES, DEMETRIO DELGADO de. Dípteros parásitos de la langosta en España. [Dipterous parasites of Dociostaurus maroccanus in Spain.]** *Bol. Patol. Veget. y Ent. Agric.* 4(15-18): 65-68. 1 fig. 1929.

13919. **WELLS, CLIFFORD W. The identification of the anopheline mosquitoes of Porto Rico.** *Amer. Jour. Trop. Med.* 10(4): 243-248. 1 pl. 2 fig. 1930.—Distinguishing larval and adult characters of *Anopheles albimanus* (known vector), *A. grabhamii* and *A. vestitipennis,* are described and illustrated, especially as an aid for field workers on malaria.

INSPECTION AND REGULATION

(See also in B. A. 6(4): Entry 10929; and in this issue 13883, 13916)

13920. **BACK, NATHANIEL A. A study of the economic costs of quarantines in New Jersey.** *State of New Jersey, Dept. of Agric., Bur. Statistics and Inspection, Circ.* 182. 3-47. 4 maps. 1930.—The costs of operation of quarantine regulations against the Japanese beetle (*Popillia japonica*), the Asiatic beetle *Anomala orientalis*), and the Asiatic garden beetle (*Aserica castanea*) in New Jersey are analyzed in detail, to determine the costs to state and federal governments, nurseries, greenhouses, and dealers, farmers and to shippers of salt hay, sphagnum moss, straw, and sand. Eighteen greenhouses and nurseries reported that the cost of meeting the regulations constituted 20.66% of their net income. For the years 1918 to 1929, inclusive, the costs of administering the Japanese beetle quarantine in New Jersey totaled over one million dollars.

13921. **ESSIG, E. O. Plant quarantine.** *Science* 71 (1840) : 350-353. 1930.—A popular discussion of the history, types, and results of plant quarantines.—*C. R. Stillinger.*

13922. **McLAINE, LEONARD S. The gypsy moth outbreak in Southern Quebec.** *Jour. Econ. Ent.* 23(1) : 38-41. 1930.—Canada has been vitally interested in the gypsy moth (*Porthetria dispar*) situation for years. Scouting was carried on in New Brunswick and Nova Scotia in 1921, and was started in Quebec in 1922. After the discovery of an infestation within ½ mile of Canadian territory in 1923, more extensive and intensive scouting was carried on in the latter province, which resulted in 1 infertile egg cluster being found at Beebe, and quite a severe infestation at Henrysburg in 1924. A total of 2,908 egg clusters were found at Henrysburg, the last in 1926. Control operations consisting of spraying, creosoting egg clusters, banding and burlapping trees, and burning stone walls were followed. In addition, 6,248 miles of road, 250 miles of railroad, 1,638 miles of main highways leading to large centers, and 11 sq. miles of woodland, were thoroughly examined. The quarantines placed on southern Quebec by the United States and Canada Departments of Agriculture in 1924, have been rescinded.—*Author's abstract.*

(See also in this issue Entries 12775, 12778, 13753, 13847, 13851, 13852, 13854, 13856, 13857, 13858, 13859, 13860, 13861, 13862, 13863, 13864, 13883, 13891, 13892, 13897, 13898, 13906, 13922)

13923. **BARNES, J. W., and C. W. MURRAY. Sampling cleaned apples for determination of arsenical spray residue.** *Industr. and Engineer. Chem.* 21(11) : 1146-1147. 1929.—A statistical study of the variations in arsenical residue on individual apples that have been cleaned indicates that for apples carrying not more than 0.01 grain of arsenic trioxide per pound, a sample of 6 apples (taken at random from a lot all parts of which have had the same treatment) will give an accuracy of ± 0.0015 grain per pound.—*Authors' conclusions.*

13924. **DOUENCE, A. Les appâts empoisonnés. Leur utilisation dans la lutte contre les ennemis des cultures.** *Ann. Epiphyties* 15(1/2) : 1-96. 1929.—The history, properties, characteristics and uses of baits are reviewed at considerable length. Information is given on toxic substances used in baits, such as As, F, Ba, strychnine, P, silica, trimono-methylxanthine, theobromine, thallium sulphate, boric acid, salicylic acid, Na salicylate, formalin, cobalt, hexamethylene, tartar emetic, $BaCO_3$, $Zn_3(PO_4)_2$, Paris green, Ca arsenate, Na arsenate, Pb arsenate, Cu arsenate, Na borate, etc. Information on stimulants and attractives, such as the following substances: Essential oils, fruit essences, mineral oils, alcohols, aldehydes, acids, beer, sweet products (molasses, sugar, etc.), are discussed. Methods for studying attractants and poison baits are discussed at length. Studies are given on poison baits for: Rodents, birds, mammals, mollusca, crustacea, grasshoppers, crickets, elaterids, noctuiid caterpillars, *Tipula* larvae, sucking parasites, Coleoptera, Lepidoptera, Diptera, Hymenoptera, and other insects. About 40 formulae for poison baits are listed and discussed in connection with the above studies. Several pages are devoted to the discussion of the advantages and disadvantages of poison baits. Legal requirements in France in connection with the use of poison baits are discussed. There is an 8-page bibliography.—*J. W. Bulger.*

13925. **FARRAR, M. D. Effect of oil sprays on orchard fruit and foliage.** *Trans. Indiana Hort. Soc.* 1930: 76-80. 1931.—Chemically inert emulsions embodying saturated white oils (100 secs. viscosity Saybolt) may be used on apple foliage and fruit. Drought and high temp. (95° F.) will sometimes cause some limited fruit and foliage injury. White oils at 2% concentration, although slightly inferior to arsenate of lead, were a satisfactory substitute for it, when used for the late brood codling moth. The reduction of lead arsenate residue on oil sprayed fruit more than offset the difference in control. Nicotine sulphate 1-800 combined with oil emulsions, gave control comparable to lead arsenate.—*M. D. Farrar.*

13926. **GLEISBERG, W., und F. MENTZEL. Zur Methode von Raupenleimprüfungen im Freilandversuch.** *Zeitschr. Pflanzenkrank.* 41(10) : 481-518. 4 fig. 1931.—From experiments and a review of the literature, it is concluded that tests with sticky banding materials are of value to horticulturists only when based on a laboratory test made shortly before the field trial. A method was developed to determine the captivating power of the banding materials in the open which has been tried out successfully by 18 makers of commercial banding materials; also, the plasticity, duration time, and resistance of the materials to rain were determined.—*Authors' summary (transl.).*

13927. **INMAN, M. T. Jr. Sulfonated oxidation products of petroleum as insecticide activators.** *Industr. and Engineer. Chem.* 21(6) : 542-543. 1929.—Addition of certain oxidation products of petroleum to nicotine sulphate sprays for soft-bodied insects greatly increases the insecticidal efficiency of the latter: added at the rate of 1:200, a satisfactory kill may be obtained with ⅓-⅕ of the nicotine otherwise necessary. Such oxidation products of petroleum are regarded as activators, and are supposed to function by: (1) promoting wetting of the leaf and of the insect; (2) carrying the insecticide; (3) penetrating to the vital organs of the insect; (4) toxicity of their own. A chemical technique of oxidation and sulfonation suitable for preparing activator substances is given, and their physical and chemical properties are discussed.

13928. **JONES, HOWARD A. Decomposition of rotenone in solution.** *Industr. and Engineer. Chem.* 23

(4) : 387-388. 1931.—The stability of rotenone in various solvents has considerable interest from the insecticidal viewpoint. Benzene is valuable for extraction of rotenone and because no appreciable decomposition occurs in it. Acetone is a good water-soluble solvent for it, whereas in the presence of pyridine decomposition takes place rapidly. Solutions of rotenone should be freshly made or stored in air-tight containers. Whenever possible, it should be stored and shipped in the dry condition.—*C. H. Richardson.*

13929. **LUIGI, EMILIANI.** L'esca al fosfuro di zinco per preservare i vivai forestali dai danni delle grillotalpe. [Bait of zinc phosphide to protect nurseries from the damage of mole crickets.] *L'Alpe Riv. Forest. Ital.* 18 (7) : 380-382. 1 fig. 1931.—A mixture of ground rice (100 parts), water (25), and zinc phosphide (5) is used. Directions for making and applying are included.

13930. **MEHRHOF, FLOYD E., and E. R. van LEEUWEN.** An electrical trap for killing Japanese beetles. *Jour. Econ. Ent.* 23(1) : 275-278. 2 pl., 1 fig. 1930.—Best results were obtained with a frequency of 60 cycles and from 10,000 to 12,000 volts. Beetles were most attracted within a radius of 2 feet from the attrahent. A metal frame and porcelain insulators gave best results. The most effective bait was a geraniol emulsion sprayed on branches. Practically all beetles that were attracted were killed.—*P. M. Casamento.*

13931. **NELLER, J. R.** Removal of spray residues from apples. A wax-solvent method. *Industr. and Engineer. Chem.* 23(3) : 323-325. 1931.—HCl is effective in most cases, but it sometimes fails with fruits that have been sprayed with oil or have become waxy. Thorough cleaning was obtained by first dipping the apples in certain wax solvents, preferably methanol, after which treatment with an unheated HCl wash dissolves and removes practically all the lead arsenate residue.

13932. **PERROT, EM.** L'état actuel de la question du chrysanthème (Pyrèthre) insecticide. [Chrysanthemum (Pyrethrum) as an insecticide.] *Compt. Rend. Acad. Agric. France* 14(14/15) : 539-553. 1928.

13933. **PIERCE, W. DWIGHT.** The bearing of the oxytofactor in insect control. *Jour. New York Ent. Soc.* 39(2) : 159-165. 1931.—The value of insecticides is often governed by the oxytofactor (pH). A departure from the normal pH condition of an organism toward acidity or alkalinity brings about dormancy or, if great enough, death. *Helix adspersa* may be killed almost instantly by a very small amount of $CuSO_4$ or $FeSO_4$ coming in contact with the slime, due to the difference in potential.

13934. **SMITH, C. M., and C. W. MURRAY.** The composition of commercial calcium arsenate. *Industr. and Engineer. Chem.* 23(2) : 207-208. 1931.—Sixteen brands of recently manufactured Ca arsenate were analyzed in detail. A basic arsenate of undetermined composition is present. The average product contains 80-85% of what is probably a mixture of tricalcium arsenate and this basic arsenate, together with about 6.5% each of $Ca(OH)_2$ and $CaCO_3$ and small amounts of incidental impurities. The individual products may, however, differ rather widely from these average figures. —*Authors' summary.*

13935. **STREETER, L. R., and G. W. PEARCE.** Reactions involved in the use of hydrates in lead arsenate sprays. *Industr. and Engineer. Chem.* 23(10) : 1140-1144. 1931.—When acid lead arsenate reacts with small amounts of $Ca(OH)_2$ to form water-soluble As, the ratio of As to Ca found in solution agrees closely with the As : Ca ratio in $CaHAsO_4$. Small amounts of $Mg(OH)_2$ react with acid Pb arsenate to form larger quantities of soluble As than are found when $Ca(OH)_2$ is used. $CaCO_3$ and $MgCO_3$ react with Pb arsenate to form soluble As. $MgCO_3$ produces more soluble As than $CaCO_3$. The data justify the opinion that hydrates high in Ca are better correctives of spray injury than hydrates high in Mg. The reaction between $CaCO_3$ and Pb arsenate is inhibited in the presence of high concentrations of CO_2. Under normal atmospheric conditions the existence of sufficient CO_2 to suppress the formation of soluble As seems doubtful.—*Courtesy Industr. and Engineer. Chem.*

13936. **TERÉNYI, ALEXANDER, und JOSEPH PÁSKUJ.** Einfache und schnelle analytische Methoden zur Bestimmung des Wirkungssubstanzgehalts von Pflanzenschutzmitteln. VI. Die titrimetrische Bestimmung des Arsens in Pflanzenschutzmitteln. *Zeitschr. Analyt. Chem.* 84(11/12) : 416-441. 1931.—The authors adjust the distillation of As, and of dilute or concentrated solutions of As in HCl without H_2SO_4 and KBr. Insecticides can be directly distilled with conc. HCl in the presence of $FeSO_4$ and KBr. The decomposition is carried out either with H_2SO_4 and H_2O_2 or with H_2SO_4 and HNO_3. A solution of 50% H_2SO_4 is added and distilled with HCl in the presence of $FeSO_4$ and KBr. It is then titrated according to Gyory's method. When hydrazine sulfate is substituted for $FeSO_4$, a micro method of analysis can be applied to small quantities (0.4 to 4 mg.).—*J. M. Ginsburg.*

13937. **WILLIAMS, C. L.** Fumigants. *U. S.* [*A.*]. *Treas. Dept. Public Health Repts.* 46(18) : 1013-1046. 1931.—This paper, read before the police school in New York City, provides a relatively complete, though generalized account of the use of HCN gas as well as a briefer reference to other fumigants. Various methods of preparation and application are described, while other sections cover warning gases, poisoning, treatment, rescue, gas mask and fire hazards.—*C. L. Williams.*

13938. **WILLIAMS, C. L.** The air jet hydrocyanic acid sprayer. *U. S.* [*A.*] *Treas. Dept. Publ. Health Repts.* 46(30) : 1755-1761. 2 pl., 1 fig. 1931.—This new apparatus for spraying liquid HCN for fumigation consists essentially of an oxy-acetylene torch to the acetylene side of which has been attached a tube carrying liquid HCN and to the O side a compressed air supply line. A pressure of 100 lbs. per sq. inch is maintained on each line. The HCN is sprayed to considerable distances as a fine mist, which rapidly evaporates. Distribution is immediate and maximum concentration is rapidly attained. A special modification with spring control valves mounted on a handle carrying the nozzle, permits direct injection of gas into small enclosed spaces. An improvement of the latter uses compressed air passed through liquid HCN, eliminating the liquid HCN line.—*C. L. Williams.*

13939. **WILLIAMS, C. L.** Report on some tests of the use of a new cyanogen product in ship fumigation. *U. S.* [*A.*] *Treas. Dept. Publ. Health Repts.* 46(35) : 2048-2059. 2 pl. 1931.—The product tested was HCN discoids (now manufactured under the name of Zyklon Discoids). This consists of liquid HCN absorbed in discs of wood fiber and packed in strong cans. It is in all essentials similar to Zyklon (a German product in which HCN is absorbed in granular Kieselguhr), with the advantage that the individual discs, carrying ¼ oz. HCN in the 1 lb. size and ½ oz. in the 2½ lb. size, permit accurate dosage in small compartments, but the disadvantage that a special can opener is required. When the material is scattered, the HCN evaporates rapidly, so that after fumigations only traces remain in the discs. —*C. L. Williams.*

13940. **ANONYMOUS.** Effect of hydrocyanic acid gas on foods, fabrics, metals and other commodities. Excerpts from authoritative references. 11p. Compiled by the Ent. Sect., The Roessler & Hasslacher Chem. Co.: New York, 1931.

(See also in B. A. 6(1): Entries 257, 1173, 1316; 6(2): 3562, 3655, 5447; 6(3): 7989; 6(4): 11442; and in this issue 12912)

13941. **CALUGAREANU, D. Eine funktionelle Eigentümlichkeit der Spinndrüse des Seidenspinners (Bombyx mori).** *Zeitschr. Wiss. Biol. Abt. C, Zeitschr. Vergleich. Physiol.* 13(2): 223-230. 1930.—In observations on 300 silkworms the silk gland developed rapidly during the last 4 days of the larval stage. It reached its maximum weight at the time the silkworm ceased to take nourishment and sought a suitable site for spinning its cocoon. After the larva had begun to spin, the weight of the gland, in contrast to the total weight of the body, increased in the first 20-25 hrs. At this time the absolute weight of the gland was unchanged although it was functional. After 20-25 hrs., or at the time the rest of the body had come to constant wt., the silk gland began to lose. This loss lasted until the cocoon was spun. During this loss in weight, the gland changed all the material stored in its cells to silk, without any replacements from the blood, lymph, or other larval tissue. The cells of this gland, aside from its secretory activity, serve as a reserve organ in which the materials necessary to produce silk are stored.

13942. **CARBONE, DOMENICO. La vaccinazione dei bachi da seta.** [Vaccination of silk worms.] *R. Ist. Lombardo Sci. e Lettere, Rend.* 62(1/5): 138-142. 2 pl. 1929.—Silk worms, fed leaves which had been immersed in or sprayed with suspensions of cultures of bacteria isolated from worms dying of flacherie and gattine, showed some resistance to both diseases. Resistance seemed to be specific.

13943. **CARBONE, DOMENICO, et ELENA FORTUNA. La vaccination des vers à soie.** *Soc. Internazion. Microbiol. Boll. Sez. Ital.* 1(1): 11-12. 1929.—In 2 series of experiments, 30 lots of silkworms (4946 in all) were vaccinated against flacherie and grasserie by polyvalent and monovalent vaccines sprinkled over the food. Of the vaccinated worms, 28 lots showed a lower mortality than the unvaccinated controls; 1 lot had a mortality equal to that of the controls; and 1 lot had a higher mortality. Vaccination was more advantageous when applied early or during all stages than when given only during late stages.

13944. **JUCCI, C. La distribuzione del pigmento negli strati del bozzolo degli incroci reciproci (F) tra due razze di bachi da seta, Oro Chinese e Giallo Indigeno.** *Atti. R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 11(10): 909-915. 1930.—Pigments from the cocoons of 2 races (Oro Chinese and Giallo Indigeno) of silk worms, were extracted and estimated. The pigment from 2 gm. of cocoons, in 350 cc. of solvent, was colorimetrically equivalent to a 0.007% solution of xanthophyll. The different colors in the cocoon of the 2 races depend on the distribution of the pigments in the layers of the cocoon. The F_1 hybrids (♀ Oro × ♂ Giallo and the reciprocal cross) were intermediate between the parents as to the distribution of pigment in the layers of the cocoon and the degree of development of pigment migrating from blood to silk.—*C. Jucci.*

13945. **LOMBARDI, L. Nuove razze del baco da seta.** [New races of silk worms.] *Boll. Staz. Gelsi-Bachicultura. Ascoli Piceno.* 6: 145-190. 3 pl. 1927.—Eighteen new strains of silk worms were secured by crossing Yellow Italians with Oriental races over a period of 10 yrs. Four of the new strains possessed the principal characteristics of the parent stock, which apparently remained fixed from the 1st generation.—*M. Tirelli* (*transl. by A. Biraghi*).

13946. **LOMBARDI, L. Ricerche preliminari sull'azione della luce ultravioletta sul baco da seta e sull'impiego della luce di Wood come mezzo di selezione.** [Effect of ultraviolet rays on silk worms and on the use of Wood's light as a medium for selection.] *Boll. Staz. Gelsi-Bachicultura Ascoli Piceno* 7: 35-60. 1928.—Fresh laid eggs of silk worms are not fluorescent under Wood's light; eggs already colored give a yellowish or dark violet fluorescence. The cocoons give different colors according to the race to which they belong: the cocoons of the Italian yellow races are nearly all yellowish, a few are violet; the "chinese gold" are yellowish or violet, a few are brilliant yellow. The "chinese white" are mostly brilliant yellow. Fluorescence of the cocoons is not related to sex. All the layers of the yellow cocoons are yellow; the violet cocoons have the medium layers yellow and the others violet. The silk thread retains the fluorescent color of the cocoons from which it comes. After bleaching the fluorescence disappears.—*M. Tirelli* (*transl. by A. Biraghi*).

13947. **PATERSON, D. D. Sericulture in Iraq.** *Iraq Dept. Agric. Mem.* 14. 1-25. 1930.—A report of 8 yrs.' experiments. Local varieties are inferior in quality. The imported variety known as Baghdad White proved to be the most suitable, having a rendement of 3.3 and yielding an excellent quality of silk. The best mulberry tree for feeding the worms is the "Naringi Khafif." Local rearing, reeling and weaving were all profitable operations. Cocoons bought in Iraq for Rs. 4/- or less per kgm. would be sold profitably in the world's markets. Silk production in Iraq increased from 19 to 1600 packets of eggs during the period.—*D. D. Paterson.*

ANIMAL PRODUCTION

(See also in this issue Entries 12097, 12098, 12139, 12507, 12530, 12548, 12550, 12553, 12559, 12568, 12574, 12575, 12920, 12995, 13106, 13116, 13377, 13563, 13578, 13596, 13979, 13982, 14427, 14461, 15035, 15071)

GENERAL

13948. **DUERST, J. ULRICH. Grundlagen der Rinderzucht.** xvi+759p. 313 fig. (some col.) Julius Springer: Berlin, 1930.—RM 66.- and 69.-.

13949. **HOGAN, A. G. Retarded growth and mature size of beef steers.** *Missouri Agric. Exp. Sta. Res. Bull.* 123. 52p. 4 pl., 16 fig. 1929.—The length of the period of growth of normal beef steers was about 6 yrs.; in one case, a low plane of nutrition lengthened it to 9 yrs. Severe undernutrition during the first 3 yrs. or longer generally tended to reduce the mature size. The severity and length of underfeeding affected the mature size attained. All cattle did not make the same percentage gains in all measurements. Retarding growth did not result in abnormalities in form.—*H. W. Marston* (*courtesy Exp. Sta. Rec.*).

13950. **ISAACHSEN, H., og OLA ULVESLI. Rotfrugtbladenes kemiske sammensaetning, fordøielighet og melkeproduksjonsvaerdi. (The production value of roots and leaves.)** [With English summary.] *Meld. Norges Landbrukshøiskole* 9(10/11): 545-572. 1929.—Leaves, mainly of Dale's hybrid turnip, were tested for 3 yrs. on

22 pairs of milking cows. Roots were used as check fodder. As compared with roots, the leaves are distinguished by greater content of dry matter, organic matter, crude protein, true protein, fat, fiber and ashes; the same or somewhat smaller content of carbohydrates; and a different distribution of nitrogenous substances. The effect of leaves on animal growth was not so favorable as that of roots. There is indication that leaves produced a small, probably not significant, increase in the milk fat. —*From authors' summary.*

13951. **KOLBE, WALTER. Das Oberländer Pferd unter besonderer Berücksichtigung des Altbürschl-, Normänner-, Clydesdaler- und Clevelandstammes. (Thesis: Universität Leipzig.)** 86p. 2 maps, 4 pl. Robert Noske: Borna-Leipzig, 1928.

13952. **MACALIK, BASIL. Dějiny chovu skotu na Hané. [History of cattle husbandry in the region of Haná, Czechoslovakia.]** [With French summary.] *Sbornik Československé Akad. Zem.* 6(2): 171-256. 10 fig. 1931.

13953. **RICHTER, K., K. E. FERBER, und CHRZASZCZ. Fütterungsversuche mit Roggen und Gerste bei Schweinen.** *Mitteil. Deutsch. Landw. Ges.* 45(25): 545-547. 1930.—There were no evident ill effects from substituting rye for half or even all of the barley in a mixed supplementary feed (80% grain, 8% herring meal, 5% dried yeast, 5% soybeans, 2% chalk) for nursing pigs or in the main feed for a 19-weeks fattening period immediately after weaning (with protein and mineral supplement). The average daily gains for the all-rye (I), half rye (II), and all-barley (III) groups were: 549, 629, 627 gm., respectively; the total nutrients required per kgm. gain: 3.26, 2.94, 2.70 kgm. The losses at slaughter for Groups I, II, and III were: 18.76, 18.57, and 16.75%, respectively. Differences in the quality of the meat were slight.—*M. H. Keith.*

13954. **[RYBIN, D. A.]** РЫБИН, Д. А. Виковое зерно, как основной источник белка для растущих и откармливаемых свиней. **[Vetch seed as the main source of protein for fattening swine.]** Известия Северо-Черноземной (бывш. Шатиловской) Областной Сельско-Хозяйственной Опытной Станции (*"Isvestia" (Annals) of the Shatilov (North-Chernoziom) Agric. Exp. Sta.*) 3(2): 125-136. 4 pl. 1929.

13955. **SHAW, THOMAS. A grassland dairy smallholding.** *Jour. Min. Agric.* [*Gt. Britain*] 36(8): 713-724. 2 pl. 1929.—Rotational grazing and fertilization were the important factors in a production of 426 gallons of milk per acre on a 25-acre farm. 8 paddocks of about 2 acres each were grazed by the herd of 14 cows. After each milking, the cows were given access to a fresh paddock for 1 hr., the balance of the grazing being obtained from partially grazed paddocks. When the grass became exhausted, each paddock was harrowed, fertilized and rested for 4-6 weeks. The amounts of milk secured when a 12% protein concentrate supplemented the pasture were about equal to those produced when a 22% protein concentrate was used. This is thought to demonstrate the high protein content of the pasture grass under the system used.—*W. B. Nevens.*

13956. **WATSON, S. J. The digestibility and feeding value of dreg meal.** *Jour. Agric. Sci.* 21(3): 410-413. 1931.—Trials with sheep showed dreg meal to be a valuable foodstuff of high digestibility and feeding value. Owing to its high oil content, however, it should be used with caution and cattle should not receive a greater allowance than 4-5 lb. per head per day. Because of its low fiber content, it should be a suitable foodstuff for pigs as well as cattle and form a useful source of protein in the ration. Detailed results are given in tables.

13957. **WILKENS, Ein Beitrag zur zweckmässigen Verwendung des Zuckers in der Schweinemast.** *Zeitschr. Schweinezucht* 38(5): 95-97. 1931.—No increased appetite was observed in animals fed sugar. Sugar may replace 20% of the total feed of barley. No unfavorable effect of sugar on the quality of flesh and fat was observed.—*Author's summary (transl. by W. E. Joseph).*

13958. **WINKLER, WILLIBALD, WALTER GRIMMER, und HERMANN WEIGMANN, Editors. Handbuch der Milchwirtschaft. Bd. I, Teil I. Die Milch: Zusammensetzung, Eigenschaften, Veränderungen, Untersuchung. The modifying factor was found to be not moisture but availability of nutrient salts.—*H. D. Hill.*

13969. **FRANKEL, O. H. Pflanzenzüchtung in Neuseeland.** *Züchter* 1(9): 290. 1929.—The Canterbury Agricultural College at Lincoln has co-operated with the Wheat Research Institute. Hilgendorf began selection work with wheat in 1910. At present 90% of the wheat grown in New Zealand is from these selections. The average yield of 250,000 acres is 31-32 bushels per acre. Oats, grasses and red clover are being studied.—*F. V. Owen.*

13970. **FURBY, E. B. Murrumbidgee irrigation area (Griffith end.)** *Agric. Gaz. New S. Wales* 41(5): 362-368. 1930.—Results of tests with fertilizers and varieties of cereals.

13971. **GARRATT, G. T. An experiment in grassland manuring, 1928.** *Jour. Min. Agric. [Gt. Britain]* 35(12): 1121-1125. 1929.

13972. **GHESQUIÈRE, J. A propos des Faux-Cotonniers Congolais et de leurs possibilités culturales.** *Annales de Gembloux* 33(5): 173-188. 1927.—Refers to *Ceiba, Gossampinus* and *Bombax.*

13973. **GÓRSKI, M., i St. KLARNER. Potrzeby nawozowe machorki. [Fertilizer trials with Nicotiana rustica.]** [German summary.] *Roczniki Nauk Rolniczych i Leśnych [Poznan]* 24(1): 17-27. 1 fig. 1930.—Results of 3 yrs. show that *N. rustica* responds most to N and to a lesser degree to K. Leaf analysis revealed a marked influence of fertilizer upon nicotine content in that lack of N and K reduces this constituent whereas lack of P increases it.—*F. F. Halma.*

13974. **HACKING, THOMAS. Grassland improvement trials at Shoby, Melton Mowbray, Leicestershire.** *Jour. Royal Agric. Soc. Eng.* 90: 176-182. 1929.—Results from trial plots at the end of 6 yr. demonstrate that grassland improvement comprises something more than the application of fertilizers. Surface cultivation is imperative in a large number of cases and where thoroughly carried out prepares the way for the full and effective use of fertilizers. Surface cultivation and fertilization must go together. The superiority of basic slag as compared to North African phosphate was shown.

13975. **HONCAMP, F. Handbuch der Pflanzenernährung und Düngerlehre.** Band 2: **Düngemittel und Düngung. [Handbook of plant nutrition and fertilizers.** Vol. 2. **Fertilizers and manures.]** xii+919p. 285 fig. Julius Springer: Berlin, 1931. RM 86; bound RM 89.80.

13976. **KOCH. Sicherstellung des Winterfutters durch Stickstoffdüngung der Wiesenflächen.** *Mitteil. Deutschen Landw.-Ges.* 45(13): 275-277. 1930.—The average hay yield of Germany is 3500-4000 lb. per acre. As an average of a large number of tests with ammonium sulphate and calcium nitrate during 1923-29, applications of 36, 71, and 107 lb. of N per acre increased hay yields by 1258, 2219, and 3306 lb., respectively, per acre (total of 2 cuttings). The interest return on the investment in nitrogen was about 90%. 63% of the total yield was obtained at the 1st cutting.—*F. H. Crane.*

13977. **LENNOX, C. G. The variety problem in Australia.** *Hawaiian Planters' Record* 35(1): 21-26. 1931.—The insect and disease problems of the Australian sugar industry are the result of unrestricted importing of sugar cane cuttings from all countries of the world. Importation is now permitted only under rigid quarantine. The breeding of sugar cane seedlings was spasmodic for 20 yr. Within the last few years an organized effort has been made to start a breeding and selection program. A system of controlled planting of only approved varieties of high sucrose content, as well as a higher rate of payment for cane of high sucrose content, has tended to increase the juice quality of the whole crop. The 1929 season's quality ratio figures from 5 representative mills show H. Q. 426, B 208 and Q 813 to average better in juice quality than Badila.—*Author's summary.*

13978. **MAKIN, R. N. Pasture improvement on the near southern highlands.** *Agric. Gaz. New So. Wales* 41(5): 334-336. 3 fig. 1930.—Notes on results of tests on fertilizing and types of pasture plants.

13979. **MONTAGUE, ENOS J. Intensive grassland management under the Hohenheim system.** *Amer. Soc. Animal Product. Rec. Proc. Ann. Meet.* 1929: 61-69. 1930.—A brief summary of 2 yr. work on intensive grassland management under the Hohenheim system at the Massachusetts Agricultural College. A heavy, thick turf is essential for best results from fertilizer application. The application of fertilizer increases the quality and quantity of pasture grass. Nitrogenous fertilizers

are necessary for greatest returns when a good pasture turf is established. Proper management of the herd and plots, combined with fertilizer treatment, is essential for the greatest net returns per acre from an intensive grassland system. It is difficult to conceive of an intensive system without the use of fertilizers.—*From author's summary.*

13980. **PADEREWSKI, JÓSEF.** Przyczynek do badań nad polaryzacją fizjologiczną i asymetrją chemiczną w burakach curkrowych. [Polarization and chemical asymmetry of beet sugars. (Cont'd.)] [French summary.] *Doswidczalnictwo Rolnicze* [*Warsaw*] 5(3): 56-77. 2 pl., 37 fig. 1929.—This article, which is part 2 of a series of studies, deals with the development and arrangement of the root system of the sugar beet.—*D. J. Healy.*

13981. **PAMMEL, L. H., and C. M. KING.** Heights of weeds. *Proc. Iowa Acad. Sci.* 36: 221-231. 1929 (1931).—The range of height of 96 spp. is given. From 1 to 11 localities are cited for each sp., with type of soil. A chart of rainfall and temp. is added.—*H. S. Conard.*

13982. **PUGSLEY, L. I., and R. R. McKIBBIN.** Calcium relationships of forage crops. *Canadian Jour. Res.* 4(1): 39-51. 1931.—The Ca content of timothy and red clover hays increased directly as the total Ca content of the clay loam soils in which they were grown, and decreased as the "lime requirement" of these soils increased. There was no proportionate increase of protein or of P as the Ca content of the hays increased. The timothy hays from the area investigated are extremely low in Ca but are otherwise normal. The ratios CaO: P_2O_5 and protein: CaO for these timothy hays are, respectively, abnormally low and abnormally high. These values appear to be normal in the red clover hays.—*Authors' abstract.*

13983. **REMY, TH., FR. von MEER, und H. VÖLKER.** Über den Einfluss von Düngung und Strandraum auf die Pflanztauglichkeit der Kartoffeln. *Landwirtsch. Jahrb.* 72(2): 209-246. 12 fig. 1930.—Contrary to earlier observations, it was found that differences in spacing and fertilization neither affected the vigor of potato plants nor the proportions of non-precipitable and amino acid N in the tubers. No relationship was established between the vigor of the plants and the amount and form of N in the tubers.—*From abstr. by T. Remy (transl. by B. A. Brown).*

13984. **SCHUSTER, GEO. L.** La potasa en relación con la calidad de las cosechas. [Potash in relation to quality of crop.] *Bol. Compañia Admin. Guano* [*Lima*] 6(7): 383-405. 15 fig. 1930.—See B. A. 2: Entry 6706.

13985. **STÄGMEYR, E.** The use of potash on tropical and sub-tropical crops. 32p. 5 fig. Agric. Dept., The Dominions Potash Supply, Ltd.: London, 1930.—This handbook, for farmers and planters in tropical and subtropical countries, includes a discussion of the principles of manuring and green manuring as applied to the tropics. Specific recommendations are given as to soil requirements and fertilizer practice best adapted for the principal commercial crops. These include grain and hay crops, tea, coffee, cacao, sugar cane, sisal, cotton, rubber, coconut, other field crops, fruit and truck. The importance of experiments conducted by farmers to determine the specific needs of their own soils is emphasized.—*F. L. Duley.*

13986. **STRÖBELE, F., PH. HOFFMANN, und G. GROSS.** Ergebnisse mehrjähriger Tabakdüngungsversuche in der Pfalz. *Arbeit. Deutschen Landw.-Ges.* 370. 9-36. 1929.—Nitrogen from manure may be entirely or partly substituted by N from artificial fertilizers. It is not usually advantageous to use manure alone, however, nor to use only artificial fertilizers in tobacco culture, but the latter is possible where the preceding crop has received manure. For bright tobacco it is good practice to supply ⅓ of the N from manure and the balance from minerals. An application of N in the form of urea or sulphate of ammonia always resulted in increased yields. 60-80 lb. of N to the acre, without manure, should suffice to produce a crop of tobacco, while with manure, 30-60 lb. should suffice. Urea produced better quality than sulphate of ammonia. When urea or sulphate of ammonia are used it is advantageous to divide the application so that ½ is given 8-14 days before planting and the balance as side-dressing. Topping did not affect quality, but a lower yield was obtained from tobacco not topped as compared with topped tobacco.—*From authors' summary (transl. by T. R. Swanback).*

13987. **TRAUB, H. P., and C. E. STEINBAUER.** Summer frost prevention on northern peat lands by raising the ground water-table. *Proc. Amer. Soc. Hort. Sci.* 1927: 54-60. 3 fig. 1927.—A study was made of the temp. 1 ft. above the surface of peat lands during summer frosts as affected by different ground water-tables. Raising the ground water-table 2 ft. raised the temp. 1.2-1.3° F., 1 ft. above the surface. Data are given to show that in 1927 a tomato crop was severely damaged by summer frosts when the ground water-table was at 4-5 ft., while with a 3 ft. table there was very slight injury.—*A. K. Anderson.*

13988. **WESSELS, P. H.** Effect of different hydrogen ion concentrations upon the yield of potatoes. *Proc. Ann. Meet. Potato Assoc. Amer.* 15: 27-29. 1928. 245-250. 1929.—Results of experiments covering a soil reaction of pH 4.4-6.6 show a rather narrow margin between the point where yields are cut by too much acidity and the point where trouble with scab begins because of too little acidity. The point at which scab becomes serious is not clearly established by these 3 yr. results. In 1926 Irish Cobblers were free of scab at pH 6.0 and 6.6. In 1927 Green Mountains in the same plots were badly scabbed. So far as yields are concerned, a reaction just sufficiently acid to control scab seems best. On Long Island scab is seldom serious where the reaction is more acid than pH 5.3. The cooking qualities of potatoes grown on the more acid soils are decidedly inferior to those of potatoes grown on soils at pH 4.9-5.3.

13989. **WUNDER, B.** Anfänge der Weizenzüchtung in Chile. *Züchter* 1(9): 280-289. 3 fig. 1929.—General adaptation tests so far have been emphasized. Wheat varietal tests were begun in 1924, much of the agricultural land in Chile being well adapted to wheat. Many varieties from the U. S. A., Canada, Europe and elsewhere have been tested. Resistance to *Puccinia graminis* and *P. triticina* is important and preliminary work is reported. A limited number of crosses are described.—*F. V. Owen.*

HORTICULTURE

F. C. BRADFORD, *Editor*

(See also in this issue Entries 12074, 12155, 12175, 12309, 12519, 12520, 12746, 12766, 12786, 12794, 12797, 12801, 12804, 12812, 12817, 12826, 12847, 12873, 12982, 12992, 13975, 13985, 14132, 14151, 14168, 14179, 14199, 14202, 14203)

13990. **BAILEY, L. H.** The fear of cultivated plants. *Gentes Herbarum* 2(4): 159-163. 1930.—The author deplores the prejudice of systematic botanists toward cultivated plants. They are not so inextricably hybridized as commonly supposed. Cultivated plants are divided into 2 great classes: (1) archeophytes (such as wheat, apple, cabbage), whose evolution goes back into archaeology, and (2) those less anciently associated with man and more readily identified with a wild prototype.

13991. **BURKHOLDER, C. L., and LAURENZ GREENE.** Influence of size of Mahaleb seedlings on nursery grades. *Proc. Amer. Soc. Hort. Sci.* 27: 85-86. 1930 (1931).—Data from trees growing under very adverse conditions for 2 seasons seem to indicate that the

size of the seedling budded is important in the production of a large, 1-year-old cherry nursery tree.

13992. **CALMA, V. C., and H. W. RICHEY. Influence of amount of foliage on rooting of Coleus cuttings.** *Proc. Amer. Soc. Hort. Sci.* 27: 457-462. 2 pl., 3 fig. 1930 (1931). —The results indicated that root production is determined largely by the amount of leaf area on the cutting. Cuttings with the greatest leaf area produced the largest amount of roots and also the highest percentage of rooted cuttings. Cuttings defoliated on one side produced roots mostly on the side containing leaves; a high percentage of mortality occurred in fully defoliated cuttings.

13993. **CIFERRI, R. Informe general sobre la industria cacaotera de Santo Domingo.** *República Dominicana Estac. Agron. Moca Ser. B. Bot.* 1929 (16): 1-177. 2 maps, 60 pl. 1929.—Contains: preliminary notes about the world development of the cacao industry; developmental history, statistical data, and economic importance of the Dominican cacao industry; distribution of cacao culture in Santo Domingo; meteorological and climatic data, and the relation of rainfall to yield in the cacao districts; species and varieties of cacao and enumeration of shade trees; organolectic and analytic data on Dominion cacao; preliminary notes on agricultural ecology of cacao tree; production data for 24 yr. from a cacao estate; parasitic and non-parasitic diseases of cacao tree. Three indices and 54 tables are annexed. The annual cycle of cacao, from the ecologic-agricultural standpoint, is divided into 5 sub-periods: (1) period of bloom; (2) from fecundation to the attainment by the fruit of a length of 10 cm.; (3) from this length to full size; (4) from full size to full ripeness; (5) rest period, from ripening of fruit to the next bloom period. No definite correlation exists between rainfall and yield of cacao in Santo Domingo.—*R. Ciferri.*

13994. **DARNELL, A. W., Ed. Illustrations and descriptions of beautiful and interesting plants suitable for outdoor culture in the British Isles.** *Hardy and Half-Hardy Plants* 1 (2): 20-42. 21 pl. (1 col.) 1929.—Plates of the following plants, with brief descriptions of each: *Arisaema triphyllum, Asplenium petrarchae, Berberis wallichiana, Calceolaria fothergillii, Castilleja linariaefolia, Chamaescilla corymbosa, Citrus trifoliata, Corysanthes macrantha, Cynoxylon floridum, Epigaea repens, Gladiolus edulis, Glaucium flavum, Iris delavayi, Kneiffia fruticosa youngii, Lathyrus pubescens, Meconopsis heterophylla, Morisia hypogaea, Philesia buxifolia, Primula paulinae, Sarracenia purpurea, Tecophilaea cyaneo-crocea.*

13995. **DOUGLASS, J. The snake bean. Suitable for dry western districts [of New South Wales.]** *Agric. Gaz. N. S. Wales* 42 (5): 379-380. 1 fig. 1931.—The author recently discovered a selected, climbing, disease-resistant type which meets the requirements of dry western districts where hot winds destroy the pollen. Best results are obtained when the plantings are made after the soil has warmed up in the early part of October.

13996. **EINSET, OLAV. Open pollination vs. hand pollination of pollen-sterile grapes.** *New York State [Geneva] Agric. Exp. Sta. Tech. Bull.* 162. 1-14. 6 fig. 1930.—Selfing Concord and Rosaki varieties with upright stamens, under glass, cheesecloth, or paper covers gave a full set; while selfing Brighton, Eclipse, Lindley, and Pontiac varieties with recurved stamens, under the same covers, gave no set. Bakator, also with recurved stamens, gave no set when enclosed in paper bags. Clusters of the self-unfruitful varieties were paired, both clusters being left to open pollination, while one of the 2 clusters was hand pollinated as well. The open-pollinated clusters were characteristically loose, while those bunches of the same variety which were also hand pollinated were compact.—*O. Einset.*

13997. **GARDNER, F. E. The relationship between tree age and the rooting of cuttings.** *Proc. Amer. Soc. Hort. Sci.* 26: 101-104. 1929.—Working with a number of deciduous and evergreen tree spp. the author found that cuttings made from the stems of 1-yr.-old seedlings root much more readily than cuttings from 1-yr. wood of older trees. Even those species considered very difficult to root from cuttings, such as cherry, apple, locust, and the pines, rooted rather freely when the stems of 1-year-old seedlings were used. With increased age the faculty of rooting diminishes rapidly.—*F. C. Bradford.*

13998. **GEISE, F. W. Spinach for canning: the relation of physical and chemical properties to quality.** *Maryland Agric. Exp. Sta. Bull.* 320. 303-326. 6 fig. 1930.—Of the 3 crops of spinach, fall harvested, overwintered, and spring sown, possible under Maryland conditions, that harvested in the 1st half of the fall produced the highest yields of trimmed spinach, while the overwintered crop averaged low in yield. Quality declined rapidly in the fall crop with the advance of the season, this loss being accompanied by a decline in moisture content, an increase in percentage of total and invert sugars, and a decline in total hydrolyzable substances, but with no evidence of any correlation between season and the percentage of crude fiber. Total and invert sugars were lower in young than in mature leaves, while the percentage of total nitrogen was greater in the young leaves. From storage experiments at controlled temp. the author concludes that the high percentage of total and invert sugars in the fall crop may be correlated with low temp. prevailing at that time. Spinach stored at 26° F. gained slightly in moisture, while at 40° and at 60-70° moisture was lost in direct proportion to rise of temp. Loss in invert and total sugars was greatest at the higher temps. Practical deductions are offered.—*J. W. Wellington (courtesy Exp. Sta. Rec.).*

13999. **HANDEL-MAZZETTI. H. The natural habitats of Chinese Primulas.** *Jour. Roy. Hort. Soc. [London]* 54 (1): 51-62. 4 pl. 1929.—The character of the habitat in China in which each of 83 species was found is briefly described. Only a small part of China is involved in the distribution of the spp. of this genus, whose real home is the highland and the high mountains of Yunnan and West Szechwan, where more than ⅓ of all the species are indigenous. The subtropic zone at 6,000-9,000 ft. is characterized by an arid climate and this seems to be the home of the Malvacea section of the genus. As the elevation increases there is a greater amount of precipitation and consequent increase of humidity. The species occurring in the various zones from the subtropic at 6,000 feet to the alpine at 15,600 feet, where the small Nivalids grow, are presented according to their specific habitats. Some species grow naturally in the crevices of rocks in open and exposed situations, others only under shelter. Granitic rocks, slate, sandstone, limestone, alluvial soils, leaf mold and decaying humus apparently each support certain species, and the facts presented indicate an adaptation of the species to widely diverse conditions of habitat. The purpose of the article is to furnish information to horticulturists useful in providing favorable conditions for propagation.—*P. D. Strausbaugh.*

14000. **HOPKINS, E. F., and J. H. GOURLEY. The effect of nitrate applications on the soluble carbohydrate in apples.** *Proc. Amer. Soc. Hort. Sci.* 27: 32-36. 7 fig. 1930 (1931).—Nitrates had little effect.

14001. **HUBBELL, DONALD S. The influence of various plant containers on the growth and development of Pelargonium hortorum.** *Proc. Amer. Soc. Hort. Sci.* 27: 475-477. 1930 (1931).—Pots made of mulch paper, unglazed clay, glazed clay, and screen were equally effective when given similar treatment. The conclusions were based on root and top weight, total amount of water consumed, inside and outside temp. within the potted soil, and the percentage "potbound." Nine other types of pots produced abnormal plants.

14002. **KNOWLTON, H. E., and M. B. HOFFMAN. Nitrogen fertilization and the keeping quality of apples. (A preliminary report.)** *Proc. Amer. Soc. Hort. Sci.* 27: 28-31. 1930 (1931). Pressure tests on Black Twig (1928 crop) and Stayman (1928 and 1929 crops) showed greater firmness in samples picked from unfertilized, as compared with N-fertilized, trees. Results with Grimes (1929 crop) were conflicting. The divergence from re-

sults obtained by some other workers is attributed to the use of composite, i.e., orchard run, samples, rather than samples with matched colors. Poorly colored fruit is softer, and the percentage of poorly colored fruits is higher, on fertilized trees. The authors conclude tentatively "from the practical standpoint there was little if any difference in storage quality between fruit from trees fertilized with nitrate and from trees receiving none," but consider further study advisable.—*F. C. Bradford.*

14003. **LAMBE, RICHARD F. The new hybrid citrus.** *Gard. Chron.* [*London*] 89(2298) : 35. 1931.—Notes on the production of hybrids of grape fruit × tangerine.

14004. **LANTZ, H. L., and S. W. EDGECOMBE. Apple breeding: some significant differences in the vigor and grade of cross-bred apple seedlings.** *Proc. Amer. Soc. Hort. Sci.* 27: 289-295. 1930(1931).—Despite the assumed heterozygous genetic constitution of apple varieties, it is evident that progenies produced by crossing different varieties differ as to average vigor, range of vigor and in grade of tree. Varieties may be placed in at least 3 general groups with respect to their prepotency for vigor. The varieties within the proposed groups may not be identical in genetic constitution, but their seedlings indicate that they are of similar constitution, but this point needs verification. The varieties studied here are grouped tentatively as follows: Group 1: Sharon, and possibly Patten 1031 and Northwestern Greening; Group 2: Delicious, Monona, Jonathan, Ames 516, McIntosh, Ames 426, and Wolf River; Group 3: Salome, Malinda, and Patten 1023.—*Authors' conclusions.*

14005. **MENDES, CARLOS TEIXEIRA. Idéas geraes sobre a adubação do cafeeiro (Adubos organicos). [Organic fertilizers for the coffee-tree.]** *Agronomia, Ann. Soc. Brasil. Agron.* 1: 39-55. 1930.

14006. **PEARSON, O. H. Methods for determining the solidity of cabbage heads.** *Hilgardia* 5(11) : 383-393. 3 fig. 1931.—The volume and density of 37 heads of the Copenhagen Market type of cabbage, approximately a slightly flattened sphere in shape, and of 18 heads of other types of cabbage, have been determined by 5 methods. Densities based upon calculated volumes showed a general agreement with those determined directly by water displacement, but a variation of as much as 25% of the direct determination was sometimes found when geometrical methods were employed. An immersion method making use of a rubber cap and heavy rubber bands to retain all the air in the head was shown to permit of duplicating results on a given individual head with an extreme experimental error of about 6%. With the apparatus used for determining volume by displacing water, not more than 6 determinations could be made an hour, while the buoyancy method was much more rapid.—*Author's summary.*

14007. **POTTER, G. F., and E. H. PUTNAM. Comparative growth characteristics of the Baldwin and McIntosh apples.** *Proc. Amer. Soc. Hort. Sci.* 27: 265-270. 3 fig. 1930(1931).—The Baldwin and McIntosh varieties in 2 orchards were similar as to amounts and variability of twig and spur growth. Some correlation exists between fruitfulness and vigor of spur as measured by annual increment of length growth. On this basis the Baldwin spur requires greater vigor to obtain any given amount of fruitfulness than does the McIntosh. Spurs of McIntosh under similar growth conditions bloom more profusely than do those of Baldwin. The most striking difference between the 2 varieties, however, is in the matter of successive bloom on the same spur, which is common in the McIntosh and with that variety is an important means of attaining annual bearing, but is almost wholly lacking in the Baldwin.—*Authors' summary.*

14008. **ROWNTREE, LESTER. California Calochorti for eastern gardens.** *Horticulture* [*Boston*] 8(21) : 507. 1930.—Of 24 spp., only the following are reliably hardy in the northeastern U. S. A.: *Calochortus leichtlinii, C. nuttalli, C. macrocarpus* and *C. nudus.*—*C. G. Bowers.*

14009. **SCHILLETTER, J. C., and H. W. RICHEY. Four years' study on the time of flower bud formation in the Dunlap strawberry.** *Proc. Amer. Soc. Hort. Sci.* 27: 175-178. 1930(1931).—Differentiation did not occur at the same corresponding time during the 4 seasons. The initiation of flower buds proceeded for at least 6 weeks, and did not take place in all plants at the same time.

14010. **TUKEY, H. B., and KARL BRASE. Granulated peat moss in field propagation of apple and quince stocks.** *Proc. Amer. Soc. Hort. Sci.* 27: 106-108. 1 pl. 1930(1931).—In general the indications are that types of vegetative stocks which root easily are benefited by peat less than are those which root with greater difficulty. The quince, which roots readily, gave 62% well-rooted plants from untreated, and 78% from treated rows, an increase of only 24.5% in favor of peat, though the quality of plants from treated rows was markedly superior. On the other hand, with apple Type XIII, which roots with greater difficulty than quince, the percentage of well-rooted plants from untreated rows is 21.5 and from treated rows 46.4, an increase of 115%, the benefits being further supplemented by the higher quality of plants from peat-treated rows.

14011. **WINKLER, A. J. The relation of number of leaves to size and quality of table grapes.** *Proc. Amer. Soc. Hort. Sci.* 27: 158-160. 1930(1931).—Under vineyard conditions at Davis, California, the Malaga, thinned to a maximum of 33 leaves to a cluster, produced fruit of good size and high quality. With less thinning of the crop, i.e., with fewer leaves to a cluster, the berries were much smaller and the sugar and acid contents indicated poor nutrition. Increasing the number of leaves to more than 33 to a cluster by more severe thinning produced somewhat larger berries and better quality. In this case, however, the thinning was sufficiently severe to reduce the total crop considerably.

FORESTRY

W. N. SPARHAWK, *Editor*

(See also in this issue Entries 12074, 12097, 12098, 12143, 12647, 12650, 12672, 12685, 13629, 13899, 14130, 14144, 14209)

14012. **AITCHISON, P. E. Annual forest administration report of the Bombay Presidency including Sind for the year 1929-30.** 69p. 10 pl. 1931.—Alternately soaking and drying teak seed fortnightly, if repeated 3 times in succession, results in wastage of seed through premature germination. An investigation with 3 methods of propagating *Dendrocalamus strictus* gave the following results in order of merit: (1) Transplanting 1-yr. old seedlings, (2) direct sowing in lines, and (3) planting out 3-foot cuttings with roots. *Santalum album* trees of the same girth growing in the same locality do not always contain the same thickness of heartwood nor is the shape of the heartwood on a cross-section necessarily concentric with the annual rings. The best age at which to coppice *Hardwickia binata* for producing a copious supply of leaves for fodder is between 30 and 40 yrs.—*M. V. Laurie.*

14013. **AUBREVILLE, M. L'aménagement de la forêt de la Côte d'Ivoire.** *Bull. Agric. Congo Belge* 21(4) : 1395-1412. 1930.—The Ivory Coast equatorial forest of 12 million ha. is botanically rich but economically poor. The original forest is being converted to a valueless secondary type with a high fire hazard. Forest laws of 1912 restricting clearings were ineffective. National forests established in 1928 serve as botanical reserves of primitive forest types and as protection areas. Other

reserves will be managed to increase the proportion of economically usable species. A minimum size cutting limit will not suffice. Rapid weed growth and costly release cuttings discourage extensive replanting. An all-aged mixed stand of a large number of valuable species can be built up gradually and economically. Often the desirable young trees present will suffice to improve the forest if their crowns are kept free by cleanings every 5 yrs. Interplanting young trees of several valuable species growing under natural conditions will hasten this improvement. One hundred young trees per ha. are needed. Old trees should be removed. By freeing seedling crowns from competition, by introducing good species into the forest and by natural seedling an intermediate type of forest can be developed which cultural operations will change into a selection forest of a type which does not now exist.—*L. Wyman.*

14014. BENSKIN, E. Annual progress report on forest administration in the province of Bihar and Orissa for the year 1929-30. p. 1-72. 1930.—The conversion from the selection to the "uniform" or concentrated regeneration system for sal (*Shorea robusta*) has proved a failure on both silvicultural and financial grounds. Though fairly satisfactory in areas where sal exists as a more or less stable climax type of vegetation, the application of the "uniform" system elsewhere has resulted in a serial retrogression into associations of other species and, in individual cases, into a complete change of vegetation. Repeated burning is being resorted to as a means of eradicating the "sal thicket fungus." Fungus disease may be the cause of the continued mortality in plantations of *Casuarina equisetifolia. Lecanium longulum* in *Casuarina* plantation causes the death of about 5% of the plants attacked. A mechanical analysis of the soil in *Casuarina* plantations, which is almost pure sand, shows a correlation between the percentage of higher fractions and the tree mortality.—*M. V. Laurie.*

14015. COOPER, WILLIAM S. The layering habit in Sitka spruce and the two western hemlocks. *Bot. Gaz.* 91(4): 441-450. 4 fig. 1931.—The layering habits of *Picea sitchensis* Carr., *Tsuga heterophylla* Sarg., and *T. mertensiana* Carr. in southeastern Alaska are described. The mechanics of the process were investigated by means of a detailed anatomical study of layered branches. Suggestions are offered as to the physiological processes involved.—*W. S. Cooper.*

14016. De WILDEMAN, É. Communication de M. De Wildeman sur une étude de M. J.-C. Peirier, de la Faculté des Sciences de Marseille, relative aux plantes oléagineuses africaines. *Bull. Inst. Roy. Col. Belge* 1(3): 486-496. 1930.—Reviewing Peirier's data the author discusses certain questions relative to the African Chaulmoogras, and to the African members of the genus *Omphalocarpum,* which he lists. He also discusses the utilization of vegetable fats for motor fuel.—*É. De Wildeman* (*transl. by J. Kittredge, Jr.*).

14017. ENEROTH, OLOF. Studier över "det lokalas järnhårda lag." [Studies of the "iron law of site."] *Skogsvårdsför. Tidskr.* 29(1): 74-95. 13 fig. 1931.—Wagner's border cuttings at Gaildorf result in natural reproduction of spruce on sandstone areas, but not on clay soil. Beech and fir are more easily established on clay soils; spruce must be planted. Fir competes with grass on clay soils more successfully than spruce. On sandstone soils the particles are more variable in size, drainage is better, and raw humus does not form. Humus layers on both soils had reactions of pH 4-5. Border cuttings have not only secured reproduction, but have also made management more systematic and reduced insect and animal damage.—*H. I. Baldwin.*

14018. FEHÉR, DÁNIEL. Vizsgálatok az erdö Széndioxidtáplálkozásaról. [C nutrition of forests.] [German summary.] *Mat. és. Természettud. Értesitö* (*Math. u. Naturwiss. Anzeiger Ungarischen Akad. Wiss.*) *Budapest* 44: 321-329. 1927.

14019. FRANK, JOHANN. Neue Erkenntnisse in der Mittelwaldwirtschaft. *Wiener Allg. Forst- u. Jagdzeitg.* 49(33): 199-200. 1931.—This is an argument for the wider application of the coppice-with-standards system in the Austrian lowlands, where the recent tendency has been toward coniferous high forest for greater financial return. Coniferous forest on these lands fails to utilize the deep rich soils fully and also brings about soil deterioration. High forest of hardwoods involves too much opening of the stand if timbers of the more valuable intolerant hardwoods are to be grown. Underplanting is difficult. Coppice-with-standards is the logical system. Detailed suggestions for its application are given.—*F. S. Baker.*

14020. GOLDING, G. H. A. Report on forest administration in the Andamans for the year 1929-30. p. 1-85. 1931.—Germination of padauk (*Pterocarpus dalbergioides*) is plentiful but few seedlings survive under forest shade. It is such a strong light demander that it seems impossible to obtain satisfactory regeneration except in clear-fellings. Maize and sugar-cane are sown between the lines in plantations in order to keep down weeds. The weed *Eupatorium odoratum* is now fairly established on Sound Island.—*M. V. Laurie.*

14021. [GROSSET, H. E.] ГРОССЕТ, Г. Э. Материалы к изучению лесов Воронежской губернии. 1. Леса Валуйского уезда. [Studies on the forests of the province of Voronezh. 1. Forests of the Valuisk district.] Труды Научно-Исследовательского Института при Воронежском Государственном Университете (*Trav. Inst. Rech. Sci. Univ. d'État, Voronèje, URSS.*) 1928(2): 49-120. 1928.—The author describes 3 basic and one transitory type of forest. The 1st basic type occurs on the plateaus with coarse clayey soil and consists of oak, ash, and elm. The underbrush is sparse and consists of hawthorn, pear, and others. Grasses include *Poa nemoralis, Brachypodium silvaticum, Carex pilosa, Stellaria holostea* and others. The 2nd basic type also occurs on the plateau but on saline podsol soil and consists wholly of oak. The underbrush is sparse and consists of hawthorn, pear, maple, and birch. The typical forest grass types are absent. The 3rd type occurs on the floor and sides of the valley and consists of oak, ash, pine, maple, and elm; the underbrush of hawthorn, *Cornus sanguinea,* and *Viburnum opulus* is well developed. The grass vegetation consists of *Pulmonoria obscura, Asarum europaeum, Stellaria holostea, Brachypodium silvaticum,* and others. The 4th type is only transitory and occurs exclusively on the floors and sides of the valley and on clearings.—*G. A. Lebedeff.*

14022. HICKS, H. G. Progress report of the forest administration in Coorg for 1929-30. 32p. 1931.—An accidental fire in March 1930 in a teak plantation 2 yrs. old caused the appearance of a valuable crop of mixed species along with the teak. The area is better stocked after the fire than it was before, and weeds have been kept down. *Terminalia tomentosa* seed does not germinate well unless sown within 10 days after falling from the parent tree. Sandal seed (*Santalum album*) is much damaged by rats and squirrels. Attempts to accelerate germination by weathering the seed are being made. Dhall (*Cajanus* sp.) is sown along with sandal as a temporary host, cuttings of *Erythrina indica* being put in as permanent hosts. Millet is sometimes used instead of dhall.—*M. V. Laurie.*

14023. JOUBERT, M. Science forestière et sylviculture. *Rev. Eaux et Forêts* 69(3): 194-209. 1931.—Silviculture is the culture of the forests. Forest science, over and above silviculture, is defined as the science which deals with forest formations, their rôle, their constitution, their evolution and the reciprocal relations between them and the environment. "Forest formation" is a group of suberoligneous plants, living in a symbiotic relation. Forest science, like other natural sciences, should be based upon experimentation to yield conclusive results. Experimentation is distinct from comparative research, which yields valuable results for the technician in silviculture, but is subjective and not scientific experimentation. The evolution of forest formations is too slow for the periods of time available for human experimentation. Coordination of observations of

the biological phenomena in the life of the forests, when suitably established, will permit inductive reasoning leading to the necessary syntheses. Deduction of consequences will then provide the facts to verify or disprove the inductions.—*J. Kittredge, Jr.*

14024. KLEM, GUSTAV G. Qualitätsbestimmung des Schleif- und Celluloseholzes. [Quality evaluation of wood for mechanical and chemical pulp.] *Der Papier-Fabrikant* 28(31): 489-494; (32): 501-508; (33): 521-524. 1930.—The width of the annual ring is not reliable for judging the specific gravity of wood, especially when it originates in different regions or in different stands with unlike conditions of growth. The summerwood zone in a growth ring largely determines its specific gravity, and the specific gravity has an important influence upon the yield of paper per unit of volume. A study of 481 spruce trees from 7 localities showed the feasibility of using tree taper or tree form as a measure of wood quality. Curves showing the relation between specific gravity and taper and between knottiness and taper are presented for each of several groups of trees and finally for all of the trees together. All of the graphs show a consistent relationship. Taper measurements taken on the upper and lower portions of the stems gave similar results, but the limits of taper in the upper portions were much narrower. Curves based on form quotient instead of taper followed the same trends in relation to specific gravity and to knottiness, with the exception that above a form quotient of 0.70 the specific gravity failed to increase with a higher form quotient. This is attributed to slow growth in overstocked stands which results in lighter wood. A decrease in the form quotient from 0.70 to 0.50 was accompanied by a decrease of over 20% in specific gravity. Finally, curves are presented to show how the quality of wood may be judged by the total height and diameter of the trees. Trees of the same height of different diameters are used for each curve. Thus, trees (all 12 m. in height) 15, 18, 21 and 24 cm. in diam. had ave. sp. gr. of 0.515, 0.445, 0.42 and 0.39 respectively. A similar relation was found with respect to knottiness of trees. The author urges that raw pulp wood be paid for according to its value for paper manufacture. In poorer classes of wood 15-20% of the wood is lost in the removal of knots, etc. He shows that the trees with better form stand in the more thickly-stocked areas.—*B. H. Paul.*

14025. LUNDBERG, GUSTAF. Om s. k. sommaravverkning av gagnvirkessortiment och dess berättigade former. [Justifiable summer cutting of timber.] *Skogen* 18(9): 212-216. 1931.—Buoyancy of freshly cut spruce and pine depends largely on the percentage of heartwood, which has a moisture content of only 30% of the dry weight, as against 100-170% for sapwood. Logs with less than 20% of heartwood require preliminary drying before driving; this is more essential for pine than for spruce. The moisture content of sapwood is nearly constant during winter, with a maximum just before the start of the vegetative season, and a minimum in midsummer. Periods of wet weather may increase the water content in summer by restricting transpiration. Peeling timber in summer exposes the wood to blue stain fungi; unpeeled wood is protected by the bark and its moisture content remains higher than the optimum for fungi. Leaving the green crown attached to summer-felled wood, or peeling strips of bark have little effect in reducing the moisture content. Wood cut in fall and winter dries very little until spring, however prepared. The best method of increasing buoyancy is to cut and peel the logs completely in Sept., pile in open triangles, remove snow from landings early in spring, and postpone driving until early summer.—*H. I. Baldwin.*

14026. MILROY, A. J. W. Progress report of forest administration in the Province of Assam for the year 1929-30. 57p. 1930.—Seed from middle aged or mature trees of *Pinus khasia*, though fairly fertile, does not give rise to healthy seedlings. The species is unique in this respect, and seed from young trees only is used. Experimental tapping of *Isonandra polymorpha* for gutta percha gave promising results.—*M. V. Laurie.*

14027. MOLL, FR. Künstliche Holztrocknung. Ein Grundriss. [Outline of artificial wood-drying.] 101p. 35 fig. Julius Springer: Berlin, 1930.

14028. NEWMAN, H. L. Annual forest administration report of the Bombay Presidency including Sind for the year 1928-29. 101p. 18 pl. 1930.—The necessity of avoiding unsuitable or waterlogged soils in selecting the sites for teak (*Tectona grandis*) plantations is emphasized. The conservation of superior mixed tree species of deciduous timber forests when they occur in the teak plantations and the artificial introduction of these species to create a mixture is receiving more consideration than in the past. Germination tests showed 20% germination for teak seed which had been alternately soaked and dried for a week, and 90% for seed which had been similarly treated for a fortnight. Underplanting in teak forests after thinning proved a failure. The conclusion is that mixtures can be introduced more cheaply and effectively at the time the teak is planted. In propagating rosha grass (*Ischaemum angustifolium*), poorly drained localities should be avoided. The effect of burning prior to seeding is negligible. Neither burning nor grazing is particularly harmful to established rosha crops. Shoot planting has proved to be the best method of propagating *Dendrocalamus strictus*.—*M. V. Laurie.*

14029. PARNELL, R. Progress report on forest administration in the Punjab for the year 1929-30. 42p. Map. 3 pl. 1930.—The parasitic plant *Arceuthobium minutissimum* is causing considerable loss in *Pinus excelsa* forests at high levels. Experiments in the irrigated plantations of *Dalbergia sissoo* on desert land to find the most economical method of irrigation showed that better results with less consumption of water were obtained by frequent shallow irrigations than by fewer deep irrigations. The attacks of white ants on cuttings of *Eucalyptus rostrata* were checked by watering with nicotine-impregnated water.—*M. V. Laurie.*

14030. POLANSKÝ, BOH. Význam školkování pro výchovu sazenic u smrku a sosny. [Results of transplanting Norway spruce and Scotch pine.] *Lesnická Práce* 10: (1-24): 4 pl., 1931.—To determine the effect of transplanting on spruce and pine, 2- and 3-yr. transplants and seedlings were compared as to development. Transplanting impaired height growth and root development, especially with spruce. Transplants are not as well adapted for use on unprepared forest sites as seedlings grown in thin stands and fertilized.—*B. Polanský (transl. by N. W. Hosley).*

14031. RICHMOND, R. D. Administration report of the forest department of the Madras Presidency for the year ending 31st March 1930. 1: 1-235. 5 pl., 2: 1-320. 1931.—Removal of root competition of weeds by forking or scraping in 1-yr. plantations of teak (*Tectona grandis*) caused the latter to retain its leaves and grow vigorously throughout the hot weather when it is usually leafless and dormant. Removal of the weed *Strobilanthes* in evergreen forests by cutting close to the ground was successful. Seed of many species of trees treated with concentrated H_2SO_4 germinated better and earlier in almost all cases. Treatment for 8 minutes gave the best results. The effect was very marked with some of the most refractory seeds. In making nurseries for tropical evergreen species outside of the evergreen jungle, evergreen forest humus or cattle manure must be added to the beds. Burnt over beds gave poorer results than unburnt beds for evergreens, but the reverse was true with deciduous species. Mound sowings of the xerophilous exotic *Acacia cyanophylla* gave much better results than sowings in patches or pits in dry scrub jungle. Attempts to introduce *Araucaria cunninghamii* (hoop pine) into tropical evergreen forest were not encouraging. *Gluta travancorica* is easily raised in gaps in evergreen forest by direct sowing. The hitherto useless weed *Atylosia albicans* is an excellent host for the lac insect. It is quick growing, tolerant of poor soil, cheap to raise and

produces good lac. Transmission of "spike disease" in sandal (*Santalum album*) by grafting has been successful. Leaf tissue is infected more readily than other tissues. Cambium tissue is next in susceptibility. It has not been found possible to transmit the disease by grafting parts of the root or bark. Ecological survey of a "spiked" area indicates a larger proportion of *Lantana camara*, the proportion being about 20:1 in spiked and healthy areas respectively. To increase the quantity of sandal in deciduous jungle, propagation centers are being formed where it is intensively cultivated. The best method of establishing sandal plants is to transplant them with a temporary host under the shade of the shrub that will form the permanent host. *Hardwickia pinnata* seed soaked in running water at night and exposed to the sun during the day gave higher germination percentage than untreated seed.—*M. V. Laurie.*

14032. SCHAEFFER, A., A. GAZIN, et A. d'ALVERNY. Sapinières. Le jardinage par contenance. (Méthode du contrôle par les courbes.) 100p. 14 fig. Presses Universitaires de France: Paris, 1931.—A tested and workable method of forest management based on the tradition of Gurnaud is presented in detail. Its most characteristic features are the short cutting cycle, determination of the cut without the use of formulae, elimination of rate of growth as a guide, and the use of curves to represent the stands. The suggestion of a method of directing the stands toward a condition of equilibrium is original. The principles of selection forest management are, 1) maintenance of the stand without clean cutting, 2) sufficient space for crown development, 3) vertical layering of the crowns with low cover for the soil and increased crown height, 4) continuous but only just sufficient regeneration, and 5) cutting of selected individual trees in all size classes, making frequent cuttings and removing each time the trees that are retarding the development of others. The method of control implies, 1) independent treatment of entire parcels, 2) a short cutting cycle, 3) measurement of volume production by comparison of periodic inventories, 4) cutting equal to this production if the forest is normal, if not, under- or over-cutting, 5) determination of the most advantageous forest condition from experience with the particular stand. The financial aim is the maximum increase in value with the least accumulation of forest capital which will insure permanence. The ideal selection forest toward which this system of management aims is based on the principle that every all-aged stand in equilibrium (that is, when cutting and continuous regeneration maintain its composition constant) may be represented by the curve of equilibrium, a hyperbola in which the number of stems per unit area decreases from one category to the next by a constant factor or in geometric progression. In fir forests, this factor varies from a poor to a very favorable site (for 5 cm. diam. classes) from 1.5 to 1.3. By appropriate cultural treatment, the curve of equilibrium may be modified so that its constant factor or coefficient of decrease becomes smaller and simultaneously, the basal area, size of the average tree and volume become larger, thus tending toward the ideal of management.—*J. Kittredge, Jr.*

14033. SCHMIDT, W. Die physiologische Keimlingsdiagnose. *Verhandl. Internat. Kongr. Forst. Versuchsanst.* [*Stockholm*] 1929: 317-332. 3 fig. 1930.—The author undertakes to show the consequences of growing seedlings under climatic conditions that differ from those under which the seed was produced. He deals mainly with light requirements and the physiology of water economy. Light requirements for germination of pine were always higher in seed from the plains of the Main than in those from Brandenburg and East Prussia. Light requirements for germination were lowered in all cases and eliminated in some by freezing the seed. The undesirability of growing seedlings in central nurseries for distribution to localities having different climatic conditions is emphasized. Pines of French origin produced fewer seed than native pines. Native trees showed greater resistance to needle cast and frost injury.—*L. J. Young.*

(See also in B. A. 6(4): Entries 9165, 11197, 11216, 11224, 11239, 11246; and in this issue 12441, 12619, 12620, 12626, 12695, 12699, 12787, 14070, 14225, 14226, 14233, 14234, 14235, 14241, 14509)

14034. BETHGE, H. Einige Fälle von Massenentwicklung bei Diatomeen. *Ber. Deutsch. Bot. Ges.* 48(10): 490-503. 3 fig. 1930.—Two cases of unusually heavy mass production of diatoms are cited: (1) *Melosira varians* Ag. occurring in a basin on the shore of the Elbe near Dresden in such numbers in Dec., 1929, as to give a bad odor to the water; (2) multiplication in Nov.-Dec., 1929, of *M. binderana* Kütz. in such masses as to prevent the use of large fishing nets for a time in the large Storkower lake. Though the latter is normal to these waters in other years, an especially favorable combination of temp., light and water movement is thought to have brought about the dominance. It occurred in greater abundance in the deeper waters, and the author believes the slower changing temperature of the Fall is more favorable to its development than the more rapid changes in the Spring. There is a discussion of these relationships, together with lists of the associated diatoms in each body of water, and mention of instances of such mass occurrences in Sweden and elsewhere. The hinderance to fishing was caused by the rapid production of clumps and felty masses by the long filaments; as soon as large numbers of the diatoms died, easy disintegration of the filaments again permitted fishing.—*P. S. Conger.*

14035. BROCKMANN, CHR. Interglaziale Brackwasserablagerungen an der deutschen Nordseeküste. *Abhandl. Naturwiss. Ver. Bremen* 27(3): 331-340. 1 fig. 1930.—Material reported was obtained from borings of diatomaceous earths at 2 points along the coast. Material from dredge borings in the blue earth layers near the island of Wangeroog were partly fresh water- and partly brackish water deposits. The material from borings at Hooksiel was a brackish water deposit. The diatom flora of all the brackish water deposits gave evidence of having been laid down in an interglacial river bed, indicating that the seacoast of that period is to be sought somewhat further north. The diatom flora gave no evidence of the age of the interglacial deposits.—*D. Doubt.*

14036. DANGEARD, PIERRE. Sur les chromatophores de l'Acrochaetium caespitosum Naegeli. *Bull. Soc. Bot. France* 76(9/10): 1043-1048. 1 pl. 1929.—*A. caespitosum* (J. Ag.) Naeg. is distinguished from other spp. of the genus by the presence of several chromatophores, with pyrenoids, in each cell. Its structure recalls that of *Rhodocorton* of the group *R. floridulum*, but the chromatophores have not the star-shaped form characteristic of that species. This phenomenon without doubt will necessitate the creation of a new subdivision of the genus *Acrochaetium*. The monospores of *A. caespitosum*, when liberated, show the amoeboid movement characteristic of *Chantransia* (*Acrochaetium*) *thuretii.*—*P. Dangeard* (*transl. by L. Newton*).

14037. De WILDEMAN, É. À propos de la multiplication chez les Conjuguées. *Acad. Roy. Belgique Bull. Cl. Sci.* 16(3): 236-243. 1930.—Apropos of a study by de Puymaly of layering and propagules in *Spirogyra*, the author returns to the subject of holdfasts in Conjugales, and multiplication by simple fragmentation of the thallus without any interdependence between asexual reproduction and zygospore formation. The author returns to the generality of the principle that every iso-

lated cell is capable of regenerating a thallus, and that the isolation need not be the result of destruction of neighboring cells.—*É. de Wildeman* (*transl. by I. F. Lewis*).

14038. **Du RIETZ, G. EINAR. Studies in the taxonomy and ecology of Ceramium diaphanum in the Baltic.** *Bot. Notiser* 1930(6): 433-458. 1930.—The *Ceramium* population of the Baltic is considered to consist of *C. rubrum* and *C. diaphanum*, the latter name covering Baltic forms that have been referred by writers to *C. strictum*, *C. arachnoideum*, *C. corticulatum*, *C. tenuicorne*, *C. vertebrale*, *C. tenuissimum*, *C. cimbrium*, *C. gracillimum*, and *C. fruticulosum*. The author's ecological studies of the polymorphic *C. diaphanum*, covering 15 yrs., confirm only in part the observations of Svedelius and of Sjöstedt. The seasonal alternation of generations is more complicated than believed by Svedelius. The over-wintering generation is certainly tetrasporic; it apparently gives rise to a 2nd tetrasporic generation, presumably from paraspores, in late spring and early summer, and even a 3rd tetrasporic generation may occur. The sexual late-summer generation is derived from the 2nd or sometimes the 3rd tetrasporic generation.—*M. A. Howe.*

14039. **ERLANDSSON, STELLAN. Marine diatoms collected by the Swedish Kamtchatka-Expedition 1920-1922.** *Arkiv Bot.* [*Stockholm*] 23(3, No. 8): 1-10. 3 fig. 1931.—An annotated list of 46 spp. and vars., including *Achnanthes* capitata* (p. 5).

14040. **FUGE, DINGLEY P. Diatoms from near Kugssuk, West Greenland.** *Meddel. Grönland* 76(5): 213-224. 1930.—Lists of diatom spp. of 11 samples from different habitats are discussed and compared with records from other Arctic regions. A comparison is made of the coastal flora with that from an altitude of 2,200 feet; little difference is noted. The spp. listed are thought to be a fairly representative flora of this latitude.—*P. S. Conger.*

14041. **GEITLER, LOTHAR. Studien über den Formwechsel der pennaten Diatomeen.** *Biol. Zentralbl.* 50(2): 65-79. 12 fig. 1930.—A comparative life history study of 4 common diatoms through the course of a year, with special reference to auxospore formation and successive change in form, the diatoms being grown in agar culture. In *Eunotia formica* Ehr., *Gomphonema gracile* var. *naviculoides* Grun. and *Navicula minima* var. *atomoides* Grun. sexual propagation in clones took place. Three cell generations of the *Navicula* were obtained in 9 months. *Gomphonema* presented a new case of anisogamy with different behavior of the gametes from those of a mother cell. It was hence concluded that the diploid hybrid differed sexually from the gametes of the mother cell and they were sterile with one another. The 3 spp. followed the usual scheme of division resulting in diminishing cells and necessary auxospore formation, which occurred only under a certain cell size. Change in cell size resulted in a definite change in cell shape. *Eunotia pectinalis* var. *minor* Grun. did not follow the usual method of division but maintained a chain of cells of equal size, auxospore production not being observed. —*P. S. Conger.*

14042. **GRINȚESCU, I. Culturile pure și importanța lor in studiul Algelor, al Schizoficeelor și al Ciupercilor. [Use of pure cultures in studies of algae, schizophytes, and fungi.]** *Intîul Congr. Nat. Naturalișt. România* 1: 171-173. 1928(1930).

14044. **KNIGHT, MARGERY. Studies in the Ectocarpaceae. II. The life history and cytology of Ectocarpus siliculosus, Dillw.** *Trans. Roy. Soc. Edinburgh* 56(2): 307-332. 6 pl., 3 fig. 1929/1930.—A review of the taxonomic literature of *E. siliculosus* is given. Morphological details are presented for distinguishing *E. siliculosus* from *E. confervoides*. Pyrenoid-like bodies, embedded in the chromatophore or attached by protoplasmic connection, arise de novo or by division. Typical fucosan granules lie in the center around the nucleus, and smaller granules lie near the cell periphery, but are not positively identifiable as fucosan. Fucosan appears after, and disappears during, nuclear and cell division. Adventitious branches arise as a response to degeneration of branches, or formation and dehiscence of plurilocular sporangia, the latter becoming smaller and arising at greater angles from the main branches as the plant ages. The development of the plurilocular sporangium is traced from its origin as an ultimate, lateral, branch. Longitudinal divisions at right angle planes establish as many as 600 cubical locules in the sporangial initial. Dehiscence of the sporangium takes place by a definite lateral or terminal opening through which the zoids escape in single file. Proliferation of dehisced sporangia is reported, a plurilocular sporangium often appearing where its predecessor was unilocular. The mature zoid is typical of the Phaeosporeae. Unilocular sporangia appear early in the growing season and late in the autumn. Their development is traced in detail. Nuclei, chromatophores, and deeply staining granules (blepharoplasts) divide in regular sequence, rearranging within the cell into groups consisting of 1 nucleus, 2 chromatophores, 1 blepharoplast. Cleavage follows, isolating hexagonal masses of protoplasm. Dehiscence occurs with considerable pressure. Zoids are similar to those of the plurilocular sporangia but slightly larger. The chromosome number of somatic cells and zoids of the plurilocular sporangium is 16. Meiosis occurs in the mother cell of the unilocular sporangium, its zoids having 8 chromosomes. The life history of *E. siliculosus* in British waters is as follows: The plant body is diploid, producing either haploid zoids from the unilocular sporangia or diploid zoids from the plurilocular. The latter develop directly into the diploid plant body, the former only after conjugation in pairs. Chromosome counts are given for related forms, based on the plurilocular sporangium, and where possible the unilocular: *E. fasciculatus*, $2n=16$; *E. tomentosus*, $2n=16$; *E. penicillatus*, $2n=16$, $n=8$; *E. velutinus*, $2n=16$, $n=8$; *Isthmoplea sphaeromorpha*, $2n=16$, $n=8$. The life history of *E. siliculosus* at Naples is entirely different: Zoids from the plurilocular sporangia are gametes, which fuse in pairs; the chromosome number in the somatic cells and those of the plurilocular sporangia is 8 (plants with unilocular sporangia were not available). The plant body of the British *E. siliculosus* is therefore diploid, $2n=16$; that of the Naples form haploid, $n=8$. It is suggested that the disagreements in reports of fusion of zoids may be correlated with the location in which the work was done; if the British plants are diploid and the Naples plants haploid, there may be both diploid and haploid plants in the intervening stations. There is no morphological alternation of generations in *E. siliculosus* in British waters, the dominant phase being the diploid (in the Naples plants, the haploid). The morphology of the plurilocular sporangium is dependent on its function—the production of large numbers of reproductive cells, irrespective of sexuality; the form of the unilocular sporangium depends on the necessity of meiosis. The gametes of *E. siliculosus* are physiologically, and to some extent morphologically, anisogamous; ♂ gametes have higher fucosan content than the ♀.—*H. C. Bold.*

14045. **KÖHLER, A. Über die Feinstruktur von Navicula (Pinnularia) nobilis Ehbg.** *Zeitschr. Bot.* 22(9): 442-454. 1 pl., 1 fig. 1930.—The shell shows on the costae structural details similar to *Pleurosigma angulatum*, but with closer intervals between the lines (about 48-51 per 10μ). For demonstration, microphotographic exposures were made with extremely oblique blue light through an apochromatic lens (N. A. 1.40) and with oblique or straight ultraviolet light ($\lambda=0.275$) through a monochromatic objective (N. A. 1.25). The preparations made by Möller (Wedel) were mounted in styrax (for blue light) or fastened dry to a quartz coverglass (for ultraviolet). The finer structures were not visible by direct observation. The parts of the shell revealing the fine structure show double refraction under the polarizing microscope.—*A. Köhler* (*transl. by I. F. Lewis*).

14046. **KOL, E. Über die Kryovegetation der Hohen-Tátra. I.** *Folia Cryptogamica* [*Szeged*] 1(6): 613-622.

1 col. pl. 1928.—The previously known snow flora of the High Tatra Mts. comprised only 8 spp. The author here lists 23 algae and 1 fungus, with locality and date records and descriptive notes. Cyanophyceae: *Chrococcus* **scherffelianus*** (p. 614); *Scytonema minor* v. **istvánffiana** (p. 615). Chlorophyceae: *Ankistrodesmus longissimus* v. **rostafinskii*** (p. 617); **GYÖRFFYELLA** (p. 618), resembling *Raphidonema,* erected for *G.* **tatrica** (p. 618); *Cosmarium subspeciosum* v. **schaarschmidtiana** (p. 619). The author found "green snow" caused by *Ankistrodesmus tatrae,* and "red snow" by *Chlamydomonas,* while "black snow" contained various species. —*E. Kol.*

14047. KYLIN, HARALD. Über Heterogamie bei Enteromorpha intestinalis. *Ber. Deutsch. Bot. Ges.* 48(10): 458-464. 1 fig. 1930.—The zoospores had a greenish colored chromatophore and germinated readily when freshly discharged from the cells. The young zoospores were always positively phototropic. After 30-40 min. the positive phototropism changed to negative. The ♀ gamete is somewhat larger than the ♂ and has a greenish chromatophore with a single pyrenoid and a red eye-spot. The ♂ gamete has a yellow-green chromatophore with the red eye-spot. The gametes fuse readily when freshly discharged but after a few hrs. the ability to copulate is lost. No parthogenetic development was found in the cultures. The gametes died after a few hrs. Germination is slow, the first cross-wall appearing the 8th or 9th day after the zygote is formed.—*S. P. Nichols.*

14048. LIEBISCH, WERNER. Experimentelle und kritische Untersuchungen über die Pektinmembran der Diatomeen unter besonderer Berücksichtigung der Auxosporenbildung und der Kratikularzustände. *Zeitschr. Bot.* 22(1/2): 1-65. 1 pl., 14 fig. 1929.—Presence of a pectic membrane both in the Centrales and Pennales is determined by microchemical tests. Auxospore and craticular development are described in detail in certain spp. of Discaceae and Biddulphiaceae (Centrales), and in the Araphideae, Raphidioideae, Monoraphideae and Biraphideae (Pennales). A pectic envelope is present around the protoplast. Across this membrane in the pore region (Centrales), or along the raphe (Pennales), diffusion of food materials, etc., must be effected. During auxospore formation in the Centrales no perizonium is formed. The daughter cell arises within the strongly developed pectic membrane. The movement of diatoms is discussed in reference to the continuity of the pectic membrane. It is suggested that water moves forward between the pectic membrane and the raphe, impelled by protoplasmic undulation. It then passes out through the polar nodule and returns backward along the outer channel of the raphe. When culture conditions become unfavorable, contraction of the protoplast and the appearance of oil mark the beginning of the craticular state. There is great similarity between this and the onset of auxospore formation. A review of previous literature is given. *Stauronella constricta* v. **linearis** Mer. (p. 33), Kiel Harbor, and *Rhopalodia gibberula* v. **sphaerola** (p. 41), Upper Egypt, are new.—*F. Murray Scott.*

14049. MIYAKE, KIICHI, and HIROSHI KUNIEDA. On the conjugation of the gametes and the development of the zoospores in Ulvaceae. *Jour. Coll. Agric. Imp. Univ. Tokyo* 11(3): 341-357. 4 pl. 1931.—In *Monostroma* the plants are strictly dioecious. Only the gametes from plants of different sexes conjugate. There is considerable variation in size and form of the gametes, but none according to sex. Gametes are positively phototactic, zygotes negatively so. The zygote is invested with a thick cell-wall and gradually increases in size. It does not germinate for many days. After about 40 days a few zygotes showed signs of germination and formed 2- or 3-celled sporelings.—In *Enteromorpha** there is strictly differentiated sexuality, and the conjugation takes place only between gametes of different sexes. As in *Monostroma,* the gametes are positively phototactic, the zygotes negatively so. The form and structure of the gametes are similar to those of *Monostroma.* Although there is considerable variation in size and form of the gametes, no sexual difference was observed. The zoospore is 4-ciliated, much larger than the gamete, and is positively phototactic although slightly less sensitive to light than the gamete. The resting zoospore germinates within 2 or 3 days, and after 5-6 days 3- or 4-celled sporelings were obtained. The further development was not followed.—In *Ulva** the form and behavior of the gametes are similar to those of *Monostroma* and *Enteromorpha.* The zoospore is much larger than the gamete and has 2 cilia, instead of 4 as previously reported. The resting zoospore with a thick cell-wall germinates in 2 or 3 days by pushing out a protuberance. The cell divides transversely into 2, one of which elongates and forms the primary rhizoid. By further cell-divisions and elongation the sporeling develops into a simple filament consisting of a single row of cells with a rather long rhizoid. When the filament increases to 10 or more cells by transverse divisions, the longitudinal divisions begin. The primary rhizoid soon degenerates, and the secondary rhizoids are formed. The sporelings often consisted of a single row of cells of nearly equal size and without a primary rhizoid; these seem to develop later into sporelings consisting of branched filaments with or without primary rhizoids. In an addendum the authors report heterogamic gametes in *Ulva* sp., like those reported by Kylin in *Enteromorpha intestinalis* (see entry 14047); one is always larger than the other. The gamete of *Ulva* described above is probably that of the ♂; in other spp. of *Ulva,* however, the gametes of different sex were of the same size.

14050. MORRISSEY, RICHARD V. Survey of algae in ponds on Presque Isle, Erie, Pa.—summer, 1928. *Proc. Pennsylvania Acad. Sci.* 3: 47-51. Map. 1929.—Sixteen ponds are briefly described, and the genera of algae found in each listed. In the most recently formed ponds *Chara* is a dominant form. Cyanophyceae were seldom found in the youngest ponds. *Spirogyra* seemed to be found in well developed, quiet water ponds. Diatoms were the one form common in most ponds of all ages. There appears to be no close correlation between the age of pond and forms of algae to be expected there.

14051. OKAMURA, K. Icones of Japanese algae. 4(5): 39-46. 5 pl. Published by the author: Tokyo, 1931.—Detailed descriptions (in English and Japanese) and figures of 8 forms. *Gracilaria* **incurvata*** (p. 41); **DELESSERIOPSIS** (p. 43), forming a new section, **DELESSERIOPSIDEAE,** in Ceramiaceae, erected for *D.* **elegans*** (p. 43). The n. spp. are from Japan.

14052. OLLIVIER, G. Étude de la flore marine de la Côte d'Azur. *Ann. Inst. Océanograph.* [*Monaco*] 7(3): 53-173. 2 maps, 1 pl., 6 fig. 1929.—The paper was edited for Ollivier posthumously by C. SAUVAGEAU. The area studied extends westward from the Italian border about 40 km. and includes rocky, sandy and muddy substrata. Geology and bathylithology of the region are reported together with environmental factors—physical and biological. Zonation is not markedly vertical, as on ocean coasts where wide tidal range exists; but there is definite zonation from the outer exposed capes in to the protected bays. 279 spp. of marine Chlorophyceae, Phaeophyceae and Rhodophyceae found on the Azure Coast are listed with ecological notes. *Cutleria* **monoica*** (p. 115) is reported, the gametophyte of *Aglaozonia chilosa* Falk, found at Villefranche-sur-Mer; formal description is lacking. Eight concluding pages, with 10 more figures, are devoted to marine Pyrenomycetes of the region: 2 found on Cyanophyceae, 3 on Chlorophyceae, 23 on Phaeophyceae, and 2 on Florideae. *Melanopsamma* **tregoubovii*** (p. 167) and vars. **cutleriae** (*Thalassoascus c.* Oll. nomen nudem) and **cystoseirae** (p. 172) are new.—*D. G. Doubt.*

14053. PALMER, C. MERVIN. Algae of Marion County, Indiana. A description of thirty-two forms. *Butler Univ. Bot. Studies* 2(paper 1): 1-21. 32 fig. 1931. —Several of the spp. are new for Indiana.

14054. **RICHARD, JOSEPH. La vie des Fucus au contact de l'eau douce.** *Botaniste* 20(6): 209-227. 2 fig., 1 map. 1929.—The author discusses observations and theories of Svedelius and of Arcichovskij on the occurrence and habit of *Fucus serratus* and *F. vesiculosus* in the Baltic Sea. He gives an account of the distribution in relation to the river-water of *F. platycarpus, F. serratus, F. vesiculosus,* and *F. ceranoides* at the mouth of the Loire (sketch map), and at the mouths of some rivers of Brittany. *F. platycarpus* and *F. serratus* disappear when salinity becomes too feeble or too inconstant, but *F. vesiculosus* withstands conditions more easily. *F. platycarpus* var. *spiralis,* however, occurs in water more fresh than salt in the Bassin d'Arcachon, but is the only exception known to the author. The general effect of fresh water is that, while the thallus remains normal, the piliferous crypts become fewer and smaller and the contained hairs more stunted, and the crypts may become marginal in position. The effective factor may be the variation in salinity, and not the feeble degree of salinity. In the Baltic, factors are too numerous and complex to determine effect of fresh water alone, but in the Loire the factors are simpler.—*B. M. Griffiths.*

14055. **SECKT, HANS. Stand der Phykologie in der Argentinischen Republik.** *Ber. Deutsch. Bot. Ges.* 48(4): 98-108. 1930.

14056. **SJÖSTEDT, L. G. Researches into the Öresund. XIV. Revision of some dubious Swedish Ceramium types, their classification and ecology.** *Lunds Univ. Arsskr.* 23 (paper 12): 1-30. 4 pl., 5 fig. 1927.—A detailed discussion of the classification and synonymy of the proposed forms in the series *Ceramium diaphanum-strictum* is followed by a taxonomic treatment of the following forms: *C. diaphanum* f. **medium**[S] (p. 7); *C. d.* form *modificatum,* emended descr.; *C. d.* form corticatulum (*C. c.* Kylin) (p. 8); *C. strictum* f. strictoides (*C. diaphanum* form *s.* Henn. Petersen) (p. 9); *C. strictum* f. corticatulo-strictum (*C. diaphanum* form *c.-s.* Kylin) (p. 10); *C. strictum* f. *stricto-tenuissimum* (= *C. s.* form *vera* Henn. Petersen, *C. cimbricum* Henn. Petersen, ? *C. diaphanum* f. *patentissima* Foslie), emended. The author presents data which show that no seasonal alternation of generations occurs in the *diaphanum-strictum* series. A review of the literature on the occurrence of a regular seasonal alternation of generations in Florideae leads to the conclusion that this phenomenon is not of such general occurrence as was claimed by Svedelius.—*W. C. Muenscher.*

14057. **BEAUVERIE, J. Sur un Zygosaccharomyces de la datte iso-hétérogame.** *Bull. Trim. Soc. Mycol. France* 45(2): 153-170. 16 fig. 1929.—The yeast from the fruit of *Phoenix dactylifera* is described from cultures on wort agar. Its reactions to temp. changes were investigated; anomalous budding is described and correlated with the temp. and osmotic pressure of the medium. Conjugation occurs above 25° C. When it occurs between equal cells, both cells form spores; when between unequal cells only the larger. The yeast is identified as a variety of *Zygosaccharomyces cavarae* Rodio, the difference between this and the parent strain being physiological and not of specific value. The physiological difference may perhaps be correlated with the climatic difference between the places where the strains were studied.—*B. Colson.*

14058. **BERNHAUER, K. Ueber die Charakterisierung der Stämme von Aspergillus niger. II. Die Bedeutung saurer Substrate für die Charakterisierung und Züchtung der Pilzstämme.** *Biochem. Zeitschr.* 205(1/3): 240-244. 1929.—The extent to which the addition of acids to the culture fluid promotes the selection of fungus races with the greatest acid-forming property, and the different effects of various mineral acids on similar races of fungi, are discussed. By selection of the cultures with the greatest acid-forming ability, i.e., selection of those with the most luxuriant mycelial growth, acid-forming ability can be increased.—*K. Bernhauer* (*transl. by R. H. Chipman*).

14059. **BLOCHWITZ, ADALBERT. Schimmelpilze als Tierparasiten. (Vorläufige Mitteilung.)** *Ber. Deutsch. Bot. Ges.* 47(1): 31-34. 1929.—To determine the course of natural infection as distinct from artificial inoculation, *Drosophila* were confined under bell jars together with small cultures of *Aspergillus,* and incubated at 25, 30, and 35° C. At 28-30° the animals were dead on the following day; they were covered with mycelium on the 2nd day, and with conidia on the 3rd, and exhibited the characteristic color of the fungus on the 4th. At 35° the mycosis developed somewhat more rapidly; at 25° but few individuals were affected by *A. clavatus.* Using larvae, mycosis developed at the same speed as in imagoes. In infections immediately preceding pupation, dense bundles of conidiophores emerged at the open ends of the pupae. Swarms of *Drosophila* confined under a bell jar with a few dead flies became generally infected,—a mycosis epidemic. *A. fumigatus, malignus, flavus* incl. *tamari, niveus, galeritus,* n. sp. [not described], *nidulans,* and *clavatus* incl. *giganteus* are parasites, and the various races of a species were usually equally virulent. No infection was obtained with other spp. of *Aspergillus* or with *Penicillium glaucum, Rhizopus nigricans, Mucor mucedo.* High temp. alone is not sufficient to insure infection; the most important factor is high humidity. Under these conditions the conidia adhering to the hairs germinate and the hyphae penetrate the soft membrane of the articulations or the spiracles. Symptoms are described. While all the parasitic spp. except *clavatus* are thermophile, not all thermophiles are parasitic. Also, not all hygrophiles are parasitic, although moist tropical climates are most favorable for them. The parasites appear to be definitely oxyphobe, none of the parasites being oxyphile. The author speculates on the phylogeny of parasitism in Aspergilli.—*From abst. by A. Blochwitz.*

14060. **BLOCHWITZ, ADALBERT. Schimmelpilze als Pflanzenparasiten.** *Ber. Deutsch. Bot. Ges.* 47(6): 351-356. 1929.—Cases of fungi parasitic on other fungi are reviewed from the literature. In the experiments reported, spp. of *Aspergillus* were cultured in mixture with *Mucor* and *Rhizopus* at 25-30°. *A. flavus* (all strains) and *A. tamarii, fumigatus, nivens, galeritus, malignus,* and *nidulans* penetrated the hyphae or stolons, and their conidiophores pierced the stolons and the sporangia. These are the same spp. that kill the *Drosophila* and other insects; the other spp. of *Aspergillus* did not parasitize the Mucorineae.—*A. Blochwitz.*

14061. **BULLER, A. H. REGINALD. Researches on Fungi, 4. Further observations on the Coprini together with some investigations on social organisation and sex in the Hymenomycetes.** 329p. 4 pl., 149 fig. Longmans, Green and Co.: London, 1931. Pr. 21 s.—Part I, divided into two parts. A continuation of the author's observations on the structure and physiology of the Coprini, contains chapters on: (1) the Curtus Sub-type of fruit-body organisation illustrated by *Coprinus curtus;* (2)

the Plicatilis Sub-type illustrated by *C. plicatilis;* (3) various remarks on the Coprini; (4) the germination of the spores of *C. sterquilinus* and of other coprophilous Coprini; and (5) an analysis of the factors concerned in the mechanical fixation of the fruit-body of *C. sterquilinus* in its substratum. The production and liberation of spores in *C. curtus* and *C. plicatilis* is described in detail. New taxonomic descriptions of these fungi are given. A fruit-body of *C. curtus* sheds its spores in 30 min. to 3½ hrs. The fruit-body of *C. plicatilis* resembles in its general structure those of other Coprini but differs from them in that its gills do not undergo autodigestion from below upwards, but remain dry during the whole of the spore-discharge period. *C. hemerobius* is regarded as merely a large form of *C. plicatilis*. The relative efficiency of the *Coprinus* and Non-*Coprinus* types are discussed. The blackness of *Coprinus* ink is chiefly due to the spores which the ink contains but is due in part to the liquid which is brown. The *Coprinus* on beet and mangel seed is *C. lagopus*. The presence of bacteria is not required for the germination of the spores of *C. sterquilinus* and other coprophilous Coprini. The various factors which enable the large fruit-body of *C. sterquilinus* to take up its upright position on its substratum of horse dung are discussed in detail. Light inhibits the growth of all small rudiments of fruit-bodies that happen to develop on the upper sides of dung balls exposed to light; and it regulates the length of the solid stipe-base. The upward pressure exerted by a growing fruit-body of *C. sterquilinus* is nearly ½ lb. Part II, which treats of sex and social organization in the Hymenomycetes contains chapters on: (1) social organisation in *C. sterquilinus* and other fungi; and (2) the effect of diploid on haploid mycelia in *C. lagopus* and the biological significance of conjugate nuclei in the Hymenomycetes and higher fungi. Social organisation in plants generally is reviewed with the aid of new drawings of *Chondromyces crocatus, Dictyostelium mucoroides* and *Arcyria pomiformis*. In *Coprinus sterquilinus* hundreds of spores may germinate in a single horse-dung ball, the mycelia may then all unite to form a single compound mycelium which may produce a single large fruit-body. The fruit-body genetically is the product of a single binucleate cell of 1 hypha of 1 of the simple mycelia, but nutritionally it is developed at the expense of all the components of the compound mycelium. Social organisation in fungus groups other than the Hymenomycetes is illustrated with special reference to *Trichoderma lignorum, Pleurage anserina, Ascobolus magnificus*, and *Colletotrichum trichellum*. Hyphal fusions in the Hymenomycetes are of importance in the following ways: (1) they convert every young mycelium into a network of such a kind that food materials may be conducted through it to fruit-bodies sclerotia, etc., in diverse directions; (2) in heterothallic spp., they place 2 mycelia of opposite sex in continuity, thus making possible the association of their nuclei in conjugate pairs; (3) in heterothallic spp., they convert the haploid mycelia into a network of such a kind that, when a haploid mycelium is being diploidised by nuclei derived from another haploid mycelium, the nuclei can travel through the mycelium by numerous and varied routes; (4) they convert all mycelia, whether haploid or diploid, into a network of such a kind that a mycelium, when injured by the breaking of some of its hyphae, still remains as a unit and can act as such in the production of a fruit-body; and, finally, (5) in a single sp., whether homothallic or heterothallic, they permit of any number of adjacent mycelia, whatever may be their sexual state, uniting to form a compound mycelium and thus acting as a social unit in the production of fruit-bodies and spores. The term diploidisation has been introduced to designate the process by which a haploid cell is converted into a diploid cell, or a haploid mycelium into a diploid mycelium, by the formation of conjugate nuclei within the cell or within the mycelium. A haploid or diploid mycelium is said to diploidise a haploid mycelium when, through its agency, the latter becomes converted into a diploid mycelium containing conjugate nuclei $(n) + (n)$. The method of inoculating a large haploid mycelium several cm. in diameter with a small haploid or diploid mycelium 1-2 mm. in diameter has been introduced as an aid to the study of the diploidisation process in *C. lagopus* and other Hymenomycetes. The *C. lagopus* of the author's "Researches on Fungi" and of his pupils is identical with the *C. fimetarius* of Mlle. Bensaude, Kniep, Brunswick, Oort, and other workers on sex in the Hymenomycetes. In *C. lapopus* legitimate combinations, $(Ab) \times (Ab) + (aB)$ and $(AB) \times (AB) + (ab)$, a large haploid mycelium became diploidised by a small diploid inoculum. A factorial analysis of the 2 diploidised haploid mycelia showed that they must have had the composition $(Ab) + (aB)$ and $(AB) + (ab)$ respectively. In 8 legitimate combinations of all possible kinds, a haploid or a diploid inoculum converted a large haploid mycelium, 5.5-6.0 cm. in diameter when just inoculated at the periphery, into a diploid mycelium in 3-4 days. When a large *C. lagopus* haploid mycelium (AB) was inoculated with a haploid mycelium of opposite sex (ab), the (ab) nuclei travelled through the large haploid mycelium at the rate of 1.5 mm. per hr. This was the maximum rate of movement observed in a combination of 2 haploid mycelia. The maximum rate of movement of nuclei derived from a diploid inoculum $(AB) + (ab)$ through a large haploid mycelium (AB) was 1.2 mm. per hr. The nuclei derived from a tiny mycelial inoculum, when advancing through a large haploid mycelium which they are diploidising, can travel through any part of the haploid mycelium, old or young, but they move more readily through a younger part. The diploidisation of a large haploid mycelium in an illegitimate combination of the type $(Ab) \times (AB) + (ab)$ has been studied. The biological significance of conjugate nuclei in the Basidiomycetes and the Ascomycetes is discussed. The complete diploidisation of any multicellular and multinuclear hymenomycetous haploid mycelium through the agency of a single nucleus or a few nuclei derived from a haploid mycelium of opposite sex or from a diploid mycelium of oppsite sex is absolutely dependent on the formation and non-fusion of conjugate nuclei. The organisation of the nuclei in conjugate pairs $(n) + (n)$ instead of as isolated nuclei $(2n)$ in the diploid mycelium and fruit-body of the Hymenomycetes results, it is true, in delaying the fusion of nuclei of opposite sex until the basidia come into existence, but it has the great advantage that, in the diploid mycelium, each member of a pair of conjugate nuclei retains its identity, so that 1 member of a pair can divide independently of the other member of the pair whenever such a division is able to promote the diploidisation of a haploid mycelium.—*Author's summary.*

14062. BURCHARD, G. Beiträge zur Kenntnis parasitischer Pilze. 1. Moniliopsis Klebahni, die Ursache des Umfallens der Koniferenkeimlinge. 2. Didymella applanata, der Erreger der Himbeerrutenkrankheit. 3. Versuche mit Sclerotinia tuberosa als Schädling der Anemone nemorosa. 4. Stachybotrys klebahni. *Phytopathologische Zeitschr.* 1(3): 277-313. 27 fig. 1929.—(1) The "damping off" which causes death of coniferous seedlings is due to *Moniliopsis* **klebahni** (p. 278). Infection of seedlings of *Pinus silvestris, Larix europea, Pseudotsuga douglasii* f. *viridis* and *Abies alba* is described. Young stems of *P. silvestris* may become infected by way of the stomata, whence the fungus spreads and results in eventual death of the plant.—(2) *Didymella applanata* is pathogenic to raspberry. Ascospores produced on old canes produce infection (April to June) on young canes. The mycelium penetrates the cortex and produces brown lesions in which, during Aug. and Sept., pycnidia of *Phoma idaei* appear. The pycnospores infect young shoots and the mycelium remains in the primary cortex where lesions develop which in the following spring bear the perithecial stage.—(3) Those ascospores of *Sclerotinia tuberosa* which germinate in the soil bring about infection of *Anemone nemorosa* only if the resulting

mycelium comes in contact with rhizomes.—(4). *Stachybotrys klebahni** (p. 314) is compared and contrasted with *S. alternans.—G. Burchard (transl. by F. A. Wolf).*

14063. CURZI, MARIO. Intorno alla posizione sistematica di un Fusarium isolato dalla pelle del cane. [The classification of a Fusarium isolated from the skin of the dog.] *Atti Istit. Bot. R. Univ. Pavia Ser. IV.* 1: 95-105. 2 fig. 1929.—*F. moronei* Curzi, here compared with allied spp. of the section Gibbosum, is the only sp. of the section isolated from an animal. Other well-known spp. from animals are those found in insects, and are included under the sections Roseum and Lateritium.—*M. Curzi (transl. by P. Hillkowitz).*

14064. FISCHER, ED. Untersuchungen über Phalloideen aus Surinam. *Beibl. Vierteljahrsschr. Naturforsch. Ges. Zürich* 73(15): 1-39. 2 pl., 7 fig. 1928.—Following a short summary of previous knowledge of the phalloids of British, French, and Dutch Guiana, there is a detailed study of the species collected by G. Stahel in Surinam. The following, described earlier by Fischer, are completely described and figured for the first time, and their development is followed: *Clathrella stahelii* Fischer, *Anthurus surinamensis* Fischer, *Aseroë arachnoidea* var. **americana** (p. 18) Fischer, *Mutinus granulatus* Fischer, and *Ithyphallus paucinervis* Fischer. Other spp., whose development is discussed, are: *Clathrus columnatus* Bosc., *Dictyophora indusiata* (Vent.) Pers., *D. farlowi* Fischer, *Staheliomyces cinctus* Fischer, and *Mutinus xylogenus* Mont. Questions discussed in connection with the studies include: generic limits in the Clathraceae, the various types of development of the intermediate tissue between gleba and receptacle in phalloids of the *Mutinus* type, and certain points raised by Lohwag concerning the significance of the receptacle.—*Ed. Fischer (transl. by G. W. Martin).*

14065. FRENZEL, WALTER. Ernährung und Farbstoffbildung von Chlorosplenium aeruginosum (Oed.). *Akad. Wiss. Wien. Math. Naturw. K. Sitzungsber. Abt. I* 137 (9): 717-746. 1 pl., 1 fig. 1928.—The so-called greenrot of lumber caused by *C. aeruginosum* may be easily produced in pure cultures. Ascospores or fragments of infected wood or fruiting bodies may be used as inoculum. It takes at least 1 mo. for good cultures to develop. Experiments were made on various solid and liquid substrata (wood, wood extract, rice, extract of plums, agar, and gelatine) with varying additions of inorganic nutrient solutions and materials from C and N sources. Although the fungus is not very particular about the choice of nutrients, because of its preference for carbohydrates, however, *C. aeruginosum* is not omnivorous. For its growth on wood it is not necessary that other microorganisms have preceded it. Growth of the fungus is possible within a wide range of pH values (pH 2.4 to slightly above neutral). It is typically aerobic. Minimum temp. for development is around 0° C and maximum about +28° C. Through a micro-chemical procedure it was possible to crystallize out the green pigments. These are not volatile, but are easily reduced to red and yellow products and the green color is again developed by the use of an oxidizing agent; they are indicators of alkali or acid.—*T. R. Swanback.*

14066. GIOELLI, FELICE. Valore dei caratteri zimogeni nella classificazione di alcune forme di miceti. [The value of fermentation tests in the classification of some fungi.] *Atti Ist. Bot. Univ. Pavia, Ser. IV.* 1: 59-74. 1928.—Many spp. chiefly of *Monilia* (as understood in medical literature), were cultivated in liquid media containing sugars. Cultures of various ages, in different media, and under various environmental conditions, were studied. According to Castellani's classification based on fermentation characters, the same strain would be placed with different spp., as these characters were found to vary according to the cultural conditions.—*F. Gioelli (transl. by C. Ciferri).*

14067. HIRATSUKA, NAOHIDE. Additional notes on the Melampsoraceae of Saghalien. *Trans. Sapporo Nat. Hist. Soc.* 10: 119-121. 1929.—*Melampsora hypericorum, Uredinopsis pteridis, U. filicina, U. struthiopteridis, Pucciniastrum arcticum* (new to Japan), *P. hydrangeae-petiolaridis,* and *Chrysomyxa pirolae* are additions to the author's former list; the following new hosts are recorded: *Calyptospora goeppertiana* on *Abies sachalinensis; Thekopsora guttata* on *Galium trifloriforme;* and *Chrysomyxa ledi* on *Picea jezoensis.—Courtesy Japanese Jour. Bot.*

14068. HRUBY, JOHANN. Die Pilze Mährens und Schlesiens. Ein Versuch der Gliederung der Pilzdecke dieser Länder. *Hedwigia* 68(1/2): 119-160; (3/4): 161-190. 1928.—An intensive phytographic study of this area (25,000 sq. miles), applying to the distribution and grouping of the fungi of this region the principles which have been so successfully used in dealing with the higher plants. Extensive lists of the fungi collected, with hosts or substrata, are given. These are grouped according to their ecological requirements: e.g., Malignosa, forest associations; Herbosa, those occurring in formations of meadow and herbaceous plants; Aquiherbosa, those requiring abundant water.—*T. H. Mac Bride.*

14069. JØRGENSEN, C. A. Barkkraeft paa Aeble og Paere, foraarsaget af Neofabraea corticola (Edgert.) C.A.J. n. sp. et n. comb. [Bark canker in apples and pears caused by N. corticola.] *Tidsskr. Planteavl [Copenhagen]* 36(5): 800-811. 13 fig. 1930.—Early in 1930 a bark canker of apples and pears, corresponding to the "superficial bark canker" known in U.S.A., came to the author's notice. In the diseased areas acervuli of *Myxosporium corticolum* Edg. soon developed; this sp. is new to Denmark. In the material a few small apothecia also developed, suggesting their connection with the Myxosporium. Monospore cultures from conidia and from ascospores developed on malt agar, but did not sporulate; better growth was obtained on sterilized apple twigs, on which the typical acervuli of *M. corticolum* were formed in both cases, the connection thus being proved. The apothecium is provisionally referred to *Neofabraea* as *N.* corticola* (*Myxosporium corticolum*) (p. 810).—*C. A. Jørgensen.*

14070. KELLER, BORIS. Die Erdflechten und Cyanophyceen am unteren Lauf der Wolga und des Ural. *Vegetationsbilder* 20(8): Pl. 43-48. 1929.—Various communities of lichens and Cyanophyceae are described and illustrated. Among the spp. depicted are *Aspicilia esculenta* and *A.* spp., *Parmelia vagans, Diploschistes scruposus, Psora decipiens, Acarospora schleicheri* and *Nostoc flagelliforme.—G. D. Fuller.*

14071. KNIEP, H. Über den Generationswechsel von Allomyces. *Zeitschr. Bot.* 22(9): 433-441. 2 fig. 1930.—This paper presents a discussion of the life cycle of *Allomyces javanicus* Kniep. An alternation of generations is described based on observations of the fungus grown in culture. The sporophytic generation begins with the germination of the zygote which is the result of the fusion of 2 unlike planogametes. The diploid mycelium formed from the zygote produces zoosporangia and resting cells. Zoospores which are produced in the zoosporangia continue to reproduce sporophytic plants, while the zoospores produced by the resting cells give rise to small plants which bear only gametangia. Reduction division is said to take place in the resting cells, thus marking the origin of the gametophytic generation. The mycelium formed from the zoospores produced by the germination of the resting cells produce only gametangia, never zoosporangia or resting cells.—*B. B. Kanouse.*

14072. KONRAD, P., et A. MAUBLANC. Icones selectae fungorum. Préface de RENÉ MAIRE. Volume 1., comprising Fascicles 1 to 6. Paul Lechevalier: Paris, price 125 frs. per fascicle.—Fasc. 2, 1924(1926) comprises p. 17-48 of text and 50 col. pl., dealing with the Agaricaceae; fasc. 3, 1927, p. 49-72, with 50 col. pl. deals with Agaricaceae, Russulaceae, Hygrophoraceae, Boletaceae, Polyporaceae, Hydnaceae, Corticiaceae, Clavariaceae, and Cantharellaceae; Fasc. 4, 1928(1929), p. 73-112. with 48 col. pl. deals with the Agaricaceae, Russulaceae, Hygrophoraceae, Boletaceae, Polyporaceae, and Clavariaceae; Fasc. 5, 1929, p. 113-152, with 52 col. pl. deals

with the Agaricaceae, Boletaceae, Polyporaceae and Hydnaceae; Fasc. 6, 1930, p. 153-192, with 50 col. pl. deals with the Agaricaceae, Boletaceae, Polyporaceae, Phylacteriaceae, Corticiaceae, Clavariaceae, and Cantharellaceae, the latter including "*Craterellus* **konradi** R. Maire et Bourdot in litt." (pl. 500). The price of subsequent fascicles has been raised to 150 frs., each fascicle to comprise a volume. The complete work is to consist of 500 col. plates with accompanying text giving descriptive notes, synonymy, distribution and degree of commestibility of each fungus. Keys, general notes and bibliography form the paged text.

14073. MALYCHEV, N. Les conditions de la germination des spores du champignon Dasyscypha wilkomii. *Rev. Gén. Bot.* 41 (483) : 185-190. 1929.—Spores of *D. wilkomii* do not germinate in water, in ½% gelatin, or in gelatin plus an extract of the dead bark of larch. On gelatin plus an extract of fresh branches of larch, 90% germination was obtained, and on gelatin containing 25-35% glycerine, 18% germination; a medium with 13-15% glycerine gave only 5% germination. Higher or lower concentrations of glycerine were not favorable. Light had no influence on germination. Good results were obtained at 25-37°. No germination was observed at 15-17°.—*R. C. Thomas.*

14074. MATTHEWS, VELMA DARE. Studies on the Genus Pythium. 136p. 29 pl. Univ. of North Carolina Press: Chapel Hill, 1931. Pr. $3.—A monographic study, in which descriptions are given of all the spp. of *Pythium* which had been described at the time of publication, and a report is made on 20 spp., isolated by the writer, 5 of which are new. Keys are given to the genera of the Pythiaceae and to the spp. of *Pythium*. Several spp. are reported from the U. S. A. for the first time. *P.* **inflatum*** (p. 45) isolated from *Vaucheria; P.* **catenulatum*** (p. 47) isolated from a fresh water collection; *P.* **carolinianum*** (p. 71) parasitic on *Spirogyra* sp.; and *P.* **echinulatum*** (p. 101) and *P.* **elongatum*** (p. 106) isolated from soil; all from No. Carolina.—*V. D. Matthews.*

14075. NISIKADO, YOSIKAZU, and HIROYOSI MATSUMOTO. Preliminary note on the studies of black-spot disease on Ulmus. [In Japanese.] *Agric. and Hort.* 4: 655-662. 8 fig. 1929.—A disease on *Ulmus* spp. (*parviflora, japonica,* and *pumila*), which is prevalent in Japan, Manchuria and China, becomes recognizable soon after the development of leaves in early spring and is continued during the existence of green leaves. The leaf spots are yellowish at first; they enlarge, and produce black stroma-like bodies in the center; severely diseased leaves fall. The causal organism, earlier regarded as *Melasmia ulmicifolia* B. et C. or *Systremma ulmi* (Schleich.) Theiss. et Sydow, is *Gnomonia* **oharana.** —*Courtesy Japanese Jour. Bot.*

14076. PILÁT, ALBERT. Ein kleiner Beitrag zur Kenntnis der Gattung Cyphella Fr. in der Tschechoslowakei. *Hedwigia* 67: 113-118. 1927.—*C.* **callostoma** (p. 113) is close to *C. struthropteridis* Pilat but is histologically different. *C.* **bourdoti** (p. 115) is related to *C. citrispora* Pilat, *C. punctiformis* Karst., and *C. jancheni* Pilat. *C. taxi* Lev. is found on rotten branches of *Juniperus communis.—A. Pilat (transl. by R. E. Stone).*

14077. POEVERLEIN, H., SPEYER, und K. v. SCHOENAU. Weitere Vorarbeiten zu einer Rostpilz-(Uredineen-) Flora Bayerns. *Kryptogam. Forsch. Bayerische Bot. Ges. Erforsch. Heimischen Flora* [*München*] 2(1) : 48-118. 1 fig. 1929.—A list of the rusts of Bavaria compiled from collections made by the writer and coworkers from 1919-1927, and from the collections deposited in the herbarium of Munich. 27 genera and 365 spp. and vars. with the localities in which they were observed, are listed. *Puccinia* **angulosi-phalaridis** Poeverl. (p. 68), I on *Allium angulosum* L., and *P.* **pumilae-coronata*** H. Paul (p. 95), O and I on *Rhamnus pumila* L. and II and III on *Sesleria caerulea* Scop.—*L. E. Wehmeyer.*

14078. SABOURAUD, R. Le problème du pléomorphisme des cultures des dermatophytes. V. *Ann. Dermat. et Syphiligr.* 10 (5) : 481-486. 1929.—When dermatophytes are cultured on media containing sugar, about ⅔ of the cultures of some spp. show 1 to several downy tufts, which coalesce until the culture becomes covered by down. This white down can be subcultured and isolated from the original growth and may then be cultured indefinitely. Changing the medium or animal passage does not alter its nature; it is a fixed mutation. Old cultures on sugar-free medium may appear down-like, but down formation is not a sign of senility, since it may appear as early as 20 days. *Endothrix acuminatum* does not show pleomorphism. The down is readily formed by animal *Microsporum* and by *Epidermophyton inguinale*. The downs resemble each other more than they do the original culture. Morphological details are given. The more the down is subcultured the more the aleurispores disappear, and only the matted flimsy hyphae remain, but the down remains alive. No fungus species has been shown to arise from another by pleomorphism.—*S. W. Becker.*

14079. SAWADA, KANEYOSHI. On the systematic investigation of Phyllactinia in Formosa. [In Japanese.] *Rept. Dept. Agric. Govt. Res. Inst. Formosa* 49. 1-95. 7 pl. 1930.—The author gives a historical résumé of the group, discusses its relationships, lists the hosts of *Phyllactinia* and *Ovulariopsis* by families and with bibliographic references, and describes the following: *Ovulariopsis* **alni-formosanae*** (p. 77), *O.* **asclepiadis-curassavicae*** (p. 77), *O.* **macarangae*** (p. 78), *O.* **caricae*** (p. 79), *O.* **ampelopsidis-heterophyllae*** (p 79), *O.* **ampelopsidis-ciliatae*** (p. 79), *O.* **cephalanthi*** (p. 80); *Phyllactinia* **kakicola*** (p. 80), *P.* **sapii*** (p. 81); *O.* **salicis-warburgii*** (p. 82); *P.* **actinidiae-formosanae*** (p. 82), *P.* **actinidiae-latifoliae*** (p. 83), *P.* **pyri-serotinae*** (p. 84), *P.* **moricola*** (*P. suffulta* var. *m.* P. Henn.) (p. 85); *O.* **broussonetiae-papyriferae*** (p. 87); *P.* **broussonetiae-kaempferi*** (p. 87). A 4-page bibliography is included.

14080. YAKUSHIJI, E., und M. KUMAZAWA. Ueber einige im Koishikawa botanischen Garten gesammelte Isaria-Arten. I. *Bot. Mag. Tokyo* 44 (517) : 40-42. 1 pl. 2 fig. 1930.—*I. cosmopsaltriae* Yasuda on Cicada, *I. atypicola* Yasuda on the spider, *Kishinouyeus typicus,* and *I.* **nigra*** (p. 42) Yakus et Kumaz. on a beetle (adult and larva) were mentioned.—*M. Kumazawa.*

14081. YUKAWA, MATAO, and MASASHI OHTA. Serological identification of yeasts. I and II. [In Japanese, with English summary.] *Bult. Sc. Fak. Terk. Kjusu Imp. Univ.* 3 (2) : 187-199, 200-216. 1928.—*Zygosaccharomyces barkeri* and *Debaryomyces globosus* are fairly closely related. *Endomyces fibuliger* acts positively almost in equal degree against *Z. barkeri, D. globosus,* saké and beer yeast. *Torula C* reacts positively against *Z. barkeri, D. globosus,* saké and beer yeast, but negatively against *E. fibuliger. Schizosaccharomyces octosporus* reacts negatively against all the yeasts studied. Saké, wine and beer yeasts are indistinguishable by the ring test. *Saccharomyces turbidans, S. pastorianus* and *S. validus* on one hand, and saké, wine and beer yeast on the other, although placed under the same subgroup by Hansen, are clearly distinguishable serologically; also, saké, wine and beer yeasts can be distinguished by the absorption test. The varieties among saké yeast itself are indistinguishable, either by the ring test or by the absorption test.—*Courtesy Japanese Jour. Bot.*

14082. ANONYMOUS. Edible and poisonous fungi. *Min. Agric. & Fisheries* [*Gr. Britain*] *Bull.* 23. 3rd edit. 25p. 25 col. pl. 1930. Pr. 2s. 6d.—This popular handbook is designed to enable those interested in mushrooms as food to distinguish the more common edible from poisonous spp. 7 new plates, 4 of which represent additional spp., are included in this edition, and some changes made in text and nomenclature. The 16 edible and 9 poisonous spp. treated, each of which is briefly described and illustrated by a colored plate, belong with few exceptions to the Agaricaceae. The scientific terms used are listed in a short glossary.—*E. K. Cash.*

LICHENES

14083. BACHMANN, E. Der Lagerbau bei Verrucaria. *Ber. Deutsch. Bot. Ges.* 47(9): 554-560. 1 pl. 1929.—The structure of the thalli of *V. acrotella* Ach. and *V. pinguicula* Mass. indicates that there are 3 forms of thallus structure. In these, the thallus layer is, respectively, endolithic (*V. calciseda* DC. and related spp.), epilithic (*V. pinguicula* and *V. nigrescens* Pers.), and exolithic. In the exolithic type, forms with well developed medulla (*V. aethiobola* Wahlb. and related spp.) and without medulla (*V. acrotella Ach.*) can be distinguished. —*C. C. Plitt.*

14084. BACHMANN, E. Die deutschen, felsbewohnenden Segestriaspezies. *Hedwigia* 69(5): 287-300. 18 fig. 1929.—*Segestria lectissima*, S. langeana**, and *S.* **makrokarpa*** (p. 287), the last collected on gneiss in mountains (the Erzgebirge) near Rittersgrün in 1911. These differ in structure of the perithecial wall, and in fruit characters. The largest perithecia, those of *S. makrokarpa*, have the strongest protective layer, the smallest perithecia (*S. langeana*) have the weakest.—*L. R. Tehon.*

14085. MAGNUSSON, A. H. New or Interesting Swedish Lichens. VI. *Bot. Notiser* 1930(6): 459-476. 1930.—In nearly all cases descriptions as well as critical notes are included in the discussion of the following spp. (No. 36-49 of the author's series): *Dermatocarpon bachmanni* Anderss., previously known from northern Bohemia, found in several localities in Sweden; *Verrucaria* **cinereoatra** Zschacke (p. 461); *V. erichsenii* Zschacke, commonly overlooked as a depauperate form of *V. maura*, and *V. e.* f. **subathallina** (p. 463); *Arthopyrenia orustensis* Erichs., common in the sublittoral zone along the west coast of Sweden, but usually overlooked; *Normandina pulchella* (Borr.) Nyl., new for Sweden; *Collema alpinum* Th. Fr., on calcareous rocks in Lappmark; *Ephebe lanata* f. *complicata* Vain., rather common on the west coast of Sweden, hitherto confused with *E. hispidula; Caliciella subparoica* (Nyl.) Vain., new for Scandinavia; *Coniocybe sulphurea* (Retz.) Nyl., a minute usually overlooked sp. now recorded from Västergötland; *Lecidea? atroumbrina* (p. 468); *Rinodina turfacea* f. *ecrustacea* Vain.; *R. demissa* f. cinerascens (p. 471); *R. diplocheila* fs. typica, caesiascens (p. 473), and **luxurians** (p. 474); *Lecanora pityrea* Erichs. is considered distinct from *L. varia.*—*H. K. Svenson.*

14086. NILSSON, GUNNAR. Lichenologiska bidrag. III. [Contributions to lichenology. III.] [With German summary.] *Bot. Notiser* 1930(5): 344-359. 1 fig. 1930.—The author found the northern *Verrucaria ceuthocarpa* Wg. in 3 localities in Bohuslän and 5 on the Baltic; thus its Finnish localities are no longer isolated. It generally occurs in the lower portion of the supralittoral zone, often with *V. microspora* Nyl. The latter species usually incorrectly named *V. halophila* is noted from 2 new localities in Bohuslän.—Räsänen (1921) described *Xylographa rubescens* from Finland, differentiated from *X. abietina* (Pers.) Zahlbr. by the red reaction of the thallus when treated with KOH. The author has found 19 localities in Sweden and 1 in Norway. The spores, despite the original description, are no larger than those of *X. abietina* and specific distinction is questionable.—*Evernea mesomorpha* Nyl., representing an eastern element in the European flora, is cited from Lule Lappmark.—*Cetraria norvegica* (Lynge) DR. is reported from Bohuslän, Sweden, and a list of the accompanying plants in 1 sq. meter is given. A bibliography of the spp. treated in this paper is included.—*H. K. Svenson.*

(p. 394); *Blechnum* **rosenstockii** (p. 394), New Guinea; *Ithycaulon* **acuminatus** (*Dennstaedtia acuminata* Ros.) (p. 395); *Cheilanthopsis* **elongata** (*Woodsia e.* Hooker) (p. 395); *Oleandra* **pubescens*** (p. 397), Siam; *O.* **gracilis*** (p. 397), New Guinea; *Araiostegia* **perdurans** (*Davallia p.* Christ) (p. 397); *A.* **dareiformis** (*Polypodium dareaeforme* Hooker) (p. 398); *A.* **gymnocarpa** (p. 398), Siam; *A.* **parva*** (p. 399), Sikkim; a key is given to the spp. of *Araiostegia; Davallodes* **novoguineense** (*Davallia viscidula* var. *novoguineensis* Ros.) (p. 400); *Humata* **werneri*** (p. 400), New Guinea; *H. intermedia,* new to Philippines (Luzon); *Scyphularia* **dorsalis*** (p. 401), New Guinea; *S.* **tannensis*** (p. 401), New Hebrides; *Polypodium* **bolanicum** (*P. solidum* var. *bolanica* Ros.) (p. 403); *Prosaptia* **rosenstockii** (p. 404), New Guinea; *P.* **davalliacea** (*Polypodium davalliaceum* Mueller & Baker) (p. 404); *P.* **engleriana** (*Davallia e.* Brause) (p. 404); *Cyclophorus* **micraster** (p. 405), Malay Peninsula; *Lecanopteris* **crustacea** (p. 406), Sumatra; *Dendroconche* **kingii** (p. 407), Papua. Critical notes on various other spp. are given.

14096. **GOEBEL, K. Archegoniatenstudien XVIII. Roraimafarne. [Roraima ferns.]** *Flora* 24(1): 1-37. 18 fig. 1929.—1. **HYMENOPHYLLOPSIS** (p. 3), based on *H.* **dejecta*** (p. 3), belongs to the hygrophyllous ferns and possesses a much simplified leaf structure similar to the Hymenophyllaceae. The leaf blade proper consists of 3 cell layers, an upper and a lower of papillose chlorophyll-bearing cells and a middle one without chlorophyll and apparently gelatinous. Stomata are absent. The vascular bundles are surrounded by a tanniferous sheath. The rhizome is covered with scales and has an amphiphloic solenostele with small leaf gaps. Sori, located at the tips of the veins, are covered with a basal indusium. The formation of the lobes of the leaf opposite the indusium and the insertion of the indusium vary. But the difference between indusium and the leaf lobe is recognizable, especially since the latter has a vascular supply, the former not. The sporangia resemble most closely those of *Alsophila;* the annulus encroaches upon the insertion of the short stalk. The form of the sporangium varies; there are only a few (five at the most) present in each sorus. The new genus, therefore, recalls the leaf structure of the Hymenophyllaceae and the form of the indusium may be compared to that of *Hymenophyllum,* if one considers the leaf lobe opposite the indusium as the upper covering and the latter as the lower. If one assumes one "indusium inferum," it resembles most closely the genus *Hemitelia* of Cyathaceae, or the indusium of Davalliaceae. *Hymenophyllopsis* may be considered as a representative of a group much reduced, and altered in form of sorus, standing close to the Cyathaceae and apparently very limited in distribution.—*Pleurogramme* **luetzelburgiana*** (p. 21), growing in rock crevices on the summit of Roraima, is the smallest American species known. It is of interest because the sporangia are not always borne only on the upper portion of the leaf. These may appear also along the peculiarly modified simple lateral veins lower down. This indicates that *Pleurogramme* represents a gymnogrammoid development approaching certain *Polypodium* species. In certain species appear in addition commissural veins in the fertile portion, a character which has established itself in quite a number of fern groups.—A third (already known) Roraima fern, *Pterozonium cyclophyllum,* is discussed because it also shows relatively primitive characters, including leaf form and hairs instead of scales.—*Enterosora,* another Roraima fern, can no longer be considered endemic as this (or a closely related species) is also found in Costa Rica. The leaf structure confirms the supposition of Baker that it is related to *Polypodium trifurcatum.* The sori of the Costa Rican species are elongated and sunken in pits from which sporangia emerge through elongation of the stalk.—The anatomical structures of the leaf of the ferns discussed agree in combining a hygrophyllous form with structural peculiarities which retard rapid desiccation. The "hygrophile" form appears in 2 types: thin leaf blade without intercellular spaces, mostly without stomata, etc., and leaves with almost homogeneous mesophyll and large intercellular spaces. As structural provisions for preventing rapid desiccation are discussed further: thickness of leaves and stonger development of epidermal cell walls. *Hymenophyllopsis,* in which the assimilative cells are freely exposed, apparently has such provision in the possession of gelatinous cells. In *Pleurogramme, Pterozonium cyclophyllum* and *Enterosora* the assimilative tissue is composed of uniform cells with intercellular spaces,—in *Enterosora* attaining a surprisingly large size for a land plant. The epidermis on the lower side has large stomata but its cell walls are relatively thick, which is not the case in the related *P. trifurcatum. Pterozonium reniforme,* found near Roraima, shows another structure. An attempt was made to establish a correlation of leaf structure of the Roraima ferns with climatic conditions. Brief mention is also made of some endemic carnivorous plants in the Roraima section (*Heliamphora nutans, Genlisea roraimensis* and *Utricularia humboldti*).—*Author's summary* (*transl. by H. L. Blomquist*).

14097. **KUPPER, W. Notiz über die Sporenausstreuung bei Platycerium biforme Bl. [Spore dispersal in P. biforme.]** *Flora* 22(3/4): 388-391. 2 fig. 1927.

GENERAL

14099. **RYDBERG, P. A.** Taxonomic notes on the flora of the prairies and plains of central North America. *Brittonia* 1(2): 79-104. 1931.—A contribution, in advance of the author's manual on the region, dealing with nomenclatorial problems, transfers, and new diagnoses. Included are: *Bothriochloa* saccharoides (*Andropogon s.* Sw. 1788, *Amphilophis s.* Nash) (p. 81); *Echinochloa* pungens (*Panicum p.* Poir.) (p. 81); *E.* occidentalis (*E. muricata o.* Wieg.) (p. 82); *E.* microstachya (*E.* [*muricata*] *m.* Wieg.) (p. 82); *Zizania* interior (*Z. aquatica i.* Fassett) (p. 82); *Spartina michauxiana* (1908) Hitchcock, to be superseded by the older name *S. pectinata* Link (1820); *Koeleria* latifrons (*K. gracilis* subsp. *nitida latifrons* Domin) (p. 84); *Poa* plattensis (p. 84), Nebraska; *P.* overi (p. 84), S. Dakota; *Agropyron* leersianum (*Triticum repens l.* Wulf.) (p. 85); *Juncus* litorum (*Juncus balticus littoralis* Engelm. 1866, not *J. littoralis* C. A. Meyer 1831); *J.* amblyocarpus (*J. articulatus obtusus* Engelm.) (p. 85); *Luzula* bulbosa (*L. campestris b.* Wood) (p. 85); **DENSLOVIA** (p. 85), based on *D.* clavellata (*Orchis c.* Michx.) (p. 86); *Goodyera* ophioides (*G. repens o.* Fern.) (p. 86); *Salix* nudescens (*S. glaucops glabrescens* Anders., not *S. glabrescens* Lindl.) (p. 86); *Quercus* mandanensis (*Q. obtusiloba depressa* Nutt., not *Q. depressa* Blume); (p. 86); *Pilea* opaca (*Adicea o.* Lunell) (p. 87); *P.* fontana (*A. f.* Lunell) (p. 87); *Eriogonum* helichrysoides (*E. microthecum h.* Gand.) (p. 87); *Persicaria* iowensis (p. 87), Iowa; *Claytonia* robusta (*C. multicaulis r.* Somes) (p. 87); *Limnia* humifusa (*Montia h.* Howell) (p. 88); *Sabulina* texana (*Arenaria stricta t.* Robins.) (p. 88); *S.* litorea (*A. l.* Fern.) (p. 88); *S.* dawsonensis (*A. d.* Britton) (p. 88); *S.* propinqua (*A. p.* Richards) (p. 88); *Thalictrum* hypoglaucum (p. 88), Texas; *Sophia* richardsoniana (*Sisymbrium richardsonianum* Sweet) (p. 89); *Cheirinia* syrticola (*Erysimum s.* Sheld.) (p. 89); *Pleurophragma* lilacinum (*Thelypodium l.* Greene) (p. 89); *Amelanchier* carrii (p. 89), S. Dakota; *Prunus* rugosa (p. 90), Kansas; *Desmanthus* cooleyi (*Acacia c.* Eat.) (p. 90); *Psoralidium* batesii (p. 91), Nebraska; reasons are advanced for retaining *Leptoglottis* DC. (1823) versus *Schrankia* Willd. (1806) and *Morongia* Britton (1894), *Larrea* Ortega (1797) versus *Hoffmanseggia* Cav. (1798), *Parosela* Cav. (1802) versus *Dalea* Juss. (1789), and *Cracca* L. (1753) versus *Tephrosia* Pers. (1807); *Lathyrus* macranthus (*L. myriafolius m.* White) (p. 92); *Meibomia* pubens (*Desmodium paniculatum p.* T. & G.) (p. 92); *Galarrhoeus* esula (*Euphorbia e.* L.) (p. 93); *G.* lucida (*E. l.* Waldst. & Kit.) (p. 93); *G.* robustus (*E. montana r.* Engelm.) (p. 93); *G.* missouriensis (*E. arkansana m.* Norton) (p. 93); *Rhus* nortonii (*Schmaltzia n.* Greene) (p. 93); *Megapterium* brachycarpum (*Oenothera brachycarpa* A. Gray) (p. 93); *Meriolix* oblanceolata (p. 93), Kansas; *Osmorrhiza* villicaulis (*O. longistylis v.* Fern.) (p. 93); *Svida* baileyi (*Cornus b.* Coulter & Evans) (p. 94); *S.* stolonifera (*C. s.* Michx.) (p. 94); *S.* foemina (*C. f.* Mill.) (p. 94); *Cyanococcus* angustifolium [sic] (*Vaccinium a.* Ait.) (p. 94); *C.* corymbosus (*V. corymbosum* L.) (p. 94); *C.* vacillans (*V. c.* Kalm) (p. 94); *Anthopogon* procerus (*Gentiana procera* Holm) (p. 94); *Moldavica* thymiflora (*Dracocephalum thymiflorum* L.) (p. 94); *Dracocephalum* formosius (*Physostegia formosior* Lunell) (p. 95); *Stachys* brevidens (p. 95), Minnesota; *S.* pustulosa (p. 95), Wisconsin; *S.* homotricha (*S. palustris h.* Fern.) (p. 95); *S.* schweinitzii (*S. velutina* Schwein.) (p. 95); *S.* borealis (p. 95); *Stachys* puberula (*S. palustris p.* Jennings) (p. 96); *Androcera* citrullifolia (*Solanum citrullifolium* A. Br.) (p. 96); *Aureolaria* serrata (*Gerardia s.* Torr.) (p. 96); *Triosteum* illinoense (*T. perfoliatum i.* Wieg.) (p. 96); *Ambrosia* striata (p. 96), Colorado; *A.* variabilis (p. 97), S. Dakota; *Eupatorium* holzingeri (p. 97), Minnesota; *Brickellia* umbellata (*Coleosanthus umbellatus* Greene) (p. 98); *Liatris* compacta (*L. squarrosa c.* T. & G.) (p. 98); *L.* glabrata (p. 98); *L.* hirsuta (p. 99), Missouri; *L.* bebbiana (p. 99), Illinois; *L.* haywardii (p. 99), S. Dakota; *L.* herrickii (*Laciniaria h.* Steele in herb.) (p. 99), Minnesota; *L.* ligulistylis (*Laciniaria l.* A. Nels.) (p. 100); *L.* rosendahlii (p. 100) and *Chrysopsis* ballardii (p. 100), Minnesota; *Isopappus* validus (p. 100), Kansas; *Solidago* hapemaniana (p. 101), Nebraska; *S.* somesii (p. 101), Iowa; *S.* lunellii (p. 101), N. Dakota; *Euthamia* glutinosa (p. 102), Kansas; *Aster* finkii (p. 102), Iowa; *A.* batesii (p. 102), Nebraska; *A.* woldeni (p. 103), Iowa; *A.* lucidulus (*A. puniceus l.* A. Gray) (p. 103); *A.* laeviformis (p. 103) and *A.* oticus (p. 103), Minnesota; *Bidens* sandbergii (*B. connata pinnata* S. Wats. not *B. pinnata* Noronh.) (p. 104); *B.* filamentosa (p. 104), Minnesota.

GYMNOSPERMAE

14100. **MARKGRAF, F.** Monographie der Gattung Gnetum. *Bull. Jard. Bot. Buitenzorg* 10(4): 407-511. 8 maps, 14 pl. 1930.—The genus *Gnetum*, isolated among the Gymnosperms, is here treated monographically for the first time. In the general part of the work the morphology of the genus is presented and its phylogeny and evolution discussed, including remarks on some general questions of taxonomy. The distribution of each sp. is illustrated by a map and the relation of distribution to evolution considered, leading to some new floristic ideas on the Indo-Malayan flora. Two keys to the species are provided, for ♂ and ♀ plants respectively. Descriptions are in Latin; citation of specimens and synonymy are complete. Included are: *G. gnemon* var. domesticum* (*Gnemon domestica* Rumph.) (p. 437), with f. volubile, New Guinea, and f. stipitatum*, Moluccas, (p. 440); *G. g.* var. brunonianum* (*G. b.* Griff.) (p. 440); *G. g.* var. griffithii* (*G. griffithii* Parl.) (p. 442); *G. g.* var. tenerum* (p. 444), Borneo; *G. g.* var. gracile (p. 444), Celebes; *G.* schwackeanum Taub.* (p. 450), Brazil; new subsect. **STIPITATI** (p. 455); *G. latifolium* var. blumei* n. name (p. 459), Malay Peninsula, with f. longipes* (p. 461) and f. brachypodum* (p. 462), both from Philippines; *G. l.* var. macropodum* (*G. m.* Kurz) (p. 462); *G. l.* var. minus* (*G. m.* Foxw.) (p. 463); *G. l.* var. funiculare (*G. f.* Bl.) (p. 463); *G.* montanum* (p. 466), Sikkim, Assam, Burma, Tenasserim, Siam, China, Tonkin, with f. megalocarpum* Assam, and f. parvifolium* (*G. scandens* v. *p.* Warb.) (p. 468); *G.* contractum* (p. 470), India; *G.* oblongum* (p. 471), Bengal, Pegu, Tenasserim; new subsect. **SESSILES** (p. 472); *G.* klossii* Merr. ms. (p. 478), Borneo; *G.* ridleyi* Gamble (p. 479), Malay Peninsula; *G.* loerzingii* (p. 480), Sumatra; *G.* diminutum* (p. 483), Borneo; *G. leptostachyum* var. tenue* (p. 489), Borneo; *G. l.* var. robustum* (p. 490), Borneo.—*F. Markgraf* (*transl. by H. A. Gleason*).

14101. **MATTFELD, JOH.** Abies duplex Hormuzaki als Gipfel von Abies alba Mill. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 405-411. 1928.—Mattfeld denies the validity of Hormuzaki's species, *Abies duplex*, claiming that it represents merely the crown of trees of *A. alba* Mill.,—a conclusion reached after extensive observations in the field.—*A. M. Johnson.*

14102. **MATTFELD, JOH.** Individuelle Heterophyllie, nicht Sippendifferenzierung, bei Abies alba Mill. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 583-593. 1929. —Mattfeld argues in support of his contention that

Abies duplex Hormuzaki is not a valid species but, as recently contended (see preceding entry), is merely the "crown" or top portion of individuals of *A. alba* Mill. The paper is a reply to a denial by Hormuzaki.—*A. M. Johnson.*

ANGIOSPERMAE (MIXED)

14103. **MATTFELD, JOH.** Vermischte Diagnosen VI. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1049-1053. 1930.—*Olyra* luetzelburgii Pilger (p. 1049) (*Gramineae*), northern Brazil; *Butia* microspadix Burret (p. 1050) (*Palmae*), Brazil; *Pycnophyllum* leptothamnum (p. 1051), (*Caryophyllaceae*), Peru; *Guranía* huebneri Harms (p. 1052) (*Cucurbitaceae*), Brazil. **ARROJADOCHARIS** (*Compositae*), n. n. for *Arrojadoa* Mattf. preoccupied, and based on *Arrojadocharis* praxeloides (*Arrojadoa p.* Mattf.) (p. 1053).—*A. M. Johnson.*

14104. **SANDWITH, N. Y., et al.** Decades Kewenses Plantarum Novarum in Herbario Horti Regii Conservatarum. Decas CXXIV. *Kew Bull. Misc. Inform.* 1930 (4): 153-161. 1 pl., 2 fig. 1930.—*Ruyschia* phylladenia (p. 153), Costa Rica; *Impatiens* barnesii C. E. C. Fischer (p. 153) and *I.* laticornis C. E. C. Fischer (p. 154), India; *Banara* regia (p. 154), Ecuador; *Strychnos* silvicola A. W. Hill (p. 156), Siam; *Jacquemontia* ciliata (p. 156), Trinidad; *Vitex* calothyrsa (p. 157), Venezuela; *Pandanus* (*Vinsonia*) basedowii* C. H. Wright (p. 158), Australia; *Eriocaulon* ensiforme C. E. C. Fischer (p. 159) and *E.* gamblei C. E. C. Fischer (p. 160), India.—*A. D. Cotton.*

14105. **STANDLEY, PAUL C.** Studies of American plants—V. *Field Mus. Nat. Hist. Bot. Ser.* 8(5): 295-398. 1931.—The present report is mainly devoted to tropical American flowering plants, especially Rubiaceae, studied in part from recent collections, in part from loans of material in European herbaria. The following appear: Gramineae: *Andropogon saccharoides* var. parvispiculus (*A. s.* ssp. *p.* Hitchc.) (p. 297); *Briza monandra* var. condensata (p. 298), Peru. Nyctaginaceae: *Mirabilis* microchlamydea (*Allionia m.* Standl.) (p. 304); *M.* glabra (*Oxybaphus glaber* Wats.) (p. 304); *M. g.* var. recedens (*O. glaber* var. *r.* Weatherby) (p. 304); *M.* exaltata (*Allionia e.* Standl.) (p. 305); *M.* carletoni (*A. c.* Standl.) (p. 305); *M.* gausapoides (*A. g.* Standl.) (p. 305); *M.* decipiens (*A. d.* Standl.) (p. 305); *M.* pauciflora (*Oxybaphus pauciflorus* Buckl.); *M.* lanceolata (*Allionia l.* Rydb.) (p. 305); *M.* coahuilensis (*A. c.* Standl.) (p. 305); *M.* pumila (*A. p.* Standl.) (p. 305); *M.* rotundifolia (*A. r.* Greene) (p. 305); *M.* grayana (*A. g.* Standl.) (p. 306); *M.* suffruticosa (*A. s.* Standl.) (p. 306); *M.* comata (*A. c.* Small) (p. 306); *M.* longipes (*A. l.* Standl.) (p. 306); *M.* ciliata (*A. c.* Standl.) (p. 306); *M.* oligantha (*Hesperonia o.* Standl.) (p. 306); *M.* polyphylla (*H. p.* Standl.) (p. 306); *M.* grandiflora (*Allionia g.* Standl.) (p. 306); *Torrubia* myrtiflora (p. 307), Peru; *T.* broadwayana (*Pisonia b.* Heimerl) (p. 308); *T.* obtusiloba (*P. o.* Huber) (p. 308); *T.* riedeliana (*P. r.* Fisch.) (p. 308); *T.* warmingii (*P. w.* Heimerl) (p. 308); *Bougainvillea* pachyphylla Heimerl in herb. (p. 308), Peru; *Neea* williamsii (p. 309), Peru; *Allionia* cristata (*Wedelia c.* Standl.) (p. 310); *A.* choisyi (*A. incarnata* var. *glabra* Choisy) (p. 310). Ranunculaceae: *Anemone* multiceps ("*multifida*") (*Pulsatilla multiceps* Greene) (p. 310). Nymphacaceae: *Nuphar* fraternum (*Nymphaea fraterna* Miller & Standl.) (p. 310); *N. advena* var. erthryaeum (*Nymphaea a.* subsp. *erythraea* Miller & Standl.) (p. 310); *N.* ozarkanum (*Nymphaea ozarkana* Miller & Standl.) (p. 310); *N.* ludovicianum (*Nymphaea ludoviciana* Miller & Standl.) (p. 311); *N.* fluviatile (*Nymphaea fluviatilis* Harper) (p. 311); *N.* chartaceum (*Nymphaea chartacea* Miller & Standl.) (p. 311); *N.* ulvaceum (*Nymphaea ulvacea* Miller & Standl.) (p. 311); *N.* ovatum (*Nymphaea ovata* Miller & Standl.) (p. 311); *N.* puberulum (*Nymphaea puberula* Miller & Standl.) (p. 311); *N.* microcarpum (*Nymphaea microcarpa* Miller & Standl.) (p. 311); *N.* orbiculatum (*Nymphaea orbiculata* Small) (p. 311); *N.* bombycinum (*Nymphaea bombycina* Miller & Standl.) (p. 311). Cruciferae: *Nasturtium* clavatum (*Roripa clavata* Rydb.) (p. 312); *N.* williamsii (*Roripa w.* Britton) (p. 312). Droseraceae: *Drosera intermedia* Hayne, Brit. Honduras, the family new to Central America. Leguminosae: *Calliandra* papillosa (*Anneslia p.* Britt. & Rose). (p. 312); *C.* belizensis (*A. b.* Britt. & Rose) (p. 312); *C.* chapaderoana (*A. c.* Britt. & Rose) (p. 312); *C.* salvadorensis (*A. s.* Britt. & Rose) (p. 312); *C.* izalcoensis (*A. i.* Britt. & Rose) (p. 312); *C.* juzepczukii (p. 313), Mexico; *Bauhinia* hondurensis (p. 313), Honduras; *Eriosema* pinetorum (p. 315), Brit. Honduras, Aquifoliaceae: *Ilex* liebmannii (p. 315), Mexico. Celastraceae: *Celastrus* liebmannii (p. 316), Mexico. Theaceae: *Eurya* lancifolia (p. 317), Brit. Honduras. Flacourtiaceae: *Abatia* mexicana (p. 318), Mexico; *Xylosma* celastrinum (*Flacourtia celastrina* HBK.) (p. 318). Myrtaceae: *Psidium* rotundifolium (p. 318), *P.* chrysobalanoides (p. 319), *P.* schippii (p. 319), *P.* hypoglaucum (p. 320) and *Eugenia* flavifolia (p. 320), Brit. Honduras. Cornaceae: *Cornus disciflora* var. floccosa (*C. f.* Wang.) (p. 321). Convolvulaceae: *Lysiostyles* sericea (p. 322), Hondurus. Solanaceae: **EUTHETA** (p. 324), based on *E.* hondurensis (*Cacabus h.* Donn. Smith) (p. 325). Scrophulariaceae: *Lagotis* minor (*Gymnandra minor* Willd.) (p. 325); *L.* reniformis (*G. r.* Willd.) (p. 325). Orobanchaceae: *Boschniakia* rossica (*Orobanche r.* C. & S.) (p. 325). Rubiaceae: *Manettia* minutiflora (p. 326), *M.* tomantha (p. 326), *M.* campanulacea (p. 327), *M.* paulina (p. 328), *M.* hoehnei (p. 329) and *M.* bradei (p. 330), Brazil; *M.* samuelssoniana (p. 331), Argentina; *M.* paranensis (p. 331), Brazil; *M.* asclepiadacea (p. 332), Peru; *Bouvardia* orizabensis (p. 334), Mexico; *Cinchona* amazonica (p. 334), Peru; *Remijia* longifolia Benth in herb. (p. 335), Brazil; *Ladenbergia* ferruginea (p. 336) and *Ferdinandusa* loretensis (p. 337), Peru; *Hillia* goudotii (p. 338), Colombia; *Exostema* leonis (p. 338), Cuba; *Sickingia* williamsii (p. 340), Peru; *S.* paraguayensis (p. 340), Paraguay; *Phitopis* sterculioides (p. 341), Peru; *Rondeletia* gracilispica (p. 342), Mexico; *R.* peruviana (p. 342), Peru; *Oldenlandia* dusenii (p. 343), Brazil; **CREATANTHA** (p. 344), based on *C.* peruviana (p. 344), Peru; *Isertia* alba (*Cassupa a.* Schum. & Krause) (p. 346); *I.* juruana (*C. j.* Schum. & Krause) (p. 346); *I.* panamensis (*C. p.* Standl.) Compositae: *Lagascea* media (*Nocca m.* Blake) (p. 398); *L.* pteropoda (*Nocca p.* Blake) (p. 398).

MONOCOTYLEDONES

14106. BLATTER, E., and C. McCANN. Gramineae. X. of: **E. BLATTER: "Revision of the flora of the Bombay Presidency."** [Continuation.] *Jour. Bombay Nat. Hist. Soc.* 33(4): 753-775. 1929.—Systematic treatment of the tribes Chlorideae, Pappophoreae, Oryzeae, Festuceae, Hordeae and Bambuseae. Keys to the genera and spp. are given with extensive synonymy and citations of literature and specimens. Descriptions are given only in cases where the species was not given in the earlier Flora of the Bombay Presidency by Cooke. Page references to this work are given for the description of all other species.—*Oxytenanthera* ritcheyi (*Bambusa r.* Munro) (p. 773). The authors here correct an error in *Ibid.* Vol. 32. 1927, and state that their n. comb. *Hemarthria glabra* must now be referred to *H. compressa* (Linn. f.) R. Br. on account of preoccupation.—*P. L. Ricker.*

14107. BLATTER, E., and C. McCANN. Gramineae. Part XI of: **BLATTER, E. Revision of the Flora of the Bombay Presidency.** *Jour. Bombay Nat. Hist. Soc.* 34 (1): 12-26. 1930.—A natural key to the 109 genera is given.—*E. Blatter.*

14108. BULLOCK, A. A. A new genus of Iridaceae from East Africa. *Kew Bull. Misc. Inform.* 1930(10): 465-466. 1930.—**OENOSTACHYS**, based on *O.* dichroa, Mt. Elgon, Uganda, at 9000-10,000 ft. alt., is remarkable for its brightly colored bracts which hide the flowers almost completely, and form a wine-colored spike. It is allied to *Gladiolus, Antholyza,* and *Watsonia.*—*A. A. Bullock.*

14109. BURRET, M. Four new palms collected in the Territory of Papua (British New Guinea) by **L. J. BRASS.** *Jour. Arnold Arboretum* 12(4): 264-269. 1931. —*Calamus* nannostachys (p. 264), *Areca* (*Balanocarpus*) nannospadix (p. 265), *Actinophloeus* microcarpus (p. 267), *A.* linearis (p. 268).—*A. Rehder.*

14110. BURRET, M. Die Palmengattung Manicaria Gaertn. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (95): 389-394. 1928.—*Manicaria* martiana (p. 392), Amazon region near Manaos, Brazil, where it goes by the name "Bussu" or "Ubussu."—*A. M. Johnson.*

14111. BURRET, M. Die Palmengattungen Chelyocarpus Dammer und Tessmanniophoenix Burret, nov. gen. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 394-401. 1928.—Dammer's *Chelyocarpus* is a fan palm, most closely related to *Acanthorhiza* and *Trithrinax* but differing in possessing 2 annular points of insertion of the spathes and in the spathes being readily deciduous. The fruiting spadix of *Chelyocarpus* is described in full. *Chelyocarpus* wallisii (*Acanthorhiza w.* H. Wendl.) (p. 397) is hesitantly proposed. **TESSMANNIOPHOENIX** (p. 397), near *Chelyocarpus,* includes *T.* longibracteata (p. 398), eastern Peru, and *T.* chuco (*Thrinax c.* Mart.) (p. 400).—*A. M. Johnson.*

14112. BURRET, M. Die Palmengattungen Orbignya, Attalea, Scheelea, und Maximiliana. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 493-543. 1929.—No grounds exist for combining the genera *Attalea* and *Scheelea, Scheelea* being a natural sharply distinct genus. Less definite is the distinction between *Attalea* and *Orbignya. Maximiliana,* closest to *Scheelea,* is distinguished by the characters of the endocarp and especially by the germ pores. The stone of the fruit furnishes useful specific distinctions in *Orbignya, Attalea,* and *Scheelea.* The carpellate inflorescence shows a flower arrangement similar to that in *Cocos* and related forms; indeed the carpellate inflorescence may be described morphologically as androgynous. No fertile staminate flowers were found in the carpellate inflorescence. The author doubts the occurrence of dioecious forms in these genera. The spadices in all cases show simple branching. Knowledge of the geographic distribution of these genera is rather incomplete, but they occur in the West Indies and S. Amer. The plants yield oils, fiber, and edible fruits. A conspectus of the genera and species follows. In *Orbignya* (19 spp. listed, with notes on localities) appear: *O.* huebneri (p. 501), Amazon region; *O.* macropetala (p. 507), British Guiana; *O.* microcarpa (*Attalea m.* Mart.) (p. 507); *O.* spectabilis (*Attalea s.* Mart.) (p. 508); *O.* agrestis (*Attalea a.* Barb. Rodr.) (p. 511). A fuller description is given for *O. speciosa** (Mart.) Barb. Rodr. In *Attalea* (17 spp. included, for most of which the fruit is unknown) appear: *A.* hoehnei (p. 522), Matto Grosso, Brazil; *A.* tessmannii (p. 538), Peru; *A.* crassispatha (*Maximiliana c.* Mart.) (p. 527); *A.* lapidea (*Cocos l.* Gaertn.) (p. 533); *A.* dubia (*Orbignya d.* Mart.) (p. 537); *A.* concinna (*Pindarea c.* Barb. Rodr.) (p. 537). A list of excluded spp. and genera and a list of nomina nuda vel delenda follow.—*A. M. Johnson.*

14113. BURRET, M. Neue und kritische Arten der Palmengattung Mauritia. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 565-574. 1929.—New material has disclosed disagreements in the literature regarding earlier spp. The difficulty in identification lies in the fact that these palms are dioecious, which has led to erroneous specific identifications of staminate and carpellate plants, these having been based on characters of the leaves only or on photographs. The inflorescences of the "sexes" are so different as to be valueless for taxonomic purposes. The most reliable characters reside in the carpellate inflorescence alone, in the fruiting stage, with which must be combined the leaf characters. *Mauritia carana* Wallace is discussed, and the following proposed: *M.* sphaerocarpa (p. 569), *M.* huebneri (p. 570) and *M.* intermedia (p. 572), Brazil; *M.* macroclada

(p. 574), Colombia. The author is unable to discover any valid characters for Drude's genus *Orophoma*.—*A. M. Johnson.*

14115. **BURRET, M.** Die Heimat von Astrocaryum rostratum Hook. f. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 837-838. 1929.—Author maintains that the palm which has passed in botanical gardens and greenhouses for *A. rostratum* did not come from Brazil but from Mexico, and should be called *A. mexicanum* Liebm.—*A. M. Johnson.*

14116. **BURRET, M.** Zur Gattung Jessenia Karst. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 839-840. 1929.—*Jessenia* weberbaueri (p. 840), Moyobamba region of Peru; the fruit is edible.—*A. M. Johnson.*

14117. **BURRET, M.** Die Gattung Ceroxylon Humb. et Bonpl. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 841-854. 1929.—A conspectus of the spp., with a key to 16 spp. The genus has a rather restricted range in the Andean region of Colombia and Peru, and perhaps of Bolivia, the spp. ascending to the limits of the tree zone. In northern S. Amer. it reaches Caracas, Venezuela. The fruits are fleshy and quite large. A list of doubtful or little known and excluded species is appended. *Ceroxylon* latisectum (p. 844), Peru; *C.* schultzei (p. 846), Colombia; *C.* ventricosum (p. 847), Ecuador; *C.* weberbaueri (p. 848), *C.* crispum (p. 849) and *C.* verruculosum (p. 850), Peru; *C.* floccosum (p. 851), Colombia; *C.* ceriferum (*Klopstockia cerifera* Karst.) (p. 846); *C.* beethovenia (*C. andicola* H. Wendl.) (p. 845).—*A. M. Johnson.*

14118. **BURRET, M.** Die Gattung Hyospathe Mart. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 854-859. 1929.—A conspectus of 10 S. Amer. spp of *Hyospathe*, with key, including: *H.* wendlandiana Dammer in scheda (p. 855), Colombia; *H.* tessmannii (p. 856), Peru; *H.* micropetala (p. 857), Peru; *H.* sodiroi Dammer in scheda (p. 857), Ecuador; *H.* weberbaueri Dammer in scheda (p. 858), Peru.—*A. M. Johnson.*

14119. **EIG, A.** Aegilops sharonensis n. sp. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 489-491. 1928. —This n. sp. from Palestine belongs to sect. *Platystachys*. —*A. M. Johnson.*

14120. **HARMS, H.** Bromeliaceae novae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 575-582. 1929. —Localities are mentioned for specimens of *Navia caulescens* Mart., from Colombia and Brazil. *Navia* is transferred from the tribe Pitcairnieae into subfamily Navioideae. MEZIOTHAMNUS (p. 575), based on *M.* brevifolius (*Navia brevifolia* Griseb.) (p. 576), Argentina; *Tillandsia* chinchicuana (p. 578), *T.* arnoldiana (p. 579) and *T.* caloura (p. 580), Colombia; *Aechmea* huebneri (p. 581), Brazil. Distributional notes are given for *Tillandsia crenulipetala* Mez., *T. grisebachiana* Bak., *Aechmea spicata* Mart., and *A. spectabilis* Brongn.—*A. M. Johnson.*

14121. **HARMS, H.** Bromeliaceae novae III. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 784-805. 1929.—A conspectus of 41 spp. of *Araeococcus, Hohenbergia, Streptocalyx, Portea, Aechmea, Pitcairnia, Puya, Lindmania, Tillandsia, Vriesea, Thecophyllum, Caraguata, Guzmania,* and *Schlumbergeria*, including: *Araeococcus* flagellifolius (p. 784), *Hohenbergia* pickelii (p. 785) and *Portea* leptantha (p. 786), Brazil; *Aechmea* inconspicua (p. 786), Bolivia; *Pitcairnia* cotahuasiana (p. 788), *P.* latibracteata (p. 788), *P.* herrerae (p. 789), *Puya* densiflora (p. 791) and *P.* herrerae (p. 792), Peru; *P.* werdermannii (p. 793), *Lindmania* villosula (p. 794) and *Tillandsia* guentheri (p. 794), Bolivia; *T.* araeostachya (p. 797), Cuba; *T.* selleana (p. 799), Hispaniola; *T.* tephrophylla (p. 800), Cuba; *Schlumbergeria* ekmanii (p. 804), Hispaniola; *Pitcairnia* imperialis (*Puya grandiflora* Hook f.) (p. 790).—*A. M. Johnson.*

14122. **HERTER, GUILELMUS.** Las Gramíneas de la República O. del Uruguay. In: **CORN. OSTEN et GUIL. HERTER.** "Plantae Uruguayensis. IV & V. Siphonogamae Angiospermae 2. Eumonocotyledoneae. Monocotyledonearum series (A 3) Glumiflorae, subseries (1) Gramineae." *An. Mus. Hist. Nat. Montevideo* 2(3): 301-320. 1927; 3(1): 43-56. 8 pl. 1929.—These 2 installments treat of 66 spp., with synonymies and distributional records. EUMONOCOTYLEDONEAE (p. 305), n. subclass proposed to include "Monocotyledonearum series 3-11 Engler, Syllabus (1892-1924)"; MAYDACEAE (p. 305), n. fam. based on Maydeae Mathieu; ANDROPOGONACEAE (p. 307), n. fam. based on Andropogoneae Presl (part); ZOYSIACEAE (p. 318), n. fam. based on Zoysieae Miquel; TRISTEGINACEAE (p. 319), n. fam. based on Tristegineae Link; PANICACEAE (p. 43), n. fam. based on Paniceae Kunth; *Eriochloa punctata* var. montevidensis (*E. annulata* var. *m.* Nees) (p. 47); *E. p.* var. parodii (p. 47); *Axonopus compressus* var. fissifolius (*Paspalum fissifolium* Raddi) (p. 48); *A. scoparius* var. suffultus (*Paspalum suffultum* Mik.) (p. 49); *Paspalum notatum* var. cromyorrhizum (*P. c.* Trin.) (p. 51); *P. quadrifarium* var. ferrugineum (*P. f.* Trin.) (p. 55).

14123. **KRAUSE, K.** Zwei für China neue Liliaceengattungen. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 806-807. 1929.—*Protolirion* sinii (p. 806) and *Chionographis* chinensis (p. 807), both from southern China, and both genera new to China.—*A. M. Johnson.*

14124. **KRAUSE, K.** Über einige neue oder seltenere Araceen. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1045-1048. 1930.—*Anthurium* longispadiceum (p. 1045) and *Philodendron* woronowii (p. 1046), Colombia; *Arisaema* sinii (p. 1947), southern China. *P. gloriosum* André, from Colombia, and *Synandrospadix vermitoxicum* (Griseb.) Engler, from Argentina are diagnosed. —*A. M. Johnson.*

14125. **LEÓN.** Contribucion al estudio de las palmas de Cuba. *Revista Soc. Geogr. Cuba* 4(2): 33-59. 7 pl. 1931.—Brother León, long a student of the Cuban flora, discusses the spp. of the island referred to the palm genus *Copernicia* of Martius, raising the number of named Copernicias recognized in Cuba to 25, 3 of which are considered to be hybrids. These species are organized in key form into 7 groups or sections: *Macroglossae, Rigidae, Pauciflorae, Hospitae, Brittonianae, Yareyes, Gigantes*. In his recent paper on the Ekman collections, Burret had added 5 Copernicias to Cuba; León now adds fourteen: *C.* torreana* (p. 10); × *C.* escarzana* (p. 12); × *C.* sueroana (p. 14); *C.* clarensis* (p. 15); *C.* roigii* (p. 17); *C.* holguinensis* (p. 18); *C.* brittonorum* (p. 19); *C.* fallaense* (p. 21); *C.* baileyana* (p. 22); *C.* curbeloi* (p. 23); *C.* textilis* (p. 24); *C.* molineti* (p. 25); *C.* excelsa* (p. 26); *C.* vespertilionum* (p. 27). —*L. H. Bailey.*

14126. **MANSFELD, R.** Zur Kenntnis der Gattung Catasetum L. C. Rich. I. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 476-478. 1928.—Included are: *Catasetum* rolfeanum* (p. 476) from Amazon region, *C. atratum* var. mentosum (*C. m.* Lemaire) (p. 477), and *C.* georgii (*C. hübneri* Mansf.) (p. 478).—*A. M. Johnson.*

14127. **MARTELLI, U.** Two Pandanaceae from the New Hebrides collected by S. F. Kajewski. *Jour. Arnold Arboretum* 12(4): 269-270. 1931.—*Pandanus* cominsii Hemsl. and *Freycinetia* tannaensis (p. 269).—*A. Rehder.*

14128. **NAKAI, TAKENOSHIN, and FUMIO MAEKAWA.** Yoania amagiensis Nakai & F. Maekawa, a new species of Yoania. *Proc. Imp. Acad.* [*Tokyo*] 7(8): 319-322. 1 pl., 1 fig. 1931.—*Y.* amagiensis* (p. 319), Japan.

14129. **PAPP, C.** Berichtigung zu: Papp, Formen von Melica usw. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 412. 1928.—Part of this article is devoted to a correction in the descriptions of forms of *Melica* occurring in *Ibid.* 10(94): pp. 354 and 355, and a correction in the description of the figure on page 354 of the same issue. *Melica adhaerens* var. tenuis is described from Bolivia.—*A. M. Johnson.*

DICOTYLEDONES

14130. **BLATTER, E., and W. S. MILLARD.** Some beautiful Indian trees. Part IV. *Jour. Bombay Nat. Hist. Soc.* 34(2): 271-274. 4 pl. (2 col.), 4 fig. 1930.—*Plumi-*

eria acutifolia Poir. and *Thespesia populnea* Corr. are illustrated and described.—*E. Blatter.*

14131. **BLATTER, E.** Revision of the flora of the Bombay Presidency. Part XII. *Jour. Bombay Nat. Hist. Soc.* 34(2): 291-306. 1930.—Annonaceae, Nymphaeaceae, Papaveraceae, Cruciferae, Pittosporaceae, Polygalaceae, Frankeniaceae, Caryophyllaceae, Portulacaceae, Tamaricaceae. *Sageraea* laurifolia (*Guatteria l.* Grah.) (p. 294) is proposed; *Nymphaea lotus* is excluded; *Miliusa eriocarpa* Dunn is doubtful in the Presidency. Morphological characters of *Cardamine trichocarpa* Hochst. are discussed. *Xanthophyllum bombayanum* Chodat and *Frankenia pulverulenta* L. are new to the region.—*E. Blatter.*

14132. **BULLOCK, A. A.** Nandi coffee. *Kew Bull. Misc. Inform.* 1930(9): 401-402. 1930.—*Coffea eugenioides* S. Moore (=*C. nandiensis* Dowson ex Hutch. ms.) occurs wild in Kenya and Uganda at 4000-6000 ft. Cultivation at Kampala and Nairobi shows that it is very susceptible to attack by *Hemileia vastatrix* B. & Br. and is unlikely to prove commercially valuable.—*A. A. Bullock.*

14136. **CRAIB, W. G.** A list of the plants known from Siam with records of their occurrence. Rosaceae—Cornaceae. *Florae Siamensis Enumeratio* 1(4): 563-809. Bangkok Times Press, Ltd.: Bangkok; Luzac & Co.: London, 1931.—An extensive, annotated list, including the following: *Prunus* nitens (*P. nitida* Koehne, not Salisb.) (p. 565); *Rubus* efferatus (*R. ferox* Wall. ex Focke, not Tratt.) (p. 570); *Pyrus cuspidata* var. lenticellata (p. 576); *P. granulosa* var. siamensis (p. 577); *Myriophyllum mezianum* var. siamense (p. 591); *Terminalia citrina* var. nana (*T. chebula* var. *n.* Gagnep.) (p. 603); *T. myriocarpa* var. hirsuta (p. 606); *Combretum annulatum* var. orbiculare (p. 614); *C. kunstleri* var. rectinerve (p. 617); *C. squamosum* var. dissitum (p. 620); *Eugenia anacardifolia* var. minor (p. 632); *E. diospyrifolia* var. lanceolata (*Jambosa lanceolata* Korth.) (p. 639); *E.* euneura (*Syzygium euneuron* Mig.) (p. 640); *E. filiformis* var. parvifolia (p. 641); *E. grata* vars. collinsae (*E. c.* Craib) (p. 645) and nervosa (p. 646); *E. javanica* var. parviflora (p. 647); *E.* leptalea (*E. leptantha* Wight not Benth.) (p. 649); *E. limnaea* var. gracilior (p. 650); *E.* megacarpa (*E. macrocarpa* Roxb. not Schlecht.) (p. 652); *E. operculata* vars. avicennifolia (p. 654) and cerasoides (*E. c.* Roxb.); *E. pseudosubtilis* var. orientalis (p. 657); *E.* rotata King Mss. (*E. urceolata* King not Cordem.) (p. 660); *E. toddalioides* var. latifolia (p. 665); *E. winitii* var. terminalis (p. 666); *Barringtonia edaphocarpa* var. ladellii (p. 669); *B. scortechinii* var. globosa (p. 673); *Osbeckia pulchra* var. rubra (p. 677); *Melastoma imbricatum* var. longipes (p. 679); *M. malabathricum* var. grandiflorum (p. 681); *M. normale* var. divergens (p. 682); *Oxyspora collina* var. subglabra (p. 684); *Sonerila helferi*, redescribed and amplified; *S. picta* var. clarkeana (p. 693); *Marumia rhodocarpa* var. esetosa (p. 697); *Medinilla caerulescens* var. nuda (p. 699); *M. elliptica* var. tetramera (p. 699); *Memecylon edule* vars. brevipes and orientale (p. 706); *M. gracilipes* var. rotundatum (p. 708); *M. pauciflorum* var. brevifolium (p. 712); *M. plebejum* vars. ellipsoideum, siamense and symplocinum (p. 712); *M. tricolor* vars. longipes (p. 714) and latifolium (p. 715); *Lagerstroemia floribunda* vars. brevifolia, subecostata and sublaevis (p. 722); *L. spireana* var. armata (p. 726); *L. undulata* var. subangulata (p. 727); *L. villosa* var. sparsior (p. 729); *Passiflora horsfieldii* var. distans (p. 743); *Adenia cardiophylla* var. arcta (p. 746); *A. nicobarica* var. obliqua (p. 747); *A. parvifolia* vars. insularis and nervosa (p. 748); *Alsomitra* angustipetala (*Gynostemma a.* Craib) (p. 767); *A. pubigera* var. glauca (p. 768); *Begonia* bilocularis (p. 771) (*Diplocl inium biloculare* Wight, *B. sinuata* Wall. not Emey.) *B. debilis* var. punicea (p. 772); *B. laciniata* var. pilosa (p. 775); *B. sibthorpioides* var. grandifolia (p. 779); *Trachyspermum* roxburghianum (*Ptychotis roxburghiana* DC. *T. involucratum* (Roxb.) Wolff not Maire) (p. 788); *Heracleum siamicum* var. gracilius (p. 793); *Aralia pseudo-ginseng* var. angustifolia (*A. quinquefolia* var. *a.* Burkill) (p. 794); *Schefflera bengalensis* var. impolita (p. 797); *S.* clarkeana (*Heptapleurum venulosum* var. *macrophyllum* C. B. Clarke) (p. 797); *S. corona-sylvae* var. siamensis (p. 797); *S. heterophylla* var. dentata (p. 799); *Arthrophyllum meliifolium* var. kratense (p. 802); *Scheffleropsis subintegra* var. angkae (p. 805); *Cornus oblonga* var. siamica Geddes (p. 808).

14137. **DINGLER, H.** Griechische Rosen. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 479-488. 1928.—A list of varieties, subvarieties, and forms of 12 spp. of roses collected in Greece by Joh. Mattfeld, including: *Rosa glutinosa* var. *leioclada* subvar. bozdaghensis (p. 480); *R. g.* var. *coqueberti* subvars. anantis (p. 481) and katantis (p. 482); *R. g.*+*R. heckeliana* Trat. forma bornmülleriana (p. 482); *R. sicula* vars. erymanthea (p. 483) and mattfeldiana (p. 484); *R. agrestis* var. *belnensis* f. glabrior M. Schulze ined. (p. 485) and var. chodschajailensis (p. 486); *R. canina* var. *subglabra* subvar. geniculata (p. 486); *R. spinosissima* var. myriadena (p. 487).—*A. M. Johnson.*

14138. **DOMIN, KAREL.** Sedum krajinae Dom. n. sp. a jeho příbuzenské vztahy. [Sedum krajinae Dom. n. sp. and its nearest allies.] [With English summary.] *Rozpravy České Akad. Věd a Umění, Tř. 2.* 39 (číslo 19): 1-21. 5 pl. 1929(1930).—*S.* krajinae* (p. 1), Slovakia;

S. sartorianum Boiss.(?) var. **novákii*** (*S. n.* Domin in sched.) (p. 11), Serbia; *S.* **robustum*** (*S. acre* var. *r.* Vel. in part) (p. 12), Bulgaria; *S.* **zlatiborense*** (p. 13), Serbia; *S.* **rohlenae** (p. 18) [loc. not given]; *S. acre* var. **confertum** (p. 15) [loc. not stated]; *S. a.* var. **umbrosum** (Schuchert nom.) Dom. (p. 15) [doubtfully new], Bohemia; *S. acre* var. **degenianum** [mentioned only in summary, p. 21]; *S. sexangulare* L. is a form of *S. acre* L., and not a synonym of *S. mite* Gilib. A synopsis of the varieties and forms of *S. acre* is given, and a key to the spp. of the genus. *S. hillebrandii* is recorded from Czechoslovakia.

14139. **GUILLAUMIN, A. Contributions to the flora of the New Hebrides; plants collected by S. F. Kajewski in 1928 and 1929.** *Jour. Arnold Arboretum* 12(4): 221-264. 3 fig. 1931.—After a short résumé of the status of the botanical exploration of the new Hebrides, the author gives a systematic enumeration of the plants collected by S. F. Kajewski with full collector's notes and the distribution of the species outside of the New Hebrides. The following appear: *Dillenia* **neo-ebudica** (p. 222); *Oncodostigma* **wilsonii** (p. 224); *Pittosporum* **aneityense** (p. 225); *Calophyllum* **neo-ebudicum** (p. 227); *Hibiscus tiliaceus* f. **variegata** (p. 228); *Sterculia* **banksiana** (p. 229); *S.* **tannaensis** (p. 230); *Grewia* **inmac** (p. 231); *Elaeocarpus* **hortensis** (p. 231); *E.* **kajewskii** (p. 232); *Evodia* **kajewskii** (p. 234); *E. schullei* var. **simplicifolia** (p. 234); *Canarium* **nungi** (p. 236); *Dysoxylum* **aneityense** (p. 237); *Gouania* **efatensis** (p. 239); *Aphania* ? **neo-ebudica** (p. 240); *Cupaniopsis* **neo-ebudensis** (p. 241); *Semecarpus* **tannaensis** (p. 242); *Rubus* **neo-ebudicus** (p. 249); *Dedea* **neo-ebudica** (p. 250); *Weinmannia* **kajewskii** (p. 250); *W.* **tannaensis** (p. 251); *Crossostylis* **banksiana** (p. 252); *Metrosideros villosa* var. **glaberrima** (*M. collina* var. *g.* Bertero) (p. 253); *Myrtus* **aneityensis** (p. 254); *Decaspermum* **neo-ebudicum** (p. 254); *Syzygium* **aneityense** (p. 256); *S.* **kajewskii** (p. 256); *S.* **neepau** (p. 257); *S.* **nidie** (p. 257); *S.* **nomoa** (p. 258); *Medinilla* **neo-ebudica** (p. 260); *M.* **heteromorphophylla** (p. 260); *Astronia* **aneityensis** (p. 261); *A.* **banksiana** (p. 261); *Homalium* **aneityense** (p. 262); *Strobilopanax* **neo-ebudicus** (p. 263); *Tieghemopanax* **neo-ebudarum** (p. 264).—*A. Rehder.*

14140. **HARMS, H. Zur Kenntnis der Gattung Sciadodendron Griseb.** *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(95): 452-456. 1928.—Examination of new material shows that *Reynoldsia americana* J. D. Smith and *Pentapanax granatensis* Rusby are conspecific with *Sciadodendron excelsum* Griseb. The author's conclusion thus gives the first report of the genus *Sciadodendron* from the Antilles.—*A. M. Johnson.*

14141. **HARMS, H. Passifloraceae americanae novae.** *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(98): 808-821. 1929.—*Passiflora* **schultzei** (p. 808), Colombia; *P.* **faroana** (p. 809), Brazil; *P.* **apoda** (p. 809), Colombia; *P.* **mapiriensis** (p. 810) and *P.* **guentheri** (p. 811), Bolivia; *P.* **rojasii** (p. 812), Paraguay; *P.* **ischnoclada** (p. 812) and *P.* **lonchophora** (p. 813), Brazil; *P.* **thaumasiantha** (p. 813), Peru; *P.* **steinbachii** (p. 815), Bolivia; *P.* **brachychlamys** (p. 815), Peru. The second part of the paper lists 17 spp. of *Passiflora* collected in the province of Paraná by P. Dusén, with notes on their localities. A complete diagnosis of *Passiflora mendoncaei* Harms is included.—*A. M. Johnson.*

14142. **HOWELL, JOHN THOMAS. A variant of the coast live oak.** *Madroño, Jour. California Bot. Soc.* 2(4): 38-39. 1931.—*Quercus oxyadenia* Torrey, long relegated to the synonymy of *Q. agrifolia,* is here designated *Q. agrifolia* var. **oxyadenia** (Torr.) J. T. Howell, n. comb. (p. 38).

14143. **HUTCHINSON, J., and J. M. DALZIEL. Flora of West Tropical Africa, the British West African colonies, British Cameroons, the French and Portuguese colonies south of the Tropic of Cancer to Lake Chad, and Fernando Po.** Vol. II, Part I. 292p. 99 fig. The Crown Agents for the Colonies: London, 1931. Price 8s. 6d.—With keys to genera and species, and brief notes on distribution, discusses the families of Metachlamydeae from 113 Ericaceae to 145 Labiatae (following the recent system of Hutchinson). Included are: (Ebenaceae) *Diospyros* **insculpta** (p. 4), Nigeria; *D.* **liberiensis** A. Chev. (p. 4), Ivory Coast; *D.* **thomasii** (p. 6), Sierra Leone, Liberia; *Maba* **cooperi** (p. 7), Liberia; (Sapotaceae) *Chrysophyllum* **sericeum** A. Chev. (p. 9), Ivory Coast; *C.* **glomeruliferum** (p. 9), Sierra Leone, Dahomey and Uganda; *C.* **metallicum** (p. 9), Gold Coast; *C.* **giganteum** A. Chev. (p. 9), Gold Coast; *Pachystela* **argentea** A. Chev. (p. 10), Dahomey; *P.* **micrantha** (p. 11), Sierra Leone, Ivory Coast, Gold Coast; *Delpydora* **gracilis** A. Chev. (p. 11), Ivory Coast; *Sideroxylon* **altissimum** (p. 12), French Guinea, Gold Coast, etc.; *Mimusops* **heckelii** (p. 14), Sierra Leone, Ivory Coast, Gold Coast, Liberia, etc.; (Myrsinaceae) *Embelia* **djalonensis** A. Chev. (p. 16) and *Maesa* **nuda** (p. 16), French Guinea; (Loganiaceae) *Anthocleista* **micrantha** Gilg. & Mildbr. ms. (p. 18), Fernando Po and St. Thomas; *Mostuea* **hymenocardioides** (p. 20), French Guinea, Sierra Leone; *Lachnopylis* **mannii** Hutch. & M. B. Moss (p. 20), French Guinea, Ivory Coast, Cameroons; *L.* **guineensis** Hutch. & Moss (p. 20), Sierra Leone, Gold Coast; *Gaertnera* **cooperi** Hutch. & Moss (p. 21), French Guinea, Liberia; *G.* **salicifolia** Hutch. & Gillett (p. 21), Liberia; *Strychnos* **soubrensis** (p. 22), Ivory Coast; *S.* **littoralis** A. Chev. (p. 24), Ivory Coast, Nigeria, Cameroons; *S.* **tricalysioides** Hutch. & Moss. (p. 24), Nigeria; *S.* **venulosa** Hutch. & Moss (p. 24), Sierra Leone, Liberia; *S.* **cinnabarina** Gilg Ms. (p. 24), Nigeria; *S.* **cooperi** Hutch. & Moss (p. 24), Liberia; *S.* **johnsonii** Hutch. & Moss (p. 24), Sierra Leone, Gold Coast, Togo; (Oleaceae) *Olea* **guineensis** Hutch. & C. A. Smith (p. 26), Ivory Coast, Cameroons; *Schrebera* **chevalieri** (p. 26), Senegal; (Apocynaceae) *Clitandra* **ivorensis** A. Chev. (p. 34), Ivory Coast; *C.* **laurifolia** A. Chev. (p. 35), Ivory Coast; *Carpodinus* **macrophylla** A. Chev. (p. 36), Liberia, Ivory Coast, Gold Coast; *C.* **baumannii** (p. 36), Togo; *Pleiocarpa* **simii** Stapf (p. 38), Liberia, Ivory Coast; *Alstonia congensis* v. **glabrata** (p. 42); *Holalafia* **jasminiflora** (p. 43), Ivory Coast; *Baissea* **aframensis** (p. 48), Gold Coast; *B.* **subsessilis** Stapf Ms. (p. 46), Nigeria; *B.* **concinna** Stapf (p. 46), Liberia; (Asclepiadaceae) *Tacazzea* **viridis** A. Chev. (p. 52), Ivory Coast; *Raphionacme* **sudanica** A. Chev. (p. 54), Sudan; *Asclepias* **solstitialis** A. Chev. (p. 56), French Guinea, Ivory Coast, Gold Coast, Nigeria; *Schizoglossum* **glanvillei** (p. 58), Sierra Leone; *Tylophora* **deightonii** (p. 59) and *Ceropegia* **deightonii** (p. 62), Sierra Leone; *C.* **tourana** A. Chev. (p. 62), Ivory Coast; *C.* **hepburnii** (p. 62), Nigeria; *Caralluma* **edulis** A. Chev. (p. 65), Mauritania; (Rubiaceae) *Hymenodictyon* **epidendron** Mildbr. Ms. (p. 70), Fernando Po; *Pausinystalia* **sankeyi** (p. 71), Nigeria; *Tarenna* **vignei** (p. 77), Gold Coast; *T.* **patula** (p. 76), Nigeria; *T.* **thomasii** (p. 76), French Guinea, Sierra Leone; *T.* **lagosensis** (p. 76), Nigeria; *Dorothea* **divergens** (p. 76), French Guinea, Sierra Leone; *Randia* **lane-poolei** (p. 78), Sierra Leone, Liberia; *R.* **thomasii** (p. 78), Sierra Leone, Nigeria; *R.* **leptactinioides** K. Schum. Ms. (p. 78), Nigeria, Cameroons; *R.* **amaralioides** K. Schum. Ms. (p. 79), Gold Coast, Nigeria; *Oxyanthus* **laxiflorus** K. Schum. Ms. (p. 80), Nigeria, Cameroons; *Tricalysia* **hookeri** (p. 83), Nigeria; *T.* **elliotii** (p. 83), Sierra Leone, Gold Coast, Cameroons, N.E. Congo; *T.* **trilocularis** (p. 83), Sierra Leone; *T.* **coffeoides** (p. 83), French Guinea, Ivory Coast, Dahomey, Nigeria; *T.* **pobeguinii** (p. 83), French Guinea, Gold Coast, Togo; *T.* **oblanceolata** (p. 83), Nigeria; *Leptactina densiflora* var. **glabra** (p. 84), Gold Coast; *Belonophora* **wernhamii** (p. 85), Nigeria; *B.* **lepidopoda** (p. 85), French Guinea, Sierra Leone, Togo; *Cremaspora* **wernhamiana** (p. 85), Nigeria; *C.* **triflora** (p. 85), French Guinea to South Africa, etc.; *Ixora* **degemensis** (p. 87), Nigeria; *I.* **linderi** (p. 87), Liberia; *I.* **bipindensis** K. Schum. Ms. (p. 87), Nigeria, Cameroons; *I.* **laxissima** (p. 87) and *I.* **bauchiensis** (p. 87), Nigeria; *I.* **divaricata** (p. 89), Liberia; *Pavetta* **plumosa** (p. 91), Nigeria; *P.*

apiculata (p. 91), French Guinea, Gold Coast; *P.* mollissima (p. 91), Gold Coast; *P.* nitida (p. 91), Senegal and French Sudan to Cameroons, etc.; *P.* staudtii (p. 91) and *P.* mannioides (p. 91), Nigeria; *P.* nigrescens (p. 91), *P.* striatula (p. 91) and *P.* smythei (p. 92), Sierra Leone; *P.* flaviflora (p. 92), Nigeria, Cameroons; *Psilanthus* jasminoides (p. 92), Gold Coast; *Bertiera* maitlandii (p. 97), Cameroons; *B. racemosa* var. glabrata (p. 97), Sierra Leone; *B.* chevalieri (p. 97), French Guinea; *Atractogyne* bracteata (p. 98), Ivory Coast, Cameroons, Nigeria, Gabon; *Sarcocephalus* nervosus (p. 100), Nigeria, Cameroons; *Mussaenda* nivea A. Chev. (p. 101), Ivory Coast, Gold Coast; *M.* uniflora (p. 101), French Guinea, Liberia; *M.* punctulata (p. 103), *M.* linderi (p. 103), *Urophyllum* sylvicola (p. 104), *U.* stipulosum (p. 104), *U.* insculptum (p. 104) and *U.* linderi (p. 104), Liberia; *Sabicea* cordata (p. 106), Gold Coast; *S.* globifera (p. 106) and *S.* arachnoidea (p. 107), Sierra Leone; *Robynsia* glabrata Hutch. (p. 108), Nigeria; *Fadogia* erythrophloea (p. 109), French Sudan, French Guinea, Sierra Leone, etc.; *Canthium* rufivillosum Robyns Ms. (p. 113), Sierra Leone, Liberia; *C.* favosum (p. 113), Nigeria; *C.* euryoides Bullock (p. 113), Nigeria and East Africa; *C.* inaequilaterum (p. 115), Nigeria; *C.* dunlapii (p. 115), Cameroons; *C.* pobeguinii (p. 155), French Guinea; *C.* venosissimum (p. 115), Liberia and Gold Coast; *Craterispermum* gracile A. Chev. (p. 116), Ivory Coast; *Vangueriopsis* leucodermis (p. 117), Gold Coast, Nigeria; *Cuviera* truncata (p. 118), Nigeria; *Psychotria* fimbriata A. Chev. (p. 123), Ivory Coast; *P.* pilifera (p. 123), Nigeria; *P.* farmari (p. 123), Gold Coast; *P.* rufipilis A. Chev. (p. 124), French Guinea, Sierra Leone, Liberia, Ivory Coast; *P.* kitsonii (p. 124) and *P.* williamsii (p. 124), Gold Coast; *P.* rowlandii (p. 124) and *P.* dalzielii Hutch. 14144. **HUTCHINSON, J., and MARION B. MOSS.** A new stinkwood from East Africa. *Kew Bull. Misc. Inform.* 1930 (2): 68-70. 1 pl. 1930.—*Ocotea* gardneri is described from material sent by the Conservator of Forests, Kenya Colony. The Cape Stinkwood is a well-known timber tree of South Africa, but hitherto only one species was recorded from East Africa, and this new plant may prove of considerable economic importance. —*M. B. Moss.*

14145. **J[ENSEN], L. P.** A white-flowering partridge pea. *Missouri Bot. Gard. Bull.* 19 (2): 38-39. 1 pl. 1931. —*Cassia chamaecrista**.

14146. **LEONARD, E. C.** The genus Mendoncia in Peru. *Jour. Washington Acad. Sci.* 21 (7): 144-152. 1931. —Treatment (with key) of the spp. indigenous to Peru, including: *M.* klugii (p. 145), *M.* smithii (p. 145), *M.* aurea (p. 147), *M.* peruviana (p. 148), *M.* killipii (p. 149), and *M.* pedunculata (p. 150).

14147. **MANSFELD, R.** Monandrodendron nov. gen. Flacourtiaceae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (98): 860-862. 1929.—MONANDRODENDRON (p. 860), based on *M.* schultzei* (p. 860), a characteristic forest tree of the Sierra Nevada de Santa Marta, Colombia.—*A. M. Johnson.*

14148. **MELCHIOR, H.** Rinorea lindeniana, eine verkannte Violaceen-Art des tropischen Südamerika. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (96): 544-550. 1929.—This species has been variously interpreted despite its clearly defined characters—seen in the configuration of the stamens and the style. The author points out the errors in the literature and gives a revised and complete diagnosis of the species, with complete synonymy and conspectus of geographical distribution.—*A. M. Johnson.*

14149. **MELCHIOR, H.** Die chinesischen Arten der Familie der Alangiaceen. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (98): 822-830. 1929.—Key and conspectus of 7 spp. of *Alangium* occurring in China, including *A.* kwangsiense (p. 823).—*A. M. Johnson.*

14150. **MILDBRAED, J.** Neue Arten von Coussapoa und Pourouma Aubl. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (95): 413-420. 1928.—*Poulsenia aculeata* Eggers (=*Coussapoa rekoi* Standley); *Coussapoa* tessmannii (p. 413), eastern Peru; *C.* donnell-smithii (p. 414), Costa Rica; *C.* sprucei (p. 415), northern Brazil; *C.* oligoneura (p. 415), Colombia; *C.* trinervia Spruce in sched. (p. 416), southeastern Colombia; *C.* warburgiana (p. 416), Brazil; *Pourouma* cuspidata Warb. (p. 417), Brazil; *P.* aurea (p. 418), western Brazil; *P.* apiculata Spruce in sched. (p. 419), southeastern Colombia;

P. crassivenosa (p. 419), Bolivia; *P.* hirsutipetiolata (p. 420), Colombia.—*A. M. Johnson.*

14151. **MYERS, J. G.** Notes on wild cacao in Surinam and in British Guiana. *Kew Bull. Misc. Inform.* 1930 (1) : 1-9. 2 pl. 1930.—Describes a visit to an area of wild cacao (*Theobroma cacao* L.) on a tributary of the Coppename River, Surinam. Witches' broom disease (*Marasmius perniciosus*) was frequent on the trees, and this locality is believed to be the source of the widespread outbreak in the Surinam plantations of cultivated cacao. The wild cacao tree and its habitat in this locality are carefully described, and the uniformity of the pods in this and other localities is considered strong evidence for the nativity of the species. Its occurrence and distribution in British Guiana and the northern Amazonian region are also discussed, the evidence being in favor of the species being indigenous. —*N. Y. Sandwith.*

14152. **PERKINS, J.** Drei neue Arten der Gattung Styrax. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (95) : 457-459. 1928.—*Styrax* ledermannii (p. 457), New Guinea; *S.* schultzei (p. 458), Colombia; *S.* tessmannii (p. 459), eastern Peru.—*A. M. Johnson.*

14153. **PILGER, R.** Einige Nachträge zur Bearbeitung der südamerikanischen Plantago-Arten. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (98) : 831-836. 1929.—A conspectus of 8 S. Amer. spp. of *Plantago: P. myosurus* Lam. and its var. *parviflora* Pilger, *P.* macbridei (p. 832), Peru, *P. extensa* Pilger, *P.* hillii (p. 833), Bolivia, *P. dombeyi* Pilger, *P. weberbaueri* Pilger, and *P. godeti* Beauv.—*A. M. Johnson.*

14154. **RIDLEY, H. N.** Additions to the flora of Borneo. *Kew Bull. Misc. Inform.* 1930 (2) : 74-87. 1930. —*Ixonanthes* grandiflora (p. 74); *I.* multiflora Stapf ms. (p. 75); *Connaropsis* grandiflora (p. 75); *Ouratea* megacarpa (p. 76); *Schuurmansia* borneensis (p. 77); *Evodia triphylla* var. pubescens (p. 77); *E.* concinna (p. 78); *E.* obtusifolia (p. 78); *Tetractomia* parviflora (p. 78); *T.* latifolia (p. 79); *T.* montana (p. 79); *Glycosmis* oliveri Stapf ms. (p. 80); *Canarium* parciflorum (p. 80); *C.* pauciflorum (p. 80); *C.* flavum (p. 81); *C.* latistipulatum (p. 81); *C.* micrantherum Stapf ms. (p. 82); *C.* costatum (*Santiria costata* Hook. fil.) (p. 82); *C.* fusco-calycinum Stapf ms. (p. 82); *C.* moultonii (p. 83); *C.* expansum (p. 83); *C.* reticulatum (p. 83); *C.* hirtipetalum (p. 84); *Santiria* mollissima (p. 85); *S.* havilandii (p. 85); *S.* latifolia (p. 86); *S.* rubra (p. 86); *S.* pedicellata (p. 86); *S.* minimiflora (p. 87). Ten other old species are recorded as new to Borneo.—*C. E. C. Fischer.*

14155. **SANDWITH, N. Y.** Contributions to the flora of Tropical America: II. Chondodendron candicans, a Menispermaceous bush-rope of Guiana. *Kew Bull. Misc. Inform.* 1930 (8) : 339-343. 1930.—It is shown that *Sciadotenia candicans* (Rich.) Diels, described from the leaves of seedlings, belongs to *Chondodendron* as *C.* candicans (*Abuta c.* Rich.) (p. 342).—*N. Y. Sandwith.*

14156. **SANDWITH, N. Y.** Contributions to the flora of Tropical America: III. Annonaceae collected by the Oxford University Expedition to British Guiana, 1929. *Kew Bull. Misc. Inform.* 1930 (10) : 466-480. 1930.—An enumeration of 14 spp. of Annonaceae collected within a radius of 2 miles from a camp on the Moraballi Creek, Essequibo River. Notes on a few other spp. of this family are added, and an index of vernacular names is appended. *Guatteria* atra (p. 468), *Duguetia* neglecta (p. 470), *D.* pycnastera (p. 471), *D.* yeshidan (p. 473), *Anaxagorea* dolichocarpa Sprague & Sandwith (p. 475), *Annona* symphyocarpa (p. 477), *Xylopia* pulcherrima (p. 477) and *X.* cinerea (p. 478) are described.—*N. Y. Sandwith.*

14157. **SCHULZ, O. E.** Cheesemania, eine neue australische Cruciferengattung. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (96) : 551-553. 1929.—**CHEESEMANIA** (*Arabideae*), near *Cardamine, Arabis,* and *Nasturtium,* with *C.* radicata (*Cardamine r.* Hook.), *C.* gibbsii (*Nasturtium g.* Cheeseman), *C.* latesiliqua (*Cardamine l.* Cheeseman), *C.* fastigiata (*Arabis f.* Hook.), and *C.* enysii (*Cardamine e.* Cheeseman) (all p. 552).—*A. M. Johnson.*

14158. **SCHULZ, O. E.** Asiatische Cruciferen verschiedener Herkunft. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (96) : 554-557. 1929.—Included are: *Cochlearia* acutangula (p. 554), China; *Draba* rockii (p. 555), Kansu, China; *D. lanceolata* var. latifolia (p. 555), Tibet; *Hesperis* ixodes Haussknecht et O. E. Schulz (p. 556), Turkish Armenia; *Megacarpaea delavayi* var. grandiflora (p. 557), Kansu; *Parrya villosa* var. albiflora (p. 557), Tibet; *Dontostemon* glandulosus (*Arabis g.* Kar. et Kir.) (p. 554).—*A. M. Johnson.*

14159. **TYMRAKIEWICZ, WŁODZIMIERZ.** Reliktowe stanowisko Warzuchy pirenejskiej Cochlearia pyrenaica D. C. var. eupyrenaica Thell. u źródlisk Bugu. [A relict station of C. p. var. eupyrenaica at the sources of the Bug.] [With German summary.] *Kosmos* [*Lwów*] 55 (3/4) : 732-733. 1930 (1931).—Second record for Poland.

14160. **ULBRICH, E.** Ranunculaceae novae vel criticae VIII. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (98) : 862-880. 1929.—A conspectus of genera, species, etc., of Ranunculaceae from Asia, including: **UROPHYSA** (p. 868), based on *U.* rockii* (p. 869), China; *Anemone* rockii (p. 876), China; **SCHLAGINTWEITIELLA** (p. 877), based on *S.* fumarioides* (p. 878), China and Tibet; *Caltha scaposa* vars. smithii (p. 864), China, and parnassioides (p. 865), China and Tibet; *Trollius pumilus* var. alpina (p. 865), Yunnan; *Thalictrum alpinum* var. elatum (p. 877), China; *Urophysa* henryi (*Isopyrum h.* Oliv.) (p. 870); *Beesia* calthifolia (*Cimicifuga calthaefolia* Maxim.) (p. 872).—*A. M. Johnson.*

14161. **WERDERMANN, E.** Beiträge zur Kenntnis der Flora von Chile. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (95) : 460-475. 1928.—II. **O. E. SCHULZ:** Die von O. Berninger, A. Hollermayer, und besonders von E. Werdermann in Chile gesammelten Cruciferen (pp. 460-472). This is a list of crucifers from Chile, with notes on localities, including: *Eudema* werdermannii (p. 462); **HOLLERMAYERA,** based on *H.* silvatica* (p. 463); *Menonvillea* arachnoidea (p. 466); **MICROCARDAMUM,** based on *M.* tenue (*Draba tenuis* Barn.) (p. 467); *Sisymbrium intricatissimum* var. brachycarpum (p. 468); *S. pubescens* var. glabrescens (p. 469); *Stenodraba suffruticosa* var. lagunae (p. 469); *Sisymbrium intricatissimum* var. deserticola (*Cardamine* (?) *d.* Phil.) (p. 469); **WERDERMANNIA** (p. 470), based on *W.* macrostachya (*Nasturtium macrostachyum* Phil.) (p. 470). III. **WERDERMANN, E.** Übersicht über die in Chile vorkommenden Arten der Gattung Salpiglossis Ruiz et Pav. (Solanaceae) (pp. 472-475). *Salpiglossis* is restricted to Peru, Chile, and Argentina, most of the species inhabiting the Atacama desert and bordering regions. *S. sinuata* R. & P., from which our cultivated forms are derived, grows in central and southern Chile. A key and descriptions are given of: *S. spinescens* Clos, *S. sinuata* R. & P., *S. parviflora* Phil., *S.* (*Reyesia*) juniperoides (p. 474), Chile, and *S. chilensis* (Clos) Wettst.—*A. M. Johnson.*

FLORISTIC AND PLANT DISTRIBUTION

14162. **BRAUN-BLANQUET, J., et R. MAIRE.** Contributions à l'étude de la flore marocaine. (Fascicule 5.) *Bull. Soc. Hist. Nat. Afrique du Nord* 22 (3) : 103-110. 1931.—An annotated list of 66 spp. (1 fern, 65 Angiosperms) from Morocco. **HANNONIA** (Amaryllidaceae) (p. 104), near *Cyrtanthus,* erected for *H.* hesperidum (p. 104); *Ononis antennata,* new to Morocco; *Erodium guttatum* var. *grandiflorum* f. caeruleum Maire (p. 107); *Viola riviniana,* new to Morocco; *Tragiopsis* hanotei (p. 108); *Teucrium rupestre* var. villosum (p. 109); *Galium viscosum* var. *gibraltaricum,* new to Africa; *Senecio lividus* ssp. foeniculaceus (DC.) n. comb. (p. 110); *Centaurea* (*Amberboa*) murbeckiana (*Amberboa maroccana* Barr. & Murb., not *C. maroccana* Ball) (p. 110).

14163. **COTTON, A. D.** A visit to Kilimanjaro. *Kew Bull. Misc. Inform.* 1930 (3) : 97-121. 2 pl. 1 fig. 1930.—

An account is given of a visit to Kilimanjaro in Tanganyika Territory and an ascent of the mountain up to 12,000 ft. A general description of the vegetation of the temperate rain forest, 6,000-8,000 ft. alt., is given and also of the grassland, 8,000-12,000 ft. A list is given of some 80 spp. collected above the forest belt, and named by Miss M. B. Moss. Included are: *Conyza* **apiculata** Hutch. & M. B. Moss (p. 113); *Senecio* **cottonii*** Hutch. & Taylor (p. 115); *Landtia* **kilimanjarica** Hutch. & M. B. Moss (p. 118); and *Pentaschistis borussica* var. **minor** Ballard & Hubbard (p. 121). Photographs show the giant Senecios *S. johnstonii* and the new *S. cottonii*.—*A. D. Cotton.*

14164. COWAN, J. M. A botanical expedition to Persia. *Kew Bull. Misc. Inform.* 1930(2): 49-68. 1 map. 1930.—Gives a descriptive account of an expedition in Persia by the author and C. D. Darlington, from Feb. 22 to July 27, 1929. An account is given of the districts passed through, namely, Palestine, Damascus to Baghdad, Khaniqin, Hamadan, Isfahan, Teheran, Tabriz, Lake Urumiya, Astara and Batum, and of the pteridophytes, gymnosperms and angiosperms observed.—*A. W. Hill.*

14165. DOMIN, K. Beiträge zur Flora und Pflanzengeographie Australiens. I. Dicotyledoneae. Systematische Bearbeitung des eigenen sowie auch fremden, besonders des von Frau Amalia Dietrich in Queensland (1863-1873), und von Dr. Clement in Nordwest-Australien gesammelten Materiales, mit teilweiser Berücksichtigung der gesamten Flora Australiens. *Bibliotheca Bot.* (No. 89III. 741-840. 1927 (See B. A. 1(2/3): Abstr. 3529)); 89IV. 841-936. 3 pl., 7 fig. 1927; 89V. 937-1032. 3 pl., 13 fig. 1928; 89VI. 1033-1128. 2 pl., 12 fig. 1928; (89VII. 1129-1200. (See B. A. 5(6/7): Abstr. 18320)); 89VIII. 1201-1317. 9 fig. 1929.—Continuations and conclusion of the treatment of Australian genera and species of numerous families. The locality is Queensland unless otherwise stated. Rutaceae: *Melicope* **simplicifolia** (p. 842); *M. pubescens* v. **superba** (p. 843); **LUERSSENIDENDRON** (p. 843), near *Melicope* and *Pentaceras*, erected for *L.* **monostylis*** (p. 843), N. S. Wales; *Evodia* **bakeriana** (p. 845); *Pagetia* **dietrichiae** (p. 845); *Fagara* **varians** (p. 846); *Geijera* **paniculata** (*Coatesia p.* F. v. Muell.) (p. 847); *G.* **linearifolia** (*Eriostemon linearifolium* DC.) (p. 847); *Acronychia laevis* vars. **dictyophleba** and **longiflora** (p. 848); *A.* **superba** (p. 849); *Murraya* **ovatifoliolata** (p. 850); *Citrus* **maideniana** (p. 851); *Flindersia* **xanthoxyla** (*Oxleya x.* A. Cunn.) (p. 851); *F.* **dissosperma** (*Strzeleckia d.* F. v. Muell.=*Flindersia strzeleckiana* F. v. Muell.) (p. 852). Meliaceae: *Owenia* **capitisyorkii** (p. 854). Polygalaceae: *Polygala leptalea* v. **australiensis** (p. 855) and *P. abyssinica* v. **intercedens** (p. 855), N. Australia; *P.* **macrobotrya** (p. 856); *P. chinensis* v. **dissitiflora** (p. 857); *P.* **pycnophylla** (p. 858); *P.* **gabrielae** (p. 858); *P. stenoclada* vars. **queenslandica** and **clementii** (p. 859), latter var. N-W. Australia; *Xanthophyllum* **octandrum** (*Macintyria octandra* F. v. Muell.) (p. 860). Euphorbiaceae: *Euphorbia mitchelliana* vars. **dietrichiae, cairnsiana,** and **filifolia** (p. 861); *E.* **biconvexa** (p. 862); *E.* **clementii** (p. 862) and *E.* **inappendiculata,** N-W. Australia; *E. i.* v. **queenslandica** (p. 863); *E. australis* vars. **canescens, subtomentosa** (from N. Australia), and **semiglabra** (p. 864); *E. macgillivrayi* vars. **pseudoserrulata** and **yarrabensis** (p. 865); *E. eremophila* v. **oblonga** (p. 866); **HETEROCALYMNANTHA** (p. 867), related to *Micrantheum* and *Stachystemon,* with *H.* **minutifolia*** (p. 867); *Amperea* **xiphoclados** (*Leptomeria x.* Sieb.) (p. 868), No. Australia; *Andrachne* **orbicularis** (p. 869); *Actephila* **foetida** (p. 869); **HEXASPERMUM** (p. 869), near *Actephila,* with *H.* **paniculatum*** (p. 870); *Petalostigma* **pubescens** (p. 871); *P.* **glabrescens** (*P. quadriloculare* var. *g.* Benth.) (p. 871); *P.* **micrandrum** (p. 871), N-W. Australia; *Glochidion* **supra-axillare** (*Phyllanthus ferdinandi* var. *s.-aullaris* Benth.) (p. 872); *G.* **benthamianum** (p. 872); *G.* **harveyanum** (p. 873); *Phyllanthus* (Sect. *Paraphyllanthus*) **collinus** (p. 874); *P.* **savannicolus** (p. 875); *P. fuernrohrii* v. **suffruticosus** (p. 875); *P. simplex* v. **myrtifolius** (p. 876); *P. s.* var. **pinifolius** (p. 877); *Flueggea virosa* v. **aridicola** (p. 878); *Bridelia leichhardtii* v. **glabrata** (p. 879); *Cleistanthus* **xerophilus** (p. 879); *Croton phebalioides* v. **acuminatus*** (p. 880); *C.* **mirus** (p. 882); *C.* **pubens** (p. 882); *Alchornea* **aquifolium** (*Sapium a.* J. Smith) (p. 886); *Mallotus claoxyloides* v. **glabratus** (p. 888). Anacardiaceae: *Pleiogynium* **cerasiferum** (*Owenia c.* F. v. Muell.) (p. 892); *Semecarpus australiensis* vars. **obtusifolius** and **macrophyllus** (p. 893). 14168. **ADRIANCE, GUY W. Dichogamy in the pecan.** *Proc. Amer. Soc. Hort. Sci.* 27: 435-439. 1930(1931).—Blossoming data for 7 varieties of pecan for 6 years, and for 10 varieties for 4 years, indicate 3 groups of varieties: protandrous, fluctuating, and protogynous. Type of dichogamy is influenced by environmental conditions previous to blossoming period. Deficiency in soil moisture or in heat units favors protogyny; more favorable conditions of moisture and temp. favor protandry. Soil moisture is the limiting factor; but when moisture is sufficient, the influence of temp. is appreciable. Staminate flowers show less variation in number of heat units required for maturity than pistillate, being earlier in a warm spring than pistillate, and later in a cool spring.—*G. W. Adriance.*

14169. **AUFHAMMER, G., und W. PECH. Die Behaarung der Basalblattscheiden bei Hordeum sativum Jess.** *Pflanzenbau, Pflanzenschutz u. Pflanzenzucht* 8(2): 49-61. 5 fig. 1931.—On the basal leaf sheath of *H. sativum* between the time of formation of the first 3 leaves and the end of culm formation occurred a downy border of mostly 1-celled hairs. All winter varieties showed greater hairiness shortly before shoot production than in spring. Low winter temp. in open fields injured plant growth and thereby retarded hair production. Favorable growth conditions favor a strong production of hairs. Hair production differs with the variety.

14171. **BANCROFT, HELEN, and JEAN DICKSON. Studies in floral anatomy. 1. The nectary of Pelargonium.** 23p. 4 pl. 9 fig. Basil Blackwell: Oxford, 1930.—This is a study in the floral anatomy of *Pelargonium,* with some histological features of the floral axis. The nectar tube is held to be contained within the floral axis, and is not a sac-like spur of the posterior sepal. Strands of vascular tissue pass off from the stele opposite the insertion of the posterior sepal, and enter a secretory papilla. An explanation of obdiplostemony in the flower is believed to be related to the fact that the vascular supplies to the antesepalous, or inner whorl, of stamens are derived at a higher level than the vascular supplies to the antepetalous stamens, which take their origin as branches of bundles which supply the petals. The vascular bundles to the petals and antepetalous stamens are therefore believed to constitute a single whorl, and by arranging the vascular supply to the different organs of the flower in an alternating series, the antepetalous position of the carpel loculi is also explained.—*C. L. Wilson.*

14172. **BARON, C. M., R. J. D. GRAHAM, and L. B. STEWART. Vegetative propagation. Kalanchoe verticillata.** *Trans. and Proc. Bot. Soc. Edinburgh* 30(2): 70-71. 3 fig. 1929.—The leaf-apex bears 3 or more teeth and 1 or more pairs of outgrowths. The outgrowths are buds consisting of a basal disc which carries 2 unequal leaves, each traversed by 6 bundles. In old leaves the buds drop off and produce roots from the disc. The bud originates from meristematic cells near the vascular trace of the leaf.—*C. M. Baron.*

14173. **BARON, C. MARION. Cork formation in Rhododendron.** *Trans. and Proc. Bot. Soc. Edinburgh* 30 (2): 127-130. 3 fig. 1929.—In some small spp. cork development in the stem is entirely pericyclic; in the majority it is first pericyclic and later cortical. A complete cork cylinder within the pericyclic fibers is formed early, but the cortex remains living, and later cork layers develop in the cortex, running obliquely from pericycle to epidermis. The cortex isolated between these layers dies, and through continued development of new layers the whole cortex eventually forms a dead bark. The junction of living and dead tissue is clearly visible externally and often extremely irregular. Green living areas are often enclosed in the dead bark.—*C. M. Baron.*

14174. **BROWN, C. H., ABD EL GHAFFAR SELIM, and W. LAWRENCE BALLS. The wall of the cotton hair.** *Nature* [*London*] 127(3211): 742-743. 1 fig. 1931. —Presents a diagram showing correlations between wall thickness, "ribbon width," and cell diameter.

14175. **CAHN, A. R. Twisted trees.** *Science* 73(1899): 561. 1931.—The author reports that on an island in Lake Kahnipiminanikok, Ontario, Canada, 219 cedar trees (*Thuja occidentalis*) out of 312 present were twisted, 187 having a right hand twist.

14176. **CAREY, GLADYS. The leaf buds of some woody perennials in the New South Wales flora.** *Proc. Linn. Soc. N. S. Wales* 55(5): 708-737. 75 fig. 1930.—Part 1. A general description of the leaf buds of New South Wales perennials. These are divided into: (1) Scaly buds; (2) intermediate buds; (3) naked buds; (4) mixed buds. Intermediate buds form a type showing transitional features between those shown by scaly buds and those of naked buds so that there is no sharp line between these classes. "Transitional forms" are a feature of the expanding bud of the intermediate type; these structures are not deciduous bud scales nor yet true leaves. They show more development than the former but less than the latter, and buds are almost invariably found in their axils. Mixed buds are those in which both leaves and flowers occur. The classification is based on the features of the expanding shoot as well as those of the dormant bud. It is evident, therefore, that bud structure reveals a greater range of form in New South Wales' woody perennials than in those of the Northern Hemisphere. In part 2 a brief description is given of the buds of each of the 140 spp. studied.—*G. Carey.*

14177. **CHODAT, R. Some facts of morphological continuity as shown by a comparison of fossil and living plants.** *Proc. Internat. Congress Plant Sci. Ithaca, N. Y. 1926.* 1: 487-496. 1929.—Paleontological discoveries of the last 20 yrs. have profoundly modified the funda-

mental conceptions of shoot, axis, leaf, bundles, and sporophylls. Attention is called to the striking parallelism of successive modifications as observed from Psilophytales to those living ferns showing primitive structure. During the differentiation of leaves from cauloids the anatomical structure maintained its unity, the apparently striking dissimilarities being of secondary importance. The terminal sporangia of the Psilophytales and Psilotales are borne on cauloids; in many ferns of primitive origin they become marginal and tend to pass to the dorsal part of the frond, retaining from their primitive terminal location their organization in sori, these last arising from veins as specialized ramifications.—*P. J. Sedgwick.*

14178. **CONNARD, MARY H., and P. W. ZIMMERMAN. The origin of adventitious roots in cuttings of Portulaca oleracea L.** *Contr. Boyce Thompson Inst.* 3 (3): 337-346. 2 pl., 1 fig. 1931.—The majority arise in the medullary rays within 5 mm. of the base and emerge through the cut surface without penetrating the epidermis. All attempts to induce roots to pass through the epidermis by orienting the cuttings failed. The activity of the cells in the region of the interfascicular cambium appeared to be the most essential feature of the formation of adventitious roots of this species. Generally, the pericycle formed the outer portions of the root while the endodermis was dissolved away. Some exceptions occurred where roots arose in the pith or within vascular bundles.—*Authors' summary.*

14179. **COOK, O. F. Branching habits of the Hevea rubber tree.** *Science* 71 (1841): 386-387. 1930.—In common with other tropical trees, Hevea has specialized habits of branching. Two distinct growth periods can be recognized: The juvenile period, covering the growth of the primary upright; the adult period, signalized by branching. This throws light on the problems of vegetative propagation since the lateral branches from which cuttings or bud wood are taken in mature trees may lack the ability to regenerate uprights.—*L. G. Polhamus.*

14180. **CRIST, J. W. The nature, formation and variability of stone cells in fruits of the pear.** *Proc. Amer. Soc. Hort. Sci.* 27: 542. 1930 (1931).—Abstract.

14181. **CROSS, GEORGE L. Meristem in Osmunda cinnamomea.** *Bot. Gaz.* 91 (1): 65-76. 15 fig. 1931.—The rhizome in the sporeling stage grows by means of a tetrahedral apical cell. As the plant reaches maturity the segmentation of the apical cell usually becomes progressively less regular until the identity of the original apical cell is lost, and growth takes place by 2 or more initials. Cells destined to become desmogen tissue may be recognized in the 2nd segment from the apical cell. Due to the slow growth of the rhizome and the frequency of leaf gaps, it is difficult if not impossible to refer any portion of the mature rhizome to any definite portion of the segments from the apical cell or group of initials. The pericycle and endodermis apparently have independent origins, although decisive evidence was lacking. The roots arise in tissue which later gives rise to the pericycle. The undifferentiated endodermis acts as a sort of protective layer to the young root. The number of cells of most young roots is increased for a time by means of an apical cell with 5 cutting faces. As in the stem, progressive irregularity in segmentation of this cell often results in the formation of 2 or more initial cells which replace the apical cell. The evidence obtained supports the conclusions of Bower that the Osmundaceae occupy an intermediate position between the leptosporangiate and the eusporangiate ferns, but it throws no light upon the relative antiquity of the 2 groups.—*Author's summary.*

14185. **FOSTER, A. S. Phylogenetic and ontogenetic interpretations of the cataphyll.** *Amer. Jour. Bot.* 18 (4): 243-249. 1931.—In view of our limited knowledge of the details of foliar evolution in seed plants, it is suggested that cataphyll morphology be approached by intensive ontogenetic studies. K. Domin's theory of the evolution of the 2-membered leaf is thought to involve certain highly speculative assumptions regarding the morphological nature of the cataphyll. Certain important facets of the problem from the standpoint of recent studies by Schüepp, Foster, and Diels are discussed and may be summarized as follows: (1) A knowledge of the complete development of a cataphyll from a meristematic protuberance at the growing point until maturity is necessary before its divergence from the foliage leaf can be clearly appreciated. (2) The mode of internal differentiation of the cataphyll seems to offer a promising field for morphogenetic and "causal" studies, especially since the postion and duration of meristematic tissue in a foliar anlage are of fundamental importance in relation to its method of growth. (3) The periodic alternation of cataphylls and foliage leaves represents a dynamic aspect of the general problem of shoot organization which requires closer examination. In certain plants the cataphylls are formed by the growing point at a faster "tempo" than the foliage leaves; this may prove of importance. (4) The experimental studies of Schüepp and Diels suggest that a foliar primordium becomes determinate at a very early stage in ontogeny. The bearing of this fact upon Goebel's "Transformation theory" is discussed.—*A. S. Foster.*

these spp. is briefly described. The *Adiantum* spp. were sterile.

14191. **HOLDEN, H. S. Some observations on the wound reactions of Ankyropteris corrugata.** *Jour. Linn. Soc. London, Bot.* 48(325): 643-655. 1 pl., 16 fig. 1931.—The tissues of this fossil fern show well-marked reactions to wounding. In the root these, which consist of irregularly disposed wedges of meristematic tissue, are confined to the cortical parenchyma and may extend for some distance beyond the actual wound area. In the stem the wounds generally take the form of irregular cortical fissures. These are bordered on either side by a strip of meristem 4-8 cells in depth. Anomalous secondary xylem which occurs in a stem in the neighborhood of a bifurcation is also considered to be due probably to traumatic stimulus. In the petiole the wound reaction varies. Where the wound is superficial a pad of healing meristem is developed from the cortical cells. The parenchymatous cells are most active, but the sclerenchymatous cells may also undergo division. Exceptionally the superficial cells may be modified in a way similar to those of the normal epidermis, thus providing an example of "restitution." Other wounds, termed "crush" wounds, are characterised by irregular cortical fissures. These become bordered or surrounded by a strip of meristematic cambiform cells. Where the wounds are deep-seated the vascular tissues may be involved in the reaction, which in such cases takes the form of the development of secondary tracheids, usually short and of small calibre, which vary in position with that of the wound. There is some evidence that the phloem or phloem-parenchyma may also become meristematic under these conditions.—*Author's summary.*

14192. **HOWE, M. DORISSE. A morphological study of the leaf notches of Bryophyllum calycinum.** *Amer. Jour. Bot.* 18(5): 387-390. 1 pl. 1931.—The growth in the notches of the leaves is exogenous. It proceeds from a meristematic group of cells present in the very young leaves. The growth, which may be termed a "bud," is definitely organized when the leaf is mature. The roots are formed after the formation of the stem primordium and are endogenous. Growth of the leaf notches producing well developed plantlets is possible while the leaf is still attached to the plant, and while the parent plant is apparently healthy.—*Author's summary.*

14195. **JOHANSEN, DONALD A. Studies on the morphology of the Onagraceae. III. Taraxia ovata (Nutt.) Small.** *Ann. Botany* 45(177): 111-124. 1 pl., 4 fig. 1931.—*Taraxia ovata,* which exhibits a wide range of gentic variations, is becoming extinct because of its lost ability to reproduce by seed. The plants have a high percentage of buds entirely destitute of sporogenous elements. It is concluded that the so-called "filiform calyx-tube" is the elongated apex of the ovary and is an adaptation to carry the flowers above the leaves. The ovules are probably the largest in the family. Mode of megasporocytic meiosis is telosynaptic; $n=7$, $2n=14$. The micropylar megaspore of the quartet is invariably the functional one, and organization of the megagametophyte proceeds normally. Megagametophyte is characterized by an excessive tendency to shrink and to stain intensely with the usual chromatin stains. Fertilization is normal and no chromosomal disturbances were noted. Early stages in embryogenesis are normal, but from about the time of differentiation in the hypophysis cell a peculiar method is followed. The final result is an embryo possessing only 2 cotyledons, a short hypocotyl and radicle. Morphogenesis in the onagrad embryo is essentially a rhythmic process requiring the utmost co-ordination among the constituent groups of cells if the series of events is to culminate in a perfectly balanced new individual. Monstrosities result from interruptions in cadence. Apogamous embryos were frequently observed and probably resulted from the continued growth of all 4 megaspores of the quartet.—*D. A. Johansen.*

14196. **KARPER, R. E. Multiple seeded spikelets in sorghum.** *Amer. Jour. Bot.* 18(3): 189-194. 2 fig. 1931.—Multiple seeded spikelets occur quite frequently in milo. Normally the fertile spikelet has 1 functional and 1 aborted flower. Apparently both flowers occasionally develop and function. Sometimes a 3rd flower may be present and functional since the following fruits were observed within a single spikelet: A single kernel, the normal condition; twin seeds; connate seeds—a 2-seeded fruit formed by the fusion of parts of 2 flowers; Siamese twins or semi-connate seeds—a series intermediate between twins and connate seeds; triplets—3 separate kernels. Connate seed always had 4 remnant style branches, 2 for each member of the pair of fused kernels, indicating that the extra kernels arose from additional functional flowers within the spikelet. This series of abnormal spikelets in *Andropogon sorghum* is almost identical with a similar series found by others in *Zea mays.* These genera apparently have in common many genetic characters, particularly chlorophyll deficiencies, and the vegetative characters are similar. Homology of these abnormal spikelets in both sorghum and maize is further evidence of close relationship. The most probable explanation of the presence of these abnormal spikelets in sorghum seems to be that, under certain favorable environmental conditions, both flowers are functional and that, furthermore, the primordium of a 3rd flower is sometimes, if not always, present in the spikelet and it may develop and become functional.—*R. E. Karper.*

14203. **PETERSEN, N. F. Vegetative propagation in the Missouri gourd.** *Science* 73(1898): 528. 1931.—Note on natural propagation of *Cucurbita foetidissima* by root formation at the nodes.

14204. **REEVES, R. G. Development of the ovule and embryo sac of alfalfa.** *Amer. Jour. Bot.* 17(3): 239-246. 2 pl., 20 fig. 1930.—Licent's fixing fluid was used mostly. Common and variegated varieties of *Medicago sativa* were studied and found to be the same. Megaspore formation is as usual in dicots and the chalazal spore functions. Most ovules have 8 nuclei in the embryo sac but sometimes only 6 occur because there is only 1 division in the chalazal end. The antipodals disappear early, long before the female gametophyte is mature. The variability of Leguminosae is shown by the extreme variation in the number of archesporial cells; in the number and arrangement of parietal and sporogenous cells; and in the form and number of tetrads (if several (2 or 3) tetrads are present only 1 tetrad completes its development).—*W. G. Houk.*

14205. **RITTER, GEORGE J. Dissection of wood fibrils by chemical means.** *Industr. and Engineer. Chem.* 21(3): 289-290. 4 fig. 1929.—Delignified spruce and elm fibers, treated with 68-77% phosphoric acid at 60-65° C. for 15-20 min., were broken down into fibrils which had begun to separate into spindle-like bodies that appear to be the smallest building units of the fibrils visible with the high power of the microscope. These units are named "fusiform bodies."

14206. **RUSBY, H. H. The value and limitations of histology in vegetable taxonomy.** *Proc. Internat. Congr. Plant. Sci., Ithaca, N. Y. 1926* 2: 1356-1360. 1929.—The author believes that the anatomical method if extensively applied would prove a great aid in taxonomic work. A large number of independent studies of groups is proposed, proceeding from the smaller to the larger categories, designed to ascertain, if possible, those anatomical characteristics invariably present in any given category, and that have therefore diagnostic value.—*P. D. Strausbaugh.*

14207. **SABNIS, T. S. Notes on Indian plant-teratology.** *Jour. Indian Bot. Soc.* 10(1): 21-26. 3 pl. 1931.—The paper describes bifurcation (1) of stem of *Saccharum officinarum,* (2) of leaves in *Anacardium occidentale,* (3) of cotyledons on seedlings of *Michelia champaca;* repeated bifurcation of the inflorescence of *Pennisetum typhoideum,* perhaps due to reversion; lateral vegetative shoots instead of terminal inflorescence shoots in *Brassica oleracea* var. *caulorapa;* and fasciation in *Linum usitatissimum,* garden roses, daisies, *Eutoca viscida,* and *Cucurbita maxima.* Fasciation may be of genetic origin.—*W. Dudgeon.*

14208. **SAHNI, B., and T. C. N. SINGH. Notes on the vegetative anatomy and female cones of Fitzroya patagonica (Hook. fils).** *Jour. Indian Bot. Soc.* 10(1): 1-20. 1 pl., 12 fig. 1931.—The leaves have been described as verticillate, but actually "the leaf traces of each whorl do not arise exactly at the same level. . . . It may turn out that a truly verticillate condition does not exist in the conifers at all." Palisade tissue in the leaves is mainly abaxial. The stomata occur on one or both surfaces in several parallel rows, forming longitudinal bands. 4-6 subsidiary cells surround each stoma, and the rows are separated only by the subsidiary cells. The cuticle is much thickened over the bands of stomata. The vestibules of the stomata are plugged with wax. The appearance of the stomata in sections and in macerations is very different. Macerations of fossil cuticles must be compared with macerations of cuticles of living plants, and not with sections. A stem 1 cm. thick showed structure similar to that of *Juniperus:* growth rings well marked; resin parenchyma scattered through the spring wood; resin canals and ray tracheids absent; medullary rays 1-10 (average 2.6) cells high and uniseriate; tracheids with circular separate bordered pits on radial walls; ray cells in the phloem region thin walled and much expanded; cortex containing resin canals. Ovulate cones of 2 ages were available,—at pollination time, and nearly mature. A cone consists of 5 whorls of 3 scales each. The scales of the uppermost whorl bear 5 ovules each, those of the next whorl 1 ovule each; the other whorls are sterile. The ovules are erect, 2-3-winged, and have a prominent funnel-like micropylar tube. At the apex of the cone, alternating with the scales of the upper whorl, are 3 gland-like organs somewhat resembling a nucellus, but hollow. Their morphology is unknown. At pollination time the ♀ gametophyte contains about 200 free nuclei. Most of the ovules had no pollen grains in the micropyle. The scales of the 3 basal whorls contain only 1 vascular bundle. Those of the 4th and 5th whorls have a single unbranched bundle to the bract. The bundle for the ovuliferous scale arises independently from the cone axis. It is inverted, and divides into many bundles, which spread out into a deeply curved arc. The bundles at the end of the arc are sometimes C-shaped, and occasionally the abaxial portion of the C may become detached as a distinct bundle, which is then oriented like the scale bundle.—*W. Dudgeon.*

14209. **SAINT-LAURENT, J. de. Études sur les caractères anatomiques des bois d'Algérie. I—(1. Gymnospermes; 2. Cupulifères).** *Bull. Sta. Rech. Forest. Nord de l'Afrique* 1(7): 241-255. 6 pl. 1926.—For the 4 species of Gnetaceae, 10 of Coniferae, and 9 of Cupuliferae growing naturally in Algeria and Tunis, keys based on anatomical characters, tabular synopses of dimensions of parenchyma, vessels, and rays, and photomicrographs of the transverse sections of the wood are presented.—*J. Kittredge, Jr.*

14210. **SCHMALFUSS, KARL. Untersuchungen über die interkalare Wachstumszone an Glumifloren und dikotylen Blütenschäften. [Intercalary growth in Glumiflorae and flower scapes.]** *Flora* 24(4): 333-366. 7 fig. 1930.—In hand sections of an elongating internode of *Hordeum hexastichon* the lowest indication of the characteristic crenation of the cell walls appeared at 15 mm. above the node. At 30 mm. stomata were fully developed and cells were 10 times as long as at 8 mm. Microtome sections (Flemming's fixative and triple stain) were used in further work. In *Cyperus alternifolius* cell division occurs in the pith in the lowermost 4 mm. of the stem. Above this the cells elongate and attain a length of 75μ at the 9-mm. level where cell division is just ceasing in the peripheral tissue, and the cells are 5μ long. Spindle axes are predominantly parallel with the direction of elongation. Studies in the following gave similar results: *Dactylis glomerata, Molinia coerulea, Hordeum distichum, Avena sativa, Triticum vulgare.* In *Avena* intercalary growth occurs in only 1 internode at a time, and in each internode successively beginning with the lowermost. Cell division occurs in the 5 mm. just above the node. Pith cells vary from 28μ in this region to 110μ at the mature upper end where a few still persist. The inflorescence develops independently. Leaf sheaths and leaves undergo a similar course and succession of intercalary growth and each is fully developed before the corresponding internode begins its intercalary growth. The upper portion of a scape of *Plantago media,* ½ its final length, was a region of cell division in all tissues, and pith cells were short with large nuclei. The reverse was true in the lower portion where all tissues were mature. In *Taraxacum officinale,* in several scapes ranging from 1.35 to 37 cm., division figures, which occurred throughout the younger, were progressively fewer and increasingly confined to the region just below the head in the older, and lacking in the mature scapes. Pith cells varied in length from 18μ in young regions to 148μ in the pith cylinders of mature regions. Until elongation is complete they are longer near the base than just below the head. Measurements in growth by stretching

were made in the following: *Arrhenatherum elatius, Phragmites communis, Molinia coerulea, Lolium temulentum, Holcus lanatus, Alopecurus pratensis, Triticum sativum, Avena sativa, Secale cereale, Cyperus alternifolius, Plantago media, Taraxacum officinale.* As seen in *Hordeum,* spiral and annular vessels, completely differentiated in the region of cell division, extend downward and disappear in the node where netted ducts occur. They stretch passively during the elongation of the tissue of the internode. As studies in *Phragmites communis* indicate, they continue through several young internodes in the grasses. In the upper portion of the zone of intercalary growth the pitted and netted ducts are differentiated and lie beside the spiral vessels, from which they take the water by lateral filtration. They extend throughout the mature region of the internode. In the scape of *Plantago* the position is reversed but the development and the functioning of the vessels and ducts corresponds with that of the internodes of the Gramineae.—*F. C. Jud.*

14211. SCHRATZ, EDUARD. Untersuchungen über die Geschlechterverteilung bei Equisetum arvense. *Biol. Zentralbl.* 48(10): 617-639. 1928.—Prothallia were studied in their natural habitats and in cultures. Under unfavorable conditions most of the thalli developed as males. From this it may be concluded that all spores have the potentiality to develop as males. Under favorable conditions at least 50% developed as males; the remaining thalli were at first female and later developed into hermaphrodites. This transformation takes place only when the archegonia remain unfertilized. Pure female thalli are genotypically hermaphrodite. The archegonia are always developed before the antheridia. Changing male thalli to female by improving nutrition was not accomplished. When the sex is once determined it becomes rather fixed. It is most easily changed in the earlier stages of development of the thallus. Hermaphroditic thalli are relatively rare in natural habitats. Author concludes that probably the hermaphroditic condition is normal for the species and that early phenotypic determination during the development of the spores with subsequent difficulty of reversal may be the cause of the apparent unisexuality of certain individuals.—*J. H. Schaffner.*

14213. SINGH, T. C. N. Studies in the morphology of pollen grain.—I (a) Boraginaceae. *Jour. Indian Bot. Soc.* 10(1): 38-42. 1 pl. 1931.—External features of the pollen grains are described and figured for *Nonnea pulla* Lamk., *Anchusa italica* Retz., *Gastrocotyle hispida* Bunge., *Borago officinalis* L., *Heliotropium supinum* L., *H. marifolium* Retz., *Myosotis caespitosa* Schultz. Grains of various sizes and shapes occur in the family, and only *Myosotis* showed dumb-bell-shaped grains. Therefore Miss Pope's statement does not hold that the family is distinguished by small dumb-bell-shaped pollen grains. —*W. Dudgeon.*

14214. SINGH, T. C. N. Notes on the teratology of certain Indian plants—V, VI. *Jour. Indian Bot. Soc.* 9 (4): 248-252. 2 pl. 1930; 10(2): 134-138. 1 pl. 1931.—The following abnormalities are described and figured: (V.) a fasciated leaf in *Mirabilis jalapa,* double fruits in *Prunus amygdalus* and *Vitis vinifera,* 2 standards in a flower of *Erythrina indica,* transformation of petals, stamens, and carpel into leaves ranging from uni- to trifoliate in *Trifolium alexanderinum,* and fasciated stem and peduncle in *Crotalaria juncea;* (VI.) double nut in *Areca catechu,* branched leaf tip in *Ficus religiosa,* leaves of *Acacia arabica* "telescoped" into cone-like structures, seedlings of *Ricinus communis, Carica papaya* and *Zinnia elegans* with 3 cotyledons, fasciated peduncle in *Jasminum sambac,* and fasciated stem in *Ipomoea pulchella.*—*W. Dudgeon.*

14215. SINHA, B. N. Notes on the teratology of certain Indian plants.—VII. *Jour. Indian Bot. Soc.* 10(2): 160-164. 1 pl. 1931.—Double fruits are described and figured for *Musa paradisiaca* var. *sapientum; Mangifera indica; Punica granatum; Diospyros kaki;* and *Solanum melongena.*—*W. Dudgeon.*

14216. SKUTCH, ALEXANDER F. Unrolling of leaves of Musa sapientum and some related plants and their reactions to environmental aridity. *Bot. Gaz.* 90(4): 337-365. 23 fig. 1930.—The leaves of many spp. of Musaceae, Marantaceae, Zingiberaceae and Cannaceae are characterized by a well developed water-tissue, composed of large, thin-walled, hyaline cells which form one or more layers just beneath the upper epidermis. Observations and experiments on *M. sapientum, Heliconia bihai, Calathea magnifica, Alpinia exaltata* and *Canna* sp. show that the leaves, which in all these spp. are convolute in vernation, are forcibly unrolled through the agency of the cells of this water-tissue lying above and immediately adjacent to the principal transverse veins of the lamina, and which for this reason are termed "expansion cells." At the proper time these cells enlarge greatly, pushing the veins toward the upper (inner) surface, so that they are thrown into a state of compression, in which they cause the lamina to unroll. If the unrolling is prevented by binding, the expansion cells become several times their size in normally unfurled leaves. On the other hand, if the leaf is prematurely unrolled and held in a plane, the expansion cells fail to enlarge more than the neighboring cells of the water-tissue which take no part in unrolling. The leaves of *Musa* and *Canna* unroll normally in darkness. While the leaves of most related plants fold above the midrib in dry weather, thereby exposing the stomata, those of the banana fold below the midrib. The movements of the lamina halves are effected by special motor organs, the pulvinar bands, which lie along either side of the midrib throughout its length. The prismatic cells on the lower sides of these bands develop only when this side becomes concave, and in the light. Without them the pulvinar bands can not function.—*A. F. Skutch.*

14217. SOLOMON, RUSSELL. The anatomy of caudex and root of Eriocaulon septangulare. *Jour. Indian Bot. Soc.* 10(2): 139-144. 2 pl. 1931.—Material was obtained from Nova Scotia and Ireland. The caudex is 2.5-10 cm. long, and hairy. The tissues of the caudex, from the epidermis inwards, are: 1 cell layer of collenchyma; cortex of large many-armed bladderlike cells; endodermis, without characteristic features; and stele. Mestome bundles in the cortex are surrounded by thick-walled endodermis, those in the stele only by parenchyma. Roots are 1-2 mm. thick and 10-50 mm. long; the root-cap is small. The endodermis has no Casparian strip. The 3-5 protoxylem elements often lie in the single-layered pericycle. The surface of the root shows transverse ridges, caused by diaphrams formed at intervals across the air spaces.—*W. Dudgeon.*

14218. TRONCHET, A. Recherches sur les types d'organisation les plus répandus de la plantule des dicotylédones. Leurs principales modifications, leurs rapports. *Arch. de Bot.* 4(1): 1-252. 266 fig. 1930.—In part one the normal structure of a number of dicotyledonous seedlings is discussed. The variation in the cross arrangement of the xylem is considered and theories advanced as to the possible relationship between the different existing types. In part two, normal and abnormal structures in seedlings are considered in relation to the mechanism which brings about the principal modifications as shown in part one. The value of the theory of adjustment is discussed. The third part discusses the principal types of anomalies which can affect the cross arrangement of the xylem, their relation to each other, and their relation to some specific normal type.—*W. E. Steidtmann.*

deriana.] *Akad. Wiss. Wien Mat.-Nat. Kl. Anzeiger* 65 (1/27): 226-230. 1928.

14220. **WELCH, M. B. The occurrence of intercellular canals in the wood of some species of Flindersia.** *Jour. and Proc. Roy. Soc. N. S. Wales* 64: 352-362. 1 pl. 4 fig. 1931.—Longitudinal intercellular canals of a gummosis type occur in the secondary wood of some spp., notably *F. brayleyana.* They are found in metatracheal parenchymatous bands and form a more or less anastomosing network extending tangentially. The contents appear to be similar to wound gum, the canals being formed by the breaking down of the cell walls. Their origin is usually schizo-lysigenous.—*M. B. Welch.*

14221. **WIELAND, G. R. Conifer inflorescence.** *Science* 72 (1857): 113-115. 1930.—The unit of structure in angiosperm and conifer inflorescences is compared, partly with reference to the fossil record, combating the more conventional view that the two are hardly comparable. It is concluded that conifers might be as much the descendants of angiosperms as the reverse.—A useful method of preparing museum sections of the larger pine cones, such as *Pinus coulteri,* is described in some detail. —*W. T. Saxton.*

14222. **WILLIAMS, S. The morphology of Trichomanes aphlebioides Christ, with special reference to the aphlebioid leaves.** *Proc. Roy. Soc. Edinburgh* 50 (2): 142-152. 1 pl., 3 fig. 1930.—The aphlebioid structures of *T. aphlebioides* arise at the base of axillary branches and the method of departure of the aphlebioid trace is similar to that of the common trace. The structures are therefore thought to be modified leaves, the first fronds of the axillary branches.—*L. R. Atkinson.*

14223. **WYLIE, ROBERT B. Cicatrization of foliage leaves. I. Wound responses of certain mesophytic leaves.** *Bot. Gaz.* 90 (3): 260-278. 14 fig. 1930.—A study of "defenses" set up by *Vitis vulpina, Rhus glabra,* and *Syringa vulgaris* after the wounding of their leaf tissue. This phenomenon in immature leaves was compared with that of mature leaves. A pseudocicatrice, resulting primarily from the death and collapse of normal leaf tissue, is formed immediately. "The cicatrice proper, while highly efficient in its completed form, is relatively slow in its development. It is not initiated until 3 or 4 days after wounding, and its formation is related to the preliminary barrier. For several days after injury the marginal living cells, covered and protected by the pseudocicatrice, are passing through the cell division and cell enlargement stages. Ten or more days may be required for completion of the cicatrice in mesophytic leaves, and 20-30 days in broad-leaved evergreens." Several photomicrographs illustrate the results.—*L. W. Melander.*

14224. **BERRY, EDWARD WILBER. A flora of Green River age in the Wind River basin of Wyoming.** *U. S. Geol. Surv. Prof. Paper 165-B.* 55-81. 10 pl. 3 fig. 1930.—Forty-one spp. are recorded from beds in the Wind River basin of western Wyoming which are supposed to be referable to the Bridger formation. Twenty-one of these are common to the flora of the Green River formation and 15 are unknown from other regions or formations, which forces the conclusion that this flora is of middle Eocene age (Lutetian or Auversian). The containing sediments are regarded as flood plain, channel and eolian deposits. The flora is considered to represent ecological conditions such as obtain in Louisiana at the present time. *Equisetum* **tipperarense*** (p. 61), *Asplenium* **serraforme*** (p. 62), *Palmocarpon* **lesquereuxi*** (p. 67), *Dryophyllum* **wyomingense*** (p. 69), *Fagara* **wyomingensis*** (p. 71), *Negundo* **fremontensis*** (p. 72), *Zizyphus* **wyomingianus*** (p. 73), *Grewiopsis* **wyomingensis*** (p. 73), *Laurus* **fremontensis*** (p. 74), *Aralia* **browni*** (p. 75), *A. notata* **denticulata*** (p. 75), *Diospyros* **mira*** (p. 76), *Antholithes* **anceps*** (p. 77), *A.* **browni*** (p. 77), *A.* **fremontensis*** (p. 78), *Carpolithus* **bridgerensis*** (p. 78), and *C.* **browni*** (p. 78).—*E. W. Berry.*

14225. **DANGEARD, LOUIS. Sur les Solénopores du Jurassique de Mortagne (Orne).** *Bull. Soc. Geol. France* 30 (6): 437-443. 3 fig. 1930.—The Solenopora are found associated with corals and *Diceras.* They are all attributed to *Solenopora jurassica* Nich. and are very numerous. The age of the beds is Lusitanian or Oxfordian. These Solenopora have retained their original pink color.—*W. Berry.*

14226. **DEWALL, HANS WERNER von. Geologisch-biologische Studie über die Kieselgurlager der Lüneburger Heide.** *Jahrb. Preuss. Geol. Landesanst.* 49 (2): 641-684. 4 pl., 4 fig. 1928 (1929).—Petrographic, physical, and chemical characteristics of the various diatomaceous deposits in the vicinity of Lüneburg are discussed, and chemical analyses are given of different grades of diatomaceous material in each. The stratigraphy and the biological significance of the included fossils are discussed in detail. Two hundred and sixty identified species of diatoms, including varieties, all freshwater forms, are found to be contemporaneous, with the exception of one, *Navicula geinitzii* Bünte, which the author gives reasons for believing may be considered a good indicator for interglacial formations in the Lüneburg area. He cites the opinions of other workers concerning the numbers and duration of the glacial and interglacial periods and, on the basis of the present studies, computes the duration of the last interglacial period in northwest Germany as 8000 yrs. Annual diatom sedimentation is discussed and the results employed in the calculations, the included fossils being used to correlate the various layers with each other and with known geological formations. Origin and subsequent disturbance of the various deposits is considered. Remains of higher plants and animals of known environmental requirements, contemporaneous in southern Germany and farther south, found in the deposits are believed to indicate a mild temperate climate in the Lüneburg area during interglacial times. A bibliography is arranged according to topics.—*P. S. Conger.*

14227. **GALENIEKS, P. Remains of buried oak forest at the town of Daugavpils.** (In English and Latvian.) *Acta Horti Bot. Univ. Latviensis* 5 (1/3): 61-74. 1930.—A peat layer containing many well preserved trunks of oak, is exposed on the right bank of the river Düna, Latvia. The horizontal extension of the layer is about 200 m. and the thickness 1 m. The layer lies 1½ m. above the average water level of the river and the foundation is a stratum of moraine marl, light greyish above and reddish in the deeper parts. Remains of 25 plants were found, besides many large oak trunks, measuring 40-65 cm. in diameter without the bark; the latter is also well preserved. Pollen diagram is given of the layer. It is estimated that the age of the forest is 3500 to 4000 years. Similar buried remains of oak woods are known in several other localities in Latvia.

14228. **GOTHAN, W. Der Stand der Vergleichung der Mitteleuropäischen Steinkohlenbecken und Vorschläge zur Vereinheitlichung. [Comparison of the Middle-European anthracite coal basins and suggestions for a system of unification.]** *Congr. Avancem. Études Stratigr. Carbonifère, Heerlen, Compte Rend. 7-11 Juin, 1927.* 259-273. 1928.

14229. **GOTHAN, W. Paläobotanik und Ruhrkarbon.** *Zeitschr. Deutsch. Geol. Ges.* 81 (3/4): 148-150. 1929.—

A preliminary report stressing the importance of paleobotany in correlations and age determinations in the Ruhr and neighboring coal districts, especially where marine and fresh water faunas are absent. Previous to the work of Potonié and Cremer (1893), correlation was attempted by comparison of the gas contents of the coals of the various beds. One plant species, *Lonchopteris rugosa*, is mentioned as an aid in correlating coal beds of hitherto doubtful age.—*H. R. Joesting.*

14230. KISSER, JOSEF. Die Anfertigung von Dünnschliffen von rezenten pflanzlichen Materialien. [The preparation of thin sections of mineralized plant tissues.] In: **EMIL ABDERHALDEN.** *Handbuch der biologischen Arbeitsmethoden.* Abt. XI. **Chemische, physikalische und physikalisch-chemische Methoden zur Untersuchung des Bodens und der Pflanze.** Teil 4. Heft 2. Lief. 353. p. 237-252. 2 fig. Urban & Schwarzenberg: Berlin, 1931.

14231. LOUBIÈRE, A. Observations sur l'Odontopteris obtusa de Brongniart. *Bull. Soc. Bot. France* 76(9/10): 1080-1082. 1929.—Contrary to an assertion by Zeiller, fig. 3 of pl. 78 of Brongniart's Histoire des végétaux fossiles accurately represents the species.—*C. A. Arnold.*

14232. NĚMEJC, F. O některých nových nálezech ve středočeských úhelných pánvích. II. *Rozpravy České Akad. Věd a Umění, Tř. 2.* 39(číslo 33): 1-7. 2 pl. 1929 (1930); Also as: **On some discoveries of fossil plant remains in the Carboniferous districts of central Bohemia. (II).** *Acad. Tchèque Sci. Bull. Internat. Rés. Trav. Prés. Cl. Sci. Math., Nat. et Méd.* 30: 131-137. 2 pl. 1929.—I. *Dicranophyllum* **domini*** (p. 131), from the Kladno coal measures. The identity of Sternberg's "species" of *Neuropteris rubescens* and Zeiller's *Alethopteris costei* is discussed. Reexamination of the original specimens of the former has convinced the author that it is identical with the latter; because of priority the name *Alethopteris rubescens* Stbg.-Zeiller should be used. Neuropteroid seeds in connection with the phyllomes were discovered in the hanging wall of the main Kladno coal measure in the Mayerau mine near Kladno. The species seems to be identical with *Neuropteris bohemica** Ett. Gothan. The attached seeds are less mature than are the unattached. They are borne at the base of large cyclopteroid leaves and therefore are transformed parts of cyclopteroid leaflets, rather than transformed normal leaflets, as in the 2 previously recorded cases of attached seeds.—*A. M. Taylor.*

France* 30(3/4): 149-164. 4 pl., 8 fig. 1930.—*Solenopora* **melobesoides*** (p. 149) from the white limestone (Portlandian), at Madrague, *S. jurassica* v. **lanquinei*** (p. 154) from the same formation north of Géménos (Bouches-du-Rhône). *Pseudochaetetes polyporus** (Qu.) Haug (=*P. champanensis* Peterhaus) from the Malm of Champagne. The author believes that *Pseudochaetetes* Haug and *Chaetetes* Munier-Chalmas should be included in the genus *Solenopora.*—*W. Berry.*

14235. PIÀ, JULIUS. Upper Triassic fossils from the Burmo-Siamese frontier. A new Dasycladacea, Holosporella siamensis nov. gen., nov. sp., with a description of the allied genus Aciculella Pià. *Rec. Geol. Survey India* 63(1): 177-181. 1 pl. 1930.—**HOLOSPORELLA** (p. 177), near *Aciculella,* erected for *H.* **siamensis*** (p. 177), Kamawkala Limestone; *Aciculella bacillum** Pià, emended description.

14236. THOMAS, H. HAMSHAW. The early evolution of the angiosperms. *Ann. Botany* 45(180): 646-672. 9 fig. 1931.—Clues to the origin of flowering plants will probably come only from study of evolutionary tendencies found in fossil Spermatophyta from the Mesozoic and Palaeozoic periods. The Bennettitales and Caytoniales are examined with a view to ascertaining the changes undergone by derivatives from the Carboniferous pteridosperms. The Caytoniales are undoubted angiosperms. The morphological relations of the sporophylls of this group to the carpels and stamens of modern plants is discussed. The venation of the follicles in several genera of Ranunculaceae and of some other carpels is figured. The accepted view that the carpel represents a simple infolded leaf is stated to be without foundation, and a new view is put forward which regards the carpel as derived from a compound structure of the Gristhorpia type in which the ovules were borne on the midribs of lateral segments. Suggestions are made as to the origin of the stigma and the anatropous ovule. A preliminary description is given of **UMKOMASIA*** (p. 664), a new type of Mesozoic pteridosperm from Natal. The flowering plants are regarded as having originated from the Pteridospermae early in the Mesozoic period; their sudden increase towards the end of this period may have been due to the evolution of features which greatly increased their rate of reproduction and their chances of hybridization.—*H. H. Thomas.*

14237. ZERNDT, J. Megasporen als Leitfossilien des produktiven Karbons. *Bull. Internat. Acad. Polonaise Sci. et Lettres Cl. Sci. Math. et Nat. Sér. A Sci. Math.* 1931 (3): 165-183. 8 pl. 1931.—From 45 strata in the Polish coal basin, megaspores were isolated and classified under 31 types. The distribution of megaspores in time both in the Carboniferous of Poland and the coal basin of Scotland is such as to show that the individual horizons are characterised by different types of megaspores. The comparison of overlying strata shows that it is possible to differentiate the different strata by aid of the megaspores, and this method has already given much promise in distinguishing the age of strata, the stratigraphic position of which was up to the present time uncertain.—*O. Raber.*

14238. ZERNDT, J. Triletes giganteus, n. sp., eine riesige Megaspore aus dem Karbon. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B Sci. Nat.* [*Bot.*] 1930(7/10): 71-79. 3 pl. 1930.—This species, characterized by its great size (it may attain 6.44 mm. by 3.2 mm.), is distributed throughout the coal-measures of Poland. The exosporium is usually without emergences, except for occasional wart-like protuberances at the wider end. Of the original tetrad, one spore was absorbed or thrown off earlier than the other two, which occasionally occur still associated with the large spore. Owing to their size, it is possible that these other two spores may have been capable of germination.—*I. M. P. Browne.*

14239. ZERNDT, J. Megasporen aus einem Flöz in Libiąż (Stéphanien). *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B. Sci. Nat.* [*Bot.*] 1930(7/10): 39-70. 8 pl. 1930.—The author discusses, first, methods of getting spores from slaty coal by washing them out with water, decanting, and then pouring the spores through a sieve; second, the fact that the spores were obtained from strata that are 100 meters deep; and third, descriptions of 4 kinds of *Triletes* spores. Pollen of *Dolerophyllum* sp. was also found. The same kind of spores found in the slaty material were also found in the coal. Megaspores can not always be told from microspores by size alone. The comparative sizes of megaspores and microspores are given in a table. Different thicknesses of the exospores and the possibilities of using spore markings for systematic classification are discussed. Some of the species, such as *Triletes triangulatus,* are widely distributed.—*B. McAvoy.*

praemucronata* (p. 128), *Cytherella* sulcosa* (p. 129), *C.* intermedia* (p. 129), *C.* araneosa* (p. 130), *Scalpellum* (*Arcoscalpellum*) dunni* (p. 131), *S.* (?*A.*) meridianus* (p. 131). Bibliography.—*F. Anderegg.*

14245. **DAVIES, A. MORLEY.** Faunal migrations since the Cretaceous Period. *Proc. Geologists' Assoc.* [*London*] 40(4): 307-327. 2 maps. 1929.—After the extinction of many forms of life at the end of Cretaceous time, there appeared in the eastern hemisphere two Paleocene faunas—boreal, with *Cucullaea, Cyprina, Astarte, Dosiniopsis, Beloptera,* etc., and Tethyan, with none of the above genera, but with *Gisortia* and many other warm-water forms. The presence of *Cucullaea* links the boreal fauna with the Paleocene faunas of America (Alabama, Texas, California, Soldado I., Brazil, Argentina). These American faunas (except those of California and Argentina) are marked by *Calyptraphorus*, also known at Mons (Belgium), Landana (Belgian Congo) and Sind. The Lower and Middle Eocene in Europe are marked by the northward spread of the Tethyan fauna and disappearance of the boreal genera, which return to northern Europe in the Oligocene. The Middle Eocene fauna of West Africa (except the Senegal) agrees with that of America in the absence of Nummulites, while North and East Africa have typical nummulitic limestone. In the Upper Eocene, nummulites and some echinoids migrated to America, and in the Oligocene *Lepidocyclina* migrated from America to Europe. Towards the end of Eocene time the Mediterranean and Indian Ocean were separated, and their faunas diverged. In the Miocene Mediterranean faunas include three main elements: (1) autochthonous, (2) a slight re-infusion of Indo-Pacific forms, and (3) cryptogenetic forms allied to the present-day Peruvian fauna; with some boreal and North American immigrants. The English Pliocene fauna contains a number of north Pacific forms which arrived before the boreal influx. The paleogeographical significance of these and other facts is discussed.—*A. M. Davies.*

14246. **DEHÉE, RENÉ.** Description de la faune d'Etroeungt. Faune de passage du Dévonien au Carbonifère. *Mém. Soc. Géol. France* 5(2, Mém. 11): 1-63. 8 pl. 1929.—Lists a great many corals, echinoderms, bryozoans, brachiopods, pelecypods, gastropods, cephalopods, and ostracods, and some trilobites from this Devonian-Carboniferous region in France. Describes the following forms, giving the synonymy where necessary: the corals *Caninia dorlodoti**, *Clisiophyllum omaliusi**, *Cyathophyllum** sp., *C. aquisgranense**, and *Michelinia;* the bryozoans *Fenestella* cf. *plebeja, Polypora** ? sp., *Ramipora** ? sp.; the brachiopods *Productus scabriculus, Athyris concentrica**, *Atrypa spinosa**, *Chonetes hardrensis, Leptaena rhomboïdalis* (p. 36), *Tylothyris laminosa**, *Dalmanella interlineata**, *Orthotetes crenistria**, *Productella subaculeata, Productus praelongus**, *P. niger**, *P. scabriculus**, *Rhynchonella letiensis**, *Schizophoria striatula, Seminula* (?) struniensis* (p. 27), *Spirifer* julii* (*S. gosseletti* Vaughan, not Béclard nor Holzapfel) (p. 19), *S. strunianus**, *S. tornacensis, S. verneuilli**, *Streptorhynchus* cf. *umbraculum**; the pelecypod *Pterinopecten radiatus;* the gastropod *Straparolus* sp.*; the cephalopod *Clymenia;* the ostracod *Leperditia okeni**; and the trilobite *Phacops bergicus**.—*D. J. MacNeil.*

14247. **GOLDRING, WINIFRED.** Handbook of paleontology for beginners and amateurs. Part 2. The formations. *New York State Mus. Handbook* 10. 1-488. 62 fig. 1931.

14248. **HOWCHIN, WALTER.** The building of Australia and the succession of life: with special reference to South Australia. Pt. 2. Mesozoic and Cainozoic. pp. 205-448. 11 fig. Brit. Sci. Guild (So. Australian Branch), Adelaide, 1928.—Gives extent and fauna of Triassic, Jurassic, Cretaceous, Eocene, Oligocene, Miocene, and Pliocene, and flora of Cainozoic and Tertiary, times.—*F. Anderegg.*

14249. **KEGEL, WILHELM.** Das Gotlandium in den kantabrischen Ketten Nordspaniens. *Zeitschr. Deutsch. Geol. Ges.* 81(1/2): 35-62. 2 maps, 2 pl., 2 fig. 1929.—In discussing the fossils of the Ordovician, Silurian, and Devonian of northern Spain the author lists the following: the coral *Chaetetes* sp.; the graptolites *Monograptus tenuis, M. priodon, M. concinnus, M. decipiens, M. halli, M. gregarius, M. sedgwickii, M.* cf. *convolutus, M. sandersoni, M. runcinatus, M. marri, M.* cf. *spiralis, Didymograptus, Diplograptus bellulus,* and *Rastrites hybridus;* the worm *Scolithus;* the brachiopods *Strophodonta* pataci* (p. 60), *Spirifer kopaninensis, S. arduennensis, S.* cf. *pellicoi, S. hystericus, S. verneuli, S. carinatus, Pentamerus* (?), and *Orthis* cf. *confinis**; the pelecypods *Cardiola interrupta, Ptorochaenia* cf. *glabra,* and *Nuculites* (*Cleidophorus*) llarenai* (p. 58); the cephalopods *Cyrtoceras* sp., *Orthoceras* sp., and *Endoceras duplex;* the trail *Cruziana;* and the trilobites *Calymene tristani* and *Homalonotus* sp. All are of Silurian age except the *Calymene* and the *Endoceras,* which are Ordovician, and the *Cyrtoceras* and the spp. of *Spirifer,* which are Devonian. The *Homalonotus,* the *Ptorochaenia,* and the *Orthis* cf. *confinus* are discussed. Bibliography.—*D. J. MacNeil.*

14250. **LADD, HARRY STEPHEN.** The stratigraphy and paleontology of the Maquoketa shale of Iowa. Part I. *Iowa Geol. Survey Ann. Rept. 1928* 34: 307-448. Illus., (many maps). 1928.—A report dealing mainly with the stratigraphic relations and the important faunal zones of this shale of the Ordovician or Silurian. Part II will describe the fossils. The shale is a lithologic unit in the southeastern area, but divisible into the Elgin Limestone, the Clermont Shale, the Fort Atkinson Limestone, and the Brainard Shale in the northwestern area. There are corresponding faunal differences. The Maquoketa is considered to be of Richmond age (possibly latest Ordovician, or, more probably, earliest Silurian), and there are unconformities above and below it in Iowa. Three faunal zones are developed in both northwestern and southeastern areas: the Depauperate Zone (at the base), a Graptolite Zone (near the base), and the *Cornulites* Zone (at the top). 27 additional spp. (10 of them new) are recorded from the Depauperate Zone, making the total for the zone 44, over half of which are mollusks. The fauna is made up of unusually small spp., but not true dwarfs. Several explanations are suggested for this smallness. The *Cornulites* Zone has a fauna of 86 spp., of which 69 are molluscoids. Other faunas are present in the northwestern area. The vertical and horizontal ranges of all the spp. are given. The coral, *Streptelasma haysii** (Zaphrentidae), previously known only from Cape Frazier, between 80° and 81° N., 70° W., is described and discussed from the Elgin (or possibly the Clermont); the coral *Lindströmia* solearis* (Zaphrentidae) (p. 397) is described from the Fort Atkinson; the new brachiopods *Hebertella insculpta* maquoketensis* (p. 399) (Orthidae) (from all zones of the Maquoketa except the Depauperate), and *H. sinuata* var. prestonensis* (p. 401) (from the *Cornulites* Zone and the underlying shales); *Dinorthis subquadrata* v. occidentalis* (p. 402) (Rhipidomellidae) (from the whole Maquoketa except the Depauperate Zone and the Fort Atkinson); and *Rhynchotrema capax* v. altirostratum* (p. 403) (Rhynchonellidae) (from the Elgin), are described and discussed; and the new pelecypod *Whitella* minnesotensis* (p. 405) (Cyrtodontidae) is described from the Elgin. Seven plates of fossiliferous slabs from the various formations are presented, the fossils not being named. There are maps of the known distribution of the Maquoketa and the Depauperate Zone in North America. It is considered that the Depauperate fauna invaded the Mississippi Valley area from the south, that the higher faunas came from the north, and the Mississippi Valley and Ohio Valley areas were separated by a barrier during Maquoketa time. Many of the Ohio Valley spp. have been erroneously identified with those of the Maquoketa, differences of at least varietal rank having been found by the author in most cases. A summary of previous work and a bibliography of 166 titles are given.—*B. F. Howell.*

14251. **MORSE, WILLIAM CLIFFORD.** Paleozoic

rocks. *Mississippi State Geol. Surv. Bull.* 23. i-xi+3-212. 2 maps, 22 pl., 14 fig. 1930.—The following formations are recognized, all new to stratigraphy except the New Scotland. In the Devonian (Upper series) the Whetstone Branch shale; (Oriskanian) Island Hill formation; (Helderbergian) New Scotland; in the Mississippian (Chester series) the Forest Grove formation with 2 members, Southward Bridge formation with 4 members; Southward Spring sandstone, Southward Pond formation with 6 members, Allsboro sandstone, Alsobrook formation with 3 members; (Lower series) Iuka terrane, and Carmack limestone. These are established principally on a paleontologic basis, their faunas being listed in numerous measured sections from Mississippi and adjacent states. Correlation is made between these formations and Weller's Standard section (1921), the Alabama section, and (in part) the Mississippi Valley, eastern Tennessee, and Ohio sections. The following are figured: specimens of brachiopods, a tentaculite, trilobites, corals, blastoids, a crinoid, and a bryozoan.

14252. **MOUTA, VELEZ, et ALEXANDRE BORGES.** Sur le crétacé du littoral de l'Angola (Districts de Benguela et de Mossamedes.) *Congrès Géol. Internat. Compt. Rend.* 14(3): 911-928. 1926(1928).—Records some echinoderms and many pelecypods, gastropods, and cephalopods from this Cretaceous formation of Angola, Africa.—*D. J. MacNeil.*

14253. **POHL, ERWIN R.** The Middle Devonian traverse group of rocks in Michigan, a summary of existing knowledge. *Proc. U. S. Nation. Mus.* 76(14): 1-34. 2 pl. 1930.—The distribution, nomenclature, and sequence of this group of rocks are discussed, and detailed stratigraphic sections are given. Faunal lists include spp. of corals, bryozoans, brachiopods, pelecypods, crinoids, and trilobites. The miniature closed anticlines and synclines, which are so abundant at exposures of the Traverse beds in western Michigan, are related to small, compact *Prismatophyllum* and *Stromatopora* reefs. The stratigraphic position occupied by the Traverse Group is between the Onondaga and Hamilton of New York, thus extending the time scale by the interpolation of 700 feet of limestone. The Traverse fauna had a northern origin, differing from the Middle Devonian faunas to the south, west, and east.—*C. W. Wilson.*

14254. **PRUVOST, PIERRE.** La Faune continentale et la division stratigraphique des terrains houillers. *Congrès Avanc. Étud. Strat. Carbonifère, Heerlen. Compt. Rend.* 1927: 519-534. 1 pl. 1928.—Records some pelecypods and cephalopods, many crustaceans, myriopods, and insects from the continental Carboniferous of Europe; also the fishes *Coelacanthus elegans, C. mucronatus, Rhizodopsis sauroides, R. wachei, Megalichthys hibberti, M. coccolepsis, Vetacapsula cooperi, Pleuroplax affinis, P. attheyi, Helodus simplex, Strepsodus sauroides, Elonichthys denticulatus, E. egertoni, E. aitkeni, Rhadinichthys renieri, R. lerichei, R. monensis, Platysomus parvulus, Mesolepsis scalaris, Cheirodus granulosus,* and *Brydenius molyneuxi,* together with some plant remains.—*D. J. MacNeil.*

14255. **RUSSO, P.** Le quaternaire dans les hauts plateaux de l'est marocain. *Congrès Géol. Internat. Compt. Rend.* 14(3): 799-832. 2 maps. 1926(1928).—Records the pelecypods *Cardium edule* and *Unio rhomboideus;* the aquatic gastropods *Limnea palustris, L. truncatula, L. depereti, Succinea putris, S. debilis, Cochlicella acuta, Bulimus psilius, Melanopsis estrusca, M. magnifica, M. maresi, M. chlorotica, M. subscalaris* v. *striolata,* and *Physa contorta;* the terrestrial gastropods *Xerophyla ounifiana, X. lemoinei, X. subcostulata, Helix bailloni, Rumina decollata, Albea marocana, Bulimus contortus,* and *Massylaea bailloni;* and leaves of the plants *Pistacia, Nerium oleander, Phoenix dactylifera,* and some indeterminable mosses,—all from this Quaternary deposit of Morocco.—*D. J. MacNeil.*

14256. **SEN-SHING, YOH.** Preliminary report on the geology and mineral resources of Nan Tan Hsien, Ho Chi Hsien, I Shan Hsien, Ma Ping Hsien & Hsiang Hsien, Northern Kwangsi Province. [With Chinese text.] *Ann. Rept. Geol. Surv. Kwangtung & Kwangsi* [*Canton, China*] 1: 97-124. 3 pl., 6 fig. 1927-1928(1928).—The Tungkanling formation of the Middle Devonian of North Kwangsi contains 12 spp. of Anthozoa, 12 of Brachiopoda, and various spp. of Bryozoa, Gastropoda, Pelecypoda, Cephalopoda, and Echinoidea. The Liangsuiaias formation (Upper Devonian) contains several spp. of brachiopods. The Tanchi Series (Carboniferous) is composed of two well-defined divisions, the quartzitic beds and the overlying flinty limestones. The fossils in the quartzitic beds are too poorly preserved to be identified. The lower division of the flinty limestone contains spp. of corals (6) and brachiopods (*Striatifera maxima*) which indicate that the beds are Dinantian. The upper division includes *Fusilina* beds, which may represent at least a part of the Vralian. Only 19 genera and 6 spp. of corals, brachiopods, foraminifera, and pelecypods are mentioned.—*C. W. Wilson.*

14257. **SIMPSON, G. C.** The climate during the Pleistocene period. *Proc. Roy. Soc. Edinburgh* 50(3): 262-296. 3 maps, 3 fig. 1929/30.—An attempt is made to reconstruct the Pleistocene climate in the neighborhood of Frankfort-on-Main, Germany, on the assumptions of (1) the shift of the pole described by Wegener, which would cause glaciation in northwest Europe during the Pleistocene, and (2) periodic variations in solar radiation which would produce the glacial and interglacial epochs. The sequence of changes is shown to be (a) a cold period at the beginning of the Pleistocene-Gunz glaciation; (b) a warm wet period—Gunz-Mindel interglacial epoch; (c) a cold dry period—beginning with the Mindel glaciation and ending with the Riss glaciation, the Mindel-Riss interglacial epoch being cold and dry; (d) a warm wet period—Riss-Würm interglacial; (e) the beginning of a cold dry period which was ended just after the Würm glaciation by a shift of the pole. A sequence in interglacial faunas and floras corresponding to the climatic changes is given, and the evidence from contemporary human cultures is discussed. Corresponding to the Acheulean culture occurred, among other forms, *Elephas antiquus* and *Rhinoceros mercki,* typical of relatively warm conditions; and at the same time were found the forest animals—*Cervus euryceros, Capreolus caprea, Castor fiber,* and *Sus scrofa ferus.* With the Mousterian belonged two groups, the arctic and tundra forms, *Ursus spelaeus, Rhinoceros tichorhinus, Elephas primigenius, Rangifer tarandus, Canis lagopus, Lupus variabilis,* and *Myodes;* and the typical open country forms, *Equus caballus* and *Canis lupus.* These two groups, with the addition of the open country *Cervus elephas,* continued also through the Aurignacian and the Solutrean, and many of the forms went on through the Magdalenian, when the characteristic steppe forms *Equus hemionus, Arvicola, Lagormys pusillus, Cricetus, Felis manul,* and *Spermophilus rufescens* appeared.—*G. C. Simpson.*

14258. **SIMPSON, G. C., A. C. SEWARD, J. W. GREGORY, PETER MITCHELL, C. E. P. BROOKS, C. TATE REGAN, and HAMSHAW THOMAS.** Discussion on geological climates. *Proc. Roy. Soc.* [*London*] *B* 106(744): 299-317. 1930.—SIMPSON: There must always have been climatic zones with the equatorial zones warmer than the polar zones; there must always have been a summer half-year and a winter half-year; no change in the distribution of land and sea alone could have produced the large changes of climate shown in the geological record. These changes in Pleistocene times can have been due only to changes in solar radiation, there having been probably two large oscillations of intensity of radiation. Changes of this nature, limited in magnitude and of relatively short period, have occurred in all geological periods. The large climatic variations which have caused Europe to be temperate to-day, frigid in the Pleistocene, subtropical in the Miocene and tropical in the Carboniferous, and have given subtropical if not tropical conditions in polar regions and polar conditions in equatorial regions, can be explained only by Wegener's hypothesis of the shift of the poles

and the drift of the continents. SEWARD: There is no justification for describing the climate of certain past periods in the northern hemisphere as tropical, on the evidence afforded by fossil plants. The climate of the world was never uniform; the early Tertiary floras of different latitudes in the northern hemispheres differed from each other. Fossil plants can be used as indicators of climate only with great caution, as their relations to climate are not well understood. We tend to think that ancient floras were more uniform in character throughout the world than they actually were because of the imperfection of our knowledge and because they lacked the flowering plants, which give such variety to modern floras; the more we learn about ancient floras, the more we realize that they show the same sort of zonation in vegetation as we have at present. MITCHELL: Fossil animals are useless for determining past climates, because they may have been adapted to almost any climate. GREGORY: Coal seams may be formed today in the Arctic from driftwood carried from more southern regions. The climate of the Eocene was not uniformly warm throughout the world, nor were those of the Cretaceous or the Miocene; the Upper Carboniferous glaciers were formed on high lands, and did not reach sea level in tropical regions. The climate of the earth, as a whole, has remained fairly uniform throughout geological time; there have been zones of climate which have been approximately parallel to the equator; the thermal isanomalies at various times have been greater than at present. All the variations in climate which have been established on adequate evidence can be accounted for by differences in atmospheric and oceanic circulation due to different distribution of land and water and different elevation of the land. All established changes can be explained without a shifting of the poles, a drift of the continents, or material variation in the heat supplied from the sun. BROOKS: Diversion of heat from equatorial regions toward the poles (especially by deflection of the equatorial currents of the oceans) has tended to keep the northern hemisphere warmer than the southern hemisphere, and this diversion was especially great in the late Carboniferous. At present a small increase of temperature in the north polar regions, which would be given by another ocean current flowing into the Arctic Ocean, would wipe out the ice and give a far more favorable climate, one which would be capable of maintaining a moderate vegetation everywhere. REGAN: The main distribution of fresh-water fishes was accomplished before the Tertiary; it depended on the distribution of land and water in Cretaceous times, and indicates that, whereas South and North America were then separated, South America was connected with Africa; throughout most of the Eocene the genera of marine fishes peculiar to America must have been developing independently. This means that America must have been much more widely separated from the Old World than Wegener's hypothesis postulates. THOMAS: In determining the distribution of plants, rainfall may have been of far more importance than temperature.—*B. F. Howell.*

14259. STEPHENSON, LLOYD W. Correlation of the Upper Cretaceous or Gulf series of the Gulf Coastal Plain. *Amer. Jour. Sci.* 16(96): 485-496. 1928.—The Cenomanian, Turonian, and Senonian are represented in the Gulf series. The correlations of the lower formations of the series are based on plants and marine invertebrates, those of the upper formations chiefly on marine invertebrates. The beds of Senonian age are divisible into the *Exogyra ponderosa* Zone (of Santonian and Campanian age) and the *E. costata* Zone (of Maestrichtian age). An *E. cancellata* Subzone, in the lower part of the *E. costata* Zone, is traceable from New Jersey to central Texas. Several spp. of ammonites related to *Acanthoceras rotomagense* in the base of the Eagle Ford Formation indicate that these basal beds and the underlying Woodline Formation are Cenomanian. That the rest of the Eagle Ford is Turonian is shown by the presence of ammonites of the genera *Metoicoceras, Prionotropis,* and *Prionocyclus,* and the pelecypod, *Inoceramus labiatus.* The Austin Chalk is believed to be of early Senonian age because it holds the pelecypod *Inoceramus undulato-plicatus* and other spp. of the same genus, as well as the cephalopod *Mortoniceras texanum.* The formations of the age of the middle Senonian Taylor Formation are characterized by the pelecypods *Exogyra ponderosa,* and *Inoceramus* of the *I. barbeni* type, the cephalopods *Scaphites hippocrepis* and *Mortoniceras delawarense,* and the crinoid *Marsupites americanus* (closely related to *M. testudinarius* of the Santonian of Europe). Twenty characteristic pelecypods, gastropods, and cephalopods of the upper part of the Maestrichtian Navarro Formation are listed; and the pelecypods *Exogyra costata* and *Pecten venustus,* and the cephalopods *Sphenodiscus* and *Pachydiscus* aff. *gollvillensis,* are said to be characteristic of that formation and the Escondido. Because of the presence in its fauna of the cephalopod *Acanthoceras* aff. *rotomagense,* the lower part of the Benton Shale is thought to be Cenomanian, but the occurrence of *Metoicoceras, Prionotropis,* and *Prionocyclus* higher up in the Benton indicates that the rest of that Shale is Turonian. *Inoceramus labiatus, I. fragilis,* and *Ostrea lugubris* are common to the Eagle Ford and the Benton. *Inoceramus deformis* and *I. undulato-plicatus* are found in the Niobrara Formation. Various spp., among them *Scaphites hippocrepis, Mortoniceras delawarense,* and *Inoceramus* aff. *sagensis,* indicate that the Pierre faunas are of about the same age as the Taylor ones. That the part of the Navarro Formation above the *Exogyra cancellata* Zone is of the same age as the Fox Hills Sandstone is evidenced by the presence in the Fox Hills of spp. of *Scaphites* closely related to *S. conradi* and some of its varieties that are found in the upper beds of the Navarro, and by the fact that *Sphenodiscus* occurs in both formations.—*B. F. Howell.*

PHYSICAL ANTHROPOLOGY

14263. ARX, MAX von. Die Tangentenkonstruktion, Kraftlinien und Kraftfelder des menschlichen Kopfes. *Zeitschr. Ges. Anat. Abt. I, Zeitschr. Anat. u. Entwicklungsgesch.* 86(1/2): 237-258. 9 fig. 1929.—The application of a technical method of orthogonic projection in 3 planes, and the consequent possibility of a trigonometrical expression of biological form, enabled the author to reach a mathematical formula in the analysis of the human pelvis, based on the relation of the power of resistance of a specific protoplasm to the forces of the environment (gravity, atmospheric pressure). The same constant relation (ϕ) between the internal morphogenetic forces (i) and the external tangential antagonistic forces (e) appears in the human head. $\phi = e/i = R/r = \sqrt{2 \sin 60°} = 1.2246 =$ constant. The brain-case is elipsoidal in form; the center of gravity falls on the oblique plane of the clivus and is thrown onto the transverse axis of the condylar processes. The principle of construction of the entire human body is dynamostatic, similar to that of a semi-rigid Zeppelin airship, with an interrupted axis (hip-joint). The value of ϕ for the human head can also be obtained from the relation of the radii R and r of 2 circles, of which r encloses an equilateral triangle, and R encloses a square of side equal to that of the triangle. Both circles intersect at the junction of the lambdoid sutures, at which point the internal and external forces are in equilibrium. Morphogenesis of the whole body is a process obeying geometrical and mechanical-mathematical laws.—*M. von Arx (transl. by G. R. de Beer).*

14264. BALDWIN, BIRD T., LAURA M. BUSBY, and HELEN V. GARSIDE. Anatomic growth of children. A study of some bones of the hand, wrist, and lower forearm by means of roentgenograms. *Univ. Iowa Studies Child Welfare* 4(1): 1-88. 2 pl., 7 fig. 1928.—This study was undertaken to obtain an objective measure of the anatomic development of the child as shown by the bones of the wrist, the epiphyses of the long bones of the lower forearm and the hand, and the sesamoid bones of the hand. Examination was made of 1300 roentgenograms of the lower forearms and wrists. The ages of the children varied from birth to 17 yrs. with a few additional cases that were older. By inspection, a record of the number and the name of the carpals present, the number, location, and fusion of the epiphyses was obtained. A quantitative measure of the amount of ossification of the carpal bones was obtained by tracing the area of each carpal bone with a circumscribing disc planimeter. Girls were in advance of the boys in time of first observation and fusion of the epiphyses of the hand and lower forearm. The distributions of areas of each carpal bone and the sums of the areas of all bones in age groups showed a wide range for each age and a large amount of overlapping in the ranges of age groups. There were no significant differences in the means of the sums of the areas of the carpal bones of the right and of the left wrists. For age groups from 1 yr., 3 mos. to 17 yrs. there was probably a significant difference in the mean total carpal area for the boys and girls at 3 and 13 yrs. and a quite evident difference at 5, 6, 7, 14, 15, 16, and 17 yrs. The boys had the larger means after 13 yrs. A high or moderately high degree of relation between total carpal area and each of 4 physical traits (height, weight, width of shoulders, and width of hips) was shown for ages 10-16 for the boys and 8-12 for the girls. The period of greatest correlation between total carpal area and the physical traits seemed to be present for boys and girls at their respective periods of accelerated anatomic development. On a whole the correlations between carpal area and the physical traits showed that the general skeletal size of the individual was a factor to be considered in judging anatomic maturity from the area of the carpal bones. In this study 2 methods are presented to allow for general skeletal size of an individual: multiple regression equation, and anatomic index. The anatomic index was a fine enough measure to discriminate the anatomic growth of 1 chronological year for boys from the 2-yr. to the 17-yr. age group, and for the girls from the 1-yr., 3-mo. age group to the 15-yr. age group. The mean anatomic index was significantly higher for the girls than for the boys at all ages from 3 to 16 yrs.—*Helen G. Kelly.*

14265. BERKSON, JOSEPH, and GERTRUDE M. SCHULTZ. The question of compensating variability. *Amer. Jour. Phys. Anthrop.* 13(1): 131-137. 1929.—The concept of compensatory variability implies that, during growth, there is a tendency to maintain a relative fixity of portions of the body, considered in their totality, so that for such as consist of a number of parts, an overgrowth of one part is accompanied by a diminishing growth of another. Measurements on 296 ♂♂ and 198 ♀♀ between the ages of 19 and 35 years were made of: total arm length, consisting of upper arm length, forearm length, and hand length; and head size, consisting of head length, head width, and head height; and for ♀♀, stature. The coefficients of variation of the totals and parts are calculated and compared, and the total has the smaller coefficients. Since this numerical result cannot be taken as evidence in favor of the main thesis the method of "partial correlation" is resorted to. The results indicate that there is no statistical evidence of compensating growth among the measurements considered. The authors disclaim finality for their results. —*Author (courtesy Wistar Bibl. Serv.).*

14266. BERKSON, JOSEPH. Growth changes in physical correlation—height, weight, and chest-circumference —males. *Human Biol.* 1(4): 462-502. 1929.—The changes in the Pearsonian correlation coefficient r between height, weight, and chest-circumference in ♂♂ that occur as age advances, and parallel changes in other statistical functions were investigated. The data comprise several independent series including a total of about 200,000 in-

dividuals. The conclusions are as follows: Intercorrelations between height and weight, weight and chest circumference, and height and chest circumference, as measured by the Pearsonian coefficient r in ♂ whites, all show significant variation with age. The correlations between height and weight show in their trend on age alternate maximum and minimum points in the neighborhood of ages 1.5 yrs., 3 yrs., 6 yrs., 11 yrs., 14 yrs., and 21 yrs. The correlations between weight and chest circumferences, and height and chest circumference, as well as that between height and weight, show a maximum point in the neighborhood of 14 yrs. Each of the other statistical functions studied, means, standard deviations, and coefficients of variation, also shows in its trend with age a maximum point in the neighborhood of 14 yrs. This is taken to be associated with adolescence and therefore the fall in the trend after 14 yrs. is referred to as the "post-pubescent decline." Comparison of the critical points of the correlation trends, other than at about 14 yrs., with those of other statistical functions, including velocity of growth of the means, shows suggestive but inconclusive analogies. The relative size of the correlation coefficient after about 10 yrs. is highest for the weight-chest circumference, next for the weight-height and smallest for height-chest circumference. Between about 6 and 10 yrs., the height-weight correlation coefficient is higher than the weight-chest circumference while the latter and height-chest circumference retain the relative position they occupy after 10 yrs.—*J. Berkson.*

14267. BERLINER, MAX. Vergleichende Untersuchungen über die Weichteilhärte am Lebenden. *Zeitschr. Ges. Anat. Abt. 2, Zeitschr. Konstitutionsl.* 15(1): 114-126. 1929.—With a specially designed instrument the firmness of the soft parts was tested on various body surfaces. The average of 63 men and women was: shoulder, 10.4 mm.; popliteal space, 10.05 mm.; back, 1.65 mm.; trigon, 3.2 mm.; and abdomen, 2.25 mm. Distinct deviations were found in 17 with various pathological conditions. Exercised muscles appeared to lose rather than increase in hardness.

14269. BINGHAM, HAROLD CLYDE. Observations on growth and development of chimpanzees. *Amer. Jour. Phys. Anthrop.* 13(3): 433-468. 18 fig. 1929.—Growth changes in 4 chimpanzees are presented over a period exceeding 3 yrs. Observations were made periodically in an effort to develop techniques for physical measurements of living anthropoid apes. Each observation was repeated many times before it was recorded, and each record represents at least 2 measurements. Tables and figures are used throughout to summarize results. Weight, dentition, and other factors are discussed as a criterion of age and in relation to other changes. It has been demonstrated that methods can be developed which will elicit cooperation of anthropoid subjects, as well as furnish criteria of growth.—*Author (courtesy Wistar Bibl. Serv.).*

14270. BLACK, DAVIDSON. A study of Kansu and Honan Aeneolithic skulls and specimens from later Kansu prehistoric sites in comparison with North China and other recent crania. Part I. On measurements and identification. *Geol. Surv. China Paleontol. Sinica* 6D (1): 1-83. 31 fig. 1928.—Investigation of the group measurements and form relations of the Honan and Kansu prehistoric crania in comparison with recent North China material, would seem to establish beyond reasonable doubt that the prehistoric populations represented were essentially Oriental in physical character. Further, the resemblances between these prehistoric and recent North China populations would appear to be such that the term "proto-Chinese" may with some propriety be applied to the former. Of the prehistoric populations represented by this material, that of the Aeneolithic culture phase would seem to diverge somewhat more widely from the modern North China type than do those of the later prehistoric culture phases, and also to present, in certain suggestive features, some near resemblance to the Tibetan B or Khams Tibetan type described by Morant. Of the Sha Ching skulls, but a relatively small proportion (7 specimens out of 18 represented) were sufficiently free from posthumous deformation to be available for the measurements from which the coefficients of Racial Likeness have been calculated. While the specimens not available for these measurements will be considered in detail in Part II of this report, it should be noted here that the Sha Ching skull series on the whole appears to include a greater proportion of individuals characterized by somewhat flatter and more coarsely modelled facial features, than obtains among the other prehistoric groups.—*Author's conclusions.*

14271. BLACK, DAVIDSON. Preliminary note on additional Sinanthropus material discovered in Chou Kou Tien during 1928. *Bull. Geol. Soc. China* 8(1): 15-32. 6 pl. 1929.—New *Sinanthropus* material has been recovered within the main deposit from 2 sub-localities, distinguished for descriptive purposes as Locus A and Locus B. These sub-localities are very definitely contemporaneous and of Lower Quaternary (Polycene) Age. From Locus A the greater part of the right horizontal ramus of an adult lower jaw with the 3 molar teeth in situ was obtained, as well as several other teeth representing different individuals. The material from Locus B is for the most part inbedded in travertine of very irregular hardness from which several important specimens have already been partially or wholly freed. Among these are included the complete symphysis region of the lower jaw of a very young individual, numerous isolated teeth of various ontogenetic ages and parts of the calvaria of both immature and adult individuals. It is evident from a preliminary study of this material that the lower jaw of *Sinanthropus*, while ape-like in the symphysis region and very massive throughout, supported a generalized but typically hominid dentition in which the 3rd permanent molar was the smallest of the grinding teeth and neither milk nor permanent canines projected above the general dental crown level. It is further to be noted that notwithstanding the primitive form of its lower facial region *Sinanthropus*, like *Eoanthropus*, was a large brained form.—*D. Black.*

14272. BLACK, DAVIDSON. Interim report on the skull of Sinanthropus. March 29, 1930. *Anthrop. Anzeiger* 7(1/2): 117-118. 1 pl. 1930.

14273. BLOCH, ADOLPHE. Sur les taches pigentmaires [pigmentaires] normales des muqueuses. *Bull. et Mem. Soc. Anthrop. Paris* 7(1/3): 8-14. 1926.—Cases of normal pigmentation of mucous membranes in individuals of pure white stock are studied. The author believes that they are due to very remote atavism.

14274. BOLK, L. Origin of racial characteristics in man. *Amer. Jour. Phys. Anthrop.* 13(1): 1-28. 1929.—The author begins with a short survey of the fundamental idea of his theory on the historical development of the specific faculties of man's body. According to this theory the somatic faculties of man are the result of a retardation of the ontogenetic development (hypothesis of retardation), in consequence of which they persist in a fetal state of development (hypothesis of fetalization). Compared with the body of other *Primates*, that of man appears, therefore, as a highly "fetalized" form. Proceeding, from the hypothesis that the evolutive factors giving rise to the human races must have been quite the same as those of man in general, the author shows that the racial differences bear a fetal character. In some sense, therefore, a race may be defined as a group of individuals in whom a definite somatic property or condition terminates its evolution at a certain stage, whereas in all other individuals its evolution is still proceeding till the very end.—*Author (courtesy Wistar. Bibl. Serv.).*

14275. BOLK, M. Le problème de l'anthropogénèse. *Compt. Rend. Assoc. Anat. France. (Soc. Impress. Topog.*

Nancy) 1926: 80-92. 1926.—The author considers anthropogenesis independently of the theories of the descent of man. He feels that the study of comparative anatomy to determine generic and familial relationships is unsound. He believes that the position of the occipital foramen in man is a retained fetal characteristic, probably responsible for his bipedal position, and that further development has caused it to move occipitally in other primates. The somatic characters which are peculiar to man alone among the primates are fetal characters made permanent. This retardation extends likewise through the period of growth, prolonged maturity, and gradual senescence. Neanderthal man (lack of jaw development being correlated with rapid dentition) is cited as having attained maturity early and as being more simian in that respect. He considers that man has evolved to his present state of retarded development. Examples are given to show that this retardation is a characteristic, in less degree, of the higher and intermediate simian forms. The endocrines are considered the internal factor causing "fetalization" and "physiological retardation."

14276. BREZINA, ERNST, und VIKTOR LEBZELTER. Über Habitus und Rassenzugehörigkeit von Wiener Schmieden und Schriftsetzern. [Habitus and race affiliations of Viennese smiths and type-setters.] *Zeitschr. Konstitutionsl.* 13(1): 1-41. 1 pl. 1927.

14277. BROOM, R. Australoid element in the Koranas. *Nature [London]* 124(3127): 507. 1929.—Fragments of a skull, more primitive than the Springbok skull, were discovered. The skull is unlike that of the Bushman or Bantu, only little like the typical Koranna, and is probably of an early Australoid race in South Africa, or perhaps of a Koranna in which Australoid characters are prominent. The discovery gives further support to the theory of the existence in S. Africa of a race, neither Bushman nor Bantu, probably ancestors of the Koranna.

14278. BORDIER, H. Évaluation de la surface du corps de l'homme. Utilité et signification de la surface spécifique. *Presse Méd.* 37(37): 602-603. 2 fig. 1929.—Measurement of body surface was made with an instrument (intégrateur de surfaces) designed by J. Richard. For each height there is a constant relationship between body surface and weight, $W/S=K$. K is a constant and is called the specific surface of the body. The value of K varies from 2.53 at 1.90 m. height to 3.0 at 1.50 m. It varies from 5.3 to 6.6 for infants. It is only necessary to measure height and weight and by the use of these values for K, the body surface can be easily calculated, $S=WK$.—*G. T. Lewis.*

14279. BOYD, EDITH. The experimental error inherent in measuring the growing human body. *Amer. Jour. Phys. Anthrop.* 13(3): 389-432. 1929.—A series of anthropometric measurements on 35 nursery-school children was taken at monthly intervals over periods of 5-17 mos. 3 readings were taken for each measurement. 6 of these measurements, 2 of stature and 4 of body stem, have been analyzed for experimental error both in the 3 readings taken in rapid sequence, "consecutive measures," and for those taken at monthly intervals, "progressive measures." By various statistical estimates (average and percentage deviations, standard deviations, rank correlations, deviations from parabolae, and straight lines fitted by method of least squares), the error for progressive measures is larger than for consecutive measures and is consistently less for standing height than for length and for the 4 measurements of body stem. This error inherent in measuring needs to be taken into consideration before positive conclusions are drawn regarding the significance of either small variations in growth trends or before individual measures are compared with a standard.—*Author (courtesy Wistar Bibl. Serv.).*

14280. [BUSHMAKIN, N. D.] БУШМАКИН, Н. Д. Некоторые особенности рельефа головного мозга бурят. [Peculiarities in brain of the Buriats.] Иркутский Медицинский Журнал *(Irkutsk Med. Jour.)* 4 (3/4): 5-8. 1926.—♂ brain-weight is 1085-1572; length of fissura cerebri lateralis varies greatly; fissure of Rolando (sulcus centralis) in 59% cuts the median border of the hemisphere; in 72% is found the middle frontal gyrus (Sul. frontalis medius); in 90% the transversal occipital gyrus (S. occipitalis transversus) is found in both hemisphere; there are 3 types: (1) S. occ. transv. is the prolongation of the fissura parieto-occipitalis; (2) S. occ. transv. is entirely independent; (3) S. occ. transv. blends in its interior end with S. temporalis superior.

14281. CAMERON, JOHN. Craniometric studies. XXI. The facial height as a criterion of race. *Amer. Jour. Phys. Anthrop.* 13(2): 319-334. 1929.—The author made a study of the upper facial height in diverse racial types, and found that by its means one could divide modern man into 3 main groups: (A) the Mongolian type; (B) the prognathic type; and (C) an intermediate type. A was represented in this research by the Eskimo, the Mongol, and the American Indian. These races possessed the highest averages for facial height. B was represented by the American negro, the native Australian, the native Tasmanian and the Melanesian, races possessing the lowest averages for facial height. The intermediate type (C) was so called because it evidently possessed averages intermediate between those for A and B. The only available material representing this type was Turner's Scottish crania. Races with high averages for the facial height also exhibited high averages for the nasal height and the orbital height, and vice versa.—*Author (courtesy Wistar Bibl. Serv.).*

14282. CAMERON, JOHN. Craniometric studies. XXII. The facial width as a criterion of race. *Amer. Jour. Phys. Anthrop.* 13(2): 335-343. 1929.—The author records 4 types of average facial width: (A) the Mongolian type; (B) the European type; (C) the African negro type; and (D) the Australasian type. Type A was represented by the Eskimo, the Mongol, and the American Indian; these races possessed the greatest average facial width. Type B was represented by Turner's Scottish crania; the average facial width for these crania was much below that for the Mongolian races. Type C was represented by the American negro and also by negro types from Africa; their average facial width was ascertained to be closely similar to that for the Scottish crania. Type D was represented by native Australian, Tasmanian, and Melanesian crania. In these the average facial width displayed a distinct increase when contrasted with type C. The averages for these 3 Australasian races showed a remarkable degree of similarity.—*Author (courtesy Wistar Bibl. Serv.).*

14283. CAMERON, JOHN. Craniometric studies. XXIII. A study of the upper facial index in diverse racial types of mankind. *Amer. Jour. Phys. Anthrop.* 13(2): 344-352. 1929.—The author studied the upper facial index in representative racial types and found that by it one could divide modern man into 3 main groups; (A) the European and Mongolian type; (B) the Australasian type; and (C) an intermediate type represented at present by the American negro. The only European crania available for study of this index were Turner's Scottish crania. The Mongolian races were represented by the Eskimo, the Mongol and the American Indian. All these races, both European and Mongolian, exhibited the highest averages for the upper facial index. Type B was represented by the native Australian, Tasmanian and Melanesian, races which were found to possess the lowest averages for the facial index. The intermediate type was so called because it evidently possessed averages intermediate between those for A and B. The only available material representing this type was the American negro.—*Author (courtesy Wistar Bibl. Serv.).*

14284. CAMERON, JOHN. Researches in craniometry. No. 19. The Basion-pituitary-alveolar angle. A new cranial angle. Its significance in man, the anthropoids and lower mammals. *Trans. Roy. Soc. Canada Biology (sect. 5)* 23(2): 199-211. 1 pl., 2 fig. 1929.—This new cranial angle reaches its minimum dimensions in the higher Hominidae, and exhibits a gradual increase as

one descends the mammalian scale. It is an index of gnathism, and follows the alveolar index consistently. It has, moreover, certain advantages over the sphenomaxillary angle as an index of gnathism. By means of this angle it is possible to divide the Hominidae into orthognathic, mesognathic, and prognathic groups. The orthognathic group will probably fall mainly within the limits 80°-85°, the mesognathic group between the limits 85°-88°, while the prognathic group will probably be represented by crania with angles over 88°. A definite evolutionary gap exists between the Hominidae and the Simiidae, so far as the dimensions of this angle are concerned. Evidently a sexual factor determines the size of the angle which was slightly larger on the average in ♀♀ than in ♂♂ in both the Hamann Museum white and negro crania. This indicated that the ♀♀ were slightly more prognathic than the ♂♂ in these 2 ethnic groups. These observations confirmed the author's previous conclusions regarding the influence of the sexual factor upon the alveolar index.—*J. Cameron.*

14285. **CAMERON, JOHN. Researches in craniometry. No. 20. The pituitary-alveolar-basion angle. A new cranial angle. Its significance in man, the anthropoids and lower mammals.** *Trans. Roy. Soc. Canada Biology (sect. 5)* 23(2): 213-220. 1 fig. 1929.—This new cranial angle attains its maximum dimensions in the higher races of modern man, and displays a gradual diminution in size, as one descends the mammalian scale. It is an index of gnathism, and follows the alveolar index consistently. There is a very definite evolutionary gap between the Hominidae and the Simiidae, so far as the size of this angle is concerned. There is evidently a sexual factor at work determining the size of the pituitary-alveolar-basion angle, for it was slightly smaller in the ♀♀ than in the ♂♂ in both the Hamann Museum white and the Hamann Museum negro. This meant that the ♀♀ were slightly more prognathic than the ♂♂ in these 2 racial groups. These observations confirmed the author's previous conclusions regarding the influence of the sexual factor upon the alveolar index.—*J. Cameron.*

14286. **CAMERON, JOHN. Researches in craniometry. No. 21. The pituitary-basion-alveolar angle. A new cranial angle. Its significance in man, the anthropoids and lower mammals.** *Trans. Roy. Soc. Canada Biology (sect. 5)* 23(2): 221-228. 2 fig. 1929.—This new cranial angle attains its maximum dimensions in the orthognathic skull of the higher Hominidae, and exhibits a gradual diminution in size, as one descends the mammalian series. It is an index of gnathism, and follows the alveolar index consistently. There is a well defined evolutionary gap between the Hominidae and the Simiidae, so far as the size of this angle is concerned.—*J. Cameron.*

14287. **CAMERON, JOHN. Researches in craniometry. No. 22. Three new cranial indices. The relative proportions of the three sides of the pituitary-alveolar-basion triangle in man, the anthropoids and lower mammals.** *Trans. Roy. Soc. Canada Biology (sect. 5)* 23(2): 229-241. 1 fig. 1929.—In this paper the human and comparative anatomy of 3 new cranial indices is described for the first time. The *P-B/P-A* index is a study of the relative proportions of the pituitary-basion and the pituitary-alveolar cranial lengths. The *P-B/B-A* index is a study of the relative proportions of the pituitary-basion and the basion-alveolar cranial lengths. The *P-A/B-A* index is a study of the relative proportions of the pituitary-alveolar and the basion-alveolar cranial lengths. All 3 are indices of gnathism, and they all follow the alveolar index consistently. All 3 attain their maximum in the orthognathic type of skull, and all exhibit a gradual diminution, as one descends the mammalian scale. This means that they all become reduced with increasing degrees of prognathism. All 3 exhibit well defined evolutionary gaps between the Hominidae and the Simiidae.—*J. Cameron.*

14288. **CAMERON, JOHN. Researches in craniometry. No. 23. The inclination of the cranio-facial Axis (Cameron) to the Frankfort Plane in man and in lower mammals.** *Trans. Roy. Soc. Canada Biology (sect. 5)* 23(2): 243-251. 1 pl., 1 fig. 1929.—The author's cranio-facial axis consists of a pre-pituitary segment (the nasion-pituitary length) and a post-pituitary segment (the pituitary-basion length). The inclination of these 2 segments to the Frankfort plane was studied in man and in lower mammals. The angle of inclination of the pre-pituitary segment exhibits a marked increase in lower mammals, as compared with man. The degree of inclination of the post-pituitary segment to the Frankfort plane in man is controlled by 2 factors, racial and sexual, thus it is less in the Hamann Museum White than in the Hamann Museum Negro, and less in the ♂♂ than in the ♀♀ of both races. It tends to approximate to 180°, as one descends the mammalian scale. In the Hamann Museum White and Negro crania the pre-pituitary segment of the cranio-facial axis is more stable in its position with reference to the Frankfort plane than the post-pituitary segment.—*J. Cameron.*

14289. **CAMPBELL, T. D. Adelaide University field anthropology: Central Australia. No. 5. Dental notes.** *Trans. & Proc. Roy. Soc. S. Australia* 52: 28-30. 1929.—Full-blooded natives showed well-formed dental arches with strong, appreciably worn teeth. The occurrence of caries was somewhat higher than among Australian natives generally, in their natural environment, but much lower than among civilized white people. Few other dental pathological conditions were present. The gums were generally firm and healthy. The dental condition of these natives supports the contention that the less refined the foodstuffs used, the less will be the occurrence of dental abnormalities and pathological conditions.

14290. **CHOUKE, K. S. The epicanthus or mongolian fold in Caucasian children.** *Amer. Jour. Phys. Anthrop.* 13(2): 255-279. 8 fig. 1929.—Most of the published work on this subject is limited to the percentages of cases found in certain races. The present study was undertaken to investigate any possible relationship between the Mongolian fold of the eye and the measurements of the head and face. In the description of variations in the Mongolian fold, Drews' classification is adopted, recognizing 3 degrees of development of the fold. Von Ammon, in 1831, first described the Mongolian fold. Since then many theories have been advanced to explain its occurrence in different races. Most authors consider the flattening of the nose to be the cause of the development of the fold, but the present investigation, supported by actual measurements, failed to corroborate such a claim. A combination of extraordinarily small superciliary arches and flattened root of the nose appears to be the cause of the formation of epicanthus.—*Author (courtesy Wistar Bibl. Serv.).*

14291. **COLLINS, SELWYN D., and TALIAFERRO CLARK. Physical measurements of boys and girls of native white race stock (third generation native born) in the United States.** *U. S. Public Health Reports.* 44(18): 1059-1083. 12 fig. 1929.—This paper is the first of a series on the growth of children of native white stock from 6 to 15 yrs. of age. Physical measurements were made of nearly 30,000 school children of native white parents and grandparents in the United States. The measurements were standing height, or stature, sitting height, or trunk length, weight, chest circumference (at rest), transverse chest diam., or width of the chest, antero-posterior diam., or depth of the chest, and vital capacity. The technique was identical in all places, the measurements all being made by 3 medical officers of the Public Health Service. The children were, roughly, from 4 geographic sections of the United States—Northeast, North Central, South Central, and Western States. As age increases, weight and vital capacity increase more rapidly than any of the other measurements taken. In all the measurements except vital capacity and transverse chest diameter, there is a period of 2-5 yrs. between 11 and 15 yrs. of age, inclusive, during which the mean measurement for girls exceeds the mean for boys of a corresponding age. In general the largest excesses of girls over boys occur at about 13 yrs. of age. By comput-

ing the difference between the mean measurements at successive ages, the mean annual increments of growth in these measurements may be approximated. The age of greatest growth varies somewhat for the different measurements, but there is a tendency for a maximum percentage increment about the age of puberty, the maxima for girls coming 1 or 2 yrs. earlier than the maxima for boys. For every measurement considered in this study there is a period of 3 or more yrs. between 6 and 13 yrs. of age during which the mean annual increment for girls exceeds the increment for boys of a corresponding age. In general, the largest excesses in the increments of girls over those of boys occur from 11 to 12 yrs. of age. The increment from 13 to 14 yrs. of age is for every measurement larger for boys than for girls. The mean annual increments of girls exceed those of boys at considerably earlier ages than in the case of the mean measurements themselves.—*S. D. Collins.*

14292. COSGROVE, C. B. A note on a trephined Indian skull from Georgia. *Amer. Jour. Phys. Anthrop.* 13(2): 353-357. 3 fig. 1929.—A fragment of a skull vault exhumed from a mound near Augusta, Georgia, shows a circular trepanation about 38 mm. in diam. with signs of healing. The fragment seems to belong to the cranium of an adult ♂ Indian.—*Author (courtesy Wistar Bibl. Serv.).*

14293. CZEKANOWSKI, J. Anthropologie von Polen. (Begleitworte zur synthetischen anthropologischen Karte von Polen.) *Petermanns Mitteil. Justus Perthes' Geogr. Anst. [Gotha].* 75(5/6): 113-119. 1 col. map, 1 fig. 1929. —When determining quantitatively the degree of similarity of the populace of single territorial districts, by means and on the ground of the averages of a number of anthropological features, the separating of geographical provinces results. These are the prevalence zones of anthropological types (racial elements). In Poland, there is a sharp contrast between the homogeneous region of the nordic type and the heterogeneous zones with a strongly mixed population, where, beside the nordic, the lapponoid type is the most prominent. The anthropologic conditions of Poland quite resemble those of Germany. The present paper gives the solution of the problem which is seen in the synthesis of geographical representations of a number of phenomena which hitherto had to be judged by comparing several charts which in the end proved quite deceptive.—*J. Czekanowski (transl. by B. Oetteking).*

14294. DART, R. A. The South African negro. *Amer. Jour. Phys. Anthrop.* 13(2): 309-318. 1929.—The history of scientific investigation of the physical anthropology of the South African negro races is discussed. The lines upon which research has chiefly proceeded in South Africa are indicated with information concerning the materials available for investigation in South Africa and a bibliography of the contributions to knowledge of the South African races.—*Author (courtesy Wistar Bibl. Serv.).*

14295. DIAKONOW, P. P. Kopf und Rumpf in ihren dynamischen Beziehungen. *Zeitschr. Ges. Anat. Abt. 2, Zeitschr. Konstitutionsl.* 14(2): 212-226. 3 fig. 1928.—The author presents his method and apparatus for the routine carrying out of measurements which estimate the lordoses (depth of cervical and lumbar lordoses) upon which the vertical body length is essentially dependent. In addition, the configuration of the head, chest, abdomen, and pelvis and their dynamics are intimately related to lordotic distortions of the vertebral column, the exact measurements of which indicate the stress to which they have been subjected. The influence of the degree of cervical lordosis upon the configuration of the calvarium has been studied by means of body and head measurements on students of the Moscow Medical School. On the head, the following measurements were made: length, height (inion-vertex level difference), parietal breadth and temporal breadth (by a new method of measurement between pterion-points based on Kronlein's method). The more marked the cervical lordosis, the more the cranial vault increases; at the same time, the temporal breadth is somewhat less markedly increased. The cervical lordosis increases with body length, as a result of the continual bending of the body over the desk while sitting. Besides the flattening of the chest skeleton, as a result of the shortening of the play of the Mm. scaleni, of the diaphragm, and of the flat abdominal muscles, there is also the above noted peculiar change in skull form as a result of marked cervical-lordosis. The spatial relationships within the skull are directly influenced thereby; in consequence, the blood supply of the brain is hindered by the numerous windings of the Aa. and Vv. vertebrales, and the function and development of the individual areas of the brain will be affected. It is therefore shown that to secure a harmonious form for the skull and brain, there should be a marked individuality in the height of work tables and table tops, determined by dynamic-anthropometric controls. The author concludes:—measurements are only worth while submitting to statistical examination when they are made in conformity with a dynamic method of measurement, here described.—*P. P. Diakonow (transl. by A. N. Burkitt).*

14296. FAWCETT, E. Report on Kilgreany human bones. *Univ. Bristol Proc. Spelaeolog. Soc.* 3(3): 126-133. 11 fig. 1929.—Pleistocene remains from a cave in Ireland, with skulls apparently of the Mediterranean type.

14297. FISCHER, EUGEN. Über Varietätenforschung. *Verhandl. Ges. Phys. Anthrop.* 3: 16-22. 1929.—The author points out the poverty of our knowledge of the nature of the numerous structural variations occurring in the organs of the human body, whether they are actually idio-variations or individual para-variations. He suggests that the matter may be approached by combined investigation, a definite number of such variations being recorded statistically from all dissections in all countries, so that information may be obtained as to the frequency of the variations in different races. The Deutsche Anatomische Gesellschaft will prepare an appropriate record form.—*From author's abstr. (transl. by J. P. McMurrich).*

14298. FISCHER, EUGEN. Zur Frage einer ätiopischen Rasse. *Zeitschr. Morph. u. Anthrop.* 27(2): 339-341. 5 pl. 1929.—The strongest support for the establishment of a distinctive Ethiopian race, and its acceptance by many authors is the fact that many groups in North East Africa, Abyssinia, Somaliland, etc., possess preponderantly wavy and not spirally curled hair. The author has previously shown in the Rehobother bastards that by crossing straight and spiral hair, a wavy type results. He assumes a special hereditary factor for this. A further factor then makes spiral hair from wavy. The assumption of multiple factors makes clear the individual degrees of wavy and spiral hair. The author figures wavy Somali and Bastard hair side by side and shows the complete agreement between the two. The hair form of the Somali and other North East Africans can therefore be considered as a result of the crossing of a negro with an oriental race, Semite). A distinctive Ethiopian race does not exist.—*E. Fischer (transl. by A. N. Burkitt).*

14299. FOSTER, ANDRÉ. Possibilités d'adaptation de l'astragale aux exigences de la statique du pied dans la serie des Mammifères. *Arch. Anat., Hist. et Embryol.* 5(1/3): 141-159. 5 fig. 1926.—The astragalus is, so to speak, the keystone of the longitudinal arch of the foot, articulating with the tibia on the one hand, and in the foot with the os calcis and scaphoid. Its form is therefore associated with the mode of locomotion of mammals, and its adaptations in this respect the author seeks to trace in a series of mammals. The form changes undergone by the astragalus, and its articular modifications in a series of mammals in correlation with changes in gait, etc., are considered.—*C. W. Bock.*

14301. FRASSETTO, FABIO. Sistema di normalità tra statura, perimetro toracico e peso nelle norme per il reclutamento. [System of normality in stature, thoracic perimeter, and normal weight, in army recruits.] *Atti Soc. Ital. Progr. Sci.* 1927: 552-553. 1928.—Abstract.

14302. GLÄSMER, ERNA. Die Eigenart weiblicher Konstitution und die Notwendigkeit einer geschlechtsspezifischen Typenaufstellung. *Zeitschr. Geburtsh. u. Gynäkol.* 96(3): 572-586. 9 fig. 1929.—Types of body build in women are: hypoplastic, including infantile; euplastic; and hyperplastic, including the adiposo-genital, dystrophic conditions. Hypoplastic corresponds to asthenic ♂ type, euplastic to pyknic, and hyperplastic to athletic. Endocrine balance plays an important part in determining body build.

14303. GREGORY, WILLIAM K. The palaeomorphology of the human head: ten structural stages from fish to man. Part II. The skull in norma basalis. *Quart. Rev. Biol.* 4(2): 233-247. 3 fig. 1929.—Three series of 10 skulls each are figured, illustrating the evolution of the under side of the skull from fish to man, the 1st series showing the evolution of the norma basalis as a whole, the 2nd and 3rd the evolution of the outer and inner jaw series respectively. The 10 stages do not constitute a direct phylogenetic series from fish to man, but they illustrate the evolutionary history of the principal skull elements. These stages are represented by the Devonian lobe-finned ganoid *Eusthenopteron,* the primitive amphibian *Eobaphetes,* the primitive reptile *Seymouria,* the advanced cotylosaurian reptile *Captorhinus,* the primitive mammal-like reptile *Scylacops,* the advanced mammal-like reptile *Cynidiognathus,* the primitive marsupial mammal *Thylacinus,* the primitive lemuroid *Adapis,* the modern chimpanzee and man. In each stage it is shown that fundamental characters of the previous stage are retained, while distinctive advances are made toward the stage beyond, the dominant factors of change in the norma basalis in the last 3 stages being the development of the dentition, the gradual assumption of the erect posture, and the increase in brain volume. A study of the individual elements of the skull confirms the evidence of the norma basalis as a whole. In the skull of man the only bones lost in the long progress from the Devonian lobe-finned ganoid are the prevomers, ectopterygoids and quadratojugals. All others are present, though some have been fused, some taken over to serve other functions and all changed in form.—*W. K. Gregory.*

14304. GRIGORJEWA, S. P. Die Manoilowsche Reaktion als Mittel zur Rassenbestimmung beim Menschen. *Zeitschr. Rassenphysiol.* 2(2): 92. 1929.—In studies of the blood of various peoples for the Manoiloff reaction, the results were not satisfactory. Of the Russian peoples, 60% gave their characteristic reaction and only 40% of the Hebrew race were typical. When numerous specimens were tested on several occasions the results were not constant in 59% of the cases. The author concludes either that the "race hormone" is very labile or that the method of performing the test must be improved; also that malaria patients do not constitute favorable material.—*P. Levine.*

14307. HECKER, PAUL. Sur le bord dit pubien de l'os iliaque chez l'homme et dans la série des mammifères. *Bull. Mém. Soc. Anthrop. Paris* 7(4/6): 79-84. 5 fig. 1926.—The pubic border is one of the 3 structural margins of the ilium of which the essential and primitive form is that of a triangular prism. Its characteristics are: the internal iliac spine; the pyramid on the pubic margin; its partial fusion with the innominate line and its continuation on the pubic. It separates the iliac cavity from the homologue of the iliac tuberosity. In the mammalian series, particularly in the simians, the internal iliac spine produces a migratory motion in a dorsal direction: (a) In the marsupials, rodents, carnivores and prosimians, the pubic border is very close to the acetabular border, so that the internal iliac spine is almost blended with the anterior superior iliac spine. (b) In the simians, the internal iliac spine is in the middle of the iliac crest. (c) In anthropoids and man, the iliac spine is very close to the ischial border. The pubic border is prominent in the prismatic and long ilia (marsupials and rodents); it is less prominent in flat short ilia (catarrhini, anthropoids and man). The development of the pubic border corresponds directly with the development of the sub-articular facet of the iliac tuberosity serving as a point of fixation for the mass of extensors of the trunk.—*Author's conclusions (transl. by J. E. Moody).*

14308. HEJINIAN, LUCEA, and ELISE HATT. The stem-length: recumbent-length ratio as an index of body type in young children. *Amer. Jour. Phys. Anthrop.* 13(2): 287-307. 3 fig. 1929.—Data on 189 nursery-school children (98 boys and 91 girls) show: that the stem-length: recumbent-length ratio progressively diminishes with increasing age during the years from 2 to 5; that the range of variability within each age group is as great as that between the median ratios at 26 and 60 months, indicating the necessity of using a measure of variability as well as the mean in interpreting the data; and that, by such a method, the ratio may be used as an index of body type during the preschool years. The validity of this index was tested by a study of the percentile ranks of the ratios of 50 children throughout their stay in the nursery school. This study showed that: fluctuations in the rank from month to month were the rule, but that these fluctuations were due more to errors in measurement than to biologic irregularity; and trend lines indicate that 72% of the children remained in approximately the same rank during the years from 2 to 5, and about ¼ distinctly changed their rank. It is concluded that, within certain limits, a child tends to retain the same relative percentile rank in stem-length: recumbent-length ratio during the preschool years, as compared with his chronological peers, and that the ratio is accordingly a valid index of body type during these years.—*Author (courtesy Wistar Bibl. Serv.).*

14309. HELLMAN, MILO. The face and teeth of man. A study of growth and position. *Jour. Dental Research* 9(2): 179-201. 15 fig. 1929.—Measurements of 104 American Indian skulls approximately 2000 yrs. old show that facial height increases continuously up to old age, then decreases in senility. Periods of rapid growth (late infancy and youth) alternate with periods of slower growth (childhood and adulthood). The teeth play a part in increase as well as in decrease of facial dimensions. Different parts grow at different rates, increase of facial height differing from that of dental height. Increase in the antero-posterior dimension occurs posteriorly, such growth in the jaws producing a forward swing of face in relation to cranium.—*S. W. Chase.*

14310. HOMANN, HANNA, und WALTER SCHEIDT. Untersuchungen über Rassenmischung. II. Annahme und Nachweis von Rassenmischung in nordeuropäischen Bevölkerungen. *Arch. Rass.- u. Ges.-Biol.* 22(3): 245-254. 1929.—Having calculated correlations between various indices in 27 groups of living Europeans, the authors conclude that, though these populations are racially mixed, there is little evidence of the presence of a component with short stature and either round head (Alpine) or long head (Mediterranean). They believe the north European population is shown rather to be made up of 2 elements with large stature, long skulls, and broad face. One of these (Scandinavian) has light eyes and light skin color; the other, which they call Atlantic, has light eyes and dark skin color.—*P. Popenoe.*

14311. HRDLIČKA, ALES. Mental fossae. *Amer. Jour. Phys. Anthrop.* 14(2): 317-319. 1 pl. 1930.—The paper calls attention to the occasional presence in the lower jaw of the human infant of a marked fossa located

externally on each side of the chin. Remnants of these fossae may now and then be seen even in later childhood. Illustrations are given of 2 cases, an Indian and an Eskimo infant, in which these fossae are very markedly developed.—*Author (courtesy Wistar Bibl. Serv.)*.

14312. IMBELLONI, J. Intorno ai crani "incredibili" degli indiani Natchez. *Atti XXII Congresso Internaz. Americanisti.* 1: 391-406. 4 pl. 1928.—The Natchez Indian skull from the burial grounds of Vicksburg investigated by S. G. Morton in 1839 is a remarkable specimen, and has occupied an important place in the literature upon artificial deformations. The cranio-trigonometrical method has been applied to this skull, tracing the cranial lozenge, after determination of the true position of the lambda and corrected the errors in the profile drawings of Gosse and Topinard. The comparative figures both of lengths and angles clearly separate this skull from those specimens deformed by means of occipito-frontal boards (brachycephali artificiales obliqui) and makes it certain that the occiput was flattened by compressions upon a back-board (decubitus board) which places it in the author's second series (brachycephali artif. erecti) which is set aside for those skulls deformed by a "berceau" or similar means. The duration for the deforming process must be very long, and on account of the tendency of certain authors who have thought that this was a question of months, it is necessary to refer to the definite statement of Garcilaso (La Florida. IV 13.) who speaks of the instrument being permanently on the child's head for 9 or 10 yrs.—*J. Imbelloni (transl. by A. N. Burkitt)*.

14313. JERLOV, EMIL. Projet de système de classification plantaire chez les nouveaux-nés. *Acta Obstetr. et Gynecol. Scand.* 9 (1/4): 267-281. 8 fig. 1930.—The author has made up a system of classification on about 450 cases. As distinguished from the classification of finger impressions this classification is based upon the different forms of design on the big toe and metatarsal region. A design present on the big toe forms the denominator of a fraction, the numerator of which is the design on the underlying metatarsal part. The designs present on the big toe of a new-born child is, in principle, similar to those present on the fingers, thus in accordance with Henry-Galton's system of 9 different kinds: arches, tented-arches, 2 loops, etc. Even in that part of the metatarsus situated just behind the big toe this sort of design is present although here, instead of 2 loops, there are 3 loops of different kinds. Here, therefore, are 10 different groups of design. The 9 possibilities of the denominator and the 10 of the numerator make up altogether 90 main groups. The designs situated on the lateral aspect of the metatarsal parts under the big toe form the sub-classes in the system. A region entirely or partly lacking in design is denoted by an O.—*Author's summary.*

14314. KLEIWEG DE ZWAAN, J. P. Schedels van Schouten-Eiland. [Skulls from Schouten Island.] *Volkenkundige Opstellen II, herausg. v. Kolonial-Inst.: Amsterdam, Mededeeling Nr. 9, Afd. Volkenkunde* Nr. 3: 69-143 p. 8 pl. 1928.—Schouten Island is one of the Dutch New Guinea group. 3 chief races inhabit this island: the Biakkers, 85.6% dolichocephalic and 14.4% mesocephalic; the Noeforeezen, 40% dolichocephalic, 40% mesocephalic, and 20% brachycephalic; the Arfakkers, 75% dolichocephalic and 25% mesocephalic. The Biakkers are the tallest of the 3 races; averaging 160.1 cm. in height, the Noeforeezen 156.7 cm. and the Arfakkers 150 cm. The Arfakkers are the purest. They seem to be the original inhabitants and are believed to have been strongly dolichocephalic, with over-long arms, and comparatively short legs. Later this dolichocephalic pigmy race mixed somewhat with mesocephalic and brachycephalic races. The spheno-parietal suture of Schouten Island skulls tended to be short. The average length was .85 cm. on the right and .81 cm. on the left. The fronto-parietal suture also tended to be short, the shortness often being due to the presence of a processus frontalis ossis temporalis. The average length of the fronto-parietal suture was 2. cm. on the right, and 2.05 on the left. In 3 skulls, there was a bilateral infra-orbital suture; this is most commonly met in Eskimo skulls. There were 2 general types of skull form: one a smaller lightly boned skull with glabella and arcus supercilares protruding but little, upper margin of the orbit short; lineae nuchae and occipital protuberance little developed; the mastoid process and nasal bone short; root of the nose flat, and the jugal bone with a tendency to bend laterad. The other type of skull is heavier and more strongly developed; glabella and arcus supercilares project forward strongly; lineae nuchae well marked and strongly developed, as are the mastoid and zygomatic processes; the occipital protuberances project forward. As a rule the pars bregmatica is the most strongly developed part of the sagittal suture. The pars lambdoidea of the lambdoidal suture is usually more tortuous than the other portions. In some skulls the pars lambdoidea was almost straight. Of the 16 skulls examined, in at least 7, one of the chief sutures was obliterated, the coronary suture was lacking in 2 skulls, the sagittal suture in 1 skull; and other skulls had parts of various sutures missing. The average bregma angle of Schouten Island skulls was 61.9°, the nasal-bregma angle 63.4°, the angulus frontalis 94.9°. These and other skull relations were marked by difference in the dolicho- and brachycephalic skulls. The skull length ranged from 15.5 to 19.1 cm.; skull breadth from 12.0 to 14.0 cm.; cephalic index from 70.68 to 80.46. Skulls were of 2 distinct types, dolicho- and brachycephalic. Skull height (Broca's method) was 13.2 cm. for dolichocephalic skulls, 13.2 cm. for mesocephalic skulls and 13.4 cm. for brachycephalic skulls. Length-height index ranged from 70.06 to 79.75; breadth-height index from 95.7 to 103.6; horizontal circumference from 44 to 52.3 cm.; sagittal circumference from 33.8 to 37.9 cm.; length of foramen magnum from 2.8 to 3.8 cm.; length of base of skull from 9.2 to 10.8 cm.; fronto-parietal index from 90.2 to 114. The average length-breadth ratio of the foramen magnum was 82.3. The sagittal index ranged from 20.7 to 30.5. When skulls of the Schouten Island were classified according to the fronto-parietal index, none fell into either the microseme or the ultra-megaseme class, 31.3% were mesoseme, 56.2% were megaseme and 12.5 were hypermegaseme. Cranial capacity varied from 1090 cc. to 1410 cc. in the 16 skulls; 53.8% were microcephalic, 46.2% mesocephalic, and none megacephalic. The facial index varied from 47.7 to 56.7; 20% were of the chamaeprosope type, 50% of the mesoprosope, and 30% of the leptoprosope. All skulls had a cranio-facial index of less than 100. Classification of the nasal indices showed 28.6% leptorhine noses, 21.4% mesorhine, and 50.0% platyrrhine. Of the 16 skulls measured 71.4% were prognathic, and 28.6 orthognathic. The average nasal profile angle was 80.5°, the average alveolar profile angle 75.5°. When skulls were classified according to orbital index, 38.8% were chamaeconchic, 44.4% mesochonchic, and 16.7% hypsiconchic.

14315. KOSINSKI, CHARLES. Le valeur anthropologique des variations dans l'innervation cutanée des membres inferieures. *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 291-295. 1926.—The author suggests the cutaneous innervation of the calf and sole of the foot as indicative of variations within the European group.

14316. LACK, L. A. HODGKINSON. The endocranial equivalents of the Frankfurt plane and the exocranial position of the internal auditory meatus. *Jour. Anat.* 65 (1): 96-107. 1930.

14317. LEBOUCQ. GEORGES. La mensuration de la surface des hémisphères cérébraux. *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 338-343. 1926.—The method involves precipitation of Cu_2O from boiling Fehling's solution on the surface of the lobe previously soaked in a glucose solution, recovery of the Cu and calculation of the total amount from each lobe against that from a measured area of the lobe.

14318. **LEBZELTER, VIKTOR. Hallstatt- und La Tène-Schädel aus Güns und Ordod Babot (Ungarn).** [Hallstadt and La Tène skulls from Güns and Ordod Babot, Hungary.] *Wiener Prähistorische Zeitschr.* 15(2): 115-120. 2 fig. 1928.

14319. **LOTH, EDOUARD. Considérations générales sur l'anthropologie des parties molles.** *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 374-380. 1926.—The author suggests methods for the study of the soft parts in primates. He discusses the application of the data obtained and stresses the importance of biological deviation from the normal rather than the study of anomalies, and requests the coöperation of medical men. He desires to interest the League of Nations in the necessity for gathering data from those races which are rapidly disappearing. The value of such data in determining the degree of primitiveness in man is indicated.

14320. **McMURRICH, J. PLAYFAIR. The evolution of the human foot.** *Amer. Jour. Phys. Anthrop.* 10(2): 165-171. 3 fig. 1927.—In the lower mammals there are, as a rule, 3 contrahentes in the plantar musculature and the dorsal interossei are arranged with reference to an axis passing through the 3rd metatarsal bone. In man there are no contrahentes, and the dorsal interossei are arranged with reference to an axis passing through the 2nd metatarsal. In the platyrrhine apes and the cercopithecid monkeys, the mammalian type persists. In the gibbons the contrahentes are reduced to 2, but the dorsal interossei still have the mammalian arrangement. In the chimpanzee, only 1 contrahens has been described, none in the orang and gorilla, while all 3 genera appear to present sometimes the mammalian and sometimes the human arrangement of the dorsal interossei.—*Author (courtesy Wistar Bibl. Serv.).*

14321. **MAGUIRE, F. A. A critical survey of the anatomy of the female pelvis based on sections and dissections of a series of sixteen female pelves.** *Med. Jour. Australia.* 1927: (3-138). 1927.—The bony pelvic ring is complete at the pelvic inlet. The obturator membrane and the sacro-tuberous and sacro-spinous ligaments confer a certain amount of resiliency on the antero-lateral and postero-lateral portions of the pelvic wall. These lie in the diagonal conjugates. On either side a quadrate mass of bone forms strong unyielding lateral pelvic wall. The joints in the pelvis allow for a certain degree of expansion and elasticity in the bony ring in pregnancy and parturition. The pubes, spines of the ischia and coccyx are in the same plane; so are the origins of the levatores ani. The pelvic floor consists of all the structures from the pelvic fascia to the skin, i.e., the muscular pelvic diaphragm (levatores and coccygei), the uro-genital diaphragm or triangular ligament, the perineal body, the ischio-rectal fossae and the superficial structures of the vulva. The levatores ani consist of 2 main parts: (1) a stout bifurcated muscle sling extending from the coccyx to the anal canal and thence by 2 limbs to the pubes. This comprises the pubo-rectalis and pubo-coccygeus portions usually described. It is strengthened and supported by the ano-coccygeal raphe, the perineal body and the uro-genital diaphragm. The muscle tissue forms a strong active or dynamic support. The supporting tissues are passive and have firm bony attachments to the margins of the bony pelvic outlet. This portion of the levator ani bounds the genital hiatus, acts as a sphincter for the vagina and slings the anal canal up the pubes. (2) The remainder of the muscle forms a thin fan-shaped sheet forming the roof of the ischio-rectal fossa. The coccygei are often vestigial, being mainly fibrous. The uro-genital diaphragm is a stout supporting structure attached to the ischio-pubic rami. It affords a strong bony attachment for the urethra and vagina and the perineal body. It strongly supports the levatores ani on either side of the genital hiatus. The terms parietal and visceral pelvic fascia as at present used should be discarded. The only true visceral fascia is that actually reflected over the viscera. The remainder should be described by the name of the muscle it covers. The firm and strong perineal body is slung from the tuber ischii by the bases of the uro-genital diaphragm and from the coccyx by the ano-coccygeal raphe. It is an important constituent of the pelvic floor holding the medial margins of the levatores ani together and completing the genital hiatus. The clitoris is described in detail. The pelvic connective tissue forms a packing for the viscera and their canals and a general support as well. The neuro-vascular bundles are reinforced by the pelvic connective tissue. They assist in suspending the viscera. The viscera are fixed by a series of supports which are described in detail. In general they are suspended from the pelvic walls by special thickenings of the pelvic connective tissue and by the neuro-vascular bundles. They are strongly supported below by the pelvic floor. The ureters have 3 danger points: at the pelvic brim where they are only 3-5 mm. posterior to the infundibulo-pelvic folds, at the base of the broad ligament where they are crossed by the uterine artery, where they enter the lateral angle of the bladder, because their relation to the vagina varies considerably owing to the asymmetry of the vagina and uterus. Hart's description of a movable pubic segment and a fixed sacral segment opening like swinging doors will not hold. The pelvic floor is entirely fixed both anteriorly and posteriorly. It can open only by stretching of the margins of the genital hiatus. The 16 pelves on which these findings are based are described in detail with 59 photographs of sections and dissections.—*F. A. Maguire.*

14322. **MICHELSON, T. Notes on Mongolian craniology.** *Human Biol.* 1(3): 421-423. 1929.—A study of Mongolian crania based upon the Catalogue of Human Crania in the U. S. National Museum Collections. The figures given do not agree with those previously given by Cameron as he has used but 34 cases instead of using the entire material available. Cameron's contention that dolichocephaly gives way to brachycephaly from Greenland to the west is sustained, but the picture of the transition changes decidedly (Mongolian ♂ crania: length 184.319 mm. as opposed to 187; breadth 150.124 mm. as opposed to 146. The figures suggest that the coefficients of correlation of skull-length to cranial capacity, etc., might vary from those given by Cameron. The procedure of Cameron in using selected cases instead of the entire material is not justifiable.—*T. Michelson.*

14323. **MICHELSON, TRUMAN. Note on Shoshoni anthropometry.** *Proc. 23rd Internation. Congress Americanists (New York)* 1928: 856. 1930.—Points out the substantial agreement between the cephalic indices earlier reported by the author (1927) and by Boas.

14324. **MIJSBERG, W. A. Die Halswirbeldornen der Javaner. Eine morphologische und anthropologische Untersuchung.** *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 85(3/4): 446-475. 15 fig. 1928.—The bifurcated cervical neural spine of man developed from an ancestral unforked stage. In the ancestors of man ontogeny ends in the preancestral condition of a single neural spine formed by the fusion of 2 halves while in man of today a further phylogenetic progression is expressed in the bifurcated neural spine due to the non-fusion of the terminal halves. The simple neural spine may be due to: (1) full growth of a median spine anlage; (2) complete fusion of 2 halves; (3) asymmetrical completion of the prongs of the fork. The neural spine of the 3rd and 5th cervical vertebrae of the Javanese present primitive conditions more frequently than do those of the Europeans and the Japanese. The spine of the 6th cervical vertebra of the Japanese, on the other hand, shows primitive conditions much more frequently than does that of the Javanese. On the whole, the neural spines of the cervical vertebrae of the Javanese present a much closer relation to those of the Europeans and the Japanese than to those of the Australians, Tasmanians, Negros and Andamanians, and Terra del Fuegians. The last much more frequently present relations more primitive phylo-

genetically. 3 tables and list of literature.—*H. F. Nachtrieb.*

14325. **MILIANITCH, N., et R. SPIRIDONOVITCH. Variations de la morphologie et de l'innervation des muscles de l'épaule et due bassin chez les Serbes. (Morphologie) Étude basée sur 200 cas.** *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 385-395. 1926.—The authors find that complete independence of the spinal head of the deltoid is common, of the clavicular head very rare, but when it does occur the spinal head is also independent. The costo-deltoid frequently inserts fleshily without connection with aponeurosis. Connections, single and mutiple, between the shoulder muscles are frequent, and may be of ethnic origin. A case of a supernumerary posterior tensor of the shoulder capsule is recorded. Partial fusion of the supraspinatus with the teres minor is frequent, complete fusion rare. Fusion of the tendons of the teres major with the latissimus dorsi occurs and is interesting in connection with variations in the innervation of the muscle. The authors conclude that there is no marked difference in percentage of variation between sane and insane, that variations are more common in the ♂, and that muscular variations are of frequent occurrence among Serbs.

14326. **MILIANITCH, N., et B. CHLYIVITCH. Variations de la morphologie et de l'innervation des muscles de l'épaule et due bassin chez les Serbes. (Innervation.)** *Compt. Rend. Assoc. Anat. France. (Soc. Impress. Topog. Nancy)* 1926: 396-402. 1926.—The authors find 3 branches, 2 anterior motor and 1 posterior mixed, in 5% of the axillary nerves studied. In 3.3% the axillary does not divide into anterior and posterior branches. A table of the occurrence of the number of branches (1-4) from the suprascapular nerve to the supraspinatus muscle is given. A short filament to the scapular is described. The variations in innervation of the infraspinatus, teres major and minor are given. The authors believe the subscapular nerves are not 2 but 3-6 in number, which they designate as N. subscapularis medialis, to the surface and interior of the subscapular; N. s. intermedius, variable but seldom absent, to the fasciae of the subscapular; N. s. lateralis, to the external part of the teres major. Distributions and variations of the upper and lower subscapulars and the thoracodorsal nerve are given.

14327. **MUCKERMANN, H. Rassenforschung und Volk der Zukunft. Ein Beitrag zur Einführung in die Frage vom biologischen Werden der Menschheit:** 49p. Ferd. Dümmler, Verlag: Berlin, 1928. Pr. M. 2.50.—Contents: I. Biologic preliminaries. II. On human races of the present. III. Source of racial differences. IV. Causes of same. V. The problem of influencing races. VI. hereditary basis and eugenics. The author discusses paravariation, idiovariation and mixovariation, plus selection with a presentation of known facts and theories. Whether races come from a common trunk is not known. Knowledge of mental racial differences and their dependence on brain structure is very limited. Idiokinesis of degeneracy does not lead to racial development. Domestication in animals with selection seems to have produced new forms. A fortunate constellation of hereditary lines is even more important than of environment. The exterminating effect of the progress of modern culture offers no hope in stemming degeneracy. Natural selection in primitive people clears out such things as myopia, deafness, and insanity. Representative national undertakings for eugenics are named. Their tasks are partly negative, especially selection of mates; more important are the positive, such as housing, work-conditions, selected culture, rearing, normalizing of life-conditions, transformation of stock-ability into current energy, exclusion of the able from public care, etc. No anthropologic race is to be excluded. But the science of anthropology is marked for a fundamental transformation. The author pleads for a combination of humanity with the needs of mass welfare.—*W. Browning.*

14328. **MUTEL. Les déhiscences normales lombo-sacrées.** *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 422-429. 11 fig. 1926.—Radiographs show that the non-closure of the neural arch in the cervical and sacral regions is normal in infancy. The cervical arch is completed at about 4 yrs. The sacral arches close around 10 yrs. In adults, dehiscence of the posterior arc of the atlas is very rare, and of the lumbo-sacral region more common. The author believes however that dehiscence in those regions where ossification is late, is a normal variation comparable to the fissures of the sternum and persistence of the frontal suture.

14329. **NOIR, J. À la Conférence Broca de la Société d'Anthropologie. Quelle est l'attitude normale de la tête chez l'homme?** *Concours Méd.* 51 (49): 3675-3676. 1929.—Each animal has an attitude of the head characteristic of the species. Comparison of 30 species of mammals and 20 species of birds shows that, without exception, the normal attitude of the head is such as to place the plane of the horizontal semicircular canal of the labyrinth actually parallel with the horizon. The human head seems at first to offer an exception, but this is only apparent, for the natural attitude of the head, in man, is inclined somewhat forward, like that of one absorbed in his task or his thoughts. The upright attitude of the human head is a forced one, which has produced a modification, at times pathological, of the cervical portion of the spinal column. This law of the natural attitude of the human head is of importance in anthropology, in which it has been difficult to establish a standard horizontal plane of reference and measurement of the skull. The alveolo-condylar plane of Broca, which is most generally employed, does not represent the normal attitude of the head in all races, since the orbital axes of different races (e.g., Europeans and Chinese) are differently placed. The discovery of a plane universal, not merely for the human race, but for all vertebrates, is of particular interest for paleontology, since it is an aid in determining the posture of extinct animals.—*Abstract from a paper by L. Girard.*

14330. **OETTEKING, BRUNO. Craniology of the Northwest Coast of North America.** *Atti XXII. Congresso Internaz. Americanisti* 1: 421-425. 1928.—Certain tribes of the northwest coast of N. America practice head deformation, which renders craniologic investigation difficult. The principal modes of deformation are the intentional anteroposterior (Cowichan, Chinook) and the cylindrical compression (Koskimo). The prevailing skull types in the undeformed are mesocranial and hypsicranial, while the face and orbit are of medium height with a tendency toward lepteny in the former and of hypsiconchy in the latter. The nose is chamaerrhinic at 47%, with a slight tendency toward narrowing. Mesognathy (ear-eye orientation) in the facial profilation, changes to decided prognathy in the alveolar region, which latter is quite characteristic in the mongoloid skull in comparison with the Mongol proper. Deformation of the kinds mentioned seems to be of more or less consequence in the morphology of the northwestern Indian skull outside of the directly changed cranial dimensions.—*B. Oetteking.*

14331. **OPPENHEIM, S., ADOLF REMANE, und W. GIESELER. Methoden zur Untersuchung der Morphologie der Primaten.** In: **E. ABDERHALDEN'S Handb. der biol. Arbeitsmeth. Abt. VII. Methoden der vergleich. morphologischen Forsch.** Heft 3, Lief. 236, p. 531-682. 6 pl., 69 fig. Urban & Schwarzenberg: Berlin, 1927.—The work is divided into 3 parts. Part 1 is by Oppenheim and deals with craniology, osteometry, and measurements in the flesh; part 2, by Remane, deals with dentition; part 3, by Gieseler, treats of the longer limb bones. In each section the various instruments and methods used in obtaining measurements and indices are described. In part 1, a scheme for comparing cranial sutures is included as well as methods for representing the skull and its parts graphically. Methods for measuring and obtaining indices of the scapula, sacrum, astragalus, and

calcaneus are given, as well as for obtaining comparative measurements of the trunk, head, and limbs in the flesh. Methods for the study of the structure, color, and shape of hair as well as for the study of friction ridges are included. In part 2, the importance of teeth in comparative morphology of primates is emphasized. A scheme for a numerical designation of teeth is given. 5 areas are recognized on the crown: the occlusal, lingual, labial (Buccal), mesial, and distal. For the tubercles, Osborn's nomenclature is employed. Methods for determining the planes and axes of the teeth are given; also for measuring the tubercles and the distance between them. Methods for obtaining root measurements are also included. From all these measurements, numerous indices are derived. The last section treats of the methods employed in dealing with the longer limb bones in anthropoids (chimpanzee, gorilla and orang-utan). Methods employed for man, as described by Martin, are used with modifications. The following bones are treated: humerus, radius, ulna, femur, tibia, and fibula. Detailed measurements are given as well as the methods for obtaining various indices.—*P. Okkelberg.*

14332. **PAN, N. Measurements of the pelvis in Hindu females.** *Jour. Anat.* 63(2): 263-266. 6 fig. 1929.—A record of measurements of the antero-posterior, transverse and oblique diam. of the pelvic inlet, cavity and outlet, made on the cadavers of 64 Hindu ♀♀. The Hindu ♀ pelvis averages 1 cm. less in all diameters than do British or American pelves. This is compensated by the smaller size of the Hindu child at full term, the average weight of 100 such being 5 lbs. 6¼ oz. and the biparietal head width being 1.25 cm. less than that of British and American children. Stature does not seem to influence the pelvic diam.—*J. P. McMurrich.*

14333. **PAPILLAULT. Étude anthropométrique de deux jumeaux monovitellins adultes. [Anthropometric study of two adult identical twins.]** *Bull. et Mém. Soc. Anthrop. Paris* 9(4/6): 177-180. 1928.

14334. **PAPILLAULT, GEORGES. Nouvelles études sur le gigantism.** *Bull. et Mém. Soc. Anthrop. Paris* 7(1-3): 73-79. 1928.—Observations on a case (J.) of gigantism and comparison with one (Ch.) previously (1899) studied by author. Subject was 1.93 m. in stature. Radiographs revealed no disturbances of pituitary, and genitals were normal in contrast to Ch. Case history showed abnormality in growth, health, and character (introvert). Heredity of subject throws light on his physical and mental features, but these are due ultimately to activities of endocrine glands. Head and trunk measurements of the 2 subjects are given and compared with the averages of 100 cadavers of Paris. Trunk in both subjects is relatively inferior in development while the legs are much longer in proportion. The segments of the legs, however, contribute to the total length in diverse proportions in the 2 subjects. The inter-membral index is lower compared to the normal. While head measurements revealed resemblances in the 2 cases, facial proportions showed profound differences, giant Ch. showing acromegalic tendencies. The author attributes these morphological differences to different physiological factors not yet determined.—*C. J. Connolly.*

14335. **PARISOT, PIERRE, et M. MUTEL. L'importance de la phalange unguéale dans l'identification de débris osseux.** *Rev. Méd. Est.* 57(6): 149-162. 3 fig. 1929.—Studies, before and after exposure to fire, of the distal phalanges of 12 adult skeletons, in relation to the general characters of each entire skeleton, lead to the conclusion that the human distal phalanx cannot be confused with the homologous bone from any lower animal; that the phalanx from a human adult is distinct from that of a child; but that there are no means of distinguishing sex by this bone.

14337. **PITTARD, EUGÈNE,** (in collaboration with A. DONICI). **Répartition géographique dans le Royaume de Roumanie de quelques caractères anthropologiques.** *Mem. du Globe* 65: 49-114. 1926.—Stature and pigmentation are studied in the examination of 2583 individuals. The median height of Roumanian men is 1.66 m.; of the women 1.57 m. This average height, which exceeds the European average, is not due to a few exceptionally tall persons; it represents the true state of the population. The hair of most Roumanians is strongly pigmented, light hair being present in only 1.9%. Black hair, however, is not frequent (about 13%). More women are blond than men (4.9%). Red hair is rare. Pigmentation of the iris is represented by 2 nearly equal groups; one with little pigment (gray, gray-blue, etc.), the other with heavy pigment. Blue eyes are not abundant (12.14%). Fewer women than men have light or medium eyes, more have dark eyes (58.3%).—*E. Pittard (transl. by J. B. Bullitt).*

14338. **PITTARD, EUGÈNE** (with collaboration of **ALEX. DONICI**). **L'indice nasal des Roumains et sa répartition géographique dans le royaume de Roumanie.** *Bull. Soc. R. Romîne Geogr.* [*Bucharest*] 46: 1-30. 1927.—This study is based upon the examination of 2604 individuals. The mean nasal index for men is 70.11 (mesorhine), for women 68.6 (leptorhine). The distribution among the sexes is as follows: ♂♂, leptorhine 49.5%, mesorhine 47.8%, platyrrhine 2.7%. ♀♀, 6.4%, 37.5%, 1.1% respectively. The nasal dimensions of ♀♀ as compared to ♂♂ are: length 91.9: 100; breadth 89.5: 100. The article gives the distribution of the nasal index by provinces and by districts.—*E. Pittard (transl. by J. B. Bullitt).*

14339. **PITTARD, EUGÈNE. Contribution à l'étude craniologique des Boschimans (Dunes de Sables).** *Bull. et Mém. Soc. Anthrop.* [*Paris*] 7(1/3): 43-47. 1928.—♂ skulls among the Bushmen are dolichocephalic; ♀ mesaticephalic. The basibregmatic diam. is feebly developed. These skulls are chamaecephalic (Broca and Topinard). As regards prognathism the Bushmen of the Sand Dunes are mesognathic (Flower). Among individual skulls the ♂♂ are orthognathic more often than the ♀♀. Prognathism is rare among both sexes. The majority among both sexes are platyrrhine. The orbital indices of the ♂♂ fall almost equally in the microsemic and mesosemic classes. The megasemic types are most numerous among the ♀♀. Weight of skulls; ♂♂ 632.6 gr., ♀♀ 554.8 gr. Cranial capacity; ♂♂ 1343.89 cc., ♀♀ 1302.85 cc.—*E. Pittard (transl. by J. B. Bullitt).*

14340. **RAUTMANN, H. Muskelarbeit und Körperwachstum.** *Anthrop. Anz.* 6(2): 167-170. 1929.—Report of the 5th anniversary meeting of the German Medical Union for the promotion of physical exercise, in Cologne. **STIEVE,** though recognizing the importance of inherited tendencies, emphasized that growth can be markedly influenced by physical exercise, nutrition, and general external conditions. Physical exercise has little effect on bodily height, but markedly influences the width of the body. **SPITZY** discussed the effect of physical exercise on growth in children from the orthopedic point of view. He maintained that the majority of deformities of the vertebral column arise in childhood. **KAUP** opined that there are 2 marked increases in the intensity of growth, viz., in the fetal period and at puberty. The conditions during puberty form the body in a characteristic manner. **KOHLRAUSCH** discussed the effect of physical exercise on the adult human organism. Sport increases the elasticity of the skin and the thickness of the subcutaneous pads of fat. According to **RAUTMANN** it is possible to obtain a uniform objective understanding of human bodily growth by taking the characteristic relationship of length to width and depth. If the height of the body is taken as length, and the chest girth as the equivalent of width and depth, a series of variations are obtained which fall into definite groups, for which Rautmann has suggested the names leptosome, mesosome and pyknosome.—*H. Rautmann (transl. by J. M. Robson).*

14346. **SCHULTZ, ADOLPH H.** The metopic fontanelle, fissure, and suture. *Amer. Jour. Anat.* 44(3): 475-499. 10 fig., 3 tables. 1929.—3 new cases of remnants of metopic fontanelles in adult human skulls are described. Certain measurements of these skulls are compared with corresponding dimensions in series of normal skulls. In one of the former skulls the left nasal bone is congenitally missing and the basioccipital bone shows a deep transverse fissure. This study includes an extensive review of the scattered literature on the subject. It is shown that the metopic fontanelle is a normal part of the bregmatic fontanelle in early fetal life, that it persists in about 15% of the cases to infantile life, and that traces of it are found in adult skulls from nearly every part of the world. Such remnants are more frequent in men than in women and are particularly common in certain Mongolian groups. Adult skulls with metopic fontanelle remnants ("metopic fissures"), as well as those with metopic sutures, are characterized by unusually broad foreheads and interorbital regions, but not by increased cranial capacities. Metopic fontanelles and fissures represent neither atavisms nor progressive variations, as has been claimed, but are due to an arrest in normal fetal development of the lower midsagittal region of the frontal bones.—*Author (courtesy Wistar Bibl. Serv.).*

14347. **SHAPIRO, H. L.** Contributions to the craniology of central Europe. 1. Crania from Greifenberg in Carinthia. *Anthrop. Papers Amer. Mus. Nat. Hist.* 31(1): 5-120. 1 map. 1929.—In this paper are recorded the results of an examination of 496 crania from Greifenberg in Austria, the main purpose of the author being an attempt to unravel the racial composition of the inhabitants of Central Europe. The paper is illustrated with tables of measurements for a comparative study of the various ethnic types of modern man. These crania displayed a high average cranial capacity. An analysis of their length-breadth indices showed that they were in the sub-brachycephalic class. The morphological features of these crania indicated a more intimate relationship to the brachycephalic Alpine type of Central Europe than to any other generalized type. The author concludes that there is a center for a brachycephalic type which may be termed Alpine, and which is represented by the crania from Danis in Switzerland. This type is spread over most of the Alpine area. On the borders of this area, however, are found certain deviations from the type, which, as far as the evidence from Greifenberg, Laas, Wurtemberg and Bavaria goes, are all in a similar direction.—*J. Cameron.*

14349. **SHIMASAKI, YOSHIAKI.** Sur le diverticule de Nuck de la Japonaise. *Folia Anat. Japonica* 8(1/2): 63-78. 1929.—From the examination of the diverticula of Nuck of 25 ♀ cadavers and of 175 living women, the following conclusions were obtained: The diverticulum of Nuck persists more frequently in Japanese than in European women. Bilateral obliteration of the diverticulum is observed most frequently, persistence on the right side secondly, bilateral persistence thirdly, and persistence only on the left side most rarely. Persistence of the diverticulum is observed more frequently in the newborn and girl than in the adult. The diverticulum persists on the right side more than twice as often as on the left. In the adult the diverticulum is situated most frequently forward and inward from the round ligament of the uterus, but in the newborn and girl it is forward and outward from the ligament. In many cases the obliteration of the diverticulum is less complete in ♀♀ whose ovaries are not descended than in those whose ovaries have completely migrated. The average length of the diverticulum on the right side of the adult is 10.90 ± 1.55 mm., and that of the left 11.86 ± 0.84 mm. The average diameter of the abdominal orifice of the left diverticulum of the adult is 5.00 ± 0.34 mm., and that of the right diverticulum is 5.23 ± 0.20 mm.—*Author (courtesy Wistar Bibl. Serv.).*

14350. **STOLYHWO, [KASIMIR].** Zur Frage der Differenzierung der fossilen Menschenrassen. *Verhandl. Ges. Phys. Anthrop.* 2: 52-56. 1927.—Supraorbital ridges seem to be the most trustworthy character for classification. On this basis it is probable that 2 races existed during the Mousterian epoch: the Krapina race and the Neanderthal. An extensive chart showing these differences is included.

14351. **STEFFAN, PAUL.** Die Beziehungen zwischen Blutgruppe, Pigment und Kopfform. [The relationship between blood group, pigment and shape of the head.] *Zeitschr. Rassenphysiol.* 2(2): 57. 1929.

14353. **STEGGERDA, MORRIS, JOCELYN CRANE, and MARY D. STEELE.** One hundred measurements and observations on one hundred Smith College students. *Amer. Jour. Phys. Anthrop.* 13(2): 189-254. 1929.—The 100 ♀ students were selected at random and ranged in age from 17 to 24 years. About ¾ of the individual measurements were purely physical, e.g., height, weight, span, head measurements, etc. The others pertained to studies of finger prints, teeth, eye color, etc. A mean, a standard deviation, and a coefficient of variation were given for each measurement, along with the frequencies and distributions. In this paper all data obtained are presented; data from other investigators are shown for comparison with those used for this study.—*Author (courtesy Wistar Bibl. Serv.).*

14354. **SUOMINEN, Y. K.** Physical anthropology in Suomi (Finland). *Jour. Roy. Anthrop. Inst. Gr. Britain & Ireland* 59 (Jan.-June): 207-230. 1 map, 2 pl. 1929.—The paper is based chiefly upon the research of Finnish authors. With the reservation necessary in the question of race, the author states: (1) The present Baltic Finns

are a distinct European race, which, as regards height, and color of hair and eyes, most nearly resembles the Nordic race, but from which it differs in greater degree of brachycephaly and also in other respects. For this reason it may be easier to distinguish it as a special East-Baltic race collateral with other European races such as the Nordic, Mediterranean, Alpine, Dinaric, etc. (2) Linguistically the Finno-Ugrian languages form their own entity, the relationship of which with other language-groups is still vague regarding several points and, in any case, so distant that such relationship can hardly have any "racial" importance. Theories have been stated regarding the possible distant relationship of the Finno-Ugrian languages as well with Indo-Germanic as with Turco-Tartarian.—*Y. K. Suominen.*

14355. TALKO-HRYNCEWICZ, J. Les habitants autochthones contemporains de la région de Cracovie. Étude anthropologique. *Bull. Internat. Acad. Polonaise Sci. et Let. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. II [Zool.]* 1928(3): 251-262. 1928(1929).—The thickly settled districts within a radius of 45-50 km. around Cracow afforded the material for this study, comprising 351 individuals, of whom 265 were ♂♂ and 86 ♀♀ of an average age of 28 yrs., while the greater number of them (66.7%) were from 21 to 25 yrs. The numerous somatic and somatometric observations brought to light the occurrence of the mongolian fold in 11.1% (Cassoubes), and here again more frequently in the children, as is the case with the Mongol proper, of protruding cheek bones in 60.4%, and of flat faces and occipita. The cephalic index ranges from 75.8 to 94.4 in the ♂♂, and from 76.9 to 95.4 in the ♀♀, averaging 85.1 in the former and 86.1 in the latter. The population of Cracow and of the Carpathian mountains is thus seen to be the most brachycephalic of Europe. Men as well as women have narrow and high foreheads, rather low and broad faces, and strongly developed lower jaws. They are of submedium stature; the hair color is chestnut in both, while the eye and skin color, bluish and light in men, is brownish and darker in women.—*B. Oetteking.*

14356. TAVARES, AMANDIO. Sobre metopismo. [Metopism.] *Arq. Anat. e Antropol.* 11(1): 1-48. 1927; Also as **Sur le metopisme.** *Compt. Rend. Soc. Biol.* 97(26): 876-877. 1927.—In regard to the morphologic significance of the persistence in the adult of the metopic suture, the generally accepted view is to attribute it to exaggeration of intracranial pressure due to the rapid development of the frontal lobes of the brain, thus causing a retardation of the ossification of the sutures by a mechanism analogous to that of hydrocephalus. Some wormian bones are present in most of the metopic examples observed, a fact which has led to comparison of the persistence of the suture and the appearance of the wormian bones in the anterior sutures of the vault, indicating the so-called osteogenetic insufficiency. The author has observed the synostosis delayed in the metopic suture compared with the other sutures in the examples of the series. Of these, 19 showed asymmetric metopism and 10 showed the caput cruciatum arrangement.—*A. Tavares (transl.).*

14357. TAVARES, AMANDIO. Sur les éminences basilaires de l'occipital. *Bull. Soc. Portug. Sci. Nat.* 10(10): 105-124. 10 fig. 1927.—The author examined 549 occipitals and only in 1.45% was a median basilar eminence (3rd condyle) encountered. Uniting these observations with those of several authors, out of 2058 occipitals, 0.97% were found to have the 3rd condyle. The percentage of presence of the median basilar eminence is less than that of the lateral basilar eminences. The author reviews the literature in detail, provides 9 fig. showing the ventral aspect of the skull, and discusses similar eminences in the skulls of other mammals.

14358. TAVARES, AMANDIO. Sur les éminences basilaires de l'occipital. *Compt. Rend. Assoc. Anat. France (Soc. Impress. Topog. Nancy)* 1926: 534-541. 2 fig. 1926.—Preliminary paper. Findings on the occurrence of a 3rd condyle, based on the examination of 528 occipital bones are given. The types of occurrences are described and possible significances and analogies are discussed.

14359. THOMPSON, HELEN. A measuring-board for infants. *Amer. Jour. Phys. Anthrop.* 13(2): 281-286. 4 fig. 1929.—The article describes a device which preserves for infant anthropometry the technique used in measuring adults and which at the same time respects the infant's intolerance of restraint and manipulation.—*Author (courtesy Wistar Bibl. Serv.).*

14360. TRATMAN, E. K. Notes on the human teeth and jaws from Kilgreany. *Univ. Bristol Proc. Spelaeolog. Soc.* 3(3): 134-136. 1929.—A report on Pleistocene remains from a cave in Ireland, with particular reference to pathology.

14361. TROTTER, MILDRED. The vertebral column in whites and in American negroes. *Amer. Jour. Phys. Anthrop.* 13(1): 95-107. 1929.—The ventral, middle, and dorsal vertical diam. or heights were measured on the movable vertebrae of the column in a series of 139 skeletons of whites and American negroes. 2 measurements were taken, also, on the base of the skulls of the same skeletons: the length of the basi-nasion and the length of the parachordal portion. The differences in length between the corresponding segments are not significant; however, the differences in length of the combined segments are more marked, being quite significant in the white ♂ group and indicating a cumulative effect. The variability is greater in the negroes than in the whites of the ♂ series, while in the ♀ series the whites are more variable than the negroes. A tendency for the columns of the ♀♀ to show less curvature than those of the ♂♂ is present in both races. In the lumbar segment the indices of the individual vertebrae are quite similar for the ♂♂ in both races, while a marked difference is present in the ♀ series. A positive correlation was found in length between all the movable segments in both sexes of both races, but no correlation could be found between the total length or the length of the parachordal portion of the base of the skull and the column in this series.—*Author (courtesy Wistar Bibl. Serv.).*

14362. TSCHERMAK, A. Beitrag zur Konservierungsweise und Rassendiagnostik ägyptischer Mumien. *Med. Klin.* 25(41): 1588-1589. 6 fig. 1929.—The author believes that the racial characteristics in Egyptian mummies are often greatly obscured, so far as the soft parts are concerned, by artificial appearances due to the method of preparation, and that much remains to be learned from them by x-ray studies of the skulls. He shows exterior views and roentgenograms of a mummy that he studied.

14363. VARIOT, M. G. Remarques sur la ressemblance apparente complète de deux jumeaux unisexués et vraisemblablement uniovulaires agés de 17 ans. Réflexions sur les variations du poids des enfants à la naissance. [Apparently complete resemblance of two 17 yr. old twins, presumably identical.] *Bull. et Mém. Soc. Anthrop. Paris* 9(4/6): 173-177. 2 portraits. 1928.

14364. VERSCHUER, O. v. Zur Frage der Asymmetrie des menschlichen Körpers. *Zeitschr. Morph. u. Anthrop.* 27(2): 171-178. 5 fig. 1929.—Observations on numerous cases of asymmetry in a large collection of single-ovum and double-ovum twins lead to the conclusion that in the former one may differentiate 3 groups of asymmetries: those which are found in practically the same manner in both twins (e.g., situs viscerum); those which often are mirror images or unlike in the 2 members of a pair (e.g., handedness, position of testicles); and those which in the partners of a single-ovum pair are the same or varied in about equal frequency (e.g., palmar ridges). The explanation for the different relations of these 3 groups of asymmetries seems to lie in the time of determination of the asymmetry. The earlier in ontogenetic development the character is determined the more likely it is to be produced alike in both twins of a single-ovum pair, and the later in development the character is determined the more likely its manifestation is to be modified by external influences

such as conditions of intrauterine development.—*O. v. Verschuer (transl. by W. J. Atwell).*

14365. **VERSCHUER, v. Demonstrationen zur Zwillingsanthropologie.** *Verhandl. Ges. Phys. Anthrop.* 4: 67-74. 11 fig. 1930.—Effects of environment on human development are shown by photographs of uni-ovular twins and by curves of weights and heights of twin pairs. Hypsicephaly and marked asymmetry of the skull are induced by mechanical effects of twin pregnancy; twins at first very similar may come to appear quite different as a result of spinal curvature in one of the pair.—*v. Verschuer (transl. by C. H. Danforth).*

14366. **VIOLA, DOMENICO. Contributo statistico allo studio del rapporto fra la misura della grande apertura delle braccia e quella della statura. [Statistical study of the relation between spread of arms and height.]** *Boll. Soc. Med.-Chir. Pavia* 44 (2) : 335-345. 1930.—In 932 of 1000 persons, mostly Lombards, over 20 yrs. old, the spread of arms was greater than the height. The excess of arm spread over height, when greater than 9 cm., was frequently, yet not exclusively, associated with adenoidism and with delicate constitution.

14367. **WATERMAN, HARRIET CUTLER. Studies on the evolution of the pelvis of man and other primates.** *Bull. Amer. Mus. Nat. Hist.* 58 (12) : 585-642. 1 pl. 10 fig. 1929.—Dissections of the pelvic region were made in certain lemurs, New World and Old World monkeys, anthropoid apes, and man with a view to determining the relation between the form of the pelvis and the function of the muscles attached to it. The results of the investigation are summarized through 2 lists—a list of the habitus and heritage characters in the ilium and ischium of the animals (*Lemur, Galago, Perodicticus, Cebus, Alouatta, Macacus, Lasiopyga, Papio, Hylobates, Pan, Pongo, Gorilla*) studied, and a list of the habitus and heritage characters in the musculature of the main groups (*Lemuridae, Lorisidae, Cebidae, Cercopithecidae, Simiidae, Hominidae*). The study supports Gregory's (1920) conclusions that the pelvis of bipedal man has been derived from that of primitive arboreal quadrupeds through earlier upright sitting stages and a later brachiating stage.—*H. C. Waterman.*

14368. **WEIL, ARTHUR. Measurements of cerebral and cerebellar surfaces. Comparative studies of the surfaces of endocranial casts of man, prehistoric men, and anthropoid apes.** *Amer. Jour. Phys. Anthrop.* 13 (1) : 69-90. 9 fig. 1929.—The surfaces of endocranial casts of men from 5 living races, 5 prehistoric men, and 4 anthropoid apes were measured with a new method. The values found were combined with linear measurements, and 22 indices were calculated. Compared with the cast of a European man as "standard" 100, the mean values of these 22 indices were for the representatives of living races: Mashona, 99.5; Japanese, 98.9; Andaman Islander, 99.3; Australian, 99.9. The corresponding numbers for the endocranial casts of prehistoric men and anthropoid apes were: Piltdown man, 97.2; Predmost man, 95.0; Rhodesian man, 94.6; La Chapelle-aux-Saints man, 93.4; Trinil man, 91.8; gorilla, 91.5; orang-utan, 88.3; chimpanzee, 86.1; gibbon, 84.2. The measurements of the cerebral surfaces did not support the theory of a marked asymmetry of both hemispheres. Only in the Piltdown man this difference was 5.4%; the reconstruction of more than 50% of the total surface of the cast may be responsible for this gross difference. The frontal part of the casts was best developed in specimens of living races measuring 28-31% of the total surface of the cap of the cast. The corresponding numbers were 27% in the reconstructed Piltdown cast, 21-25% in the casts of the other prehistoric men, and 17-20% in the casts of the 4 anthropoids.—*Author (courtesy Wistar Bibl. Serv.).*

14370. **WESTHUYZEN, G. C. A. van der. An account of anthropometrical and anthroposcopical observations carried out on male students at the University of Stellenbosch.** *Ann. Univ. Stellenbosch, Sect. A* 7 (5) : 1-64. 1929.—This investigation is the first of its kind carried out on Europeans in S. Africa and highly interesting results are recorded. The results were obtained by measuring some 128-130 individuals more or less completely. The distribution of these individuals over the 4 Provinces of the Union and Rhodesia were as follows: Cape 104; Transvaal 12; Orange Free State 11; Natal 0; Rhodesia 1. The simian fold was present in 6.7% of all the hands examined. It is probable that this fold is widely distributed in all races of mankind, although this point has, strangely enough, evidently received little attention from investigators. The mongolian folds have a low percentage incidence as would be expected. A noteworthy point is the rather large percentage incidence of epicanthus. Other interesting features are the meso-chamaetapeinocephalic head form, the moderate broadness of the face and of the root of the nose, which in itself is coupled with a relatively preponderant leptorrhiny while the face in general seems to be of a leptoprosopic character. The stature of the individuals places them amongst the tall races of man.—*P. A. van der Byl.*

14371. **WELLISCH, S. Die zahlenmässigen Rassenanteile der Deutschen.** *Zeitschr. Rassenphysiol.* 3 (3/4) : 117-120. 1931.—The author concludes that both from a serological and anthropological point of view the German race is not a unit. He states that the populations in various parts of Germany resemble their adjacent anthropological types found in Europe.—*P. Levine.*

14372. **WESTENHÖFER, M. Der Gang des Gibbon in Beziehung zum Menschenfuss. [Gait of the gibbon in relation to the human foot.]** *Zeitschr. Säugetierk.* 3: 278-283. 1 pl. 1928.

14373. **WILDER, INEZ W. The morphology of the palmar digital triradii and main lines.** *Jour. Morph. and Physiol.* 49 (1) : 153-222. 7 pl., 20 fig. 1930.—A study is made of the morphological types of the 2nd, 3rd and 4th interdigital patterns of the human palm and their differential occurrence as a basis for determining the morphological significance of the digital triradii and main lines, which are the final remnants of the pattern boundaries. Certain types of patterns show a large preponderance, with a correspondingly large percentage of a certain morphological value for each digital triradius, although other morphological possibilities than the usual one are discovered in each case. Correlated combinations of rare patterns are presented and their hereditary nature discussed.—*Author (courtesy Wistar Bibl. Serv.).*

14374. **WISSLER, CLARK. Growth of children in Hawaii; based on observations by LOUIS R. SULLIVAN.** *Bayard Dominick Expedition Publ.* 17. 256p. 4 fig. 1930. Pr. $2.—In 1920 the following measurements were made upon more than 8,000 children attending school in Honolulu: weight, stature, span, head length and width, minimum frontal face width, anatomical face height, bigonial diameter, nasal width and height, ear length and breadth; in addition, skin color, hair form, texture and color, eyefold, nose bridge, nasal profile, axis of the nostrils, septum, forehead, glabella, lips, chin and ears were checked according to the accepted standards. The race groups represented are Hawaiian, Chinese, Japanese, Korean, N. European, S. European and mixed Hawaiian. Under each race group are averages for each age from 6 to 18 yrs. for each measurement and character ratings —67 tables in all. These tables present comparative data on race groups, and the changes in dimensions and characteristics due to growth. Sex differences are recorded in the growth tables for all measurements. As a rule girls lead in rate of growth during the earlier years, to be overtaken by the boys later, shown in the crossing of the growth curves for girls and boys. However, the growth curves for head width, head length, relative span, and transverse fronto-parietal index do not cross, but tend to be parallel. The above holds for all the race groups. In general the growth curves for each character show no essential race difference in pattern. Some of the

changes from child to adult are an increase in the magnitude of size measurements: in the case of indices, those for relative span, anatomical face, cephalo-facial and transverse fronto-parietal increase in childhood and youth, whereas the relative sitting height, cephalic index, zygomatico-frontal, nasal index and ear index, show a decrease; the zygomatico-mandibular index remains fairly constant. Among the qualitative characters straight hair decreases in frequency in all race groups: in hair color the Hawaiians and Europeans darken with age, the Chinese, Japanese and Koreans tend toward brown; the epicanthic fold declines in frequency and prominence; nose bridge from low to high; axis of the nostrils from transverse to antero-posterior; lips from thin to thick.—*C. Wissler.*

14375. **WOO, T. L. A study of seventy-one ninth dynasty Egyptian skulls from Sedment.** *Biometrika* 22(1/2): 65-93. 5 pl. 1930.—Individual measurements, means, and type contours are given. The series is not more variable than in other Egyptian dynasties. Judged by the coefficient of racial likeness it is most like the 4th and 5th dynasty Egyptians from Deshasheh and Medum and the modern Cretans. It has a higher cephalic index, a greater height, and a higher height-length index than any other early Egyptian type. These divergences are in the direction of the modern Cretan type.—*J. R. Miner.*

14376. **WOOD JONES, FREDERIC. The Tasmanian skull.** *Jour. Anat.* 63(2): 224-232. 4 fig.; **The Australian skull.** *Jour. Anat.* 63(3): 352-355. 3 fig. 1929.—Outline drawings of the normae lateralis, facialis, verticalis, and occipitalis were made of 90 skulls of each race, 480 points were measured, and 24,000 measurements of the Tasmanian skulls, and 40,000 of the Australian skulls are available for mathematical treatment. In the Tasmanian skulls the contours are well rounded, not angular, the temporal fossae are well filled, the forehead and cranial vault are not low and narrow, the sutures are simple, the metopic is present in 3 cases, narial margins and nasal bones are "infantile," styloid process is absent, teeth are large and well rooted, and palate is roomy. The cranial capacity is 1353.09 cc. Sexual differences are not given. The Tasmanian has heretofore been given a lower place in the human scale than the character of his skull warrants. The Australian skull is markedly dolichocephalic, narrow in the parietal and temporal regions, low and narrow in the frontal but wide in the facial region, with great prognathism, long nasal bones not upturned, "infantile" rounded orbits, large teeth and palate. Cranial capacity 1290.09 cc. Tasmanian and Australian cannot be called the same race.—*R. B. Bean.*

14377. **WOOLLARD, H. H. The cutaneous glands of man.** *Jour. Anat.* 64(4): 415-421. 1930.—The frequency of occurrence of apocrine and epicrine glands in the axilla, the mammary, pubic and circumanal regions in the bodies of 2 ♂ Australian aborigines was studied. The percentage of apocrine glands in the mammary and pubic regions show variations the directions of which do not mutually accord. The method used has too many sources of error to make the numerical values of much importance. In the pubic region, where differences are greatest, the racial order so derived would advance the Australian aboriginals in front of the whites. The large circumanal glands in Australian aboriginals are regarded as the equivalent of the circumanal glands of European anatomy. If circumanal glands are few and scattered in the white, and if they are of the same type though more frequent in the negro, then the large circumanal glands of the Australian aboriginal may be a character of some racial importance. This latter conclusion is rejected.

14378. **WOOLLARD, H. H. The growth of the brain of the Australian aboriginal.** *Jour. Anat.* 65(2): 224-241. 3 pl., 4 fig. 1931.—Study of the brain of an Australian aboriginal ♀ and her infant, both dead in childbirth, indicates that the brain of the Australian aboriginal fetus in its general conformation resembles the fetal brain of the white. The extreme dolichocephaly of the adult is due to later unequal rates of growth. The dimensions of the cortical fissures in the principal areas of the adult brain indicate that absolutely and relatively the occipital area is the most developed; that the parietal and frontal areas are moderately developed, the frontal, however, falling behind that of the white; while the temporal area lags very far behind that of the white. Comparison of the dimensions of the fissures in the aboriginal fetus and adult indicate the precocious development of the occipital area and its relatively great extent. The backwardness of the temporal area is also evident. It may be said then that the occipital area is the most important neural basis for symbolic formulation in the aboriginal cortex. The order of development in the principal cortical areas in man is first the visual area, later the temporal area; with each of these is correlated expansion in the parietal and frontal areas; the frontal area is the last of all to show its characteristic human development. The histological examination of the cortex shows that the degree of cell stratification is less well established than in the white brain except in the visual area. Everywhere the cerebral cortex is thinner than in that of the white except in the visual area. Though a sulcus lunatus may be absent, the striate area extends onto the lateral occipital cortex. The number of cells in the aboriginal cortex is both absolutely and relatively fewer than in the white cortex. The facts elicited afford at least an approximate neural basis for the cultural level of the Australian aboriginal as well as an explanation of his special aptitudes such as those based on visual symbolization.—*Author's summary.*

14379. **WYNKOOP, ELIZABETH M. A study of the age correlations of the cuticular scales, medullas, and shaft diameters of human head hair.** *Amer. Jour. Phys. Anthrop.* 13(2): 177-188. 7 fig. 1929.—In this study 483 specimens of the head hair of humans, representing 82 individuals and ranging in age from 3 hrs. to 91 yrs., were used. Shaft diameters, scale widths and indices were measured, and the morphological types of the medullas determined ocularly—all under the microscope. The writer concludes that: The morphological type of the medullas of human head hair is not determined by the age of the individual, but is definitely correlated with the diameter of the hair shaft. The relative sizes of the cuticular scales (referred to as scale index) bear no relation to the age of the individual, but vary inversely with the diameter of the hair shaft. The hair-shaft diameter bears little or no relationship to the age of the individual, though there seems to be a rough correlation (subject to wide variation within limits) with age group of individuals, reaching maxima in the age groups 10-20, 40-50, and 90-100. Wide variations of hair-shaft diameter are frequently found in the same scalp. The relationships between medullary form and cuticular-scale size (and index), and diameter of hair shaft, already suggested by earlier studies cited, are further substantiated in this present study, in which an entirely new series of hair samples was used.—*Author (courtesy Wistar Bibl. Serv.).*

14380. **WURZINGER, ST. Vergleichende Entwicklungstudien an Säuglingen und Kleinkindern.** *Klin. Wochenschr.* 8(13): 594-596. 1929.—Anthropometric studies (with the method modified by Martin) were made of 111 boys and 100 girls up to 18 mos. old in a Munich asylum. From the statistics gathered, it is evident that even at the youngest age period there is a difference between the sexes as regards height, weight, circumference of chest, head and thigh, as well as breadth of the shoulders. With the single exception of the thigh circumference, all measurements were greater for boys than girls, at all age periods.—*St. Wurzinger (transl. by T. C. Hempelmann).*

[Morphology and development of the pancreas in the lamprey.] *Jahrb. Morph. u. Mikrosk. Anat. Abt. 2, Zeitschr. Mikrosk.-Anat. Forsch.* 8(3/4): 489-511. 3 pl., 4 fig. 1927.

14384. **JOKL, ALEXANDER.** Vergleichende Untersuchungen über den Bau und die Entwicklung des Glaskörpers und seiner Inhaltsgebilde bei Wirbeltieren und beim Menschen. Dissertation. 249p. 44 pl. 18 fig. Almquist und Wiksell: Upsala, 1927.—This comprehensive paper begins with a discussion of the special technique used. The following sections describe the development and structure of the vitreous body in selachians, teleosts, ganoids, amphibians, reptiles, birds, mammals, and man: *Acanthias vulgaris, Torpedo ocellata, Salmo salar, (Lota vulgaris, Syphonostoma typhle, Caregolus lavaretus, Liparis montagui) Amia calva, Lepidosteus osseus, Triton cristatus, T. alpestris, Rana temporaria, Tropidonotus natrix, Vipera berus, Lacerta muralis, Alligator, Gallus domesticus, Columba domestica, Bos taurus.* Each section gives a detailed historical account of previous investigations, followed by the results of the author's own investigation. Original work has been done by the author on at least 1 member of each group of vertebrates. The last part of the paper deals with various disputed questions related to the vitreous body. The author comes to the following conclusions:—(1) the fibrils composing the vitreous body arise first as protoplasmic processes from the cells of the lens and retina and are, therefore, ectodermal in origin; (2) mesodermal cells may appear later among the primary ectodermal fibers; (3) the processes of both ectodermal and mesodermal cells become finer and appear like faintly staining fibers, giving a more openwork appearance to the tissue; (4) the fibers of the suspensory ligament of the lens arise from a fine membrane on the surface of the ciliary body and are not connected with the ciliary epithelium; (5) the anterior vitreous body is formed by processes from cells of all the surrounding structures; (6) in early embryonic stages and in the lower vertebrates the fibers of the vitreous body form a network, in mammals and man the network is lacking; (7) the interfibrillar substance is gelatinous in nature; (8) a hyaloid membrane is present in all the animals investigated and arises from the outer layers of the vitreous body independently of any cells. Other subjects discussed are the choroid fissure, the papillary process, blood vessels and cells of the vitreous body. At the end of the paper is an extensive bibliography (over 800 titles).—*H. W. Kaan.*

14385. **JOUBIN, L.** Les métamorphoses des animaux marins. 270p. 71 fig. 1926. Ernest Flammarion: Paris.—This is a semi-popular account of the larval histories of marine metazoa. It does not attempt any discussion of cell-lineage or of the more technical phases of development, but treats the larval life-stages of the groups as successive members of the plankton. Many of the characteristic types are figured.—*H. B. Baker.*

Sci.* 29(6): 253-259. 1929.—The evidence indicates that the number of somites is not constant for embryos of a given age, estimated from the time of deposition of the sperm plug; and it is inferred that in the growth and differentiation of a particular structure when compared with a standard such as age, length, weight or number of somites, a wide range of variation might be encountered.—*C. J. Pierson.*

14388. **KRÜGER, WILHELM.** Die vergleichende Entwicklungsgeschichte im Dienste der Lösung des Homologisierungsproblems an den Darm- und Gekrösabschnitten des Menschen und einiger Haussäugetiere (Hund, Katze, Pferd, Schwein und Wiederkäuer). *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 90 (3/4): 458-548. 63 fig. 1929.—An extensive study on a large number of specimens of various species of mammalia, with plates made from dissections. That there is a single principle for the development of the mesentery in all mammals is more readily understood by considering the digestive system to be separated into 2 parts: a cranial portion, the stomach and duodenum, and a caudal portion, the remainder of the canal. The stomach appears as a sagittal spindle from the wall of which there is an out-pocketing either to the dorsal and left or to ventral and right side. This results in a V-formed sack with a greater and a lesser curvature. The stomach rotates 90° with simultaneous rotation of pyloric region forming an angle to the body axis. In horse, pig and ruminants, the stomach is at almost right angles to body axis. In animals with relatively simple and small stomachs, this rotation results in an approximately transverse position in the body. The rotation changes the position of the pars cranialis duodeni in horse, pig, carnivora and man. The principal for the remainder of the intestine is dependent upon frontal ventral loop of the intestine at the level of the aperture to the yolk sac and its rotation around a dorsoventral axis, the arteria mesenterica cranii. This rotation may start from the base of the loop and twist the cranial limb in horse, carnivores and man. It may involve the whole loop in pig, or it may start from both points in ruminants. The amount of rotation can be 360°, in which the flexura duodenojejunalis may be rotated from the right side caudal to the left of the artery and come to lie cranial to it. The flexuria coli I. does not appear so active as the flexura duodenalis. In carnivora, horse and man, it is shifted a little to the left and cranially, so that it lies to the left and cranially to A. mesenterica cranialis. The ascending colon is different, for the cecum

is to the right and caudal to the artery. The rotation can be less than 360° or it can be even more, 540°, as in the pig. In this animal, the flexura coli I. lies in the median line and cranial to the artery. The ascending colon as well as the descending colon may increase markedly in length. In ruminants, pig and horse, the ascending colon is long; in horse the descending colon is long. The mesentery may fuse with the body wall as does that of the duodenum in pig and man; or the cecum in horse and pig; or the ascending colon in pig, ruminants, and man; or the transverse colon in which there is partial fusion in pig and ruminants; or the descending colon in ruminants and man.—*S. P. Miller.*

14389. LAMBERTINI, GASTONE. Studio comparativo sulla formazione dei villi. *Arch. Ital. Anat. e Embriol.* 26(3): 401-416. 2 col. pl. 1929.—The development of the intestinal villi was studied in larvae of *Rana esculenta* and in fetuses of the guinea-pig and of man. The epithelial cells toward the apices of the villi are at first, especially in the guinea-pig, high and pyramidal in form, with their nuclei near the free surfaces; at the sides they become lower and in the infundibular regions (the future intervillous spaces) they may have the appearance of an invagination. The formation of the villi is due to the proliferation of the connective tissue of the mucosa keeping pace with that of the epithelium and is an example of the morphogenetic factor termed by Ruffini stichotropism.—*A. Mannu (transl. by J. P. McMurrich).*

14390. LAMBERTINI, GASTONE. Studio istologico sulla struttura della vescicola ombelicale negli embrioni umani. [Histological study of the structure of the umbilical vesicle in human embryos.] *Arch. Ital. Anat. e Embriol.* 26(4): 493-527. 9 fig. 1929.—Eleven human embryos 1-3 mos. old were the material for this study. Examined with a lens the glandular nature of the vesicle is suggested by the occurrence of minute bodies resembling cysts. The external splanchnopleural endothelium is 1-layered, its cells being of the cubical type and containing lipoid vacuoles. The inner epithelial lining is in general simple, in some areas high and regular, in others cubical or flattened. Into the intermediate layer the epithelial buds observed by Tourneux project, becoming transformed into cysts or utricles with a single-layered epithelium. These utricles vary in development; their lumina vary in size, there epithelial cells are cubical in form and show evident signs of secretory activity. In the first period of its development the yolk sac is a hematopoietic and nutritive organ; in the second stage it may be an organ of internal secretion.—*J. P. McMurrich (from abstract by A. Mannu).*

14391. ORBAN, B., und E. MUELLER. Die Entwicklung der Bifurkation mehrwurzeliger Zähne. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 90(1): 115-128. 25 fig. 1929.—Graphic reconstruction of serial sections of developing molars of rats show that the bifurcation is determined before coronal development is completed. The roots are first outlined by eccentric peripheral enlargement of the basal opening of the tooth-germ (enamel organ). In this eccentric growth certain portions of Hertwig's epithelial sheath remain relatively fixed, though later these projections enlarge and unite to form the bifurcations. There is no epithelial downgrowth. The epithelial sheath is a fixed level from which the tooth-germs grow toward the oral cavity.—*S. W. Chase.*

14397. ARON, MAX. Experiences de greffe siamoise chez les larves de batraciens. Nouveaux arguments en faveur de la notion de facteurs de la croissance et de la morphogenèse, supportés par l'axe nerveux cérébro-spinal. *Compt. Rend. Soc. Biol.* 98(17): 1539-1542. 2 fig. 1928.—Larvae of anurans, were joined so that the tail of one was continuous with that of the other so as to result not only in intimate humoral connections but also in direct continuity of the spinal cords. Such larvae retained their individual growth rate. After section of the nerve axis of one of the conjoined twins at some level posterior to the brain, the axial organs of the operated twin were controlled by the normal and behaved like a distal extremity of the normal twin. The behavior indicated that the spinal cord of each twin was polarized in the opposite direction from the other twin. If one such twin were decapitated, it came under the dominance (control) of the normal twin and assumed the growth rate of the normal twin even though before injury its own growth rate had been slower. The author can only say that "growth of anuran larvae is dominated by an unknown factor propagated along the spinal cord posterior to the brain."

Organ.* 123(2): 206-229. 11 fig. 1930.—From earlier work the author found that the optic cup determines the heteropolarity of the lens for it induces the fibers comprising the fiber zone (Faserkugel) at the proximal pole. Further investigations were made to ascertain whether the inducing action lasted for a long time or if

the prospective significance of the proximal pole was determined before its pronounced differentiation. The lens-forming area of an embryo of *Amblystoma mexicanum* was transplanted homoplastically under the skin in the region of the ear. The transplant could not be distinguished from the neighboring cells of the inner layer of the skin ectoderm or was present as a thickened disc without distinct limits. The relation to the optic vesicle and the optic cup respectively was always easily demonstrated. The postoperative period did not last more than 12 days. The transplant developed like the normal lens or (in ⅓ of the cases) was entirely absent. This absence can probably be explained by the fact that the transplant was subjected to the factors of differentiation of the host epidermis and completely mingled with it (in connection with the local conditions and the orientation at operation). Degeneration of the transplant was never observed. In 6 cases the heteropolarity of the lens was destined from the beginning or before the beginning of demonstrable morphogenesis of its material; the central cells of the lens-forming disc were determined as future fibers of the median pole. The fibrous differentiation may occur without other influence in normal or almost normal temp. The factors determining the form of the fiber region lie in the changing cells themselves; there was no dependence upon the size or form of the lenticular vesicular space. New, supplementary fibers in the young lens sometimes occurred in the absence of other inducing action, owing to the assimilating influence of the fiber region on the epithelial cells, which embraced its basal pole.—*Author's summary (transl.)*.

14400. **FILATOW, D. Über die Verpflanzung des Epithels und des Mesenchyms einer vorderen Extremitätenknospe bei Embryonen von Axolotl.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 113(1): 240-244. 1928.—The mesenchymal mass from just visible limb anlagen was implanted in the flank. The result was negative. The epithelium of the anlagen, similarly implanted, induced limb-formation in about half the cases. The epithelium is thus an "organisator," a result different from those of other investigators.—*A. F. Coventry.*

14401. **FLAT-HAUSER, EUGENIE, und HANS PRZIBRAM. Regeneration der langen Knochen nach teilweiser Entfernung im Innern der Molchextremitäten (Triton cristatus Laur.).** *Zeitschr. Wiss. Biol. Abt. D, Wilhelm Roux' Arch. Entwicklungsmech. Organ.* 122(2): 237-250. 3 fig. 1930.—59 of 73 operated animals survived long enough for study. Removal of either proximal or distal half of a long bone within a *Triton* extremity was followed by regeneration; but only in the proximal segments, was regeneration at all typical; if the proximal part was excised, a mirror-image of the remaining part grew proximad from the remaining distal piece. In a few cases all that was formed was a small cone with well-formed epiphysis resting upon the much shortened diaphysis. The sections showed in the well-formed regenerates a restoration of bony tissue of not quite normal thickness 16-17 mos. after the operation. Regeneration of bone inside of an otherwise intact limb showed the same form as those growing proximad from free or exposed surfaces of section ("Bruchdreifachbildung Przibram"). Regeneration in both directions from any single cut surface was mirror-image-wise, even though at times regeneration beginning with the distal half followed upon the severing of the pertinent nerve. No evidence suggests the presence of lesion-hormones. The form of the ends of bones regenerated is independent of adnectant bones or the surfaces of their joints. Within any long bone various "areas" or "territories" (Guyenot) of formation are distinguishable.—*E. W. Count (from German summary)*.

14402. **GÉRARD, POL. Contribution à l'étude de la placentation chez les Lémuriens: à propos d'une anomalie de la placentation chez Galago Demidoffi (Fisch).** *Arch. Anat. Microsc.* 25: 56-68. 8 fig. 1929.—In the uterus of a gestating *G. demidoffi*, a small part of epithelium of the fetal chorion differed in structure from that of the rest of the chorion. It was composed of a 2-layered epithelium with the external row composed of giant cells. The latter had destroyed the cells of the uterine epithelium and were directly joined to the connective tissue of the maternal villi without affecting their vascularization. This is no doubt a local anomaly of placentation, emphasizing the weak reactivity of the maternal tissue. The author considers this favorable to the view of the epithelial chorionic placenta of lemurs as primitive.—*P. Gérard (transl.)*.

14403. **GUARESCHI, CELSO. L'otocisti degli anfibi anuri considerata come un sistema a mosaico. [Otocysts of tailless amphibians considered as a mosaic.]** *Atti R. Accad. Lincei, Cl. Sci. Fis. Mat. e. Nat.* 9(8): 666-668. 1929; **Nota 2. Dimostrazione sperimentale.** 10(1/2): 120-122. 1929; also in *Monitore Zool. Ital.* 40(11/12): 438-441. 1930.—Repeating former experiments on the otic vesicle of the tailless amphibians (*Bufo* and *Rana*) the author demonstrated the mosaic development of the otocysts, formerly suspected. It is shown that: (1) if a part of the otocyst is removed, the remainder can develop but without regenerating the structures potentially contained in the portion removed; (2) the transplantation of one part of the otocyst contributes to development of only the structures potentially contained in it; (3) fusion of 2 otocysts can produce a single vesicle, provided all the formations contained potentially in the 2 parts fuse.—*H. C. Stevens.*

14404. **GUARESCHI, CELSO. Studi sullo sviluppo dell'otocisti degli anfibi anuri. [Development of the otocysts of Anura.]** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(1): 179-203. 12 fig. 1930.—The author sectioned embryos of *Bufo vulgaris* and of *Rana esculenta* in 2 stages. Of 176 embryos, only 29 gave results suitable for use. Removal of a part of the otic cup or otic vesicle gives the following results: in *Bufo* the formation of a simple single-layered "scar wall" which closes the wound, shows a tendency to flatten, and exhibits no trace of differentiation, thus removing the possibility of a reappearance of structures potentially present in the extirpated portions; in *Rana* the closure and regulation of the general shape of the otocyst, although there is no regeneration of different structures (endolymphatic canal, semicircular canals, sensory epithelium). From a transplanted otocyst fragment develop only those structures which were potentially present. The fusion of 2 more or less complete otocysts may lead to the formation of a single vesicle, which appears almost normal externally, but which shows all the structures potentially present in its original parts. Inasmuch as these facts point towards the regulation of favorable spatial relations, it is concluded that the otocysts of anurans represent a mosaic at the stage of the otic cup or primary otic vesicle. The research shows also that the various structures of the otocyst are already localized in the primary otic vesicle.—*Summary (transl. by H. W. Kaan)*.

14405. **GUILLERY, H. Untersuchungen über die Bestandteile des embryonalen Gewebesaftes und seine Bedeutung für wachsende Gewebe.** *Virchow's Arch. Path. Anat. u. Physiol.* 275: 181-192. 1930.—An inquiry into the efficiency of embryonic juices in tissue culture. The juice obtained by cutting up chick embryos with scissors was more effective than that obtained by crushing through a sieve or in a mortar with sand, presumably because there was less destruction of the cells. Filtering the extract diminished its activity, the filtrate from porcelain filters being less active than that from filters with coarser pores; the activity of the filtrate persisted for 8 days, but if subjected to a temp. of 37° or more it became inactive after a few hours or less. These facts point to the existence in the filtrate of a ferment produced by undestroyed embryonic cells. If the material remaining on the filter be now thoroughly washed and treated by the method of Baker and Carrel for preparing proteose from fibrin, a solution is obtained which surpasses the embryonic juice in effectiveness and resembles that of proteose. If the filtrate is made inactive by heat and is then subjected to the peptic diges-

tion its activity returns. The embryonic juice contains a ferment that acts on the contained proteins, converting them into proteoses which can be assimilated by the cells of the tissue culture.—*J. P. McMurrich.*

14406. **GUYÉNOT, ÉMILE.** La perte du pouvoir régénérateur des Anoures, étudiée par les hétérogreffes, et la notion de territoires. *Rev. Suisse Zool.* 34(1): 1-54. 1 pl., 21 fig. 1927.—Limbs of tadpoles of *Bufo vulgaris* amputated at metamorphosis or slightly later, a time when all regenerative capacity has been lost, and grafted to the back of the larvae of *Salamandra maculosa*, a form in which the internal medium is favorable for regenerative processes, fail to show, after the secondary amputation, any return of regenerative capacity as a result of host stimulation. The disappearance of the capacity for regeneration is not simultaneous in all the organs of the tadpole, as grafted and amputated tails do regenerate. The loss of regenerative capacity is not the result of some change in the internal medium (hormonal) of the tadpole due to metamorphosis, but is an expression of a local change taking place in the organ itself. The tadpole is thus a mosaic of territories, each having its own capacity for differentiation and regeneration.—*A. J. Waterman.*

14407. **GUYÉNOT, ÉMILE, et K. PONSE.** Territoires de régénération et transplantations. *Bull. Biol. France et Belgique* 64(3): 251-287. 2 pl., 7 fig. 1930.—In the lizard, *Lacerta*, caudiform structures about 7 mm. long, were produced by deviation of the sciatic nerve into the lateral part of the tail. The external form, color and scales of the regenerated bud resembled those of a normal tail but internally, axial structures were absent. Similar experiments performed previously by Guyénot and Schotte and by Bovet on *Triton* had yielded similar results, here described. In *Triton* autoplastic transplantations were made from the dorsal region of the tail including the crest, to the region of the shoulder after removal of the girdle and part of its musculature. The nerves of the brachial plexus were left intact, one of them being drawn into the implant. A plate-like regenerating bud was produced which finally developed, along its borders, the pigmentation characteristic of the tail. Histological examination showed unorganized blastema traversed by nerves, and covered by well-developed skin. The authors discuss their results from the standpoint of the theory of "territoires de régénération."—*C. V. Morrill.*

14408. **HOLTFRETER, JOHANNES.** Über die Aufzucht isolierter Teile des Amphibienkeimes. I. Methode einer Gewebezüchtung in vivo. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 117: 421-510. 37 fig. 1929.—A method is presented for the cultivation of isolated portions of the amphibian germ to the stage of histological differentiation. The body cavity and lymph spaces in the mesenchyme of older amphibian larvae are suitable cultivation-places. The germinal parts transplanted with an "introducer" develop unrestrained, either in a free state or attached to the host. Their differentiation products are to be considered self-differentiations. A series of control experiments with older already "determined" material was used for judging the developmental products derived from the younger germinal stages and for testing the cultivation regions as to their suitableness. The method was homoplastic for *Amblystoma* and *Rana* and xenoplastic for several species of amphibia, the larvae of *Rana fusca, Hyla* and *Bombinator* serving as host and the germs of *Triton, Amblystoma, Bombinator,* and *Hyla* as "donor." The "implant" from the blastula or the gastrula in all combinations yielded, according to origin, a series of different differentiations that could be related to the determining power the implant possessed at the time of its removal. The mitosis in the implant, the normal course of yolk-absorption, the differentiations, and the harmonious behavior of the partners in chimeras indicate a physiological balance betwen the host and implant. The growth of blood vessels of the host into the implant, observed in the living object, and the migration of implanted pigment cells to the epidermis of the host indicate a balance in the chemical conditions between the generically different partners. In spite of the differences in age and the specific properties of the partners the development of the younger implant in the different cultivation centers proceeds with its own rhythm of growth. The specific cells structures of the implanted tissues are retained in the specifically different host. The deviating formations that appear to a slight extent in the implant are partly of a degenerated kind and may also be due to mechanical injuries inflicted by the host or to unfavorable conditions of nutrition; in part they appear to arise because of a restriction of the capacity of selfdifferentiation of the material. Specific defense reactions of the host organism—granulation tissues and a rich accumulation of leucocytes at the place of implantation, encapsulation of the foreign material, blood infiltrations as a result of specific poisoning through the implant—were not observed. Fatalities were very rare. Examples presented show that various assumed organ-anlagen from the blastula and gastrula can develop independently. Older tissues were transplanted to investigate the power of xenoplastic implants to live for a long period in the larva. The anterior leg-bud of *Triton*, easily controllable externally, was best suited for this. The bud, introduced into or under the epidermis of very young larvae of *Hyla, Bombinator* and somewhat older larvae of *Rana*, grew there into small leg-stumps with well developed cartilaginous axis, musculature, and connective tissue cover. Its epidermis passed smoothly into that of the host. Its yellow and black pigment cells retained the normal condition of expansion and also spread out under the host-epidermis. Mitosis was observed even after 53 days. Blood vessels from the host gradually penetrated the implant and formed a richly anastomosing network, similar to that of the normal *Triton*-leg. Development progressed to the formation of 2 toes and an anlage of a wide cortical bone-mantle. Then growth stopped completely, although after 80 days it, in general, appeared to be very fresh. Several possibilities are expounded in explanation of this growth inhibition. Some suggestions are made on the application of the method. *Author's summary (transl. by H. F. Nachtrieb).*

14409. **LEVI, GIUSEPPE.** Il contributo portado dal metodo della coltivazione in vitro alla conoscenze della struttura del tessuto nervoso. [Method of cultivation in vitro for the study of structure of nervous tissues.] *Monitore Zool. Ital.* 40(11/12): 302-313. 1930.—The author summarizes the most important results of his own and his collaborators' investigations on the cultivation of nervous tissue and attempts to harmonize them with the present knowledge of the structure of nerve tissue. In regard to the problem of the interrelation of neurones, the author emphasizes that his collaborator Esaki has recently demonstrated an important and surprising fact,—that the behavior of the nerve fibers in the culture differs according to the region from which the explant has been taken; in explants from spinal ganglia the formation of plexuses and networks was especially observed; on the other hand, in cultures from mid and fore-brain, the migrating neurites always remained independent of one another. On the whole, the results obtained by the method of explantation are not contradictory to the fundamental ideas of the neuron theory.—*G. Levi (transl. by M. Gardiner).*

14410. **MARTINOVIĆ, PETAR N.** Migration and survival in vitro of the nerve cells cultivated in the cerebrospinal fluid of the embryo and the young animal. *Arch. Exp. Zellforsch. Bes. Gewebezücht.* (*Explantation*) 10(2): 145-156. 9 fig. 1930.—The nerve cells from explants of brain of albino rat embryos and new born animals and very probably from young cats migrate quite readily upon the cover glass in the cerebrospinal fluid as the culture medium. [80 cultures from 14-20 day rat embryos, 40 from 1-3 day old rats, 8 from a 7 day old kitten showed migrating cells in 28, 12, and 4 cultures respectively.] The neuroblasts from the brain and the medulla of the chick embryos 8-11 days old do the same upon the

new growth of an explant of heart or liver tissue which serves as a support medium. If the explant has been sucked out of the cranium together with the culture medium the number of the successful cultures is greater than if the explant has been cut off of a larger piece of tissue that has previously been immersed in Tyrode solution (temp. 37°) on a hollow ground slide.—*Author's summary.*

14411. **MIJSBERG, W. A.** De regeling der ontwikkeling. [Regulation in development.] H. Kolff en Co.: Weltevreden, 1929.

14412. **MURRAY, P. D. F., and DORIS SELBY.** Intrinsic and extrinsic factors in the primary development of the skeleton. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(3): 629-662. 6 fig. 1930.—The femora, with only perichondrium, of chick embryos of 6- and 7-days incubation were grafted upon the chorio-allantois of 8-day chicks. Femora from 6-day chicks were grafted entire and those from 7-day chicks after transverse sectioning into approximately equal halves. The grafts of femora derived from 6- and 7-day chicks regularly showed 3 deviations from the normal: (1) The groove across the head of the normal femur, which lodges the acetabular ligament, was always absent due to absence of pressure from the acetabular ligament. (2) The condyles of the grafted femora showed a marked tendency to fuse in the mid-line on the posterior aspect, so reducing the intercondyloid fossa to a shallow depression because of the absence either of the tibio-fibula or of muscular pull. (3) The articular structures were subnormal in relative size, probably due in part to an artefact resulting from the operation and in part to the failure of some unknown factor extrinsic to the developing epiphyses. It is therefore concluded that, while the gross form of the skeleton of the limbs at least develops under the direction of intrinsic forces, extrinsic factors produce the final perfection of form of the functioning skeleton; that extrinsic forces provide the conditions necessary for normal development under the action of the intrinsic forces. After birth and in adult life, the extrinsic influences probably become of relatively greater, and intrinsic forces of relatively less, importance. In the case of replacing bones the form of the bone is primarily dependent upon that of the pre-existing cartilaginous element. In the grafts if bone developed around a curved or bent cartilaginous element, the thickness of bone deposited on the concave side was greater than that deposited on the convex side. Grafts of entire femora of 6-day chicks usually showed a vigorous development of bone, but those from halves of femora of 7-day chicks showed only a very thin layer of bone. In various kinds of graft which contain half a cartilaginous shaft, with 1 epiphysis and half a diaphysis, ossification and resorption of cartilage frequently occurred and always commenced at the end of the diaphysis remote from the epiphysis, i.e., approximately at that region which normally would be the middle of the shaft. Grafts of halves of femora of 7-day chicks showed that ossification and cartilage resorption progress largely independently of one another, for while ossification is retarded as compared with the same process in grafts of entire femora there was no such distinction between the amount of cartilage resorption in the 2 sets of grafts.—*From authors' summary.*

14413. **NORDMANN, MARTIN.** Wachstum und Stoffwechsel der Leberzellen in der Gewebskultur. *Arch. Exp. Zellforsch. Bes. Gewebezücht.* (*Explantation*) 8(3): 371-414. 6 fig. 1929.—Studies on about 1300 cultures (from 500 growing or adult rats, 300 from embryonic or new-born rats, 100 from newly hatched chicks, 400 from chick embryos) indicate that liver cells show a limited growth on so-called fluid media (Locke-Lewis solution and certain modifications thereof). With increase in age of the animal from which the explant is taken, growth decreases. Growth is promoted by addition of plasma, which not only prolongs the life of the individual culture, but permits the successful use of tissues from older animals. Liver cells can be recognized by the shape of the nucleus and cell body, color, and epithelial arrangement. Glycogen dissolved in liver cells can be detected by I-vapor, and precipitated in granules by alcohol. Plasma and living liver cells can reduce the glycogen; macrophages can store it. It is produced by the liver cells in tissue cultures only under favorable conditions, its abundance being proportional to the rapidity of growth; it is largely independent of the composition of the medium. Fat, whether present in the cells or introduced in the culture, does not prevent growth, but decreases its speed, and cripples the synthesis of glycogen. Hence the speed of growth is not so much an indication of the age of the animal used, as of the metabolism of the explant or culture. Fat must be in the explant or in the medium in order to be stored by the liver cells. The observations in tissue cultures agree with those found in the living animal in so far as the quantitative relations of the medium control the metabolism.—*M. Nordmann.*

144414. **OKKELS, HARALD.** Experimentell-embryologische Untersuchungen über die Kupfferschen Sternzellen bei Hühnerembryonen. *Arch. Exp. Zellforsch. Bes. Gewebezücht.* (*Explantation*) 10(1): 73-81. 11 fig. 1930.—Microscopic examination after iron hydrosol or very fine suspensions of India ink had been injected into the vitelline vessels or the chorionallantois showed that from the 9th day macrophages which resembled the Kupffer cells in structure and topography were present in the liver of the chick embryo. It was impossible to decide in how far the pictures of parietal attachment, observed in the young embryo, actually corresponded to endothelial phagocytic processes. The macrophages observed in tissue culture of such embryonic livers may well be derived from the Kupffer cells.—*From author's summary (transl.).*

14415. **PERRONCITO, ALDO.** Le rigenerazioni. *Atti Soc. Ital. Progr. Sci. [Roma]* (*Riunione 15, Roma*) 1926: 317-336. (1927.)

(Dupplicitas anterior assymmetricus) Ranae arvalis. [Investigations on the mechanics of development. 3. A. A new method of obtaining asyntaxia medullaris. B. Monster Rana arvalis found in nature.] [German summary.] Записки Биологической Станции Общества Любитедей Естествознания, Антропологии и Этнографии в Болшеве Московской губернии (*Bull. Sta. Biol. Soc. Amis Sci. Nat. Anthrop. et Ethnogr. à Bolchevo, Gouv. Moscou*) 4. 53-58. 12 fig. 1930.—A. Early blastulae of *R. arvalis* and *R. esculenta* were placed in cane sugar solution, the best concentration being 12-13%. After 24 hrs. they were returned to lake water. In most embryos gastrulation was markedly disturbed, due, apparently, to shrinkage. Swelling of the vitellus caused various monstrosities, such as double tail, asymmetrical growth, formation of proboscis, etc. B. Among the embryos of *R. arvalis* was one with duplicitas anterior asymmetricus, with 2 distinctly pronounced head parts.

14417. **WEBER, A.** Ricerches sur les premières manifestations des ébauches d'origine épithéliale. *Arch. Anat. Microsc.* 25: 132-136. 3 fig. 1929.—The first appearance of organs of epithelial origin were studied on the chick embryo of 48 hrs. and duck embryos of 57 hrs. of incubation. At these stages, changes in thickness of the intestinal endodermal layer is seen in sections of the mid-dorsal line. At first the portion between the aditus anterior and the last branchial pouch is transparent. Caudad from there a thickened, straight zone develops which corresponds to the right and left borders of the digestive tube, called the branchial crest. On the mid-ventral line a thick, narrow band is seen. Between it and the branchial crest thin islets constitute the first formation of the lung in the chick embryo. In the duck embryo the same formation runs transversely. The bronchi do not seem to be derived from the same cellular material.

The mitoses change direction at 48 hrs. in the chick and 55 hrs. in the duck embryo.—*B. Bickel.*

14418. WEISS, PAUL. Potenzprüfung am Regenerationsblastem. II. Das Verhalten des Schwanzblastems nach Transplantation an die Stelle der Vorderextremität bei Eidechsen (Lacerta). *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(2): 379-394. 9 fig. 1930.—The experimental animals (number not stated) were *Lacerta muralis, L. agilis* and *L. serpa.* When the blastema from which the tail of the lizard was regenerating was about 2 wks. old it was transplanted to the site of a fore-limb, following amputation of the latter. In most cases the transplant developed no further; in some cases it formed a wartlike bud of tissue. Evidently the material formed after transverse amputation of the tail is at first not determined so that it shall produce a definite form. On the other hand at present it can only be concluded that there is not, in the lizard, an active limb-producing field able to determine material within its influence. In 8 cases the transplanted blastema developed into a well-differentiated tail of considerable size. These tails are diagnosed as such not only through their external appearance but also through their whole internal organization. All tails regenerating at the shoulder show a considerable bending or twisting never observed in the normal regeneration of a tail and plainly to be ascribed to the abnormal position. Possibly growth on the dorsal side is favored, a condition in harmony with the normal tendency to bending shown by the growing limb. The entire course of regeneration, both in form and in histology, from the blastema stage to that of the finished tail shows that the differentiation of a blastema, once it has been determined, does not depend upon the blastema remaining attached to its old stump. Not only does growth occur but also processes of differentiation in the direction originally indicated are carried forward without further support of similar old tissues. The lack of spinal cord in tails regenerating at the shoulder shows that the development of a regenerated tail in the lizard is independent of the presence or absence of spinal cord. The regenerated tails were well supplied with nerves. Should nervous influence play a part in tail development it is doubtless entirely unspecific as regards the form and differentiation of the part regenerating, otherwise there would not have arisen a regenerated tail with the innervation of an arm.—*From summary (transl. by W. H. Piersol).*

ANOMALIES, MONSTERS AND MARKED VARIATIONS IN DEVELOPMENT

14419. ARNTZEN, LEIF, and BØRGE WORNING. A case of double renal pelvis and double ureter in both sides. [With English, French and German summaries.] *Acta Radiol.* 10(5): 499-501. 5 fig. 1929.—The roentgen findings in a case of bilateral double pelves of the kidneys, double ureters and a large concrement in the lower pelvis on the right.—*Authors' summary.*

14420. BARILLET, H. Fissure du sternum. (Étude anatomique et radiologique.) *Presse Méd.* 37(50): 817-818. 1929.—In a study of the cleft sternum, the author shows that the origin of the anomaly occurs during the chondrogenous stage, and that it is produced by the failure of the double cartilaginous hemisternum to coalesce, also followed by the normal osseous development, which, considering the dehiscence, consists of 2 hemimanubria and the hemisternebrae, in variable numbers according to the degree of the fissure. Certain symmetrical parts are independent: in this case, the first and second sternebrae (failure of lateral conjugation), forming a purely simian character.—*P. L. Risley.*

14421. BERGEL, ARTUR. Der Dotterstiel als Ursache einer menschlichen Fehlbildung. *Zeitschr. Ges. Anat. Abt. I, Zeitschr. Anat. u. Entwicklungsgesch.* 89(4): 532-542. 6 fig. 1929.—A description of 2 deformed human embryos: (1) a 6 mm. embryo with deformities of head and fore-brain; (2) a fetus of 42 cm. crown-heel length, with umbilical hernia, exencephalia, exobulby, and cheilognathoschisis. The second case is attributed to causal factors similar to those of the first, having merely developed further. The defect in the fore-brain in the first case is attributed to the fusion of the yolk-stalk with the forehead. The incorporation of the yolk-stalk with the umbilical cord results in the cord being brought into contact with the head. These processes are instrumental in the production of exencephaly. Descriptions of the relations of the embryonic membranes to these developmental anomalies are included.—*P. L. Risley.*

[Cryptorchidism in the horse, pig, dog and cat, with especial reference to microscopic anatomy.] *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 89(5/6): 727-753. 5 fig. 1929.

14425. BUCKLEY, R. C., and E. M. DEERY. Abnormality of the cerebrum and leptomeninges simulating an intracranial tumor. *Amer. Jour. Path.* 5(5): 459-466. 3 pl. 1929.—Localized gross developmental anomalies of the brain are rare. Such a case, clinically considered a tumor, is reported from Cushing's clinic. The patient was a ♂, age 6 mos., with an asymmetrically enlarged head. Death occurred from bronchopneumonia. Autopsy revealed a large firm mass occupying the right fronto-parietal region. Only in the frontal region was the mass sharply demarcated from the normal cerebrum. The leptomeninges were firmly adherent to the mass and studied with small thickenings. Sections revealed an asymmetrical hydrocephalus, the right lateral ventricle being larger than the left. Microscopic study revealed nests of astroblasts and astrocytes in the subarachnoid space, marginal gliosis, incomplete myelinization and extensive gliosis. Microglia and oligodendroglia were not demonstrated in this abnormal tissue.—*P. C. Bucy.*

14426. BUSSE, WALTER. Zur Frage des Ileothoracopagus tripus. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 90(5/6): 671-689. 15 fig. 1929.

14427. DANFORTH, C. H. A case of alopecia in the fowl. *Jour. Heredity* 19(12): 546-550. 3 fig. 1928.—An instance of marked deficiency in feather production in the case of a Rhode Island Red fowl was analyzed by means of a skin graft from a White Leghorn donor. The grafted skin produced normal White Leghorn feathers, from which it is inferred that the feather deficiency of the host was occasioned by an anomaly in the skin rather than in the endocrine system.—*C. H. Danforth.*

14428. DEHNEL, GUSTAV. Badania nad rozwojem i geneza potwornósci złozonych u żółwia błotnego (Emys orbicularis L.) [Development and origin of reptiles, especially mud turtles.] (With French summary.) *Arch. Biol. Soc. Sci. Lettr. Varsovie* 2(2): 1-68. 4 pl., 34 fig. 1929.—Detailed evidence is adduced to show: (1) that the presence of plurinuclear ovules in the ovaries of a monstriparous ♀ turtle (*E. orbicularis*) favors the polygeneses of ova with plurivalent nuclear system; (2) that true polygeneses, arising in nature, have their origin in an increase and primary decentralization of the nuclear material of the ovum. The results are in accord with those of Lur and Coppe de Baillon on the origin of double monsters in *Carausius morosus.*—*C. F. De Garis.*

[Defects of the extrahepatic bile ducts with disturbances of the lumina (obliteration, stenosis and cystic dilatation) and derangement of the normal course of the ducts.] *Virchow's Arch. Path. Anat. u. Physiol.* 271(1) : 20-44. 17 fig. 1929.

14432. FONTES, VICTOR. Nota sôbre um case de hemimélia. *Arquivo Anat. e Antrop.* 13(1/2) : 191-209. 8 fig. 1929(1930).—In this individual the left radius was completely absent, the right was partially lacking, and also some of the radial bones in the carpus, metacarpus, and digits. From the way the radial ray is altered it is concluded that the middle segment (of the arm) was not able to reach as complete a development as the extreme segments. The partial absence of the skeleton gave rise to equally well-marked disturbances of the muscular system, easily visible in the morphological irregularities of the palmar eminences of the 2 hands. —*From abstr. by V. Fontes (transl. by F. W. Appel).*

14433. GATES, WM. H. A two-headed snake. *Jour. Heredity* 20(12) : 555-556. 2 fig. 1929.—A report of duplication of the head and neck region of a young *Opheodrys aestivus.—W. H. Gates.*

14434. GIACOMO, U. de. Le anomalie morfologiche congenite del cranio e della colonna vertebrale nelle atassie ereditarie. [Congenital morphological anomaly of the skull and of the vertebral column in hereditary ataxia.] *Riv. Patol. Nerv. e Ment.* 34(3) : 364-382. 8 fig. 1929.—Three cases reported: 1st case had an unusually large longitudinal diameter of the posterior cerebral fossa, 6 lumbar vertebrae, the 6th being arc-shaped with a tendency toward sacralization, especially on the left side; 4 coccygeal vertebrae were present. Case 2, a brother of the above, also showed enlarged longitudinal diameter of the posterior cerebral fossa, and a somewhat smaller transverse diameter than normal; mastoid was also abnormal. Vertebral column showed a marked scoliosis with a tendency toward sacralization of the left side of the 5th lumbar vertebra. In case 3, the posterior cerebral fossa was enlarged in the posterior diameter, with abnormal mastoid. There was a break in the 5th lumbar vertebra and a tendency toward sacralization. There was a comminuted fracture of the right inferior angle of the 11th dorsal vertebra. Marked scoliosis was present. Author concludes that in hereditary ataxia (Friedreich's disease) there is a fragility of bone associated with anomalies of bony structure.

14435. GRUBER, G. G. Die Morphologie der Missbildungen des Menschen und der Tiere. [Morphology of congenital anomalies in man and animals.] Teil 13. Lief. 3. Abt. 4 und 5. p. 375-574. 106 fig. Gustav Fischer: Jena, 1929. Pr. 13.50 M.

14436. HERMAN, J. v. Über Nieren- und Uretermissbildungen. *Zeitschr. Urol. Chir.* 26(5/6) : 505-561. 3 fig. 1929.—Developmental disturbances of the uropoietic system are generally due to not one but several basic causes. They are associated with other anomalies of the genital or renal system. The author classifies them as: (1) primary developmental faults with renal aplasia (anephria), hypo- and hyperplasia, polycystic or embryonal lobed kidney; renal ascent, ureteral diverticulum or fission, extrarenal calyx, supernumerary renal pelvis; blind ureteral sacs, obliteration, stenosis, hyper- and hypoplasia, and valvular irregularities; dystopic renal pelvis and renal dystopy, defects of the bladder base. (2) Secondary developmental disturbances with supernumerary kidney or fission, ureteral and renal pelvic fission, multiple ureter, dystopic ureter openings, faulty insertion of ureter in bladder. (3) Congenital anomalies, acquired renal hypo- or hyperplasia (renal atrophy, hypertrophy), displaced renal pelvis; obliterated stenosed hyperplastic ureter, changes in the ureteral valves, faulty insertion of the ureter in the renal pelvis; changed course of ureter, kinking, crowding.—*B. Bickel.*

14437. HYNIE, JOSEF. Vzácný případ hermafroditismu. [A rare case of hermaphroditism.] [With French résumé.] *Česká Dermatol.* 10(10) : 261-269. 1929.—An individual with external genitalia in the indifferent stage is described. Neither menstruation nor sperm ejaculation had ever been present. Psychologically the individual was a ♂.

14438. JAGNOV, Z. Die anatomischen Verhältnisse eines Dicephalus pseudotribrachius tetramanus. [The anatomic features of a 2-headed, 4-handed, apparently 3-armed monster.] *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 90(5/6) : 659-670. 16 fig. 1929.

14439. KRACZKIEWICZ, ZYGMUND. Studja nad platineurja. [Embryonal platyneury.] [In Polish with French résumé.] *Archiwum Nauk Biologiczych Towarzystwa Naukowego Warzawskiego (Arch. Biol. Soc. Sci. et Lettres Varsovie)* 2(3) : 3-46. 3 pl. 1929.—The author studied several human monsters (platyneural embryos) characterized by complete or partial failure of the neural plate to form a neural tube. From comparison of the length and area of the neural plate and the somites with similar measurements of normal human embryos of the same stage the following specific conclusions are drawn: (a) the neural plate of the platyneural embryo may be considered as homologous with the neural tube of the normal embryo of the being constituted from the same ectodermal primordium, but in platyneural embryos the direction of differentiation is transverse whereas that in normal embryos is in a cephalo-caudal; the area of the neural plate in platyneural embryos equals that of the neural tube in normal embryos of the same stage (criterion being the degree of cardiogenesis); the surface area of the somites of the platyneural embryo equals that of the normal embryo of the same age, but the somites of the platyneural embryo look abnormal because of the transverse differentiation; that the chorda dorsalis which superficially (in toto mounts) appears doubled in platyneural embryos is not doubled is revealed by study of serial sections. The author's general conclusions are: (1) Platyneury is a teratogenous process which may take place in different regions of the embryo. (2) It consists of a differentiation and growth of the same embryonal material as that of the normal embryo, but the direction of differentiation is transverse to, rather than parallel with, the longitudinal axis of the embryo. (3) Different organs show a certain independence and are refractory to this process (heart, notochord). Different parts of the same organ can be affected in differing degree (neural tube). (4) The facts recorded from this study seem to indicate not only a certain autonomy of the different organs, but also an independence, more or less accentuated, of different regions of the embryo during development.—*From author's French résumé (transl. by J. E. Kindred).*

14440. KREDIET, G. Intersexualität oder Hermaphroditismus bei Säugetieren. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 91(1-3) : 251-291. 36 fig. 1929.—The works of Goldsmith on *Lymantria* are basic for the comprehension of intersexuality in mammals. In each hermaphrodite in which sex reversion arises during sexual differentiation, the ♂ and ♀ sexual impulses remain active. The true as well as the false hermaphrodites are explained by these 2 principles, and are recognized as the zygote intersexes. Kleb's scheme for the classification of hermaphrodites is discussed. Two young, intersexual pigs are described, one transitional from ♂ to ♀, the other showing newly formed follicles and seminiferous tubules derived from the germinal epithelium. The process of sex reversion of

mammals is considered in detail, also heredity of intersexuality in pigs.—*G. Krediet (transl. by C. S. Simkins).*

14441. **LOCCHI, R. Sobre um caso de polyodontia no homem.** *Ann. Fac. Med., São Paulo* 4: 1-23. 2 pl. 1929. —A case of polyodontia observed in the cadaver of a ♂ negro of 18 yrs. is described. In the maxillary dental arch there are 7 supernumerary teeth: 3 conoid teeth in the incisal region; 1 paramolar, situated buccally between the right molars; 1 distomolar, imbedded and cuspidate, also on the right; 2 left distomolars, imbedded and superimposed, the deeper one larger and with 4 cusps, the more superficial one rootless and with 3 cusps (the cusps disposed in almost perfect linear series recalling the primitive triconodont form). A left molar presents a bilobed accessory tubercle mesiobuccally. The author reviews briefly the various hypotheses proposed in explanation of polyodontia in man (atavistic, accidental, and eclectic), calling attention to the divergence of these theories.—*R. Locchi (transl. by S. W. Chase).*

14442. **LUNDH, GÖSTA. Case of hypernephroma malignum with virilismus in a girl of 3½ years.** *Acta Paediatr.* 9(1/2): 118-127. 4 fig. 1929.—In a fatal case of malignant hypernephroma with virilism in a girl of 3½ yrs., necropsy revealed, in place of the left suprarenal, a tumor almost as large as a man's head and composed of large, richly protoplasmic, polyhedral cells with large nuclei, often in the form of giant cells, with metastases in both lungs. In ♀♀, heterosexual precocious puberty appears almost always to be caused by a change (hyperplasia or tumor) in the suprarenal cortex.

14443. **McCLURE, CHARLES F. W., and GEORGE SUMNER HUNTINGTON. The mammalian vena cava posterior. An ontogenetic interpretation of the atypical forms of vena cava posterior (inferior) found in the adult domestic cat (Felis domestica) and in man.** *Amer. Anat. Mem.* 15: 5-149. 46 pl. (21 col.). 1929.—All atypical forms of the vena cava posterior found in the adult cat and in man can be interpreted and explained as modifications of a common ontogenetic plan of the veins. An analysis of this ontogenetic plan shows that these atypical forms fall within 17 predictable types, and that every atypical condition of the adult vena cava posterior thus far observed by the writers and by others has been found to fall within one or within a combination of these 17 types. The monograph contains a fairly complete bibliography of the atypical forms of the adult vena cava posterior to date.—*C. F. W. McClure.*

14444. **MacMAHON, H. E. Congenital anomalies of the liver.** *Amer. Jour. Path.* 5(5): 499-508. 4 pl. 1929. —Congenital histologic variations, exclusive of changes which result from some abnormality in the extrahepatic portion of the biliary system, may be separated into 2 groups. In the 1st, the normal development has been retarded, i.e., the liver of a full-term child may structurally resemble, in part at least, that of a fetus. In the 2nd, the developmental anomaly concerns either the parenchyma (the arrangement of the liver cells, the lobules, the intrahepatic biliary ducts), or the stroma (the architecture of the portal areas). Two cases of the 1st group and several of the 2nd are described. Of the latter, one type is characterized by an increase and dilatation of the periportal biliary ducts accompanied by an increase in connective tissue in the portal areas. Associated with this type of anomaly, which may persist throughout life, are congenital cysts of the liver and commonly, also, bilateral congenital cysts of the kidneys. —*B. Halpert.*

14445. **MAJÓ, B. PLÁ. Variété du tronc thyroidien inférieur coexistant avec l'artère thyroidienne de Neubauer.** *Arquivo Anat. e Antropol.* [*Lisboa*] 13(3): 467-478. 7 fig. 1929(1930).—This anomaly of the inferior thyroid artery consisted of division into 2 branches; one, representing the inferior terminal branch, anastomosed with the external terminal branch of the superior thyroid; the other terminated as deep and posterior branches. The latter branch rested upon the bifurcation of the right inferior laryngeal nerve. The artery of Neubauer (A. thyreoidea ima), of very large size, crossed the trachea below the thyroid gland.—*B. P. Majó (transl. by J. B. Bullitt).*

[Congenital heart malformation with sclerosis of pulmonary artery.]** *Prensa Méd. Argentina* 16 (2): 101-110. 5 fig. 1929.—Description of case with intraventricular communication, hypertrophy of right cavities, thickening of wall and diminished caliber of pulmonary vessels. Permanent and progressive cyanosis. —*E. A. Molinelli.*

14448. **MENTZER, STANLEY H. Anomalous bile ducts in man. Based on a study of comparative anatomy.** *Jour. Amer. Med. Assoc.* 93(17): 1273-1277. 9 fig. 1929. —Most anomalous biliary structures in man represent arrangements normal in lower animals. Anomalous biliary tracts occur in about 10% of routine necropsies in man. Approximately 50 instances of congenital absence of the gallbladder in man have been reported. The gallbladder is normally absent in 17 species of fish, 9 species of birds and 26 species of mammals. Duplication of the gallbladder has been reported in man in 16 instances. Duplication of the gallbladder in lower animals is relatively common. Accessory and bilobed gallbladders are relatively rare in man but common in animals. The gallbladder has been found completely buried in the substance of the liver in many persons. This is its normal position in many animals. Congenital absence and duplication of the cystic duct are relatively rare in man as they are in animals. Cases of termination of the cystic duct into the left hepatic duct, the common duct, stomach, and the duodenum are reported. Normal instances of these in lower animals are given. —*S. H. Mentzer.*

14449. **MOLL, JOACHIM ALBRECHT. Beitrag zur Lehre von den solitären Leberzysten.** *Frankfurter Zeitschr. Path.* 36(2): 225-248. 4 fig. 1928.—In a macerated full term stillborn ♂, the skull was flattened anterioposteriorly. There was edema under the maxillary angle and in thorax. Both scrotal portions were well developed, but edematous. At the upper portion of the raphe was a small opening leading to a canal lined with mucous membrane. There was no penis. The anus was patent and from it protruded thready masses, seemingly desquamated epithelium. The upper cutaneous layer was cut off circularly under the inguinal fold, exposing the yellow, ductless, fatty tissue. Large quantities of fluid were evacuated from the abdomen, and a large hepatic cyst consisting of 2 parts hung from the lower surface of the diaphragm. The bipartition of the cyst was produced by the umbilical vein which ran over the outside. Hepatic tissue was found only at the borders of the hepatic lobes. Under the right lobe was a flattened kidney. Adrenal was present on the right, but no ureter. Clavicle and jaw were outside of the periosteal covering. Hard palate uncleft, but the soft showed a division. The thymus was the size of a bean.—*B. Bickel.*

14450. **PAŃKOWSKI, M., i ST. RUNGE. Przyczynek do obojnactwa u owiec. [Hermaphroditism in sheep.]** [With German summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 18(1): 66-80. 7 fig. 1927. —A case of masculine pseudohermaphroditism is described.

14451. **PARHON, C. T., L. BALLIF, et N. LAVERENCO. Microcephalie familiale. Acromicrie ed syndrome adipeux-genital.** *Rev. Franç. Endocrin.* 7(4): 308-318. 3 fig. 1929.—The author reports cases of microcephalic brother and sister, whose paternal aunt was also microcephalic. The condition is thought to be hereditary. Microcephaly is a symptom of acromicria as opposed to acromegaly. The boy showed marked adiposity and double cryptorchidism.—*B. Cunningham.*

14452. **PATTEN, B. M., and W. B. TAGGART. An**

unusual type of triatrial heart. *Arch. Path.* 8(6): 894-905. 5 fig. 1929.—The heart of a 3 mos. old infant showed externally a marked dilatation of the right ventricle and a definitely enlarged pulmonary trunk. This dilatation marked the presence of an accessory median atrial chamber. External depressions bounding it indicated the attachments of the septa separating it from the right and left atria respectively. Both left pulmonary veins opened into it by a common funnel; also 3 right inferior pulmonary veins entered here: the right superior pulmonary vein entered near the apex of the chamber. About 1/10 of the total pulmonary return could enter the left atrium directly. An oval orifice, apparently the foramen ovale, was guarded only by a loose flap of the left-hand septum. The child with these defects presented an increased heart rate, both in intensity and extent. The blood was darker than could be registered with a Tallqvist scale.

14453. **PETIT, G. Sur la synostose de l'axis de la troisième vertèbre cervicale chez les Lamantins.** *Bull. Mus. Nation. Hist. Nat. Paris* 1928(6): 429-431. 1 fig. 1928.—Several cases of total synostosis are briefly described, and one, in *Manatus senegalensis,* is figured.

14454. **PEZCOLLER, A. Contributo allo studio delle cisti congenite del collo di origine timica.** [Congenital cysts of the neck of thymic origin.] *Clin. Chir.* [*Milan*] 32(3): 272-284. 2 fig. 1929.—A cyst about the size of a hazelnut, situated in the median line at the base of the neck about 1 cm. above the sternal notch, was removed from a 5 yr. old child. No sign of inflammatory processes were found. From the histologic finding the author concludes that the cyst was due to a degeneration of Hassall's corpuscles.

14455. **PIRES de LIMA, J.-A., et ROBERTO de CARVALHO. Deux cas très rares d'anomalies des membres.** *Ann. Anat. Path. et Anat. Normale Med.-Chir.* 6(8): (1-4). 1929.—The first is a ♂ full term, showing hydrocephalous, left sided anophthalmia, ectrodactylia and syndactyly of the hands, partial fusion of 4 ribs on left side, etc. The right foot is clubbed and has 6 toes plus a 7th on the inner side at the level of the tibiotarsal joint. This prehallux is 2-jointed with a metatarsal separate from the skeleton of the limb. The 2nd case presents a rare anomaly i.e., fusion of the carpals with the bones of the forearm in a ♂ of 23 yrs.

14456. **POLI, ANTONIO. Contributo allo studio delle assenze muscolari congenite. (Difetto dei muscoli addominali).** [Congenital absence of abdominal muscles.] *Arch. Ortopedia* 45(4): 775-801. 3 fig. 1929.—Case report with review of theories. The author believes that there is no absolute line to be drawn between dystrophy and congenital absence of muscles.

14457. **ROWAN, W. A hermaphrodite spiny dogfish (Squalus sucklei).** *Proc. Zool. Soc. London* 1929(3): 441-443. 1 pl. 1 fig. 1929.—Hermaphroditism is rare among elasmobranch fishes, only 5 published examples being known to the author, and 3 of these being very incomplete. The specimen described came from Nanaimo, B. C.—*Evermann & Clark.*

14458. **SCHRAMM, H. G. Schwere Herzmissbildungen bei älteren Individuen.** *Beitr. Path. Anat. u. Allg. Path.* 82(1): 153-162. 4 fig. 1929.—Septum defects in a 48 yr. old patient were accompanied by stenosis of pulmonary artery and tumors of septomarginal trabecula and crista supraventricularis. In a patient 58 yrs. old with a septum defect, the aorta was directly connected with the right ventricle. These cases show that pronounced heart defects do not always cause early death.

14459. **SEROICZKOWSKI, A. Symmetrische Missbildung an beiden Händen und Füssen. (Spaltbildung.)** *Zeitschr. Ges. Anat. Abt. I, Zeitschr. Anat. u. Entwicklungsgesch.* 89(1/2): 145-155. 5 fig. 1929.—In a newborn ♂ child, otherwise normal, was discovered a symmetrical deformity of all 4 extremities. In place of hands and feet were rounded stumps, each bearing an ulnar and a radial knob instead of fingers and toes. The muscles, nerves, blood vessels and skeletal parts are described in detail. In each deformed hand and foot the skeleton was cartilaginous throughout. Bone primordia, normally present at birth, were completely lacking, indicating that the defect arose relatively early in the embryonal period. Nerves, muscles, and blood vessels, however, were normal almost to the distal extremity of each defective part, and the innervation of the skin was normal. The fact that the muscles, etc., were divided in typical fashion indicates that the factors governing their differentiation are not inherent in the skeleton. The symmetrical malformation of all 4 limb-buds, as well as absence of irregularities, constrictions, or scars, indicates that the condition arose through faulty germ primordia rather than through accidental constriction by amnionic cords or other abnormal pressures.—*H. H. Johnson.*

14464. **HEFNER, R. A. Studies of parajulid diplopods. 2. The micro-anatomy of the alimentary canal of Parajulus impressus Say.** *Trans. Amer. Microsc. Soc.* 48(4): 321-351. 6 pl. 1929.—A detailed description is given of the technique, which can be used in the study of many arthropod tissues. The diplopod mouth-parts consist of an unpaired labrum, a pair of mandibles, and a compound lower lip called the gnathochilarium. The foregut is lined with chitin secreted by a bordering layer of hypodermal cells. This cellular wall is surrounded by circular muscles on either side of which are strands of longitudinal muscle fibers. A pronounced oesophageal valve marks the junction of the foregut with the midgut. The midgut is the most extensive of the 3 alimentary regions. Its lining cells are large glandular structures. Muscle fibers outside the midgut are few, but a net-like covering of large oval cells is prominent. The junction of the midgut with the hindgut is marked

by the attachment of a pair of malpighian tubules and the presence of a thick pyloric valve. The hindgut consists of 6 separate regions, each with characteristic structure. In general, the histology of all of these regions is similar to that of the foregut, with the exception that no longitudinal muscles are found beneath the circulars. Five pairs of glands open on or within the head of *P. impressus*. The major portion of 2 pairs of these glands lies within the anterior part of the body cavity; 3 pairs lie wholly within the head. The salivary glands surround the oesophagus to which they are attached by connective tissues. The ducts of these glands open on the ventral floor of the mouth. The anterior tubular glands, ventral to the anterior third of the alimentary tract, open outside the body on the ventral surface of the gnathochilarium. Two pairs of labral glands lie above the mouth into which they open by short ducts leading through the ventral wall of the labrum. The ventral clustered glands lie within the gnathochilarium and open by short ducts leading to the grooves which mark the openings of the anterior tubular glands.—*Author's abstr. and summary.*

14465. **HOLMES, GLADYS ELIZABETH. The influence of the nervous system on regeneration in Nereis virens, Sars.** *Jour. Exp. Zool.* 60(4): 485-503. 3 pl., 1 fig. 1931.—If the nerve cord is present at the cut surface of anterior pieces, normal posterior regeneration is evident in approximately 2 weeks; if absent, either posterior regeneration does not occur or the regenerated portion, always retarded in appearance, is abnormal in structure, lacking ventral nerve cord, parapodia, and anal cirri. Absence of the central nervous system is assured by cutting the nerve cord and looping the cut ends back, leaving several segments free of the cord. Later, when the incision is healed, the animal is cut in two in the cordless region. Histological checks were made using Heidenhain's iron hematoxylin and Boulê's silver-nitrate impregnation. Injury to the tissues in general does not account for the absence of normal regeneration. Apparently the presence of the ventral nerve cord is necessary for complete organization of new tissue. Normal regeneration can take place, even though the union of the ventral nerve cord with the cephalic ganglion is interrupted, provided the nerve cord is still intact at the cut surface.—*Author (courtesy Wistar Bibl. Serv.).*

14466. **INABA, DENSABURO. Notes on the development of a Holothurian, Caudina chilensis (J. Müller).** *Sci. Rept. Tôhoku Imp. Univ., 4th. ser., Biol.* 5(2): 215-248. 8 pl. (1 col.), 8 fig. 1930.—This paper presents the first embryological study in the family Molpadiidae. *Caudina chilensis* passes through the type of development characteristic of the Cucumariidae, having a doliolaria stage in its metamorphosis. The genital organs, egg, fertilization, maturation, cleavage*, wrinkled blastula*, gastrulation*, dipleurula stage*, ciliation of the ectoderm*, doliolaria stage*, pentacula stage (in color*), and young* are described; the rate of growth in the first year was studied and is shown graphically. The larvae emerge from the egg-membrane before gastrulation begins and the formation of free mesenchyme cells also precedes gastrulation. The bibliography contains 34 references.

14467. **LI, YIKING. Regulative Erscheinungen bei der Planarienregeneration unter anormalen Bedingugen.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 114(2/3): 226-271. 29 fig. 1928.—A number of experiments on *Planaria lugubris* are described, in which duplex and other atypical forms were produced by incisions and by the gelatin method of grafting. From his results on double-headed and double-tailed forms where one of the duplicated members is removed, the author concludes that the doubled part regenerates the better, the farther removed the cut is from the common portion; also, that regeneration proceeds better in older pieces. In other duplex individuals the duplicated members were removed simultaneously. When slight stumps are left both members regenerate; when incision is made at the level of the common portion so that no stump is left, regeneration of a single member follows. The author states that already existing body parts do not exercise a restraining influence on the formation of supernumerary regenerates. It seems rather to depend upon external conditions whether regeneration merely restores normal integrity or produces a supernumerary part. If fusion with another regenerate is not possible, a doubled part is not reduced and regeneration of doubled parts is not suppressed. From results on "isopolarly" joined pieces it is concluded that "isopolar" coalescence cannot suppress regeneration in the wound area, if a body part is missing between the joined regions. In "heteropolarly" joined parts the regenerative polarity is not changed, and regeneration at site of union does not result. Pieces "heteropolarly" joined for 5 days, if cut are no longer capable of regeneration in the direction of their coalescence. This failure of "heteropolar" forms to regenerate is not due to the small size of the piece nor to the repetition of the operation, for 1/30 of a worm regulated to form a typical planarian, and animals 2-3 cm. long regenerated heads after 11 decapitations over a period of 4 mos. An hypothesis dealing with regenerative correlation is advanced. An attempt to show its applicability to the various phenomena previously mentioned is made.—*E. D. Goldsmith.*

14468. **McCONNELL, CARL H. The successful application of Rongalit white for the study of the development of the nerve net of Hydra.** (Preliminary note.) *Zool. Anzeiger* 93(7/10): 279-281. 1931.—To a 0.5% solution of methylene blue in distilled water add 3 drops of 25% HCl; mix and filter; add 2 cc. of 15% solution of Rongalit in distilled water; warm the mixture gently over a flame, never allowing it to reach the boiling point; when the color begins to change to deep, dirty green, remove from flame, continuing to stir. The preparation becomes almost clear, and contains a yellowish precipitate. At this stage, set it aside to cool. When cool, filter into a dropping bottle. It may be used after 24-36 hrs., and is good for a week. It may be used in darkness.

14469. **PIERANTONI, UMBERTO. L'organo simbiotico sullo sviluppo di Calandra oryzae. [The symbiotic organ in the development of C. oryzae.]** *Rend. Accad. Sci. Fis. e Mat. Napoli* 33(9/12): 244-250. 4 fig. 1927.

14470. **PORTMANN, ADOLF. Die Entstehung der Nähreier bei Purpura lapillus durch atypische Befruchtung.** *Zeitschr. Wiss. Biol. Abt. B. Zeitschr. Zellforsch. u. Mikrosk. Anat.* 12(1): 167-178. 12 fig. 1930.—In each egg capsule of *P. lapillus* only a few eggs develop into larvae and the remainder of the eggs serve as food for these larvae. There is no egg dimorphism but the "nurse eggs" come from eggs that have been fertilized by atypical spermatozoa. When an egg is fertilized by an abnormal sperm the 2 sex nuclei fuse and the egg divides irregularly a number of times but there are no true maturation divisions and the resulting divisions of the cytoplasm have no observable nuclear elements or centrosomes. It is thus demonstrated that maturation and fertilization are 2 series of phenomena quite independent of one another.—*A. B. Needler.*

14471. **PORTMANN, ADOLF. Die atypische Spermatogenese bei Buccinum undatum L. und Purpura lapillus L. Ein Beitrag zur Analyse des Spermiendimorphismus der Prosobranchier.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 12(2): 307-326. 21 fig. 1930.—In *B. undatum* L., 2 types of sperms are produced, typical and atypical. The atypical sperms are worm-shaped, apyrene, and without a centriole or any of its derivatives. The formation of these atypical sperms is described. In *Purpura lapillus* all fully developed sperms are outwardly quite normal but it is shown that in reality the majority are abnormal having undergone an abnormal behavior of the chromatin material at synapsis. As the atypical spermatozoa so far examined in Prosobranchia have some very complicated functions they cannot be regarded as degeneration phenomena. It is believed that abnormal spermatogenesis

has arisen through sudden mutative changes in the nuclei of the sperm-forming cells, and that the small deviation from the normal found in *Purpura* and the large deviation found in *Buccinum* should not be regarded as steps in a progressive change of the spermatozoa but rather as mutations that have occurred independently.—*A. B. Needler.*

14472. RAMMNER, WALTER. Über die postembryonale Entwicklung der Cladocere scapholeberis mucronata O. F. Muller. (Ergebnisse aus Einzelzuchten.) *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 113(2): 287-311. 10 fig. 1928.—Females were reared individually for 20 instars. Growth is most intense during the early instars, decreases after egg production begins, and ceases entirely in older animals. The reduction in growth intensity varies considerably for each individual. The form of older animals remains relatively constant. A strongly arched brood chamber forms in the young animals which becomes more or less reduced in very old animals permitting young, mature, and old forms to be identified. Two local races are sharply defined throughout their entire postembryonic development,—not only in the retention of a frontal spine in advanced instars. Females bear their first brood during the fifth instar. The first clutch of eggs averages 3-4. The greatest number in older individuals was 22. One ♀ bore an ephippium and, later, parthenogenetic eggs but retained her ephippial form. Males were reared through 8 instars. Growth is not retarded earlier than in the females. They pass through a greater number of instars as can be determined from preserved material. The ephippium is not fully prepared immediately after molting but develops gradually. Considerable change may occur later in the instar. The changes in the sculpturing of the head show that great proliferation of cells occurs at first, only, however, after considerable increase in cell surface comes about. For analytical work on form, preserved material may be used only for preadult instars. Individually reared animals alone are of value for adult instars.—*B. G. Anderson.*

14473. RIESE, KARL. Phylogenetische Betrachtung über das Nervensystem von Cypraea moneta auf Grund seiner Morphologie und Histologie. (Fauna et anatomia ceylanica, IV, nr. 12.) *Jenaische Zeitschr. Naturwiss.* 65(2): 361-486. 32 fig. 1931.—This detailed account of the nervous system of *C. moneta* from Ceylon is based on reconstruction and study of serial sections. The entire system is surrounded by a connective tissue sheath. The ganglionic cortex consists of unipolar, bipolar and multipolar neurons, but all 3 types are not present in every ganglion. The neuroglia usually is composed of fibrous cells and a spongy network (sometimes absent). Special ganglion-cells, grouped between lamellar partitions, are developed in the cerebral ganglia. The cerebral and pleural ganglia of each side are practically fused, although histologically separable, and are asymmetrically twisted towards the left. The cerebral and pleural commissures are also extremely short and a secondary cerebropleural connection is present. Each cerebral gyrus gives off a tentacular, an ocular, 2 frontals and 4 nerves to the proboscis, also the pedal connective, the statocystic nerve and the combined buccal and subradular connectives. Besides the usual connectives, the left pleural ganglion is the origin of a secondary left columellar, a left posterior pallial, a siphonal nerve and the sinistral zygoneury. Right zygoneury is absent. The buccal and subradular ganglia are separable and have distinct commissures but their very long (cerebro-) connectives are fused together on each side. Two pairs of radular nerves, 3 pairs of oesophageals, a left salivary and 2 left buccals arise from the ganglia; a nerve to the radular bed branches off each connective. Chiastoneury is not developed. The subintestinal and supraintestinal connectives are both quite short, and *Cypraea* is intermediate between those groups in which the suprintestinal ganglion is close to the left pleural and those in which it is nearer the right ganglion. The long visceral commissure has 4 accessory and 1 visceral ganglion proper. Also, a primitive condition is indicated by the double fiber-origin of the 21 parietovisceral nerves, which supply mantle, hypobranchial glands, rectum, anus, genitalia, kidney, osphradium, gills, columellar muscle, enlargement of foregut and pericardium. The anastomoses of the subintestinal nerves are interesting. The pedal connectives are quite long but the pedal commissure is extremely short. In the pedal system, the vaguely circumscribed ganglia, the 9 accessory commissures and the presence of even a vestigial lateral groove appear to be primitive characters, although these "ganglia" are well demarcated anteriad and have closed cortex and structure like true ganglia. On the other hand, the cortex of the pedal cords is not continuous and posteriad their ganglion cells are restricted to longitudinal strands. The fibers of the pedal and pleuropedal connectives, which enter the right and left pedal ganglia differently, can be followed into the penial and into the columellar muscle nerves, which superficially appear to arise from the right and from the left pedal ganglia, respectively. Both nerves can thus be regarded as primitive cerebral (or pleural) nerves which have secondarily become associated with the pedal ganglia. The 34 pedal nerves anastomose in a complex manner in the foot-musculature. A detailed account of the statocysts is included. *Cypraea* is considered a primitive group of Taenioglossa, derived from the same ancestors as the Architaeniglossa. It shows affinities with the Aporrhaidae, Capulidae, Calyptraeidae, Crepidulidae, Lamellariidae and Naticidae on the one hand, and with the Cassidiidae, Tritonidae, Janthinidae and Doliidae on the other.—*K. Riese (transl. by H. B. Baker).*

14474. SLIFER, ELEANOR H. Insect development. II. Mitotic activity in the grasshopper embryo. *Jour. Morph. and Physiol.* 51(2): 613-618. 1931.—The onset of hibernation in *Melanoplus differentialis* eggs kept at high temp. is accompanied by a fairly abrupt cessation of cell division. The total number of mitotic figures present in the different individuals of a series of embryos of this grasshopper, from eggs kept 18-20 days at 25°C. from the time of laying, varied between 1000 and 4400. In contrast, embryos from eggs kept 27 days at 25°C., as well as those older and still in the hibernating state, contained few or no dividing cells. In rare cases hibernation failed to occur, a few or many of the eggs developed without a pause when kept at 25°C., and hatched at approximately the 38th day.—*Author (courtesy Wistar Bibl. Serv.).*

14475. SPEK, JOSEF. Über die Winterknospenentwicklung, Regeneration und Reduktion bei Clavellina lepadiformis und die Bedeutung besonderer "Omnipotenter" Zellelemente für diese Vorgänge. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 111(1): 119-172. 18 col. fig. 1927.—Amoebocytes of *Clavellina* (including the test-cells, connective tissue cells, blood-corpuscles, and follicle-cells of the ovum) commonly contain a refringent viscous colloid protein reserve-body which stains brilliantly with neutral red. They have nutritive and formative functions, feeding regenerating tissues and organizing new structures in the winter buds. When circulating in the lacunae of the branchial sac, they often attach themselves to the basal surface of the branchial epithelium and penetrate between the epithelial cells. They migrate wholesale from th body into the test and there remain as the "tunica-cells," still characterized by the presence of the vitally-stained droplet, whence the name "Tropfenzellen" (drop-cells) of the mesenchyme. The thin ciliated epithelium to right and left of the endostyle is underlain by the red-staining drop-cells, but in the endostyle itself the dark-red refringent drops are never seen, only pale rose-tinted vacuoles, indicative of rapid utilization of the reserve-product. It is undetermined how far there may be a specific interaction between the gland-cells of the endostyle and the wandering colloid cells. The organs of individuals which have been injured in scraping the colonies from the rocks become necrotic and, if stained promptly at the beginning of the histolysis, the lacunae

are seen to be gorged with amoeboid drop-cells in full activity without any sign of approaching cytolysis, displaying an extraordinary degree of resistance in comparison with the ordinary tissue-cells. As the tissue-destruction continues, the drop-cells gradually migrate out of the lacunar system into the stolons at the hinder end of the body. These epithelial saccules become swollen by mass-aggregations of the amoeboid cells and appear as white nodules which finally separate from the dead parent-body and are then identical with winter-buds. After a resting period of about 3 weeks they come suddenly to life and within 3 days give rise to a new organism at the expense of the protein-reserve. The first organ to appear is the primordium of the gut. The intervention of the drop-cells in oögenesis and in regeneration is described with equal fullness and their omnipotential nature is briefly discussed.—*A. Willey.*

14476. **SPEK, JOSEF. Zustandsänderungen der Plasmakolloide bei Befruchtung und Entwicklung des Nereis-eies.** *Protoplasma* 9(3): 370-427. 1 pl., 2 fig. 1930.—Oocytes of *N. dumerilii* take protein drops out of amoeboid cells in the egg cell. The proteins swell and pass almost completely into solution, making the egg transparent and altering the results of centrifuging. A cortical sheath of small granules appears. A natural indicator forms in these granules. After fertilization the egg becomes brown, due to differences in refraction between the proteins and the hyaloplasm. The cortical sheath is separated off and swells to a thick gel. General hydration sets in. After polar body formation the protein and oil drops and the indicator pass to the pole opposite the polar bodies; the other pole becomes colorless. In the 4-celled stage or earlier there occurs a change in reaction (at the pole containing the drops) to the acid side; at the clear pole it becomes alkaline. This is shown both by added indicators and the natural one. On furrowing, the cell which is alkaline forms the ectoderm while the acid one forms the endoderm. KCl-sea water induces the process artificially up to furrowing, even to change in acidity. After the change in pH the stability of the oil at the one pole is suddently lost and it aggregates while the proteins become clear; at the other, the plasma becomes more dense. Salts were injected and some which had no influence outside (even normal sea water) changed the cell markedly inside by coagulation.—*L. S. Moyer.*

14477. **VOGELSANG, ENRIQUE G. Über Taenien-Missbildungen.** *Zool. Anzeiger* 80(7/9): 268-270. 2 fig. 1929.—A specimen of *Dipylidium caninum* is described with 5 suckers, the extra one being much smaller than the 4 normal ones. In another specimen the last 3 proglottids had a median split. Abnormalities of *T. caninum* in Uruguay are apparently very rare. In 2 specimens of *Taenia marginata* the end of the strobila was forked.—*R. T. Young.*

14478. **WARNER, STANLEY G. Histological polarization of lateral giant-fibers in the crayfish.** *Proc. Nation. Acad. Sci. U. S.* 17(3): 140-141. 2 fig. 1931.—In stained sections of the abdominal nerve cord of the crayfish, segments overlap one another as in the earthworm nerve fiber; overlapping fibers differ in staining reaction, the lateral member of the overlapping pair staining darker than the median one.

14479. **ZYENG, DU-HYEN. Distribution of the intermuscular nerve cells in the earthworm.** *Sci. Rept. Tôhoku Imp. Univ. 4th Ser. Biol.* 5(3): 449-466. 3 fig. 1930.—Intermuscular nerve cells were found between the longitudinal and circular muscle layer, between the epidermis and the circular muscle layer, and sometimes within the circular muscle layer itself. The distribution of the cells, however, varied considerably in the species studied: *Allolobophora foetida, Pheretima megascolidioides, P. communissima,* and *P. vittata,* named in order of the number of these cells. *A. foetida* possesses nearly the same number of ordinary type cells as the others but many more of a particular spindle-shaped bipolar cell. The number of these cells tended to decrease anterio-posteriorly. It is suggested that the cells are vestiges of the primitive nerve net of lower invertebrates.—*W. N. Hess.*

14481. **BARKER, H. ALBERT, and C. V. TAYLOR. A study of the conditions of encystment of Colpoda cucullus.** *Physiol. Zool.* 4(4): 620-634. 1931.—Encystment was studied by making daily counts of the number of motile and of encysted organisms in ½ cc. of cultures varied with respect to pH, bacterial food supply, and total number of ciliates. Because of the impossibility of controlling even the more obvious environmental factors in the classical hay infusion, a balanced inorganic salt solution was used as culture medium. To this was added the bacterium *Pseudomonas fluorescens,* on which *Colpoda* throve and showed optimal rate of fission. Permanent encystment was: (1) not markedly influenced by the pH of the medium (neither accelerated nor retarded within the limits of pH 6.2 to 8.2); (2) not significantly accelerated or retarded by the absence or abundance of bacterial food; (3) prevented for a long time and presumably indefinitely by frequently renewing the culture medium and not allowing the ciliates to become crowded. The formation of permanent cysts is normally dependent upon crowding, or, where not numerous at any one time, upon a cumulative alteration of the medium brought about by the ciliates themselves. The more abundant the Colpoda in a certain volume of a given medium, the sooner will permanent encystment occur.—*Authors (courtesy Wistar Bibl. Serv.).*

14482. **BOUGHTON, DONALD C. The value of measurements in the study of a protozoan parasite Isospora lacazie (Labbé).** *Amer. Jour. Hyg.* 11(1): 212-226. 1930.—The average volume of the oocysts of coccidia in the English sparrow, measured at different times during the course of the infections in captive birds, varied significantly from time to time during an infection in a single host. From measurements made at different times it was possible to obtain statistical differences greater than those which have been used in the literature to differentiate coccidian species. The author does not decide whether the results are due to several species or strains of *Isospora* in the sparrow, or to a change in oocyst size during the course of an infection. It is shown, however, that a short series of measurements at one time may give size relations which are not typical for the species at all times.—*H. Kirby.*

14483. **CHATTON, ÉDOUARD, et ANDRÉ LWOFF. Contribution à l'étude de l'adaptation Ellobiophrya donacis Ch. et Lw. Péritriche vivant sur les branchies de l'acéphale Donax vittatus Da Costa.** *Bull. Biol. France et Belgique* 63(3): 321-349. 3 pl., 4 fig. 1929.—The ciliate *Ellobiophrya* was found in about 50% of *D.*

vittatus procured from the bay of Morlaix, France, but not in any other lamellibranchs. It is typically located between the 2 filamentous lamina of the gills, attached to them by a characteristic ring-shaped structure. The adult consists of a somewhat cylindrical body 60-100μ long $\times$ 25-30μ at the widest part, and a ring formed of 2 projections which arise from the aboral end of the body, surround a gill filament and meet again in a distinct suture with a special coupling structure. The adoral end has a peristome and cytopharynx like those of most vorticellids. The organism is holozoic and feeds solely on cellular debris from the host's kidney. Fatty reserves and characteristic bacilli are constant cytoplasmic inclusions. Division begins in the usual way at the peristome but later resembles a budding process. The daughter cell remains attached for some time to the mother by a style homologous with the style of *Vorticella*. It then develops aboral cilia and breaks loose. The supporting ring now begins to form and when this is complete the aboral cilia disappear to leave a set of blepharoplasts called by the authors the "infraciliature." They propose this as a general term to designate ciliatures without cilia but persisting as chains of blepharoplasts capable at certain stages of reorganizing to produce functional ciliatures. They suggest an analogy between the alternate organization and disorganization of the infraciliature and the formation of chromosomes from dispersed chromatin with the later redispersion. The ring support of *Ellobiophrya* is found in no other protozoon, but the homologies of this structure with structures in other vorticellids may be traced. The organism is classed as a dextral peritrich in the vorticellid group and a new subfamily for it is erected: the **ELLOBIOPHRYINAE** (p. 346).—*W. Trager.*

14484. **CHEISSIN, E. Infusorien Ancistridae und Boveridae aus dem Baikalsee.** *Arch. Protistenk.* 73(2): 280-304. 1 pl., 10 fig. 1931.—The following ciliates were found in large numbers between the gill filaments of the gastropods. *Benedictia* and *Choanomphalus* in Lake Baikal: **TIARELLA** (Boveridae) erected to include *T. baicalensis** (p. 286) and *T. b.* forma **elongata*** (p. 294); **ANCISTRINA** (Ancistridae), erected to include *A. ovata** (p. 295); **ANCISTRELLA** (Ancistridae), erected to include *A.* **choanomphali*** (p. 297). The presence in Lake Baikal of these ciliates, whose family relatives are all marine, leads the author to believe that L. Baikal was once connected with the sea. The oral end of these ciliates is regarded by the author as the original rear end, the aboral as the original front end. Details of ciliation, especially of the pharyngeal region, are given, based on the Klein silver line technique. Contrary to the opinion of some, these ciliates are not heterotrichs, but are much more closely related to primitive peritrichs. Evidence is given to show that the mouth has migrated in phylogenetic development from the front end to its present position.—*L. E. Noland.*

14485. **CUNHA, A. MARQUES da, et CESAR PINTO. Trichodina fariai, n. sp., cilié péritriche endoparasite de poisson marin.** *Compt. Rend. Soc. Biol.* 98(17): 1570-1571. 2 fig. 1928.—*T. fariai** (p. 1570), from intestine of *Sphaeroides testudineus* from Brazil.

14486. **DAMEROW, ARTHUR P. An attempt to grow paramoecia in pure cultures of tubercle bacilli.** *Amer. Rev. Tuberc.* 24(3): 363-366. 1931.—Cultures of a virulent human tubercle bacilli did not support growth and reproduction of *Paramoecium caudatum*. Attempts to develop tolerance in the paramecium for the bacillus were unsuccessful. Tubercle bacilli are rapidly washed from the paramecium after they have been in contact for varying intervals of time up to 2 wks., indicating that probably the bacilli were not taken up by the protoplasm of the paramecium. A simple and satisfactory method of washing the paramecium free from bacteria is described.—*Author's summary.*

14487. **DAVIES, L. M. The fossil fauna of the Samana Range and some neighbouring areas: Part VI. The Palaeocene Foraminifera.** *Mem. Geol. Surv. India, Palaeont. Indica* 15: 67-79. 1 pl. 1930.—The author discusses and figures 8 forms of the genera *Nummulites, Operculina, Discocyclina, Dictyoconoides,* and *Nonionina* ?, including *Dictyoconoides conditi* v. roeae* (p. 76), type in Geol. Surv. India.

14488. **DAWSON, J. A., and D. C. HEWITT. The longevity of encysted colpodas.** *Amer. Naturalist* 65 (697): 181-186. 1931.—*Colpoda cucullus* was recovered from protection cysts in hay collected in Cuba in May, 1925. Motile colpodas were recovered in different media in times varying from 18 to 24 hrs. Nematodes of the genera *Cephalobus, Aphelenchus,* and *Rhabditis* as well as a small species of amoeba were recovered in active condition.—*J. A. Dawson.*

14489. **DONS, CARL. Parafolliculina röstensis n. sp.** *Kgl. Norske Vidensk. Selsk. Forhandl.* 3(paper 45): 173-176. 3 fig. 1930(1931).—*P.* röstensis from "Röst," the outermost archipelago of Lofoten, Norway.

14490. **EKSEMPLARSKAJA, E. V. Morphologie und Cytologie von Anoplophrya sp. aus dem Regenwurmdarm.** *Arch. Protistenk.* 73(2): 147-163. 3 pl. 1931.—A species of *Anoplophrya,* occurring along with *Hoplitophrya, Maupasella,* and *Plagiotoma* in the earthworm's intestine, was studied. Incidence was 80-90% in spring and summer, 30-40% in the fall. Only adult worms were infected. The *Anoplophrya* was 50-80μ long, oval, with one row of 3-5 contractile vacuoles, a long cylindrical macronucleus, uniform ciliation, no fixation apparatus. The macronuclear structure and micronuclear division are described, based largely on iron-haematoxylin and Feulgen preparations. Granules and rods of chromatin in the cytoplasm are interpreted as degeneration products. Cytoplasmic inclusions of paraglycogen, fat and lipoid are demonstrated. The *Anoplophrya* were kept alive in artificial culture medium for 5 days.—*L. E. Noland.*

14491. **GALLI-VALERIO, B. Notes de parasitologie.** *Zentralbl. Bakt. I Abt. Orig.* 120(1/2): 98-106. 1 fig. 1931.—Sporozoa in the feces of *Vulpes vulgaris,* a coccidium, *Isospora* **vulpis** (p. 102); in the feces of a ♀ *Lyrurus tetrix, Isospora* lyruri (p. 103). Nemathelminthes: in the intestine of a *Cypselus apus,* a ♀ *oxyuris* **cypselidae** (p. 104). Other parasites are described without identification. All are from the vicinity of Lausanne.

14492. **GELEI, J. v. Sensorischer Basalapparat der Tastborsten und der Syncilien bei Hypotrichen** *Zool. Anz.* 83(11/12): 275-280. 5 fig. 1929.—By means of special technics (osmium-toluidin and silver-osmium formol) certain sack-like structures at the bases of the sensory spines, cirri, and membranelles in *Euplotes patella,* or a species closely related thereto, were demonstrated. These the author calls "sensory cysts" because of their supposed function as accessory organelles of the sensory apparatus in the conduction and increase of mechanical stimuli effects, and in "registering" the movement (Bewegungszustandes) of cirri and membranelles.—*R. T. Young.*

14493. **GOUSSEFF, W. F. Zur Frage der Kaninchenkokzidien.** *Zeitschr. Infektionskr. u. Hyg. Haustiere* 39 (4): 265-271. 1931.—Gousseff discusses the 3 forms (occurring in rabbits) which he recognizes as distinct: (1) *Eimeria stiedae* Lindemann (1865); the oöcysts are colorless or orange yellow; micropyle often open; poles somewhat unequal; oöcysts 23.7—43.2 $\times$ 15.1—28.0μ; spores 6.4—17.2 $\times$ 4.3—8.6μ. (2) *E. perforans* Leuckart (1879); micropyle invisible or slightly visible; oöcysts 15.1—34.5 $\times$ 8.6—23.7μ; spores 5.1—8.6 $\times$ 3.4—6.4μ. (3) *E. magna* Pérard (1924); oöcysts oval to egg shaped, of orange yellow or brown color; on the broader end is a distinctly visible micropyle; oöcysts 23.7—38.8 $\times$ 12.9—28.0μ; spores 6.4—15.1 $\times$ 4.3—8.1μ. These measurements agree with those previously published by other writers.—*L. D. Bushnell.*

14494. **HOLMES, FRANCIS O. Herpetomonas bancrofti n. sp. from the latex of a Ficus in Queensland.** *Contr. Boyce Thompson Inst.* 3(3): 375-384. 5 fig. 1931.—A new herpetomonad flagellate, *H.* **bancrofti***, occurring in the latex of *Ficus scabra,* later identified as *F. opposita* Mig., is distinguishable from all other known latex

herpetomonads by its furrowed body, unusual frequency of pairs, and its unique occurrence in chains of 3-30 cells, in addition to occurrence like that of other species in pairs and isolated individuals. Individuals in chains, 5-10μ; isolated and paired individuals, 5-24μ in length. Many short cells, and all cells in chains, aflagellate; when flagellate, both daughter cells of dividing pairs have flagella of nearly equal length. In flagellate, isolated individuals, flagellum a little shorter than body of cell on the average. Nucleus $1\frac{1}{2} \times 1\mu$; 2.4μ from anterior end of nucleus to anterior end of cell; nearly spherical parabasal body midway between these points.—*F. O. Holmes.*

14495. HURST, C. T., and D. R. STRONG. Studies on the plates of the fresh-water Ceratium, the so-called Ceratium hirundinella. *Arch. Protistenk.* 73(1): 104-110. 4 fig. 1931.—Four plates were found in the apical horn of the *Ceratium* studied; the 2 ventral ones are narrower than the dorsal ones. The first extends posteriorly to the flagellar pore, separating the first precingular plate from the sulcus.—*L. E. Noland.*

14496. [ЯКІМОV, V. L.] ЯКИМОВ, В. Л. К вопросу о паразитах у пресноводных рыб. Кокцидиоз у окуня. [Parasites of fresh water fishes. Coccidiosis of the perch.] [French summary.] Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии [*Russ. Jour. Trop. Med., Med. & Vet. Parasitol.*] 7(8): 537-540. 1 fig. 1929.—In July 1926, for the first time in U. S. S. R., author found heavy infection in the liver of *Perca fluviatilis* due to *Eimeria* **rivierei.**

14497. JANICKI, C. Neue Beiträge über Paramoeba Schaud. *Congrès Internation. Xe Zool. à Budapest 1927.* Part 2. pp. 903-905. 1929.—Cytological investigation on *P. pigmentifera* (Grassi) with reference to the appearance of centrosomes, the finer phenomena associated with division of nucleus and "Nebenkörpers," and the significance of the latter.—*G. Alexander.*

14498. JÍROVEC, OTTO. Über ein neues Balantidium aus dem Darmtraktus von Amblystoma tigrinum. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 3(1): 17-21. 10 fig. 1930.—*B.* **amblystomatis*** (p. 17), from the intestinal tract of *Amblystoma tigrinum*, Czechoslovakia; *B. elongatum* was found in the small intestine of *Amblystoma.*

14499. JÍROVEC, OTTO. Ueber das Vorkommen von blepharoplastlosen Trypanosomen in normalen Stämmen. *Zentralbl. Bakt. I. Abt. Orig.* 121(1/2): 55-58. 1931.—Blepharoplast-free trypanosomes were found in all strains examined (*Trypanosoma gambiense* Braun, *T. gambiense* Funk, *T. rhodesiense* James, *T. rhodesiense* Eastwood, *T. brucei* Naguna 30, *T. evansi, T. congolense, T. lewisi, T. equinum, Schizotrypanosoma cruzi, T. equiperdum*), even those long cultivated in experimental animals. The % was higher in freshly isolated strains; when the hematogenous infection increased in severity the number increased because of increase in abnormalities of division. The % varied from animal to animal and often was very irregular during the course of infection, the cause of the irregularity being unknown.—*Author's summary.* (*transl.*).

14500. KARLING, J. S. A preliminary descriptive study of a parasitic monad in cells of American Characeae. *Amer. Jour. Bot.* 17(9): 928-937. 3 pl. 1930.—*Diplophysalis stagnalis* Zopf is parasitic in many species of the Characeae, where it feeds on the degenerating plastids, starch grains, and the remainder of the cytoplasm. It has 4 rather sharply defined stages in its life history: Zoospores, amoebae, zoosporangium, and resting cyst. Active feeding occurs in the amoeboid stage. The resting or sporocyst has a primary and secondary wall, the latter being very rough, so that the whole structure looks somewhat like a many pointed star within a sphere.—*J. S. Karling.*

14501. KONSULOFF, STEFAN. Über die Färbbarkeit der Kerne der Infusorien aus der Familie der Opaliniden in Zusammenhang mit der Bedeutung der Feulgen's mikrochemischen Reaktion. *Arch. Protistenk.* 73(2): 311-314. 1931.—The author regards the so-called disk-shaped bodies in *Opalina* as macronuclei, the "nuclei" of other authors as micronuclei. As further evidence for this view he states that in dilute Delafield's hematoxylin and methyl green both types of nuclei stain, when young Opalinae from tadpoles are used. Feulgen's reaction was negative for both types of nuclei in both young and old Opalinae. This, in the author's opinion, however, does not exclude the possibility of chromatin being present.—*L. E. Noland.*

14502. PASCHER, A. Über die Verfestigung des Protoplasten im Gehäuse einer neuen Euglenine (Klebsiella). *Arch. Protistenk.* 73(2): 315-322. 6 fig. 1931.—**KLEBSIELLA** (p. 322), erected for *K.* **alligata*** (p. 322), a new case-bearing euglenoid flagellate, which is attached to the inner end of its case by fine gelatinous elastic fibers secreted from the posterior end of the cell. The organism, which closely resembles *Euglena*, is about 35μ long with a cup-shaped case 25μ long. A detailed description of the cell is given and comparison made with *Ascoglena, Trachelomonas, Euglena chlamydophora,* and *E. terricola.*—*L. E. Noland.*

14503. PESCHKOWSKY, LUDMILLA. Zur Morphologie von Dileptus gigas und Loxophyllum meleagris. *Arch. Protistenk.* 73(2): 179-202. 1 pl., 9 fig. 1931.—In *D. gigas* 3 myonemes were found on the ventral surface of the proboscis. The large middle one connects with the inner lining of pharyngeal rods; the 2 smaller outer ones connect on either side with the outer sheath of pharyngeal rods. Along the ventral surface of the proboscis are many short transverse superficial supporting fibrils, found as far down as the mouth in the protoplasm between the 2 sheaths of pharyngeal rods. More delicate supporting fibers were also found along the dorsal surface of the proboscis. A fibrillar network was found in the cytoplasm under the pellicle, connecting anteriorly with the outer layer of pharyngeal rods. In *L. meleagris* a peripheral fibrillar layer was observed, originating in and connecting the basal granules of the 3 left marginal rows of cilia, and running thence to the right through the peripheral cytoplasm, independently of the cilia of that region, to the oral slit on the right where they unite and form supporting strands in the pharynx and wall of the mouth. Oval cytoplasmic inclusions, presumably of glandular character, were observed and believed to be in some way associated with the trichocysts. Endoplasmic fibrils connecting these bodies may possibly be ducts or contractile strands.—*L. E. Noland.*

14505. RAMMELMEYER, H. Zur Biologie einiger Raubinfusorien. *Arch. Protistenk.* 73(2): 251-273. 3 pl., 2 fig. 1931.—*Didinium* fed on *Paramecia* that had ingested congo red showed the blue acid color in their food vacuoles in about 20 minutes and for about 2 hrs. thereafter. Defecation ordinarily occurred during the 2nd hour after ingestion. $MgSO_4$ and $MgCl_2$ did not materially alter the time of digestion. *Dileptus anser* ate *Paramecium, Chilomonas, Colpoda,* and *Stentor,* but not *Amoeba.* A split-tailed variety of *Dileptus* was isolated and showed some tendency to pass on the defect to offspring. Neither hunger nor extremes of temp. regularly produce encystment in *Didinium, Dileptus,* or *Euplotes.* Excretions accumulating in the medium are more effective in bringing about encystment. The encystment process is described in detail for *Dileptus* and the changes occurring in the cytoplasm are set forth. The intimocyst in *Didinium* cysts was observed by the use of 0.5% NaCl solution. *Spirostomum* cysts were obtained.—*L. E. Noland.*

14506. REGENDANZ, P., et W. KIKUTH. Sur les hémogrégarines du "Gamba" (Haemogregarina didelphydis), de la "Quica" (Haemogregarina metachiri n. sp.) et sur l'Haemogregarina ratti. *Compt. Rend. Soc. Biol.* 98(17): 1565-1567. 1 fig. 1928.—A further description of *H. didelphydis* from *Didelphys didelphydis aurita,* especially a form found in the intestine of a tick (*Ixodes loricatus*) which had been feeding on an infected *Didelphys;* a form occurring in the leucocytes was also

described. A similar gregarine from the blood of *Metachirus quica* is provisionally named *H.* **metachiri*** (p. 1567, illus. p. 1568) from Brazil. Heavy infection of wild rats with *H. ratti* is noted.

14507. REGENDANZ, P., et W. KIKUTH. Sur un parasite du sang des "Quica" (Metachirus quica), Nuttalia brasiliensis n. sp., et influence de la rate sur les infections latentes du sang. *Compt. Rend. Soc. Biol.* 98(17): 1567-1569. 1 fig. 1928.—Following splenectomy large numbers of a parasite, *Nuttalia* **brasiliensis*** (p. 1568), appeared in the blood of *Metachirus quica* (Brazil). The infections could not be transmitted to *Didelphys* or to dogs. The appearance or increase in numbers of parasites after splenectomy is noted, and the protective rôle of the spleen in parasite infections is discussed.

14508. SANDERS, ELIZABETH P., and L. R. CLEVELAND. The morphology and life-cycle of Entamoeba terrapinae spec. nov., from the terrapin, Chrysemys elegans. *Arch. Protistenk.* 70(2): 267-272. 1 pl. 1930.—The organism has a typical *Entamoeba* nucleus, its trophozoites vary in size from 10 to 15μ and its cysts from 8 to 14μ. The cysts develop in a *histolytica*-like manner to the 4-nucleate stage with heavy, blunt, rod-like chromatoid bodies. Occasionally 8-nucleate cysts are formed. All of these stages develop at 20-23° C. in the liver infusion agar medium used for *Entamoeba histolytica*. Transfers are made every 6 days. The optimum temp. for excystation and metacystic development is about 27° C., when the amoeba excysts as a 4-nucleate trophozoite. This gives rise by cytoplasmic division to 2 binucleate amoebae, which by cytoplasmic division produce 4 uninucleate amoebae. A cyst of *E. histolytica* gives rise to 8 metacystic amoebae. All stages in the life-cycle of *E. histolytica* could be found regularly in the liver infusion agar cultures grown at 37° C. Metacystic development of *E. terrapinae* at room temp. in the regular cultures was rare.—*E. P. Sanders.*

14509. SKVORTZOW, B. W. Phytoplankton from Siberia. *Jour. Bot.* 69(818): 33-38. 2 fig.; (819): 69-72. 1 fig. 1931.—One hundred and ninety-eight spp. and varieties are listed as occurring in the Akmolinsk Lake district, in the Altai Mts., and from the Amur River, including *Trachelomonas minuta* v. **siberica*** (p. 34), *T. ovoides* v. **siberica*** (p. 34).—*A. 14510. VAUGHAN, THOMAS WAYLAND. Results of recent investigations of American Tertiary larger Foraminifera. *Proc. Third Pan-Pacific Sci. Congr., Tokyo, 1926* 2: 1850-1857. 1928.—The review of earlier investigations of American Tertiary larger foraminifera commencing about 1913 is given. A number of genera are discussed, and notes are given on the species recognized in America, especially data are given in regard to advances in knowledge of these forms published since the appearance in 1924 of a paper by T. Wayland Vaughan on American and European Tertiary larger foraminifera. A bibliography gives the literature published during and subsequent to 1923.—*J. A. Cushman.*

14511. [VINOGRADOVA-FEDOROVA, T.] ВИНОГРАДОВА-ФЕДОРОВА, Т. Опыт учета инфузорий желудка жвачных и культивирования их **in vitro. [Infusoria of the stomach in ruminants, and their culture in vitro.]** [German summary.] Труды Ленинградского Общества Естествоиспытателей, Отделение Зоологии и Физиологии (*Trav. Soc. Nat. Leningrad, Sect. Zool. et Physiol.*) 59(2): 3-20. 1929.—Counts of the infusoria population of the rumen of goats (♂ and ♀), by the Dogiel-Vinogradova and the Mangold-Ferber methods, gave good agreement. Counts taken from day to day, and at different hours, are fairly constant; daily variations in count were probably due to the dilution of the contents of the rumen by ingested food and drink. With these variations eliminated (in hunger) there is no significant change in infusoria count, and the infusoria population characteristic of any given ration can be determined. Counts of 649 and 782 per cu. mm. were recorded for 2 tests. The density of the infusorial population depends, undoubtedly, on the energy of their reproduction, and on the numbers of infusoria taken in with food.

14512. WETZEL, A. Über die Zucht von Actinosphaerium. *Zool. Anz.* 96(7/8): 198-200. 1931.—The methods of propagating *A. eichhorni* for laboratory use are discussed, and formulae are given for culture media.

14513. WEYER, GEORG. Untersuchungen über die Morphologie und Physiologie des Formwechsels der Gastrostyla steinii Engelmann. *Arch. Protistenk.* 71(1): 139-228. 83 fig. 1930.—The Gastrostylae were cultured in Knop's solution and fed on *Gonium pectorale*. Cell division required 70 minutes for completion. Encystment involved successively: cessation of feeding, egestion of all solid wastes, disappearance of peristomial cilia and ambulatory cirri, assumption of spherical form, transformation of pellicle into ectocyst, disappearance of all remaining cilia, occurrence of streaming movements in the cytoplasm, deposition of the endocyst, fusion of the 4 macronuclei into one, shrinking and wrinkling of the ectocyst, contraction of protoplasm away from endocyst, cessation of protoplasmic currents, disappearance of contractile vacuole, requiring 15 hrs. for completion. Excystment involves successively: resumption of cytoplasmic currents, changes of form in macronucleus, reappearance of contractile vacuole, appearance of cilia over a clear zone at one end of the cell, followed by their appearance elsewhere, swelling of endocyst, which stretches and ruptures the ectocyst, rupture of endocyst with escape of the animal, requiring 11¾ hrs. for completion. Re-encystment could be induced by changing the external conditions before emergence. Details of cell division are given. No evidence of endomixis was observed in the cysts, although abnormal encystments occasionally gave nuclear pictures like those interpreted by others as endomixis. In excystment the macronucleus divides twice to form the typical number, and the enlarged "activated" micronucleus divides, the other micronuclei remaining unchanged. In micronuclear division 8 chromosomes form and split longitudinally, giving 16, of which 8 slip out from the others to pass to each pole. Observations and speculations on spindle formation and presence of centrosome are given. In dividing of excysted animals the "activated" micronucleus does not differ in its behavior from the others. Pure line cultures were maintained 30 months without depressions, rhythms, parthenogenesis, conjugation, or encystment. In vegetative cultures the animals breed true as to micronuclear number. Encystment is not induced by variations in salt concentration, oxygen, pH, organic matter, temperature, metabolic wastes, or evaporation of medium, but is induced solely by hunger or injuries that bring the animal into a state of hunger. Excystment occurs only in the presence of organic matter; gelatin, thoroughly liquefied and decomposed by bacterial action, was found to be most effective in inducing excystment. Encystment of the Gastrostylae apparently increased the alkalinity of the culture. Too much organic matter produced abnormal excystment. Cysts washed free of organic matter died quickly after drying; dried with organic matter they lived a long time. In Knop's solution cysts retain their vitality over long periods.—*L. E. Noland.*

14514. YAKIMOFF, W. L., und S. K. TERWINSKY. Die Coccidiose des Zobeltieres. *Arch. Protistenk.* 73(1): 56-59. 1 fig. 1931.—*Eimeria* **sibirica*** (p. 58), from the Siberian sable, *Martes zibellina*. The oöcysts are oval and without micropyle, contain 4 sporoblasts and are larger than the sporocysts of *E. vulpes* or *E. mesnili*, averaging 24.5 × 19.45μ in length and breadth respectively.—*L. E. Noland.*

14515. YAKIMOFF, W. L., und E. F. RASTEGAÏEFF. Zur Frage der endoglobulären Parasiten der Rinder in dem nord-westlichen Gebiet Russlands (UdSSR.). *Arch. Protistenk.* 73(1): 111-1119. 1 pl. 1931.—The so-called *Babesia karelica* Yakimoff 1926 is identical with *Françaiella caucasica* Yakimoff & Bourzeff 1927. The latter, as well as *F. occidentalis*, are here reported as occurring in northwestern Russia (Leningrad district), in addition

to the previously reported occurrence in the Caucasus.—*L. E. Noland.*

14516. YAKIMOFF, W. L., W. S. BELAWINE, W. I. BOURZEFF, und S. N. NIKOLSKY. Zur Frage der Theileria annulata im Nordkaukasus. *Arch. Protistenk.* 73(1): 120-130. 1 pl. 1931.—Symptoms and blood pictures of animals (cows and oxen) suffering from *T. annulata* infections are given, together with detailed description of the morphology of the parasite, showing that the disease and the parasite occurring in the northern Caucasus is the same as the disease and the parasite of the Transcaucasian and Turkestan districts.—*L. E. Noland.*

14517. YAKIMOFF, W. L. Zur Frage über den Parasitismus der Süsswasserfische. VI. Eperythrozoon beim Hecht (Esox lucius). *Arch. Protistenk.* 73(2): 274-279. 1 pl. 1931.—*E.* perekropovi* (p. 278) from *Esox lucius,* Russia, is the 4th species to be assigned to the genus *Eperythrozoon* V. Schilling [See B. A. 3(9/11): entry 19886].—*W. L. Yakimoff (transl. by A. S. Pearse).*

14518. YAKIMOFF, W. L., I. I. SOKOLOFF, und E. F. RASTEGAÏEFF. Zur Frage der Coccidien beim Eichhörnchen. *Arch. Protistenk.* 73(3): 487-490. 4 fig. 1931.—*Eimeria sciurorum* Galli-Valerio is reported from a squirrel (*Sciurus vulgaris*) in Russia. The oöcysts are oval; size: 28.8-34.5 × 19.8-23.7 μ (ave.: 31.44 × 21.44). The spores are oval; 10.62-14.80 × 7.2-9.0 (ave.: 12.68 × 8.09) μ. Sporozoites are pyriform; 10.8 × 4.32 μ.—*W. L. Yakimoff (transl. by A. S. Pearse).*

14519. [ZASUKHIN, D. N., and N. A. GAÎSKII.] ЗАСУХИН, Д. Н., и Н. А. ГАЙСКИЙ. Toxoplasma nikanorovi n. sp.—новый кровепаразит степного суслика Citellus pygmaeus Pallas. [Toxoplasma nikanorovi n. sp., a new blood parasite of Citellus pygmaeus Pallas.] Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(1): 96-100. [French résumé p. 135.] 1 pl. 1930.—Marmot (*Citellus pygmaeus*) infected with *Bacillus pestis* during hibernation died on the 204th day after infection. Analyses for plague were negative, although the autopsy gave picture strongly resembling plague: The lymphatic glands were enlarged, dark with small grayish and white knots; spleen yellow in color, and also covered with knots; lungs pink. In smears from these organs a great number of round, and half moon shaped bodies were found; they were either free or bounded in groups of 10-50 by protoplasm, which is homogeneous, vacuoles rarely found. The parasites are 4-6 × 2-3 μ in size; there was no definite membrane, only a fine pellicle around the parasites. The shape of the stained nucleus was often with pointed angles; karyosome in the nucleus could often be seen. Reproduction is by longitudinal splitting into 2 daughter cells. The organism proved to be pathogenic for *C. pygmaeus* and *C. fulvus* and nonpathogenic for *Gerbillus meridianus* and guinea pigs.—*G. A. Lebedeff.*

14520. ZINGHER, J. A., und W. W. FISIKOW. Biometrische Untersuchungen an Infusorien. I. Über die Mittelgrösse von Stentor coeruleus Ehrbg. *Arch. Protistenk.* 73(3): 482-486. 1931.—Applying biometric formulae to about 2000 individual measurements of *S. coeruleus* collected at different periods of the year and subjected to different conditions of temp. and light, it was determined that the mean size varies with the season, being largest in summer, least in winter. Under the influence of higher temp. the animals in general are larger. No independent size races were evident.—*L. E. Noland.*

COELENTERATA AND CTENOPHORA

P. L. KRAMP, *Editor*

(See also in B. A. 6(4): 9165, 11242, 11243, 11247, 11258, 11443, 11447, 11451, 11524; and in this issue 12620, 12626, 14242, 14243, 14244, 14246, 14249, 14251, 14253, 14256, 14262, 14468, 14591, 14629)

14521. BRIGGS, E. A. Studies in Australian athecate hydroids. No. 3. The histology of Myriothela harrisoni, Briggs. *Rec. Australian Mus.* 18(1): 5-14. 3 pl., 1 fig. 1930.—The ectoderm of the hydranth of *M. harrisoni** is stratified; the supporting lamella is thin and from its outer surface arises a series of either simple or branched secondary lamellae. The endodern consists of a distal region rich in goblet cells*, a middle region with gland cells and vacuolate cells, and a proximal region of vacuolate cells loaded with stored nutritive matter. The tentacles are remarkable for the extraordinary development of the supporting lamella in the capitulum*. The blastostyles are borne in the middle zone of the hydranth in such numbers as to completely hide the surface. The species is dioecious. The nematocysts* are of two kinds.

14522. CHAPMAN, FREDK. On the occurrence of a fossil Hydractinia in Australia. *Proc. Roy. Soc. Victoria* 43(2): 233-235. 1 pl. 1931.—*Hydractinia,* notes on the genus and its position; *H.* thatcheri* (p. 234), in shell-bearing polyzoal limestone of the River Cliffs, Murray, South Australia, Middle Miocene (Middle Murravian). Type in National Mus.

14523. CORIN, F. Nouveaux gîtes à Dictyonema flabelliforme, à Lorcé-Chevron. [New deposits of D. flabelliforme at Lorcé-Chevron.] *Bull. Soc. Belge Géol. Paléont. et Hydr.* 40(2): 74-76. 1931.

14524. DELÉPINE, G. Description d'un polypier nouveau, Humboldtia avesnensis nov. sp., du Viséen inférieur de Sars-Poteries. *Ann. Soc. Geol. du Nord* 54: 104-107. 1 pl. 1929.—*H.* avesnensis* (p. 104).—*W. Berry.*

14525. DUTERTRE, A. P. Etude de quelques Polypiers du Viséen du Boulonnais. *Ann. Soc. Geol. du Nord* 54: 108-129. 1 pl. 5 fig. 1929.—Enumerates a fauna of 7 spp. of corals from Boulonnais (northern France) and gives geologic and geographic ranges.—*W. Berry.*

14526. HICKSON, SYDNEY J. Three species of Alcyonaria from the Gulf of Manaar. *Bull. Madras Gov. Mus.* 1(2, pt. 2): 81-89. 3 fig. 1931.—*Clavularia margaritiferae* v. shinglei* (p. 82); *C. m.* var. krusadai (p. 84); *Xenia* nana* (p. 84); *Cornularia cornucopiae**, critical notes.

14527. LAVERDIÈRE, J. W. Contribution a l'etude des terrains Paléozoiques dans les Pyrénées Occidentales. *Mem. Soc. Geol. du Nord* 10(2): 1-131. Maps, 8 pl. 1930.—The author after discussing the stratigraphy of the Devonian of the region describes 29 graptolites and gives a table of occurrences for 52 spp. from the Pyrenees; describes 6 corals, recognizes *Stromatopora,* describes 50 brachiopods, 4 Lamellibranchia, and 1 Pteropoda.—*W. Berry.*

14528. MAZZARELLI, GIUSEPPE. Note sul corallo (Corallium rubrum L.). [With French, English and German summaries.] *Arch. Zool. Italiano* 13(3/4): 400-407. 1 pl., 1 fig. 1929.—The author examined imitative forms of *Corallium rubrum* which are formed by imposition and incrustation of coral on madreporite-skeletons and mollusk shells. He also studied the period of sexual maturity of corals, noting that in the bay of Naples they mature up to the 2nd part of September. Examination of the coral deposits of Sciacca has shown that the coral banks are due to accumulation of dead coral material rather than to living coral reefs.—*Author's summary.*

14529. NORDGARD, O. On the distribution of some alcyonarian corals in northern Norway. Faunistic notes on marine evertebrates VII. *Kgl. Norske Vidensk. Selsk. Forhandl.* 3(paper 1): 1-2. 1 fig. 1930(1931).—Notes on *Paragorgia arborea,* hitherto not found beyond Rognsund (70 23'5 N, 22 48' E) on the Norwegian coast; Rognsund (70 23'5 N) is the northernmost locality known for living specimens of *Primnoa.* Author states that there is a probability of finding *Paramuricea placomus* even north of Lofoten.

14530. PAX, FERDINAND. Edelkorallen des Schlesi-

schen Museums für Kunstgewerbe und Altertümer. *Zool. Anz.* 95(11/12) : 273-277. 1 fig. 1931.—Notes on a specimen of *Corallium reginae** from Amboina.

14531. **REDEKE, H. C., und A. P. C. de VOS.** Microhydra germanica in den Niederlanden. *Zool. Anz.* 94 (11/12) : 328-330. 1 fig. 1931.—Records the first finding of *Microhydra germanica** from Netherlands in plankton of the canals.

14532. **SMITH, STANLEY, and W. D. LANG.** Silurian corals. The genera Xiphelasma, gen. nov., and Acervularia, Schweigger, with special reference to Tubiporites tubulatus, Schlotheim, and Diplophyllum caespitosum, Hall. *Ann. and Mag. Nat. Hist.* 8(43) : 83-94. 2 pl. 1931. —**XIPHELASMA** (p. 83), a rugose coral, near *Tryplasma*, type *X.* **tubulatum*** (*Tubiporites tubulatus* Schloth.) (p. 84) ; *Tryplasma*, redefined; *Acervularia* Schweigger, type *A. ananas** (L.) (=*A. baltica* Schweigg.) ; *A. a.* var. *truncata** (His.) (=*Rhabdophyllum elongatum* Wed.) ; *A. a.* var. *singularis**; *Diplophyllum** J. Hall, type *D. caespitosum** Hall becomes a subgenus of *Acervularia*. *Rhabdophyllum excavatum* is chosen from the 6 genosyntypes as type of the genus. *R. striatum* and *R. cylindricum* are referred to *Acervularia*, and *R. truncatum* to *Kodonophyllum*. *A.* **densa*** (p. 89), Lower Salopian, horizon "f" of Lindström, Hallshuk, North Gotland, type in Brit. Mus.; *A.* **exigua*** (p. 89), Salopian horizon, Gotland, type in Hisinger coll.; *A.* **conglomerata*** (*Rhabdophyllum c.* Wed.) (p. 90) ; *A.* **breviseptata*** (*A. luxurians* var. *b.* Weiss.) (p. 91).

14533. **VOGEL, R.** Hydra circumcincta P. Sch. in fliessendem Wasser. *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(5/6) : 381-382. 1931.—Notes on this sp. in the high Alps.

PLATYHELMINTHES AND MESOZOA

H. W. STUNKARD, *Editor*

(See also in this issue Entries 12491, 12639, 13412, 13572, 13585, 13622, 13628, 14467, 14477)

14534. **BOCK, SIXTEN.** Die Polycladen der Deutschen Südpolar-Expedition 1901-1903. *Drygalski's Deutsche Südpolar-Exped. 1901-1903. Zool.* 20(12) : 261-304. 4 pl., 23 fig. W. de Gruyter & Co.: Berlin & Leipzig, 1931.—*Stylochus* **crassus*** (p. 263) ; *Emprosthopharynx* **vanhöffeni*** (p. 268) ; **NOTOPLANELLA** (p. 271), (Leptoplanidae) near *Notoplana*, type *N.* **inarmata*** (p. 272) ; *Planocera pellucida*, notes; *Stylostomum* **frigidum*** (p. 279) ; *Stylochoides albus**, discussion of characters; *Laidlawia trigonopora**, anatomical notes; *Prosthiostomum* **capense*** (p. 296) ; *P.* **drygalskii*** (p. 298). Bibliography of 27 titles.

14535. **CHANDLER, ASA C.** On a specimen of Taenia pisiformis with a completely double strobila. *Trans. Amer. Microsc. Soc.* 49(2) : 168-173. 1 pl. 1930.

14536. **JONES, MYRNA F.** Tapeworms of the genera Rhabdometra and Paruterina found in the quail and yellow-billed cuckoo. *Proc. U. S. Nation. Mus.* 75(20) : 1-8. 1 pl. 1929.—*Rhabdometra* **odiosa*** (*Taenia o.* Leidy, =*R. tomica* (Kol.)) (p.1) from *Colinus virginianus*, Georgia and Florida; redescribed from type material and from fresh specimens; *Paruterina* **similis** (*Rhabdometra s.* Ransom) (p. 6), from *Coccygus americanus*.—*E. T. Boardman.*

14537. **JOYEUX, CH., RONDEAU du NOYER, et J. G. BAER.** Les Bothriocéphales. *Bull. Sci. Pharmacol.* 38 (3) : 175-190; (4) : 235-251. 29 fig. 1931.—Review of history, classification, description of *Diphyllobothrium* genus and spp., and life cycle.

14538. **LÓPEZ-NEYRA, CARLOS RODRÍGUEZ.** Consideraciones sobre el género Davainea (s.l.) y descripción de dos especies nuevas. [Discussion of the genus Davainea (s.l.) with descriptions of two new species.] *Bol. R. Soc. Españ. Hist. Nat.* 29(9) : 345-359. 1929.—Fuhrmann 1920 divided the *Davainea* Blanchard and Railliet 1891 into 5 genera. Subsequent revisions have left but 4 of these, of which 3 now contain but 9 spp. between them, the remaining genus having 149. The author offers in place of this unsatisfactory arrangement a new division based chiefly upon the shape of the uterus and the type of capsule surrounding the eggs. The genera are *Ophryocotyloides* Fuhrmann, type *Davainea uniuterina* Fuhrmann; *Davainea* López-Neyra, type *D. proglottina* (Davaine) ; **IDIOGENOIDES** (p. 351), type *D. allagea* Kotlàn; **BRUMPTIELLA** (p. 352), type *D. cesticillus* (Molín) ; **MEGGITTIA** (p. 354), type *M.* **bolivari** (p. 354) from *Alectoris rufa* L.; **KOTLANIA** (p. 355), type *D. echinobothrida* (Megnin), and including *K.* **joyeuxi** (p. 359) from *Columba livia domestica* L.—*E. T. Boardman.*

14539. **MUELLER, JUSTUS F.** The trematode genus Plagiorchis in fishes. *Trans. Amer. Microsc. Soc.* 49 (2) : 174-177. 1 pl. 1930.—*Plagiorchis corti* Lamont (=*P. ameiurensis* McCoy) ; *P.* **geminus*** (p. 176) from *Schilbeodes gyrinus* and *Ameiurus nebulosus*, Oneida Lake, New York, type in Roosevelt Wild Life Forest Exp. Sta.

14540. **NAGATY, H. F.** A new anaporrhutine trematode genus and species Nagmia yorkei, with a review of the classification of the sub-family. *Ann. Trop. Med. and Parasitol.* 24(1) : 97-108. 1 pl., 3 fig. 1930.—**NAGMIA** (p. 97), type *N.* **yorkei*** (p. 97) from *Trygon* sp., Pearl Banks. Ceylon; *Staphylorchis largum* from *Ginglymostoma concolor*, emended description. Family Gorgoderidae was divided by Looss (1901) into 2 subfamilies, viz., Gorgoderinae and Anaporrhutinae. The latter now contains the following genera—*Anaporrhutum offenheim; Probolitrema* Looss; *Plesiochorus* Looss; *Petalodistomum* Johnston; *Staphylorchis* Travassos. *Dendrorchis* Travassos is a synonym of *Phyllodistomum* Braun and belongs in Gorgoderinae. The author gives a table of differences, schematic diagrams and diagnoses of the 6 genera of the subfamily Anaporrhutinae, including *Nagmia*.—*E. W. Stafford.*

14541. **PIGULEWSKY, S. W.** Neue Arten von Trematoden aus Fischen des Dnjeprbassins. *Zool. Anz.* 96 (1/2) : 9-18. 6 fig. 1931.—*Pleurogenes* **minus*** (p. 9), in intestines of *Esox lucius;* Gasterostomidae Braun (=Bucephalidae Lühe) ; key to subfamilies, tribes, and genera; **MORDVILKOVIA** (p. 12) (Gasterostomidae) near *Gotonius*, type *M.* **elongata*** (p. 13), in intestine of *Esox lucius; Coitocoecum* **macrostomum*** (p. 14), in intestinal canal of *Silurus glanis; C.* **ovatum*** (p. 15), in intestine of *Esox lucius; Lebouria* **acerinae*** (p. 16), in intestine of *Acerina cernua; Stephanophiala* **lata*** (p. 17), in intestine of *Scardinius erythrophthalmus*. All from Ukraine; types in Zool. Mus. Acad. Sci. USSR, Leningrad.

14542. **POISSON, RAYMOND.** Présentation d'un Coenurus serialis Gerv., forme larvaire du Taenia serialis Baillet. *Bull. Soc. Linn. Normandie* 1: 8-9. 1928 (1929).—Record of specimen from rabbit.

14543. **RUSZOWSKI, J. S.** Sur la découverte d'un ectoparasite Amphibdella torpedinis dans le coeur des torpilles. *Pubbl. Staz. Zool. Napoli* 11(2) : 161-167. 4 fig. 1931.—*A. torpedinis*, adult* and egg* from the heart of *Torpedo ocellata* and *T. marmorata* in the Mediterranean.

14544. **SKRJABIN, K. J., und N. P. POPOW.** Pharyngostomum fausti n. sp., ein neuer Trematode aus dem Darm der Hauskatze. *Tierärztl. Rundschau* 36(42) : 709-710. 2 fig. 1930.—*Pharyngostomum* **fausti*** (p. 709), from domestic cat.

14545. **SZIDAT, LOTHAR.** Gigantobilharzia monocotylea n. sp., ein neuer Blutparasit aus Ostpreussischen Wasservögeln. [G. monocotylea n. sp., a new blood para-

site of east Prussian waterfowl.] *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 2(5): 583-588. 5 fig. 1930.

14546. VAN HAITSMA, J. P. Studies on the trematode family Strigeidae (Holostomidae). No. 20. Paradiplostomum ptychocheilus (Faust). *Trans. Amer. Microsc. Soc.* 49(2): 140-153. 2 pl. 1930.—The adult is fully described as *P.* **ptychocheilus*** (*Neascus p.* (Faust)) (p. 140); the identity with the metacercaria described by Faust from the minnow *Notropis deliciosus stramineus* was established by feeding infected minnows to domestic ducks. The adults were found in 4 ducks; *Mergus americanus, M. serrator, Lophodytes cucullatus* and *Harelda hyemalis*. An emended diagnosis of *Crocodilicola* Poche is given.

14547. VOGEL, HANS. Studien über die Entwicklung von Diphyllobothrium. II. Teil: Die Entwicklung des Procercoids von Diphyllobothrium latum. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 2(5): 629-644. 8 fig. 1930.—Studies of the anatomy of the oncosphere* of *D. latum;* the infection of the first intermediate host (*Diaptomus vulgaris**, *D. gracilis, Cyclops strenuus, C. viridis, C. albidus, C. bicuspidatus,* and *C. serrulatus*); the development of the oncosphere into the procercoid*, with anatomical and cytological studies of the latter.

NEMATHELMINTHES AND NEMATOMORPHA

M. C. HALL, *Editor*

B. G. CHITWOOD, *Associate Editor*

(See also in this issue Entries 12737, 12738, 12739, 13572, 13575, 13586, 13602, 13607, 13610, 13611, 13616, 13619, 13620, 13621, 13623, 13624, 13625, 13637, 13640, 13641, 13642, 14488, 14491, 14671)

14548. ALLGÉN, CARL. Was ist die von Bütschli 1874 aufgestellte Odontophora marina? *Zool. Anz.* 81 (11/12): 305-309. 2 fig. 1929.—A discussion of *Odontophora* Bütschli and *Conolaimus* Filipjev, with illustrations of the mouth parts.

14549. ALLGÉN, CARL. Zur Kenntnis des Genus Pelagonema Cobb. *Zool. Anz.* 83(1/4): 7-16. 6 fig. 1929.—A diagnosis is given of the genus, with notes on the 4 previously known spp. *P.* **propinqua*** (p. 14) and *P.* **rotundicauda*** (p. 15), from Sweden, are new.

14550. DOUBROW, S., et J. ROUSSET. Sur un procédé de technique histologique concernant la coupe en série des petits Nématodes. *Bull. d'Hist. Appl. Phys. et Path.* 6: 416-417. 1929.—Modified Schaudinn fixation and butyl-alcohol dehydration allows 4μ serial sections and good cytological detail.—*J. G. Sinclair.*

14551. GOODEY, T. The species of the genus Aphelenchus. *Jour. Helminth.* 6(3): 121-160. 23 fig. 1928.—Each disease is considered to have its own particular sp. of *Aphelenchus* as causative agent, the spp. differing only in dimensions, not in morphological details. The following are described: (parasitic forms) *A. fragariae** Ritzema-Bos from strawberries; *A. ritzemabosi** Schwartz from chrysanthemum; *A. ribes** (Taylor) from black currant; *A. olesistus** Ritzema-Bos from *Lygodium, Lomaria ciliata,* etc.; *A. olesistus longicollis* Schwartz from violets; *A. cocophilus* Cobb from coconut; *A. subtenuis* Cobb from narcissus bulbs; (free-living forms) *Aphelenchus avenae* Bastian (=*A. agricola* de Man, *A. maupasi* Micol.) from decaying plant tissues; *A. parietinus** Bastian from potato tubers, mint rhizomes, etc.; *A. helophilus** de Man from pasture grass washings; *A.* **pseudolesistus*** (p. 139), England, from decaying oak leaves and galls on *Chrysanthemum maximum; A. tenuicaudatus** de Man from rotting banana rhizome; *A.* **demani*** (p. 144), England, from grass, narcissus bulb, hop roots, potato tubers; *A. longicaudatus* Cobb from banana roots; *A. chamelocephalus* Steiner from peanuts; *A. retusus* Cobb from dead pupa of the fly *Chaetopsis aenea; A. goeldii* Steiner from damp humus; *A. naticochensis* Steiner, from Lake Naticocha, Peru; *A. caprifici* (Gaspar.) from the fig-wasp *Blastoghaga;* (species inquirendae) *A. aderholdi* Schwartz from lily-of-the-valley roots; *A. mycogenes* Schwartz from cultures of the fungus *Cryptosporium nesii;* (spp. wrongly attributed to genus) *A. neglectus* Rensch. from roots cortex of barley, wheat, grass; *A. foetidus* Büts. (removed to genus *Tylopharynx* de Man) from cow-dung; *A. nivalis* Auriv. from the alga *Sphaerella nivialis.* Closes with a habitat and locality list of the spp.—*F. J. Meggitt.*

14552. GOODEY, T. On some new and little-known free-living nematodes. *Jour. Helminth.* 7(1): 27-62. 36 fig. 1929.—The following nematodes from St. Albans, England, are described: **RHABDITOIDES** (p. 27), near *Rhabditis,* based on *R.* **coprophaga*** (p. 27) from sheep's droppings; *Rhabditis* **pseudoxycerca*** (p. 30) from pig manure; *R. oxycerca* from pig manure, and from rotting coconut palm stem from Trinidad; *Myolaimus heterurus** from pig and goat manure and orchard humus; *Tylopharynx striata** from chicken run soil and a manure heap; **BUTLERIUS** (p. 41), near *Odontopharynx,* based on *B.* **butleri*** (p. 41) from rotting banana roots; *Diplogaster* **vorax*** (p. 45), ingesting nematodes, ciliates and tardigrades, from pig manure; *D.* **microstoma*** (p. 49) from pig manure; *D.* **winchesi*** (p. 51) from decaying leaves; *D. coprophages** from sheep droppings; *D. gracilis** from goat droppings; *D. minor** from decaying leaves. *Tylopharynx* is removed from the Anguillulininae and placed in the Diphtherophorinae.—*F. J. Meggitt.*

14553. GOODEY, T. On some details of comparative anatomy in Aphelenchus, Tylenchus and Heterodera. *Jour. Helminth.* 7(4): 223-230. 4 fig. 1929.—The esophageal glands of *A. avenae* (from decaying roots of narcissus bulbs) are described, together with the shape of the stylet. A comparison of the 3 genera is made, and a description given of the cephalic glands of *A. parietinus* (from mint rhizomes).—*F. J. Meggitt.*

14554. KEMNER, N. A. Potatisnematoden eller potatisålen (Heterodera schachtii ssp. rostochiensis Woll.) och dess framträdande i Sverige. [The potato nematode, H. schachtii ssp. rostochiensis, and its occurrence in Sweden.] [In Swedish with English summary.] *Meddel. (355) Centralanst. Försöksväs. Jordbruksomr. Lantbruksent. avd.* No. 56: 1-76. 1 fig. 1929.—This nematode is believed to have been introduced into Sweden from England or Germany. It was first observed in one province in Sweden in 1922. Control measures are discussed, particularly the suggestion of temporary suspension of potato cultivation on infected fields.

14555. KEMNER, N. A. Kvantitativa undersökningar av nematodhalten i svenska åkerjordar. [Quantitative investigations on the content of nematodes in cultivated soil, Sweden.] [In Swedish with German summary.] *Meddel. (357) Centralanst. Försöksväs. Jordbruksomr. Lantbruksent. avd.* No. 57: 1-27. 4 fig. 1929.—Methods and results are discussed.

14556. ROSELLA, ET. La rouille de l'Immortelle (Helichrysum orientale). *Rev. Pathol. Végét. et Ent. Agric.* 16(4/5): 153-155. 1929.—*H. orientale,* which is grown along the French Riviera, and *H. staechas,* which grows wild, show many abortive flowers as the result of infection by *Tylenchus dipsaci.—J. Dufrenoy.*

14557. SCHUURMANS STEKHOVEN, J. H. Jr. Ein Karnivor unter den marinen Nematoden. *Zool. Anz.* 81 (7/10): 261-269. 6 fig. 1929.—Carnivorous habits are known for the spp. of the terrestrial genus *Mononchus.* The same phenomenon was observed for the first time for the marine genus *Sphaerolaimus,* all spp. of which swallow nemas of the genus *Monhystera* and, occa-

sionally, of *Axonolaimus*. The mouth cavity of *Sphaerolaimus*, described in detail, is well adapted to this mode of feeding. The quantitative relations between the spp. of *Sphaerolaimus* and those of *Monhystera* in the brackish habitats in the Zuiderzee, Holland, vary within certain limits, which is not the case when *Sphaerolaimus* and *Axonolaimus* are compared.—*J. H. Schuurmans Stekhoven, Jr.*

14558. **SCHUURMANS STEKHOVEN, J. H. Jr. Additional notes on Diplogaster entomophaga Steiner.** *Zool. Anz.* 83(9/10): 265-267. 1 fig. 1929.—*D. entomophaga*, originally found by Steiner in *Pamphilius stellatus* (Hymenoptera), was found to parasitize *Astilbus* (Coleoptera). The author shows that it is parasitic, not saprophitic, since newly-laid eggs in an early stage of development were observed in the body musculature of the host, the nemas finally causing its death. A description is given of the feeding mechanism of the nema.—*J. H. Schuurmans Stekhoven, Jr.*

14559. **THOMAS, LYELL J. Philometra nodulosa nov. spec. With notes on the life history.** *Jour. Parasitol.* 15(3): 193-198. 1 pl. 1929.—*P.* **nodulosa*** is described from a single ♀ obtained from a cyst on the upper lip of the common sucker, *Catostomus commersonii*, taken at Douglas Lake, Michigan, in 1927. Type is in the Ward coll., Urbana, Illinois. This specimen was loaded with eggs and larvae and afforded material for the study of adult and larval morphology and also for some life history experiments. *Cyclops brevispinosus* was found to ingest young larvae of *Philometra* but after passing through this crustacean host, reinfection in young suckers was not successful.—*A. C. Walton.*

14560. **TRAVASSOS, L., und E. G. VOGELSANG. Mitteilung über das Genus Streptopharagus Blanc, 1912.** *Zool. Anz.* 85(3/4): 110-111. 1929.—A brief historical account of the genus and a critical note on some of the spp. Specimens from *Macacus rhesus* agree with *S. armatus* Blanc, as described by Blanc (1912) and Monning (1923), but not with the material described under that name by Bayliss (1923), which is here regarded as identical with *S. baylisi* Ortlepp. Material from *Hamadryas hamadryas* agrees well with the latter.

ROTATORIA, GASTROTRICHA, ECHINODERA, AND CHAETOGNATHA

Mus.—*A. L. Treadwell.*

14574. WOLF, WILHELM. Über die Bodenfauna der Moldau im Gebiete von Prag im Jahreszyklus. Oligochaeta. *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* [*Leipzig*] 20(5/6): 377-408. 9 fig. 1928.—Thirty-eight spp. of Oligochaeta are enumerated, 2 being Aeolosomatidae, 30 Naididae, 3 Tubificidae, 1 Enchytraeidae, 2 Lumbriculidae; those which are new to Bohemia are noted, and for 3 of the commonest species indications are given of their relative abundance in each month throughout the year. Frequency of occurrence was not shown to vary with pH concentration, alkalinity, or CO_2 content. O content has an influence on the number of species found at any given locality; more are found in better oxygenated waters. A few data are given concerning relation of certain species to abundance of food. A rise in the river is followed by reduction in numbers of individuals; probably they are carried away by the current. As to seasonal variation, fewer individuals are found in winter (Dec.-Feb.), but there is not a total disappearance; scarcity of food in winter leads to infrequency of fission, and hence to paucity of individuals. Short anatomical notes are given on all the species, and also a few data on frequency at the 6 stations in the different months or seasons. *Stylaria* brevirostris* (p. 396). *Amphichaeta leydigi, Chaetogaster langi, Paranais uncinata, Macrochaetina intermedia*, and *Nais elinguis* are treated most fully. Three modes of life of aquatic Oligochaeta are described, and the Oligochaeta of the Moldau belonging to each group are enumerated: (1) Creeping, in mud; including worms which push forward by a series of jerks, others which creep sluggishly, and others which move by creeping, combined with gliding on the substratum. (2) Tube-inhabiting, the tubes being of their own making; a general description of the tubes is given, with notes on the tubes of several spp., and on the behavior of *Dero* in their tubes. (3) Anchoring, or adhering to the substratum; notes on the habits of the several spp. of this group are given. Certain representatives of each group have the power of swimming freely; this is performed by a spring-like movement of both head and tail ends toward the middle of the body but on opposite sides, so forming an S-like figure; the dorsal setae are more or less applied to the body. All swimmers have long dorsal setae, which in the intervals of swimming are spread out and act as a parachute, hindering the fall through the water. The grade of swimming power is proportional to the number and length of the dorsal setae.—*J. Stephenson.*

14575. YAMAGUCHI, HIDEJI. On the variability of the capsulogenous glands in the earthworm (Pheretima hilgendorfi, Michaelsen). [With Japanese summary.] *Trans. Sapporo Nat. Hist. Soc.* 11(2): 89-96. 1 fig. 1930. —The capsulogenous glands open externally, concentrating on a circular papillate area ("Porenfeld" of Michaelsen) on the ventral median line in front of the chaetal line of the segment and in either the pre- or postclitellar region. The position and frequency of both glands and pore field varies greatly. They may occur in both pre- and postclitellar regions, in one only, or be completely absent. In most cases, they are found in segments VIII and XVIII. Observations show 961 occurrences for the former and 93 for the latter in 1010 individuals. Frequently more than 2 papillate areas are found in successive segments, that is, VI-XIV in the preclitellar region and XVII-XXII in the postclitellar. —*H. Yamaguchi.*
